VEHICLE IDENTIFICATION NUMBER

DESCRIPTION

The Vehicle Identification Number (VIN) plate is attached to the top left side of the instrument panel. The VIN contains 17 characters that provide data concerning the vehicle. Refer to the decoding chart to determine the identification of a vehicle.

To protect the consumer from theft and possible fraud the manufacturer is required to include a Check Digit at the ninth position of the Vehicle Identification Number. The check digit is used by the manufacturer and government agencies to verify the authenticity of the vehicle and official documentation. The formula to use the check digit is not released to the general public.

VEHICLE IDENTIFICATION NUMBER DECODING CHART

POSITION	INTERPRETATION	CODE = DESCRIPTION
1	Country of Origin	1 = Manufactured By DaimlerChrysler Corporation

VEHICLE EMISSION CONTROL INFORMATION (VECI)**DESCRIPTION**

All vehicles are equipped with a combined vehicle emission control information (VECI) label(s). The label is located in the engine compartment on the vehicle hood. Two labels are used for vehicles built for sale in the country of Canada.

The VECI label(s) contain the following:

- Engine family and displacement
- Evaporative family
- Emission control system schematic
- Certification application
- Spark plug and gap

The label also contains an engine vacuum schematic. There are unique labels for vehicles built for sale in the state of California and the country of Canada. Canadian labels are written in both the English and French languages. These labels are permanently attached and cannot be removed without defacing information and destroying label.

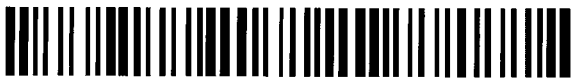

VEHICLE CERTIFICATION LABEL

DESCRIPTION

A vehicle certification label is attached to every DaimlerChrysler Corporation vehicle. The label certifies that the vehicle conforms to all applicable Federal Motor Vehicle Standards. The label also lists:

- Month and year of vehicle manufacture.
- Gross Vehicle Weight Rating (GVWR). The gross front and rear axle weight ratings (GAWR's) are based on a minimum rim size and maximum cold tire inflation pressure.
- Vehicle Identification Number (VIN).
- Type of vehicle.
- Type of rear wheels.
- Bar code.
- Month, Day and Hour (MDH) of final assembly.
- Paint and Trim codes.
- Country of origin.

The label is located on the driver-side door shut-face.

FASTENER IDENTIFICATION

DESCRIPTION

The SAE bolt strength grades range from grade 2 to grade 8. The higher the grade number, the greater the bolt strength. Identification is determined by the line marks on the top of each bolt head. The actual bolt strength grade corresponds to the number of line marks plus 2. The most commonly used metric bolt strength classes are 9.8 and 10.9. The metric strength class identification number is imprinted on the head of the bolt. The higher the class number, the greater the bolt strength. Some metric nuts are imprinted with a single-digit strength class on the nut face. Refer to the Fastener Identification and Fastener Strength Charts.

FASTENER USAGE

DESCRIPTION

FASTENER USAGE

WARNING: Use of an incorrect fastener may result in component damage or personal injury.

Fasteners and torque specifications references in this Service Manual are identified in metric and SAE format.

During any maintenance or repair procedures, it is important to salvage all fasteners (nuts, bolts, etc.) for reassembly. If the fastener is not salvageable, a fastener of equivalent specification must be used.

THREADED HOLE REPAIR

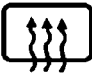

DESCRIPTION

THREADED HOLE REPAIR

Most stripped threaded holes can be repaired using a Helicoil®. Follow the vehicle or Helicoil® recommendations for application and repair procedures.

The graphic symbols illustrated in the following International Control and Display Symbols Chart are used to identify various instrument controls. The symbols correspond to the controls and displays that are located on the instrument panel.

METRIC SYSTEM

DESCRIPTION

The metric system is based on quantities of one, ten, one hundred, one thousand and one million. The following chart will assist in converting metric units to equivalent English and SAE units, or vice versa.

CONVERSION FORMULAS AND EQUIVALENT VALUES

MULTIPLY	BY	TO GET	MULTIPLY	BY	TO GET
in-lbs	x 0.11298	= Newton Meters (N·m)	N·m	x 8.851	= in-lbs
ft-lbs	x 1.3558	= Newton Meters (N·m)	N·m	x 0.7376	= ft-lbs
Inches Hg (60° F)	x 3.377	= Kilopascals (kPa)	kPa	x 0.2961	= Inches Hg
psi	x 6.895	= Kilopascals (kPa)	kPa	x 0.145	= psi
Inches	x 25.4	= Millimeters (mm)	mm	x 0.03937	= Inches

PARTS & LUBRICANT RECOMMENDATION

DESCRIPTION

LUBRICANT RECOMMENDATIONS

Chassis

Component	Fluid, Lubricant, or Genuine Part
Steering Gear & Linkage, Ball Joints, Prop Shafts & Yokes, Wheel Bearings	Mopar® Multi-Purpose Lubricant NLGI Grade 2 EP, GC-LB

Body

Component	Fluid, Lubricant, and Genuine Part
Hinges:	
Door & Hood	Mopar® Engine Oil
Swing Gate	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Latches: Door, Hood/Safety Catch, Swing Gate	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Seat Regulator & Track	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Lock Cylinders	Mopar® Lock Cylinder Lube

FLUID TYPES

When service is required, DaimlerChrysler Corporation recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing DaimlerChrysler Corporation vehicles.

Only lubricants bearing designations defined by the following organization should be used to service a Chrysler Corporation vehicle.

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)

API QUALITY CLASSIFICATION

This symbol on the front of an oil container means that the oil has been certified by the American Petroleum Institute (API) to meet all the lubrication requirements specified by DaimlerChrysler Corporation.

9400-9

GEAR LUBRICANTS

SAE ratings also apply to multigrade gear lubricants. In addition, API classification defines the lubricants usage. Such as API GL-5 and SAE 75W-90.

FLUID TYPES

DESCRIPTION

ENGINE OIL

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

When service is required, DaimlerChrysler Corporation recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing DaimlerChrysler Corporation vehicles.

Only lubricants bearing designations defined by the following organization should be used.

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)
- Association des Constructeurs Européens d' Automobiles (European Automobile Manufacturers Association) (ACEA)

API SERVICE GRADE CERTIFIED

Use an engine oil that is API Certified. MOPAR® provides engine oils, that meet or exceed this requirement.

SAE VISCOSITY

An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities such as 5W-30 or 10W-30. These are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range. **For 3.7L/4.7L engines SAE 5W-30 engine oil is recommended for all operating temperatures. For 5.7L engines, SAE 5W-20 engine oil is recommended for all operating temperatures. Vehicles with 5.7L engines equipped with Multiple Displacement System, (MDS), must use SAE 5W-20 oil. Failure to do so may result in improper operation of the Multiple Displacement System (MDS). These engine oils improve low temperature starting and vehicle fuel economy. Refer to your engine oil filler cap for the recommended engine oil viscosity for your vehicle.**

ACEA Categories

For countries that use the ACEA European Oil Categories for Service Fill Oils, use engine oils that meet the requirements of ACEA A1/B1, A2/B2, or A3/B3.

ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

CONTAINER IDENTIFICATION

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the front label of engine oil plastic bottles and the top of engine oil cans.

This symbol means that the oil has been certified by the American Petroleum Institute (API). Daimler-Chrysler only recommend API Certified engine oils. Use Mopar® engine oil or equivalent.

SYNTHETIC ENGINE OILS

There are a number of engine oils being promoted as either synthetic or semi-synthetic. If you chose to use such a product, use **only** those oils that meet the American Petroleum Institute (API) and SAE viscosity standard. Follow the service schedule that describes your driving type.

ENGINE OIL ADDITIVES/SUPPLEMENTS

The manufacturer **does not recommend** the addition of any engine oil additives/supplements to the specified engine oil. Engine oil additives/supplements should not be used to enhance engine oil performance. Engine oil additives/supplements should not be used to extend engine oil change intervals. No additive is known to be safe for engine durability and can degrade emission components. Additives can contain undesirable materials that harm the long term durability of engines by:

- Doubling the level of Phosphorus in the engine oil. The ILSAC (International Lubricant Standard Approval Committee) GF-2 and GF-3 standards require that engine oil contain no more than 0.10% Phosphorus to protect the vehicles emissions performance. Addition of engine oil additives/supplements can poison, from the added sulfur and phosphorus, catalysts and hinder efforts to guarantee emissions performance to 80,000 miles.
- Altering the viscosity characteristics of the engine oil so that it no longer meets the requirements of the specified viscosity grade.
- Creating potential for an undesirable additive compatibility interaction in the engine crankcase. Generally it is not desirable to mix additive packages from different suppliers in the crankcase; there have been reports of low temperature engine failures caused by additive package incompatibility with such mixtures.

GEAR LUBRICANTS

SAE ratings also apply to multigrade gear lubricants. In addition, API classification defines the lubricants usage. Such as API GL-5 and SAE 75W-90.

ENGINE COOLANT

ETHYLENE-GLYCOL MIXTURES

CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

The required ethylene-glycol (antifreeze) and water mixture depends upon the climate and vehicle operating conditions. The recommended mixture of 50/50 ethylene-glycol and water will provide protection against freezing to -37° C (-35° F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. **If percentage is lower than 44 percent, engine parts may be eroded by cavitation, and cooling system components may be severely damaged by corrosion.** Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7° C (-90° F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because the specific heat of antifreeze is lower than that of water.

Use of 100 percent ethylene-glycol will cause formation of additive deposits in the system, as the corrosion inhibitive additives in ethylene-glycol require the presence of water to dissolve. The deposits act as insulation, causing temperatures to rise to as high as 149° C (300° F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 percent ethylene-glycol freezes at 22° C (-8° F).

PROPYLENE-GLYCOL MIXTURES

It's overall effective temperature range is smaller than that of ethylene-glycol. The freeze point of 50/50 propylene-glycol and water is -32° C (-26° F). 5° C higher than ethylene-glycol's freeze point. The boiling point (protection against summer boil-over) of propylene-glycol is 125° C (257° F) at 96.5 kPa (14 psi), compared to 128° C (263° F) for ethylene-glycol. Use of propylene-glycol can result in boil-over or freeze-up on a cooling system designed for ethylene-glycol. Propylene glycol also has poorer heat transfer characteristics than ethylene glycol. This can increase cylinder head temperatures under certain conditions.

Propylene-glycol/ethylene-glycol Mixtures can cause the destabilization of various corrosion inhibitors, causing damage to the various cooling system components. Also, once ethylene-glycol and propylene-glycol based coolants are mixed in the vehicle, conventional methods of determining freeze point will not be accurate. Both the refractive index and specific gravity differ between ethylene glycol and propylene glycol.

HOAT COOLANT

WARNING: ANTIFREEZE IS AN ETHYLENE-GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE-GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASE COOLANT PROPERLY, CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE, PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED, PERSONAL INJURY CAN RESULT.

CAUTION: Use of Propylene-Glycol based coolants is not recommended, as they provide less freeze protection and less corrosion protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene-glycol base coolant with organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% ethylene-glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Mixing of coolants other than specified (non-HOAT or other HOAT), may result in engine damage that may not be covered under the new vehicle warranty, and decreased corrosion protection.

COOLANT PERFORMANCE

The required ethylene-glycol (antifreeze) and water mixture depends upon climate and vehicle operating conditions. The coolant performance of various mixtures follows:

Pure Water- Water can absorb more heat than a mixture of water and ethylene-glycol. This is for purpose of heat transfer only. Water also freezes at a higher temperature and allows corrosion.

100 percent Ethylene-Glycol - The corrosion inhibiting additives in ethylene-glycol need the presence of water to dissolve. Without water, additives form deposits in system. These act as insulation causing temperature to rise to as

high as 149°C (300°F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 percent ethylene-glycol freezes at -22°C (-8°F).

50/50 Ethylene-Glycol and Water - Is the recommended mixture, it provides protection against freezing to -37°C (-34°F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. If percentage is lower, engine parts may be eroded by cavitation. Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7°C (-90°F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because specific heat of antifreeze is lower than that of water.

CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

COOLANT SELECTION AND ADDITIVES

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (glycol base coolant with corrosion inhibitors called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Do not use coolant additives that are claimed to improve engine cooling.

AXLE

NOTE: DaimlerChrysler recommends using Mopar® lubricants or lubricants of equal quality

FRONT AXLE

- 200MM - Mopar® Synthetic Gear Lubricant 75W-140

REAR AXLE

- 213MM - Mopar® Synthetic Gear Lubricant 75W-140

NOTE: Vari-lok® equipped axles require 118 ml (4 ounces) of Limited Slip Additive be added to the lubricant.

TRANSFER CASE

Recommended lubricant for the NV140 transfer case is Mopar® ATF+4, Automatic Transmission Fluid. Recommended lubricant for the NV245 transfer case is Mopar® NV245/247 Transfer Case Fluid.

AUTOMATIC TRANSMISSION FLUID

NOTE: Refer to Service Procedures in this group for fluid level checking procedures.

Mopar® ATF +4, Automatic Transmission Fluid is the recommended fluid for DaimlerChrysler automatic transmissions.

Dexron II fluid IS NOT recommended. Clutch chatter can result from the use of improper fluid.

Mopar® ATF +4, Automatic Transmission Fluid when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

FLUID ADDITIVES

DaimlerChrysler strongly recommends against the addition of any fluids to the transmission, other than those automatic transmission fluids listed above. Exceptions to this policy are the use of special dyes to aid in detecting fluid leaks.

Various “special” additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of DaimlerChrysler and these additives **must not be used**. The use of transmission “sealers” should also be avoided, since they may adversely affect the integrity of transmission seals.

POWER STEERING FLUID

This system requires the use of hydraulic system/power steering fluid which meets Daimler Chrysler specification MS-10838, such as Mopar part number 05142893AA, or equivalent, DO NOT MIX POWER STEERING FLUID TYPES. Damage may result to the power steering pump and system if any other fluid is used, and DO NOT OVER-FILL.

OPERATION - AUTOMATIC TRANSMISSION FLUID

The automatic transmission fluid is selected based upon several qualities. The fluid must provide a high level of protection for the internal components by providing a lubricating film between adjacent metal components. The fluid must also be thermally stable so that it can maintain a consistent viscosity through a large temperature range. If the viscosity stays constant through the temperature range of operation, transmission operation and shift feel will remain consistent. Transmission fluid must also be a good conductor of heat. The fluid must absorb heat from the internal transmission components and transfer that heat to the transmission case.

FLUID CAPACITIES

SPECIFICATIONS - FLUID CAPACITIES

DESCRIPTION	SPECIFICATION
FUEL TANK	20 U.S. Gallons (76 Liters)****
Engine Oil - with Filter - 3.7L	4.7 L (5.0 qts.)
Engine Oil - with Filter - 4.7L	5.6 L (6.0 qts.)
Engine Oil - with Filter - 5.7L	6.6 L (7.0 qts.)
Cooling System - 3.7L	10.0 L (9 qts.)***
Cooling System - 4.7L	13.7 L (14.5 qts.)***
Cooling System - 5.7L	13.7 L (14.5 qts.)***
POWER STEERING SYSTEM	
Power steering fluid capacities are dependent on engine/chassis options as well as steering gear/cooler options. Depending on type and size of internal cooler, length and inside diameter of cooler lines, or use of an auxiliary cooler, these capacities may vary. Refer to 19, Steering for proper fill and bleed procedures.	
AUTOMATIC TRANSMISSION	
Service Fill - 545RFE	2WD - 5.2 L (11 pts.) 4WD - 6.2 L (13 pts.)
Service Fill - NAG1	5.0 L (10.6 pts.)
O-haul Fill - 545RFE	13.33 L (28.0 pts.)
O-haul Fill - NAG1	7.7 L (16.3 pts.)
Dry fill capacity Depending on type and size of internal cooler, length and inside diameter of cooler lines, or use of an auxiliary cooler, these figures may vary. (Refer to appropriate 21 - TRANSMISSION/AUTOMATIC/FLUID - STANDARD PROCEDURE).	
TRANSFER CASE	
NV140	0.65L (1.4 pts.)
NV245	1.8L (3.8 pts.)

DESCRIPTION	SPECIFICATION
FRONT AXLE ± 0.3 L (2 oz.)	
C200F	1.7 L (57.5 oz.)
C200FE	1.7 L (57.5 oz.)
REAR AXLE ± 0.3 L (2 oz.)	
C213R	2.07 L (70 oz.)*
C213RE	2.24L (75.5 oz.)
*Vari-Lok, add 0.07 L (2.5 oz.) of Friction Modifier.	
*** Includes 0.9L (1.0 qts.) for coolant reservoir.	
****Nominal refill capacities are shown. A variation may be observed from vehicle to vehicle due to manufacturing tolerance and refill procedure.	

FLUID FILL/CHECK LOCATIONS

INSPECTION - FLUID FILL/CHECK LOCATIONS

The fluid fill/check locations and lubrication points are located in each applicable group.

MAINTENANCE SCHEDULES

DESCRIPTION

MAINTENANCE SCHEDULES

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule "B". It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule.

- Day or night temperatures are below 32°F (0°C)
- Stop and go driving
- Excessive engine idling
- Driving in dusty conditions
- Short trips of less than 10 miles (16.2 km)
- More than 50% of your driving is at sustained high speeds during hot weather, above 90°F (32°C)
- Trailer towing
- Taxi, police, or delivery service (commercial service)
- Off-road or desert driving
- **If equipped for and operated with E-85 (ethanol) fuel.**

NOTE: Most vehicles are operated under the conditions listed for Schedule "B."

NOTE: If ANY of these apply to you, change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first, and follow the maintenance recommendations in "Maintenance Schedule B."

NOTE: If ANY of these apply to you then flush and replace your engine coolant every 102,000 miles (163 000 km) or 60 months, whichever comes first, and follow "Schedule B" of the "Maintenance Schedules" section of this manual.

Second is Schedule "A". It is for vehicles that are not operated under any of the conditions listed under Schedule "B."

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent, add as required.

Once a Month

- Check the tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of the coolant reservoir, brake master cylinder, and transmission, and add as needed.
- Check all lights and all other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the exhaust system.
- Inspect brake hoses.
- Check the engine coolant/anti-freeze level, hoses, and clamps.
- After completion of off-road operation, the underside of the vehicle should be thoroughly inspected. Examine threaded fasteners for looseness.

Schedule “B”

Follow this schedule if you usually operate your vehicle under one or more of the following conditions.

- Day or night temperatures are below 32°F (0°C)
- Stop and go driving
- Excessive engine idling
- Driving in dusty conditions
- Short trips of less than 10 miles (16.2 km)
- More than 50% of your driving is at sustained high speeds during hot weather, above 90°F (32°C)
- Trailer towing
- Taxi, police, or delivery service (commercial service)
- Off-road or desert driving
- **If equipped for and operated with E-85 (ethanol) fuel.**

NOTE: If ANY of these apply to you, change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first, and follow the maintenance recommendations in “Maintenance Schedule B.”

NOTE: If ANY of these apply to you then flush and replace your engine coolant every 102,000 miles (163 000 km) or 60 months, whichever comes first, and follow “Schedule B” of the “Maintenance Schedules” section of this manual.

Miles (Kilometers)	3,000 (5 000)	6,000 (10 000)	9,000 (14 000)	12,000 (19 000)	15,000 (24 000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.		X		X	
Inspect the engine air cleaner filter, replace if necessary.					X
Lubricate the upper knuckle ball stud at steering & suspension ball joints.		X		X	
Drain and refill the front and rear axles.				X	
Inspect the brake linings.				X	
Clean and lubricate the brake caliper pins.				X	

Miles (Kilometers)	18,000 (29 000)	21,000 (34 000)	24,000 (38 000)	27,000 (43 000)	30,000 (48 000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.	X		X		X
Inspect the engine air cleaner filter, replace if necessary.					X
Inspect the PCV Valve, replace if necessary. ◇					X
Replace the spark plugs.					X
Lubricate the upper knuckle ball stud at steering & suspension ball joints.	X		X		X
Drain and refill the front and rear axles.			X		
Inspect the brake linings.			X		
Clean and lubricate the brake caliper pins.			X		
Drain the transfer case and refill.					X

Miles (Kilometers)	33,000 (53 000)	36,000 (58 000)	39,000 (62 000)	42,000 (67 000)	45,000 (72 000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.		X		X	
Inspect the engine air cleaner filter, replace if necessary.					X
Drain and refill the front and rear axles.		X			
Inspect the brake linings.		X			
Lubricate the upper knuckle ball stud at steering & suspension ball joints.		X		X	
Clean and lubricate the brake caliper pins.		X			

Miles (Kilometers)	48,000 (77 000)	51,000 (82 000)	54,000 (86 000)	57,000 (91 000)	60,000 (96 000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.	X		X		X
Inspect the engine air cleaner filter, replace if necessary.					X
Inspect the PCV Valve, replace if necessary. ◇					X
Replace the spark plugs.					X
Inspect the ignition cables, replace if necessary (5.7L Only).					X
Inspect drive belt, replace if necessary.					X
Lubricate the upper knuckle ball stud at steering & suspension ball joints.	X		X		X
Clean and lubricate brake caliper pins.	X				X
Inspect the brake linings.	X				X
Drain and refill the front and rear axles.	X				X
Drain and refill the automatic transmission fluid, and replace main sump filter (4.7L/5.7L Only). ‡					X

Miles (Kilometers)	48,000 (77 000)	51,000 (82 000)	54,000 (86 000)	57,000 (91 000)	60,000 (96 000)
Drain and refill the transfer case fluid.					X
Flush and replace engine coolant/anti-freeze at 60 months, if not done at 102,000 miles (163 000 km).					X

NOTE: ‡ Applies only if vehicle is used for frequent trailer towing, or fleet/commercial service.

Miles (Kilometers)	63,000 (101 000)	66,000 (106 000)	69,000 (110 000)	72,000 (115 000)	75,000 (120 000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.		X		X	
Inspect the engine air cleaner filter, replace if necessary.					X
Inspect the drive belt, replace if necessary.					X
Lubricate the upper knuckle ball stud at steering & suspension ball joints.		X		X	
Inspect the brake linings.				X	
Clean and lubricate the brake caliper pins.				X	
Drain and refill the front and rear axle fluid.				X	

Miles (Kilometers)	78,000 (125 000)	81,000 (130 000)	84,000 (134 000)	87,000 (139 000)	90,000 (144 000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.	X		X		X
Inspect the engine air cleaner filter, replace if necessary.					X
Inspect the PCV Valve, replace if necessary. ◇					X
Replace the spark plugs.					X
Inspect the drive belt, replace if necessary.					X
Lubricate the upper knuckle ball stud at steering & suspension ball joints.	X		X		X
Drain and refill the transfer case fluid.					X
Inspect the brake linings.			X		
Clean and lubricate the brake caliper pins.			X		
Drain and refill the front and rear axle fluid.			X		

Miles (Kilometers)	93,000 (149 000)	96,000 (154 000)	99,000 (158 000)	102,000 (163 000)	105,000 (168 000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.		X		X	
Inspect the engine air cleaner filter, replace if necessary.					X
Inspect the drive belt, replace if necessary.					X
Lubricate the upper knuckle ball stud at steering & suspension ball joints.		X		X	
Inspect the brake linings.		X			
Clean and lubricate the brake caliper pins.		X			
Drain and refill the front and rear axle fluid.		X			
Flush and replace the engine coolant/anti-freeze, if not done at 60 months.				X	

Miles (Kilometers)	108,000 (173 000)	111,000 (178 000)	114,000 (182 000)	117,000 (187 000)	120,000 (192 000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.	X		X		X
Inspect the engine air cleaner filter, replace if necessary.					X
Inspect the PCV Valve, replace if necessary. ◇					X
Replace the spark plugs.					X
Inspect the ignition cables, replace if necessary (5.7L Only).					X
Inspect the drive belt, replace if necessary.					X
Lubricate the upper knuckle ball stud at steering & suspension ball joints.	X		X		X
Inspect the brake linings.	X				X
Clean and lubricate the brake caliper pins.	X				X
Drain and refill the front and rear axle fluid.	X				X
Drain and refill the automatic transmission fluid, replace main sump filter, and spin-on cooler return filter (if equipped). (4.7L/5.7L Only). ‡					X
Drain and refill the transfer case fluid.					X
Flush and replace the engine coolant/anti-freeze at 120 months, if not replaced at 102,000 miles (163 000 km).					X

NOTE: ‡ Applies only if vehicle is used for frequent trailer towing, or fleet/commercial service.

Inspection and service should also be performed anytime a malfunction is observed or suspected. Retain all receipts.

◇ This maintenance is recommended by the manufacturer to the owner, but is not required to maintain emissions warranty.

Schedule “A”

Miles (Kilometers) [Months]	6,000 (10 000) [6]	12,000 (19 000) [12]	18,000 (29 000) [18]	24,000 (38 000) [24]	30,000 (48 000) [30]
Change the engine oil and engine oil filter.	X	X	X	X	X
Rotate the tires.	X	X	X	X	X
Inspect the engine air cleaner filter, and replace if necessary.					X
Replace the spark plugs.					X
Lubricate the upper knuckle ball stud at steering & suspension ball joints.		X		X	
Inspect the brake linings.			X		
Clean and lubricate the brake caliper pins.			X		
Drain the transfer case and refill.					X

Miles (Kilometers) [Months]	36,000 (58 000) [36]	42,000 (67 000) [42]	48,000 (77 000) [48]	54, 000 (86 000) [54]
Change the engine oil and engine oil filter.	X	X	X	X
Rotate the tires.	X	X	X	X
Inspect the brake linings.	X			X
Lubricate the upper knuckle ball stud at steering & suspension ball joints.	X		X	
Clean and lubricate the brake caliper pins.	X			X

Miles (Kilometers) [Months]	60,000 (96 000) [60]	66,000 (106 000) [66]	72,000 (115 000) [72]	78,000 (125 000) [78]
Change the engine oil and engine oil filter.	X	X	X	X
Rotate the tires.	X	X	X	X
Inspect the engine air cleaner filter, and replace if necessary.	X			
Inspect the PCV Valve, replace if necessary. ◇	X			
Replace the spark plugs.	X			
Inspect the ignition cables, replace if necessary (5.7L Only).	X			
Inspect the drive belt, replace if necessary.	X			
Lubricate the upper knuckle ball stud at steering & suspension ball joints.	X		X	
Flush and replace the engine coolant/anti-freeze, at 60 months if not done at 102,000 miles (163 000 km).	X			
Inspect the brake linings.			X	
Clean and lubricate the brake caliper pins.			X	
Drain the transfer case and refill.	X			

Miles (Kilometers) [Months]	84,000 (134 000) [84]	90,000 (144 000) [90]	96,000 (154 000) [96]	102, 000 (163 000) [102]
Change the engine oil and engine oil filter.	X	X	X	X
Rotate the tires.	X	X	X	X
Inspect the engine air cleaner filter, and replace if necessary.		X		
Inspect the PCV Valve, replace if necessary. ◇		X		
Replace the spark plugs.		X		
Inspect the drive belt, replace if necessary.		X		
Lubricate the upper knuckle ball stud at steering & suspension ball joints.	X		X	
Clean and lubricate the brake caliper pins.		X		
Inspect the brake linings.		X		
Flush and replace the engine coolant/anti-freeze if not replaced at 60 months.				X
Drain the transfer case and refill.		X		

Miles (Kilometers) [Months]	108,000 (173 000) [108]	114,000 (182 000) [114]	120,000 (192 000) [120]
Change the engine oil and engine oil filter.	X	X	X
Rotate the tires.	X	X	X
Inspect the engine air cleaner filter, and replace if necessary.			X
Inspect the PCV Valve, replace if necessary. ◇			X
Replace the spark plugs.			X
Inspect the ignition cables, replace if necessary (5.7L Only).			X
Inspect the drive belt, replace if necessary.			X
Lubricate the upper knuckle ball stud at steering & suspension ball joints.	X		X
Inspect the brake linings.	X		
Clean and lubricate the brake caliper pins.	X		
Flush and replace the engine coolant/anti-freeze if not done at 102,000 miles (163 000 km).			X
Drain the transfer case and refill.			X

Inspection and service should also be performed anytime a malfunction is observed or suspected. Retain all receipts.

◇ This maintenance is recommended by the manufacturer to the owner, but is not required to maintain emissions warranty.

WARNING: You can be badly injured working on or around a motor vehicle. Do only that service work for which you have the proper equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.

MAINTENANCE SCHEDULES - GASOLINE ENGINES - EXPORT

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule "B". It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule.

- Day or night temperatures are below 32°F (0°C)
- Stop and go driving
- Excessive engine idling
- Driving in dusty conditions
- Short trips of less than 10 miles (16.2 km)
- More than 50% of your driving is at sustained high speeds during hot weather, above 90°F (32°C)
- Trailer towing
- Taxi, police, or delivery service (commercial service)
- Off-road or desert driving
- **If equipped for and operated with E-85 (ethanol) fuel.**

NOTE: Most vehicles are operated under the conditions listed for Schedule "B."

NOTE: If ANY of these apply to you, change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first, and follow the maintenance recommendations in "Maintenance Schedule B."

NOTE: If ANY of these apply to you then flush and replace your engine coolant every 102,000 miles (163 000 km) or 60 months, whichever comes first, and follow "Schedule B" of the "Maintenance Schedules" section of this manual.

Second is Schedule "A". It is for vehicles that are not operated under any of the conditions listed under Schedule "B."

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent, add as required.

Once a Month

- Check the tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of the coolant reservoir, brake master cylinder, and transmission, and add as needed.
- Check all lights and all other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the exhaust system.
- Inspect brake hoses.
- Check the engine coolant/anti-freeze level, hoses, and clamps.
- After completion of off-road operation, the underside of the vehicle should be thoroughly inspected. Examine threaded fasteners for looseness.

Schedule “B”

Follow this schedule if you usually operate your vehicle under one or more of the following conditions.

- Day or night temperatures are below 32°F (0°C)
- Stop and go driving
- Excessive engine idling
- Driving in dusty conditions
- Short trips of less than 10 miles (16.2 km)
- More than 50% of your driving is at sustained high speeds during hot weather, above 90°F (32°C)
- Trailer towing
- Taxi, police, or delivery service (commercial service)
- Off-road or desert driving
- **If equipped for and operated with E-85 (ethanol) fuel.**

NOTE: If ANY of these apply to you, change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first, and follow the maintenance recommendations in “Maintenance Schedule B.”

NOTE: If ANY of these apply to you then flush and replace your engine coolant every 102,000 miles (163 000 km) or 60 months, whichever comes first, and follow “Schedule B” of the “Maintenance Schedules” section of this manual.

Miles (Kilometers)	3,000 (5 000)	6,000 (10 000)	9,000 (14 000)	12,000 (19 000)	15,000 (24 000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.		X		X	
Inspect the engine air cleaner filter, replace if necessary.					X
Lubricate the upper knuckle ball stud at steering & suspension ball joints.		X		X	
Drain and refill the front and rear axles.				X	
Inspect the brake linings.				X	
Clean and lubricate the brake caliper pins.				X	

Miles (Kilometers)	18,000 (29 000)	21,000 (34 000)	24,000 (38 000)	27,000 (43 000)	30,000 (48 000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.	X		X		X
Inspect the engine air cleaner filter, replace if necessary.					X
Inspect the PCV Valve, replace if necessary. ◇					X
Replace the spark plugs.					X
Lubricate the upper knuckle ball stud at steering & suspension ball joints.	X		X		X
Drain and refill the front and rear axles.			X		
Inspect the brake linings.			X		
Clean and lubricate the brake caliper pins.			X		
Drain the transfer case and refill.					X

Miles (Kilometers)	33,000 (53 000)	36,000 (58 000)	39,000 (62 000)	42,000 (67 000)	45,000 (72 000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.		X		X	
Inspect the engine air cleaner filter, replace if necessary.					X
Drain and refill the front and rear axles.		X			
Inspect the brake linings.		X			
Lubricate the upper knuckle ball stud at steering & suspension ball joints.		X		X	
Clean and lubricate the brake caliper pins.		X			

Miles (Kilometers)	48,000 (77 000)	51,000 (82 000)	54,000 (86 000)	57,000 (91 000)	60,000 (96 000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.	X		X		X
Inspect the engine air cleaner filter, replace if necessary.					X
Inspect the PCV Valve, replace if necessary. ♦					X
Replace the spark plugs.					X
Inspect the ignition cables, replace if necessary (5.7L Only).					X
Inspect drive belt, replace if necessary.					X
Lubricate the upper knuckle ball stud at steering & suspension ball joints.	X		X		X
Clean and lubricate brake caliper pins.	X				X
Inspect the brake linings.	X				X
Drain and refill the front and rear axles.	X				X
Drain and refill the automatic transmission fluid, and replace main sump filter (4.7L/5.7L Only). ‡					X
Drain and refill the transfer case fluid.					X
Flush and replace engine coolant/anti-freeze at 60 months, if not done at 102,000 miles (163 000 km).					X

NOTE: ‡ Applies only if vehicle is used for frequent trailer towing, or fleet/commercial service.

Miles (Kilometers)	63,000 (101 000)	66,000 (106 000)	69,000 (110 000)	72,000 (115 000)	75,000 (120 000)
Change the engine oil and engine oil filter, if not replaced at 3 months.	X	X	X	X	X
Rotate the tires.		X		X	
Inspect the engine air cleaner filter, replace if necessary.					X
Inspect the drive belt, replace if necessary.					X
Lubricate the upper knuckle ball stud at steering & suspension ball joints.		X		X	
Inspect the brake linings.				X	
Clean and lubricate the brake caliper pins.				X	
Drain and refill the front and rear axle fluid.				X

WHEEL ALIGNMENT

DESCRIPTION

NOTE: Suspension components with rubber/urethane bushings should be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.

Wheel alignment involves the correct positioning of the wheels in relation to the vehicle. The positioning is accomplished through suspension and steering linkage adjustments. An alignment is considered essential for efficient steering, good directional stability and to minimize tire wear. The most important measurements of an alignment are caster, camber and toe.

80b0d70b

CAUTION: Never attempt to modify suspension or steering components by heating or bending.

OPERATION

- **CASTER (1)** is the forward or rearward tilt of the steering knuckle from vertical. Tilting the top of the knuckle forward provides less positive caster. Tilting the top of the knuckle rearward provides more positive caster. Positive caster promotes directional stability. This angle enables the front wheels to return to a straight ahead position after turns.
- **CAMBER (2)** is the inward or outward tilt of the wheel relative to the center of the vehicle. Tilting the top of the wheel inward provides negative camber. Tilting the top of the wheel outward provides positive camber. Incorrect camber will cause wear on the inside or outside edge of the tire.
- **TOE (4)** is the difference between the leading inside edges and trailing inside edges of the front tires. Wheel toe position out of specification cause's unstable steering, uneven tire wear and steering wheel off-center. The wheel toe position is the **final** front wheel alignment adjustment.
- **THRUST ANGLE (3)** is the angle of the rear axle relative to the centerline of the vehicle. Incorrect thrust angle can cause off-center steering and excessive tire wear. This angle is not adjustable, damaged component(s) must be replaced to correct the thrust angle.

DIAGNOSIS AND TESTING

PRE-ALIGNMENT INSPECTION

Before starting wheel alignment, the following inspection and necessary corrections must be completed. Refer to Suspension and Steering System Diagnosis Chart below for additional information.

1. Inspect tires for size, air pressure and tread wear.
2. Inspect front wheel bearings for wear.
3. Inspect front wheels for excessive radial or lateral runout and balance.
4. Inspect ball studs, linkage pivot points and steering gear for looseness, roughness or binding.
5. Inspect suspension components for wear and noise.
6. Check suspension ride height.
7. Road test the vehicle.

SUSPENSION AND STEERING SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
FRONT END NOISE	<ol style="list-style-type: none"> 1. Loose or worn wheel bearing. 2. Loose or worn steering or suspension components. 3. Loose or worn steering or suspension components. 	<ol style="list-style-type: none"> 1. Replace wheel bearing. 2. Tighten or replace components as necessary. 3. Rotate or replace tire as necessary. 6. Repair brake as necessary. 8. Measure and adjust ride height.

STANDARD PROCEDURE

CAMBER, CASTER AND TOE ADJUSTMENT

NOTE: SUSPENSION HEIGHT MEASUREMENT MUST BE PERFORMED BEFORE AN ALIGNMENT.

Camber and caster angle adjustments involve changing the position of the lower control arm with the slots in the frame brackets to move the lower control arm inwards or outwards for proper adjustment. **This can be achieved by using a long pry bar with a curved tip and inserting the pry bar into the lower control arm frame brackets and prying inwards or outwards.**

NOTE: Camber and caster adjustments must be made at the lower control arm. Do not use the upper control arm for Camber and Caster adjustments.

NOTE: When the lower control arm pivot bolts are loosened the lower control arm will normally go outwards automatically with the weight of the vehicle.

CASTER

Moving the rear position of the lower control arm at the frame in or out, will change the caster angle significantly and camber angle only slightly. To maintain the camber angle while adjusting caster, move the rear of the lower control arm in or out. Then move the front of the lower control arm slightly in the opposite direction.

CAMBER

Move both the front and rear of the lower control arm together in or out. This will change the camber angle significantly and caster angle slightly.

After adjustment is made tighten the lower control arm bolt & nuts to **FRONT** 169 N·m (125 ft. lbs.) and the **REAR** 88 N·m (65 ft. lbs.).

TOE ADJUSTMENT

The wheel toe position adjustment is the final adjustment.

1. Start the engine and turn wheels both ways before straightening the wheels. Secure the steering wheel with the front wheels in the straight-ahead position.
2. Loosen the tie rod jam nuts (3).

NOTE: Each front wheel should be adjusted for one-half of the total toe position specification. This will ensure the steering wheel will be centered when the wheels are positioned straight-ahead.

3. Adjust the wheel toe position by turning the inner tie rod (4) as necessary.
4. Tighten the tie rod jam nut (3) to 75N·m (55 ft. lbs.).
5. Verify the specifications.
6. Turn off engine.

TOE ADJUSTMENT

SUSPENSION HEIGHT MEASUREMENT MUST BE PERFORMED BEFORE AN ALIGNMENT.

The wheel toe position adjustment is the final adjustment.

1. Start the engine and turn wheels both ways before straightening the wheels. Secure the steering wheel with the front wheels in the straight-ahead position.
2. Loosen the tie rod jam nuts (3).

NOTE: Each front wheel should be adjusted for one-half of the total toe position specification. This will ensure the steering wheel will be centered when the wheels are positioned straight-ahead.

3. Adjust the wheel toe position by turning the inner tie rod (4) as necessary.
4. Tighten the tie rod jam nut (3) to 75N·m (55 ft. lbs.).
5. Verify the specifications.
6. Turn off engine.

FRONT

DESCRIPTION

NOTE: Suspension components with rubber/urethane bushings should be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.

The front suspension is designed to allow each wheel to adapt to different road surfaces independently. The wheels are mounted to hub bearings on the steering knuckle spindles. The double-row hub bearings are sealed and lubricated for life. The steering knuckles turn (pivot) on ball joints integral to the outboard portion of the upper control arms and pressed into the lower steering knuckle. The ball joints are lubricated for life.

BUSHINGS

DESCRIPTION

Suspension components with rubber/urethane bushings should be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort could be affected and premature bushing wear may occur.

REMOVAL

STABILIZER BAR TO FRAME BUSHING

1. Raise and support the vehicle.
2. Remove the front splash shield.
3. Remove the two stabilizer barretainer bracket bolts (2).
4. Remove the bushing clamp (2).
5. Remove the stabilizer bar bushing (3).

CLEVIS BRACKET BUSHING

1. Remove the clevis bracket (3) from the shock (1) (Refer to 2 - SUSPENSION/FRONT/CLEVIS BRACKET - REMOVAL).

NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.

2. Press the bushing out using special tools C-4212-F (Press) (1), 9653-1 (driver) (4) and 9653-2 (Receiver) (2) from the lower control arm (3).

INSTALLATION

STABILIZER BAR TO FRAME BUSHING

1. Install the stabilizer bar bushing (3) to the bar (1).
2. Install the stabilizer bar bushing retainer bracket (2) bolts and tighten the two mounting bolts.
3. Install the front splash shield.
4. Lower the vehicle.

CLEVIS BRACKET BUSHING

NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.

1. Install the new clevis bracket bushing (3) into the lower control arm (5) using tools C-4212-F (Press) (1), 9653-3 (driver) (2), 9653-4 (Depth gauge) (4) the depth gauge will automatically set the depth of the bushing (3) in the control arm (5).

2. Install the clevis bracket (3) to the shock (1) (Refer to 2 - SUSPENSION/FRONT/CLEVIS BRACKET - INSTALLATION).

HUB / BEARING

DESCRIPTION

The bearing used on the front hub of this vehicle is the combined hub and bearing unit type assembly. This unit assembly combines the front wheel mounting hub (flange) and the front wheel bearing into a one piece unit. The wheel mounting studs are the only replaceable component of the hub/bearing assembly.

OPERATION

The hub/bearing assembly is mounted to the steering knuckle and is retained by three mounting bolts accessible from the back of the steering knuckle. The hub/bearing unit is not serviceable and must be replaced as an assembly if the bearing or the hub is determined to be defective.

REMOVAL

1. Raise and support the vehicle.
2. Remove the wheel and tire assembly.

Support the caliper, Do not let the caliper hang by the hose.

3. Remove the disc brake caliper (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).

4. Remove the brake caliper adaptor (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - REMOVAL).

5. Remove and discard the o-ring (2) and then remove the disc brake rotor (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).

6. Remove the wheel speed sensor nut (2).
7. Remove the wheel speed sensor (Refer to 5 - BRAKES/ELECTRICAL/FRONT WHEEL SPEED SENSOR - REMOVAL).
8. Remove the 3 hub bearing mounting bolts from the back of the steering knuckle. Remove hub bearing (3) from the steering knuckle.

INSTALLATION

1. Install the hub bearing (3) to the knuckle.
2. Install the hub bearing to knuckle and the 3 bolts then tighten to 136 N·m (100 ft. lbs.).
3. Install the wheel speed sensor (Refer to 5 - BRAKES/ELECTRICAL/FRONT WHEEL SPEED SENSOR - INSTALLATION).
4. Install the wheel speed sensor nut (2).

5. Install the brake rotor (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).

6. Install the brake caliper adaptor (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - INSTALLATION).

7. Install the caliper (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).

8. Install the wheel and tire assembly (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE).

9. Remove the support and lower the vehicle.

KNUCKLE

DESCRIPTION

The knuckle is a single casting with legs machined for the upper and lower ball joints. The knuckle also has machined mounting locations for the front brake calipers and hub bearing.

OPERATION

The steering knuckle pivot between the upper and lower ball joint. Steering linkage attached to the knuckle allows the vehicle to be steered.

REMOVAL

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.

CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose will result. Provide a suitable support to hang the caliper securely.

3. Remove the brake caliper (1).

4. Remove the caliper adapter (1). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - REMOVAL).

5. Remove the o-ring (2) and discard then remove disc brake rotor (1). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).

6. Remove the wheel speed sensor (2). (Refer to 5 - BRAKES/ELECTRICAL/Front WHEEL SPEED SENSOR - REMOVAL).
7. Remove the axle shaft nut. (if equipped with four wheel drive)
8. Remove the hub/bearing (3). (Refer to 2 - SUSPENSION/Front/HUB / BEARING - REMOVAL).

9. Remove the outer tie rod end retaining nut.
10. Separate the outer tie rod end (3) from the steering knuckle using special tool 8677(5). (Refer to 19 - STEERING/LINKAGE/TIE ROD END - REMOVAL).

11. Remove the lower ball joint nut.
12. Separate the lower ball joint from the knuckle (1) using tool C-4150A (2).

13. Remove the upper ball joint nut.
14. Separate the upper ball joint (2) from the knuckle (3) using tool 8677 (1).

15. Remove the knuckle (3) from the vehicle.

INSTALLATION

1. Install the knuckle (1) to the vehicle.
2. Install the lower ball joint into the knuckle.
3. Install the lower ball joint nut. Tighten the nut to 81 N·m (60 ft.lbs.).

4. Install the upper ball joint (2) into the knuckle (3)
5. Install the upper ball joint nut (4). Tighten the nut to 81 N·m (60 ft.lbs.).

6. Install the outer tie rod end to the steering knuckle. (Refer to 19 - STEERING/LINKAGE/TIE ROD END - INSTALLATION).

7. Install the hub/bearing (3), Tighten to 136 N·m (100 ft.lbs.). (Refer to 2 - SUSPENSION/FRONT/HUB / BEARING - INSTALLATION).
8. Install the axle shaft nut. Tighten the nut to 135 N·m (96 ft.lbs.).(if equipped with four wheel drive).
9. Install the wheel speed sensor (2). (Refer to 5 - BRAKES/ELECTRICAL/FRONT WHEEL SPEED SENSOR - INSTALLATION).

10. Install the disc brake rotor (1). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).

11. Install the caliper adapter (1). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER ADAPTER - INSTALLATION).
12. Install the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
13. Perform wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

LOWER BALL JOINT

DIAGNOSIS AND TESTING

LOWER BALL JOINT

NOTE: If the ball joint is equipped with a lubrication fitting, grease the joint then road test the vehicle before performing test.

1. Raise the front of the vehicle. Place safety floor stands under both lower control arms as far outboard as possible. Lower the vehicle to allow the stands to support some or all of the vehicle weight.
2. Mount a dial indicator solidly to the topside of the lower control arm and then zero the dial indicator.
3. Position the indicator plunger against the bottom surface of the steering knuckle.

NOTE: The dial indicator plunger must be perpendicular to the machined surface of the steering knuckle.

4. Position a pry bar under the tire assembly. Pry upwards on the tire assembly.
5. If the travel exceeds 0.5 mm (0.020 in.), replace the lower ball joint (Refer to 2 - SUSPENSION/FRONT/LOWER BALL JOINT - REMOVAL).

REMOVAL

1. Remove the tire and wheel assembly.
2. Remove the brake caliper and rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
3. Disconnect the tie rod (1) from the steering knuckle using special tool C-3894-A (1) (Refer to 19 - STEERING/LINKAGE/TIE ROD END - REMOVAL).

4. Separate the upper ball joint (2) from the knuckle (3) using special tool 8677 (1).

5. Separate the lower ball joint (3) from the steering knuckle (1) using special tool 8677 (2).

6. Remove the steering knuckle (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - REMOVAL).
7. Move the halfshaft to the side and support the halfshaft out of the way **4X4 only**.
8. Chisel out the ball joint stakes.

NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.

9. Press the ball joint from the lower control arm (3) using special tools C-4212-F (PRESS) (1), C-4212-3 (Driver) (2) and 9654-3 (Receiver) (4).

INSTALLATION

NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.

1. Install the ball joint (4) into the control arm (3) and press in using special tools C-4212-F (press) (1), 9654-1 (Driver) (5) and 9654-2 (Receiver) (2).

2. Stake the ball joint flange in four evenly spaced places around the ball joint flange, using a chisel and hammer.
3. Remove the support for the halfshaft and install into position **4X4 only**.
4. Install the steering knuckle (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - INSTALLATION).
5. Install the tie rod end into the steering knuckle (Refer to 19 - STEERING/LINKAGE/TIE ROD END - INSTALLATION).
6. Install and tighten the halfshaft nut to 251 N·m (185 ft. lbs.). (If Equipped).
7. Install the brake caliper and rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
8. Install the tire and wheel assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).
9. Check the vehicle ride height (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).
10. Perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

LOWER CONTROL ARM

DESCRIPTION

The front lower suspension arms are cast iron.

OPERATION

The bushings provide isolation from the road. The arms mount to the cradle bracket and the knuckle. The arm and bushings provide location and react to loads from the road.

REMOVAL

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the steering knuckle (3). (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - REMOVAL).

4. Remove the shock clevis bracket (2) from the lower control arm.

5. Remove the nut and bolt from the front of the lower control arm.
6. Remove the rear bolts and flag nuts from the lower control arm.
7. Remove the lower control arm from the vehicle.

INSTALLATION

1. Position the lower suspension arm into the frame rail bracket.
2. Install the rear bolts for the lower control arm to the frame, Tighten to 142 N·m (105 ft lbs).
3. Install the nut and bolt for the front of the lower control arm Tighten to 169 N·m (125 ft lbs).

4. Install the lower clevis bolt (2) at the lower control arm and tighten to 88 N·m (65 ft. lbs.).

5. Install the steering knuckle (3) and tighten the nut to 75 N·m (55 ft. lbs.) (Refer to 2 - SUSPENSION/Front/KNUCKLE - INSTALLATION).

6. Install the tire and wheel assembly.
7. Lower the vehicle.
8. Perform wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

SHOCK

DESCRIPTION

The top of the shock absorbers are bolted to the body. The bottom of the shocks are bolted to the lower control arm. The standard shocks have conventional twin tube construction and are low pressure gas charged. Gas charging prevents cavitation during rough road operation.

OPERATION

The shock absorbers dampen jounce and rebound motion of the vehicle over various road conditions and limit suspension rebound travel.

REMOVAL

RIGHT FRONT

1. Remove the air box cover and air intake hose.
2. Disconnect the cruise control servo electrical connector.
3. Remove the coolant reservoir mounting bolt and move the coolant reservoir off to the side.

4. Remove the four upper shock mounting nuts (1).

5. Raise and support the vehicle.
6. Remove the tire.
7. Remove the two brake caliper adapter bolts.
8. Support the brake caliper adaptor and caliper. **Do not allow the caliper to hang by the brake hose.**
9. Remove the disc brake rotor.
10. Remove the upper ball joint nut.
11. Separate the upper ball joint (2) from the knuckle (3) using special tool 8677(1).

12. Remove the lower clevis bolt (2) at the lower control arm.
13. Remove the lower stabilizer bolt (3) at the lower control arm.

14. Remove the shock from the vehicle.
15. Remove the spring if necessary (Refer to 2 - SUSPENSION/FRONT/SPRING - REMOVAL).

LEFT FRONT

1. Remove the air box cover and air intake hose.
2. Remove the 3 PDC bracket nuts (1).

3. Move the PDC (1) off to the side to access the four upper shock mount nuts (2).
4. Remove the four upper shock mount nuts (2).

5. Raise and support the vehicle.
6. Remove the tire.
7. Remove the two brake caliper adapter bolts.
8. Support the brake caliper adaptor and caliper. **Do not allow the caliper to hang by the brake hose.**
9. Remove the disc brake rotor.
10. Remove the upper ball joint nut.
11. Separate the upper ball joint (2) from the knuckle (3) using special tool 8677 (1).

12. Remove the lower clevis bolt (2) at the lower control arm.
13. Remove the lower stabilizer bolt (3) at the lower control arm.

14. Remove the shock (3) from the vehicle.
15. Remove the spring if necessary (Refer to 2 - SUSPENSION/FRONT/SPRING - REMOVAL).

INSTALLATION

RIGHT FRONT

1. Install the clevis bracket (4) to the shock (3) and tighten to 122 N·m (90 ft. lbs.).
2. Install the shock assembly (3) to the vehicle.

3. Install the four upper shock nuts (1), Tighten to 95 N·m (70 ft. lbs.).

4. Install the coolant reservoir bolt.
5. Reconnect the cruise control servo wiring connector.
6. Install the air box cover and air intake hose.
7. Raise the vehicle up.

8. Install the lower stabilizer bolt (2) at the lower control arm.
9. Install the lower clevis bolt (3) at the lower control arm and tighten to 169 N·m (125 ft. lbs.).
10. Install the upper ball joint into the knuckle (1) and tighten the nut to 75 N·m (55 ft. lbs.).
11. Install the disc brake rotor.

12. Install the caliper adaptor mounting bolts to 176 N·m (130 ft. lbs.).
13. Install the tire and wheel assembly.
14. Lower the vehicle.

LEFT FRONT

1. Install the clevis bracket (4) to the shock (3) and tighten to 122 N·m (90 ft. lbs.).
2. Install the shock assembly (3) to the vehicle.

3. Install the four upper shock nuts (2), Tighten to 95 N·m (70 ft. lbs.).

4. Install the 3 PDC (1) bracket nuts.

5. Raise the vehicle up.
6. Install the lower stabilizer bolt (2) at the lower control arm and tighten to 115 N·m (85 ft. lbs.).
7. Install the lower clevis bolt (3) at the lower control arm and tighten to 169 N·m (125 ft. lbs.).
8. Install the upper ball joint into the knuckle (1) and tighten the nut to 75 N·m (55 ft. lbs.).
9. Install the disc brake rotor.

10. Install the caliper adaptor mounting bolts to 176 N·m (130 ft. lbs.).

11. Install the tire and wheel assembly.
12. Lower the vehicle.

SPRING

REMOVAL

1. Remove the shock (Refer to 2 - SUSPENSION/ FRONT/SHOCK - REMOVAL).
2. Install the shock assembly in the Branick 7200® spring removal/installation tool or equivalent (1).
3. Compress the spring (2).

4. Remove the upper shock nut (2).

NOTE: The nub (1) in the upper shock mount (3) must be 180° from the centerline of the lower bracket (9) on the shock (8) for proper installation.

5. Remove the shock (8).
6. Remove the shock upper mounting plate (3).
7. Remove and inspect the upper (5) and lower (7) spring isolators.

INSTALLATION

1. Compress the spring (2).

2. Install the lower isolator (7).
3. Position the shock (8) into the coil spring (6) **make sure the jounce bumper (4) is on the shock rod.**
4. Install the upper isolator (5).

NOTE: For proper orientation the nub hole (1) in the upper shock plate (3) must be 180° in a centerline from the bracket (9) at the bottom of the shock (8).

5. Install the upper shock mounting plate (3).
6. Install the shock upper mounting nut (2) Tighten to 39 N·m (25 ft. lbs.).
7. Decompress the spring.
8. Remove the shock assembly from the spring compressor tool (1).
9. Install the shock assembly (Refer to 2 - SUSPENSION/FRONT/SHOCK - INSTALLATION).

STABILIZER BAR

DESCRIPTION

The bar extends across the front underside of the chassis and is mounted to the cradle. Links are connected from the bar to the lower control arms. The stabilizer bar and links are isolated by rubber bushings.

OPERATION

The stabilizer bar is used to control vehicle body sway during turns. The spring steel bar helps to control the vehicle body in relationship to the suspension.

REMOVAL

1. Raise and support the vehicle.
2. Remove the front splash shield.
3. Remove the stabilizer bar link upper nut (1) & bolt (2).

4. Remove the two stabilizer bushing clamp bolts (2).
5. Remove the stabilizer bar (1).

INSTALLATION

1. Install the stabilizer bar (1) to the vehicle.
2. Install the stabilizer bushing clamp (2) and tighten the bolts to 142 N·m (105 ft. lbs.).

3. Install the upper stabilizer link (3) and tighten nut (1) & bolt (2) to 135 N·m (100 ft. lbs.).
4. Install the front splash shield.
5. Lower the vehicle.

STABILIZER LINK

REMOVAL

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the upper link bolt/nut (1&2).
4. Remove the lower link bolt (6).
5. Remove the stabilizer link (3).

INSTALLATION

1. Install the stabilizer link (3) to the vehicle.
2. Install the lower link bolt (6) and tighten to 115 N·m (85 ft. lbs.)
3. Install the upper link bolt/nut (1&2) and tighten to 135 N·m (100 ft. lbs.).
4. Install the tire and wheel assembly.
5. lower the vehicle.

UPPER BALL JOINT

DIAGNOSIS AND TESTING

UPPER BALL JOINT

1. Raise the front of the vehicle. Place safety floor stands under both lower control arms as far outboard as possible. Lower the vehicle to allow the stands to support some or all of the vehicle weight.
2. Remove the front tires.
3. Mount a dial indicator (1) solidly to the frame and then zero the dial indicator.
4. Position dial indicator plunger on the topside of the upper ball joint (5).

NOTE: The dial indicator plunger must be perpendicular to the machined surface of the ball joint.

NOTE: Use care not to pry or tear the ball joint boot, when checking the free play.

5. Position a pry bar (3) between the steering knuckle (4) and the upper control arm (2). Pry upwards on the upper control arm.
6. If the travel exceeds 0.5 mm (0.020 in.), replace the upper ball joint (Refer to 2 - SUSPENSION/FRONT/UPPER BALL JOINT - REMOVAL).
7. If the upper ball joint is within specs reinstall the front tires (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

REMOVAL

1. Raise vehicle and support the axle.
2. Remove the tire and wheel.
3. Remove the upper ball joint retaining nut.
4. Separate the upper ball joint (2) from the knuckle (3) using special tool #8677 (1).

5. Remove the wheel speed sensor wire from the upper control arm (1).
6. Move the knuckle (3) out of the way to allow ball joint removal tool access.

NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.

7. Press the ball joint from the upper control arm (1) using special tools C-4212-F (PRESS) (2) and 9652 (Driver) (3).

INSTALLATION

NOTE: Extreme pressure lubrication must be used on the threaded portions of the tool. This will increase the longevity of the tool and insure proper operation during the removal and installation process.

1. Install the ball joint (4) into the upper control arm (5) and press in using special tools C-4212-F (press) (2), 9652 (Driver) (1) and 8975-2 (Receiver) (4).

2. Install the upper ball joint (2) into the knuckle (3).
3. Install the upper ball joint retaining nut (4) and tighten to 75 N·m (55 ft. lbs.).

4. Install the wheel speed sensor wire to the upper control arm.
5. Install the tire and wheel.
6. Remove the supports and lower the vehicle.
7. Perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

UPPER CONTROL ARM

DESCRIPTION

The upper suspension arms are forged steel and use rubber bushings at each end of the arm.

OPERATION

The arms mount to the unibody frame rail bracket and the knuckle. The arm and bushings provide location and react to loads from the road. The bushings provide isolation from the road.

REMOVAL

1. Raise vehicle and support the axle.
2. Remove the tire and wheel.
3. Remove the inner fender well (2).

4. Remove the upper ball joint retaining nut.
5. Separate the upper ball joint (2) from the knuckle (3) using special tool #8677 (1).

6. Remove the wheel speed sensor wire from the upper control arm (5).
7. Remove the nut and bolt (1) securing the upper control arm (5) to the body.
8. Remove the upper control arm (5) from the vehicle.

INSTALLATION

1. Install the upper control arm (5) to the vehicle.
2. Install the nut and bolt (1) securing the upper control arm (5) to the body.
3. Install the wheel speed sensor wire to the upper control arm (5).

4. Install the upper ball joint (2) into the knuckle (3).
5. Install the upper ball joint retaining nut (4) and tighten the nut to 81 N·m (60 ft.lbs.).

6. Install the inner fender well (2).
7. Install the tire and wheel.
8. Remove the supports and lower the vehicle.
9. Perform a wheel alignment (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

CLEVIS BRACKET

REMOVAL

1. Raise and support the vehicle.
2. Remove the tire.
3. Remove the two brake caliper adapter bolts (3).
4. Support the brake caliper adaptor and caliper. **Do not allow the caliper to hang by the brake hose.**

5. Remove the disc brake rotor.
6. Remove the upper ball joint nut (4).
7. Separate the upper ball joint (2) from the knuckle (3) using special tool 8677.

8. Remove the clevis bolt (2) at the shock (1).
9. Remove the lower clevis bolt/nut (4) at the lower control arm.

10. Remove the lower stabilizer link bolt (6).

11. Remove the clevis bracket (3).

INSTALLATION

1. Install the clevis bracket (3) to the shock (1) and tighten to 122 N·m (90 ft. lbs.)..

2. Install the lower stabilizer link bolt (6) and tighten to 115 N·m (85 ft. lbs.)..

3. Install the lower clevis bolt/nut (4) at the lower control arm and tighten to 169 N·m (125 ft. lbs.)..

4. Install the upper ball joint (2) into the knuckle (3) and tighten the nut to 75 N·m (55 ft. lbs.).

5. Install the disc brake rotor.
6. Install the caliper adaptor mounting bolts (3) to 25 N·m (18 ft. lbs.).
7. Install the tire and wheel assembly.
8. Lower the vehicle.

REAR

DESCRIPTION

The rear suspension is comprised of :

- Drive axle
- Shock absorbers
- Coil springs
- Lower suspension arms (3)
- Upper suspension arm
- Stabilizer bar

CAUTION: Suspension components with rubber/urethane bushings should be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. This will maintain vehicle ride comfort and prevent premature bushing wear.

WARNING

WARNING: Suspension components with rubber bushings must be tightened with the vehicle at normal ride height. It is important to have the springs supporting the weight of the vehicle when the fasteners are torqued. If springs are not at their normal ride position, vehicle ride comfort will be affected and cause premature bushing wear.

DIAGNOSIS AND TESTING - REAR SUSPENSION

CONDITION	POSSIBLE CAUSES	CORRECTION
VEHICLE INSTABILITY	<ol style="list-style-type: none"> 1. Loose or worn wheel bearings. 2. Loose, worn or bent suspension components. 3. Tire pressure. 	<ol style="list-style-type: none"> 1. Replace wheel bearings. 2. Inspect, tighten or replace components as necessary. 3. Adjust tire pressure.

LOWER CONTROL ARM

DESCRIPTION

The lower suspension arms (3) are tubular steel and use a voided oval bushing at the arm on the axle side.

OPERATION

The bushings provide isolation from the axle. The arms mount to the unibody frame rail bracket and the axle brackets. The arm and bushings provide location and react to loads.

REMOVAL

LEFT SIDE

1. Raise the vehicle and support the rear axle.
2. Remove the fuel tank (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - REMOVAL).
3. Remove the lower suspension arm nut (2) and bolt (1) from the axle bracket.

4. Remove the nut (1) and bolt (8) from the frame rail and remove the lower suspension arm (9).

RIGHT SIDE

1. Raise the vehicle and support the rear axle.

2. Remove the lower suspension arm nut (2) and bolt (1) from the axle bracket.

3. Remove the nut (1) and bolt (8) from the frame rail and remove the lower suspension arm (9).

INSTALLATION

LEFT SIDE

NOTE: All torques should be done with vehicle on the ground with full vehicle weight.

1. Position the lower suspension arm (9) in the frame rail.
2. Install the frame rail bracket bolt (8) and nut (1) tighten to 176 N-m (130 ft. lbs.).

3. Position the lower suspension arm(3) in the axle bracket.
4. Install the axle bracket bolt (1) and nut (2) Tighten to 210 N-m (155 ft. lbs.).
5. Install the fuel tank (Refer to 14 - FUEL SYSTEM/ FUEL DELIVERY/FUEL TANK - INSTALLATION).
6. Remove the supports and lower the vehicle.

RIGHT SIDE

NOTE: All torques should be done with vehicle on the ground with full vehicle weight.

1. Position the lower suspension arm (9) in the frame rail.
2. Install the frame rail bracket bolt (8) and nut (1) tighten to 176 N·m (130 ft. lbs.).

3. Position the lower suspension arm (3) in the axle bracket.
4. Install the axle bracket bolt (1) and nut (2) Tighten to 210 N·m (155 ft. lbs.).
5. Remove the supports and lower the vehicle.

UPPER CONTROL ARM

DESCRIPTION

The suspension arm uses bushings to isolate road noise. The suspension arm is bolted through bushings to a bracket at the body and axle.

OPERATION

The upper suspension arm provides fore/aft and lateral location of the rear axle. The suspension arm travel is limited through the use of jounce bumpers in compression and shock absorbers in rebound.

REMOVAL

LEFT SIDE

1. Raise and support the vehicle.
2. Support the rear axle.
3. Lower the fuel tank in order to gain access to the bolt (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - REMOVAL).

4. Remove the upper suspension arm nut (2) and bolt (3) from the axle bracket.

5. Remove the nut (1) and bolt (5) from the frame rail and remove the upper suspension arm (2).

RIGHT SIDE

1. Raise and support the vehicle.
2. Support the rear axle.

3. Remove the upper suspension arm nut (2) and bolt (3) from the axle bracket.

4. Remove the nut (1) and bolt (5) from the frame rail and remove the upper suspension arm (2).

INSTALLATION

LEFT SIDE

NOTE: All torques should be done with vehicle on the ground with full vehicle weight.

1. Position the upper suspension arm (2) in the frame rail bracket.
2. Install the mounting bolt (5) and nut (1) tighten to 129 N·m (95 ft. lbs.).

3. Position the upper suspension arm (4) in the axle bracket.
4. Install the mounting bolt (3) and nut (2) tighten to 136 N·m (100 ft. lbs.).
5. Raise the fuel tank back into place and secure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - INSTALLATION).
6. Remove the supports and lower the vehicle.

RIGHT SIDE

NOTE: All torques should be done with vehicle on the ground with full vehicle weight.

1. Position the upper suspension arm (2) in the frame rail bracket.
2. Install the mounting bolt (5) and nut (1) tighten to 129 N·m (95 ft. lbs.).

3. Position the upper suspension arm (4) in the axle bracket.
4. Install the mounting bolt (3) and nut (2) tighten to 136 N·m (100 ft. lbs.).
5. Remove the supports and lower the vehicle.

SHOCK

DESCRIPTION

The top of the shock absorbers are bolted to the body. The bottom of the shocks are bolted to the axle brackets. The standard shocks have conventional twin tube construction and are low pressure gas charged. Gas charging prevents cavitation during rough road operation.

OPERATION

The shock absorbers dampen jounce and rebound motion of the vehicle over various road conditions and limit suspension rebound travel.

REMOVAL

1. Raise and support the vehicle. Position a hydraulic jack under the axle to support the axle.
2. Remove the upper nut and bolt (1) from the frame bracket.

3. Remove the lower nut and bolt from the axle bracket (2). Remove the shock absorber (1).

INSTALLATION

1. Install the shock absorber (2) in the frame bracket and install the bolt (1) and nut.

2. Install the shock absorber (1) in the axle bracket (2) and install the bolt and nut.
3. Tighten the upper mounting nuts to 95 N·m (70 ft. lbs.). Tighten the lower mounting nuts to 115 N·m (85 ft. lbs.).
4. Remove the supports and lower the vehicle.

SPRING

DESCRIPTION

The coil springs mount up in the wheelhouse which is part of the unitized body bracket. A rubber doughnut isolator is located between the top and bottom of the spring. The isolators provide road noise isolation

OPERATION

The coil springs control ride quality and maintain proper ride height.

REMOVAL

1. Raise and support the vehicle. Position a hydraulic jack under the axle to support the axle.
2. Remove the wheel and tire assemblies.
3. Remove the lower shock bolt (3) from the axle bracket.
4. Remove the stabilizer bar link from the body rail.
5. Lower the hydraulic jack and tilt the axle and remove the coil spring (4).
6. Remove and inspect the spring isolators.

INSTALLATION

1. Install the upper isolator.
2. Install the lower isolator (3).
3. Pull down on the axle and position the coil spring (1) in the lower isolator.
4. Raise the axle with the hydraulic jack.
5. Install the shock absorber (3) to the axle bracket and tighten to 115 N·m (85 ft. lbs.).
6. Install the stabilizer bar link to the body rail, tighten to 102 N·m (75 ft. lbs.).
7. Install the wheel and tire assemblies.
8. Remove the supports and lower the vehicle.

JOUNCE BUMPER

REMOVAL

1. Raise and support the vehicle. Position a hydraulic jack under the axle to support the axle.
2. Remove the wheel and tire assemblies.
3. Remove the lower shock bolt (3) from the axle bracket.
4. Remove the stabilizer bar link from the body rail.
5. Lower the hydraulic jack and tilt the axle and remove the coil spring (4).

6. Remove the jounce bumper (6).

INSTALLATION

1. Install the jounce bumper, Tighten to 54 N·m (40 ft. lbs.).
2. Install the upper isolator.

3. Install the lower isolator (1).
4. Pull down on the axle and position the coil spring in the lower isolator.
5. Raise the axle with the hydraulic jack.
6. Install the shock absorber to the axle bracket and tighten to 115 N·m (85 ft. lbs.).
7. Install the stabilizer bar link to the body rail, Tighten to 102 N·m (75 ft. lbs.).
8. Install the wheel and tire assemblies.
9. Remove the supports and lower the vehicle.

STABILIZER BAR

DESCRIPTION

The stabilizer bar extends across the front of the rear axle. Links are connected between the bar and frame rail. The stabilizer bar has a bushing at the body attachment and a ball joint at the stabilizer bar attachment.

OPERATION

The stabilizer bar is used to control vehicle body roll, during turns. The bar helps control the vehicle body in relationship to the suspension.

REMOVAL

1. Raise and support the vehicle.
2. Remove both rear tire assemblies.
3. Remove the stabilizer bar links from stabilizer bar.
4. Remove the stabilizer bar retainer bolts from the retainer (2).

5. Remove the stabilizer bar (1) by twisting it out and around the rotor and caliper from the right rear side of the vehicle.

INSTALLATION

1. Twist and rotate to position the stabilizer bar (1) on the axle from the right rear side of the vehicle.

2. Install the retainers (2) and bolts. Ensure the bar is centered with equal spacing on both sides. Tighten the bolts to 54 N·m (40 ft. lbs.).

3. Install the links to the stabilizer bar.
4. Tighten the nuts at the stabilizer bar to 88 N·m (65 ft. lbs.).
5. Install the tire and wheel assemblies.
6. Remove support and lower the vehicle.

STABILIZER LINK

REMOVAL

1. Raise and support the vehicle.
2. Remove the rear tire.
3. Support the rear axle with a jack.
4. Remove the upper link bolt at the frame.
5. Remove the lower link nut at the stabilizer bar.
6. Remove stabilizer link.

INSTALLATION

1. Install the upper bolt for the stabilizer link to the frame and tighten to 102 N·m (75 ft. lbs.).
2. Install the stabilizer link to the stabilizer bar.
3. Install the nut and tighten to 88 N·m (65 ft. lbs.).
4. Remove the jack and lower the vehicle.

BUSHINGS

REMOVAL

1. Raise and support vehicle.
2. Remove the stabilizer bushing clamp.
3. Remove the bushing from the stabilizer bar.

INSTALLATION

1. Install the bushing to the stabilizer bar.
2. Install the stabilizer bar bushing clamp and bolts. Tighten the bolts to 46 N·m (34 ft.lbs.).
3. Lower the vehicle.

TRACK BAR

REMOVAL

1. Raise and support the vehicle. Position a hydraulic jack under the axle to support the axle.
2. Remove the track bar bolt (3) and nut (2) from the frame bracket.
3. Remove the left lower shock bolt at the axle.
4. Pry in between the coil springs to remove track bar bolt.

5. Remove the track bar bolt (3) and nut (2) from the axle bracket.

INSTALLATION

1. Install the track bar (1) to the vehicle.
2. Pry in between the coil springs to install track bar bolt (3).
3. Install the track bar bolt (3) and nut (2) in the frame bracket.

4. Install the track bar (1) into the axle bracket.
5. Install the track bar bolt (3) and nut (2) in the axle bracket.
6. Install the left lower shock bolt to the axle. Tighten to 115 N·m (85 ft. lbs.).
7. Remove the supports and lower the vehicle.
8. Tighten the upper mounting nuts to 190 N·m (140 ft. lbs.). Tighten the lower mounting nuts to 190 N·m (140 ft. lbs.). **with full vehicle weight.**

DIFFERENTIAL & DRIVELINE - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

C1417-FRONT DIFFERENTIAL CONTROL CIRCUIT LOW

MODULE-FINAL DRIVE CONTROL C1 (EXCEPT 3.7L)

SOLENOID-FRONT DIFFERENTIAL

SOLENOID-REAR DIFFERENTIAL

C1417-FRONT DIFFERENTIAL CONTROL CIRCUIT LOW (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
The Solenoid is active, no solenoid supply circuit DTCs are present and battery voltage is normal.
- **Set Condition:**
The FDCM detects the Front Differential Solenoid Control is shorted low.

Possible Causes
FRONT DIFFERENTIAL SOLENOID (T306) FRONT DIFFERENTIAL SOLENOID CONTROL CIRCUIT SHORTED TO GROUND (T306) FRONT DIFFERENTIAL SOLENOID CONTROL CIRCUIT OPEN (T301) SWITCHED BATTERY SOLENIOD SUPPLY OPEN/SHORTED TO GROUND FDCM

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

With the DRBIII®, read DTCs.

Is the DTC active at this time?

Yes >> Go To 2

No >> Go To 8

2. FRONT DIFFERENTIAL SOLENOID OPERATION

Turn the ignition off.

Disconnect the Front Differential Solenoid harness connector.

Ignition on, engine not running.

Using a 12-volt test light, jump across from the (T301) Switch Battery Solenoid Supply circuit and the (T306) Front Differential Solenoid Control circuit in the Front Differential Solenoid harness connector.

With the DRBIII®, actuate the Front Differential Solenoid.

Does the test light illuminate brightly and flash on and off?

Yes >> Inspect the Front Differential Solenoid Jumper harness, repair/replace as necessary. If OK, replace the Front Differential Solenoid.

Perform FDCM VERIFICATION TEST.

No >> Go To 3

C1417-FRONT DIFFERENTIAL CONTROL CIRCUIT LOW (CONTINUED)

3. (T306) FRONT DIFFERENTIAL SOLENOID CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the FDCM harness connector.

Measure the resistance of the (T306) Front Differential Solenoid Control circuit at the FDCM harness connector to ground.

Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the Front Differential Solenoid Control circuit.
Perform FDCM VERIFICATION TEST.

No >> Go To 4

4. (T306) FRONT DIFFERENTIAL SOLENOID CONTROL CIRCUIT OPEN

Measure the resistance of the (T306) Front Differential Solenoid Control circuit between the Front Differential Solenoid harness connector and the FDCM harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 5

No >> Repair the open in the (T306) Front Differential Solenoid Control circuit.
Perform FDCM VERIFICATION TEST

5. (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance of the (T301) Switched Battery Solenoid Supply circuit at the FDCM harness connector to ground.

Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (T301) Switched Battery Solenoid Supply circuit.
Perform FDCM VERIFICATION TEST.

No >> Go To 6

6. (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT OPEN

Measure the resistance of the (T301) Switched Battery Solenoid Supply circuit between the Front Differential Solenoid harness connector and the FDCM harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 7

No >> Repair the open in the (T301) Switched Battery Solenoid Supply circuit.
Perform FDCM VERIFICATION TEST

Go To 7

C1417-FRONT DIFFERENTIAL CONTROL CIRCUIT LOW (CONTINUED)**7. FDCM**

NOTE: Before continuing, check the FDCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

- Yes** >> Repair as necessary.
Perform FDCM VERIFICATION TEST
- No** >> Replace and program the Final Drive Control Module in accordance with Service Information.
Perform FDCM VERIFICATION TEST.
-

8. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

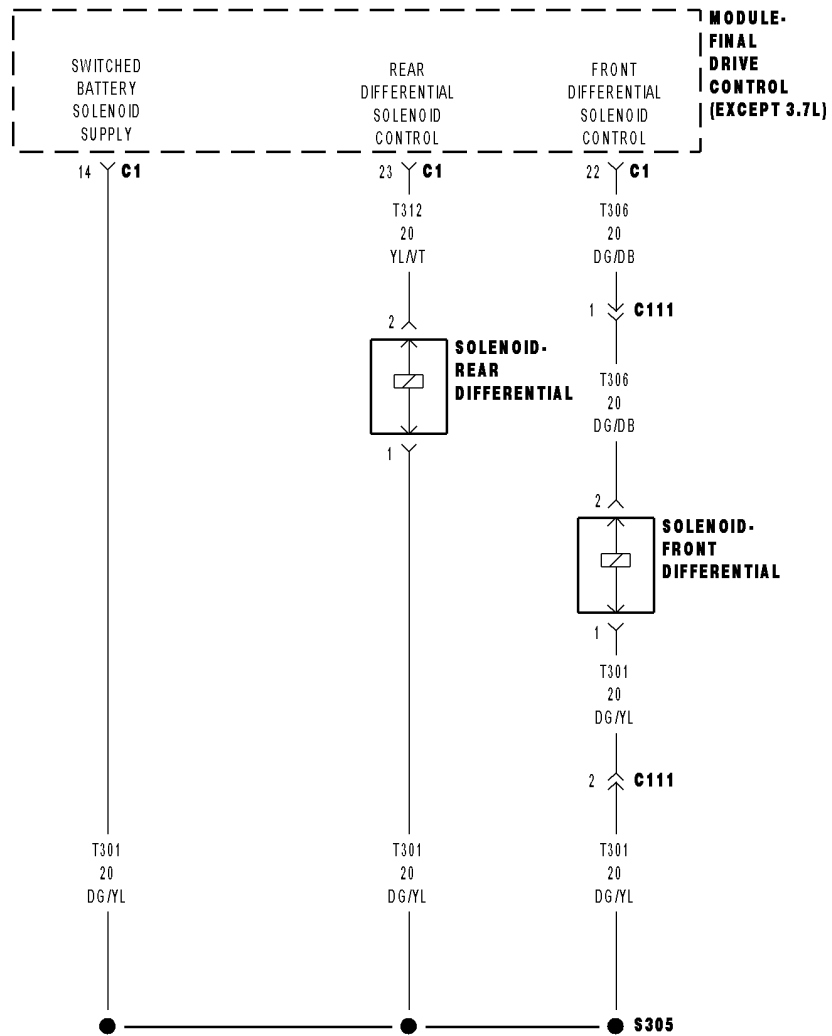

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the DRBIII®, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

Were there any problems found?

- Yes** >> Repair as necessary.
Perform FDCM VERIFICATION TEST.
- No** >> Test Complete.
-

C1418-FRONT DIFFERENTIAL CONTROL CIRCUIT HIGH

MODULE-FINAL DRIVE CONTROL C1 (EXCEPT 3.7L)

SOLENOID-FRONT DIFFERENTIAL

SOLENOID-REAR DIFFERENTIAL

C1418-FRONT DIFFERENTIAL CONTROL CIRCUIT HIGH (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
The Solenoid is active, no solenoid supply circuit DTCs are present and battery voltage is normal.
- **Set Condition:**
The FDCM detects the Front Differential Solenoid Control is high.

Possible Causes
FRONT DIFFERENTIAL SOLENOID (T306) FRONT DIFFERENTIAL SOLENOID CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE (T306) FRONT DIFFERENTIAL SOLENOID CONTROL CIRCUIT SHORTED TO (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT FDCM

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.
With the DRBIII®, read DTCs.

Is the DTC active at this time?

- Yes** >> Go To 2
No >> Go To 6

2. FRONT DIFFERENTIAL SOLENOID OPERATION

Turn the ignition off.
Disconnect the Front Differential Solenoid harness connector.
Ignition on, engine not running.
Using a 12-volt test light, jump across from the (T306) Front Differential Solenoid Control circuit and the (T301) Switched Battery Solenoid Supply circuit in the Front Differential Solenoid harness connector.
With a DRBIII®, actuate the Front Differential Solenoid.

Does the test light flash on and off?

- Yes** >> Inspect the Front Differential Solenoid Jumper harness connector, repair/replace as necessary. If OK, replace the Front Differential Solenoid.
Perform FDCM VERIFICATION TEST.
No >> Go To 3

C1418–FRONT DIFFERENTIAL CONTROL CIRCUIT HIGH (CONTINUED)**3. (T306) FRONT DIFFERENTIAL SOLENOID CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE**

Turn the ignition off.

Disconnect the FDCM harness connector.

Turn the ignition on.

Measure the voltage on the (T306) Front Differential Solenoid Control circuit at the FDCM harness connector.

Does the voltmeter indicate voltage present?

Yes >> Repair the short to voltage in the (T306) Front Differential Solenoid Control circuit.
Perform FDCM VERIFICATION TEST.

No >> Go To 4

4. (T306) FRONT DIFFERENTIAL SOLENOID CONTROL CIRCUIT SHORTED TO (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT

Measure the resistance between the (T306) Front Differential Solenoid Control circuit and the (T301) Switched Battery Solenoid Supply circuit in the FDCM harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the short between the (T306) Front Differential Solenoid Control circuit and the (T301) Switched Battery Solenoid Supply circuit.
Perform FDCM VERIFICATION TEST

No >> Go To 5

5. FDCM

NOTE: Before continuing, check the FDCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes >> Repair as necessary.
Perform FDCM VERIFICATION TEST

No >> Replace and program the Final Drive Control Module in accordance with Service Information.
Perform FDCM VERIFICATION TEST.

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the DRBIII®, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

Were there any problems found?

Yes >> Repair as necessary.
Perform FDCM VERIFICATION TEST.

No >> Test Complete.

C141A-FRONT DIFFERENTIAL CONTROL CIRCUIT "CURRENT" PERFORMANCE

MODULE-FINAL DRIVE CONTROL C1 (EXCEPT 3.7L)

SOLENOID-FRONT DIFFERENTIAL

SOLENOID-REAR DIFFERENTIAL

C141A-FRONT DIFFERENTIAL CONTROL CIRCUIT "CURRENT" PERFORMANCE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
The ignition on. No Solenoid DTCs present.
- **Set Condition:**
The FDCM detects a current feedback when the solenoid is not active.

Possible Causes
WIRING HARNESS INSPECTION
FDCM

Diagnostic Test**1. ACTIVE DTC**

NOTE: You must diagnose any Solenoid circuit (Low or High) DTCs first if set along with this DTC before continuing.

Ignition on, engine not running.

With the DRBIII®, read DTCs.

Is the DTC active at this time?

Yes >> Go To 2

No >> Go To 3

2. WIRING HARNESS INSPECTION

Inspect the wiring harness from both solenoids to the FDCM. Ensure that the harness has routed correctly.

Inspect the FDCM harness connector and Differential Solenoid connectors. Ensure the terminals are clean and no damage is present.

Was the wiring harness and connectors OK?

Yes >> Repair as necessary.
Perform FDCM VERIFICATION TEST.

No >> Replace the FDCM in accordance with the Service Manual.
Perform FDCM VERIFICATION TEST.

3. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

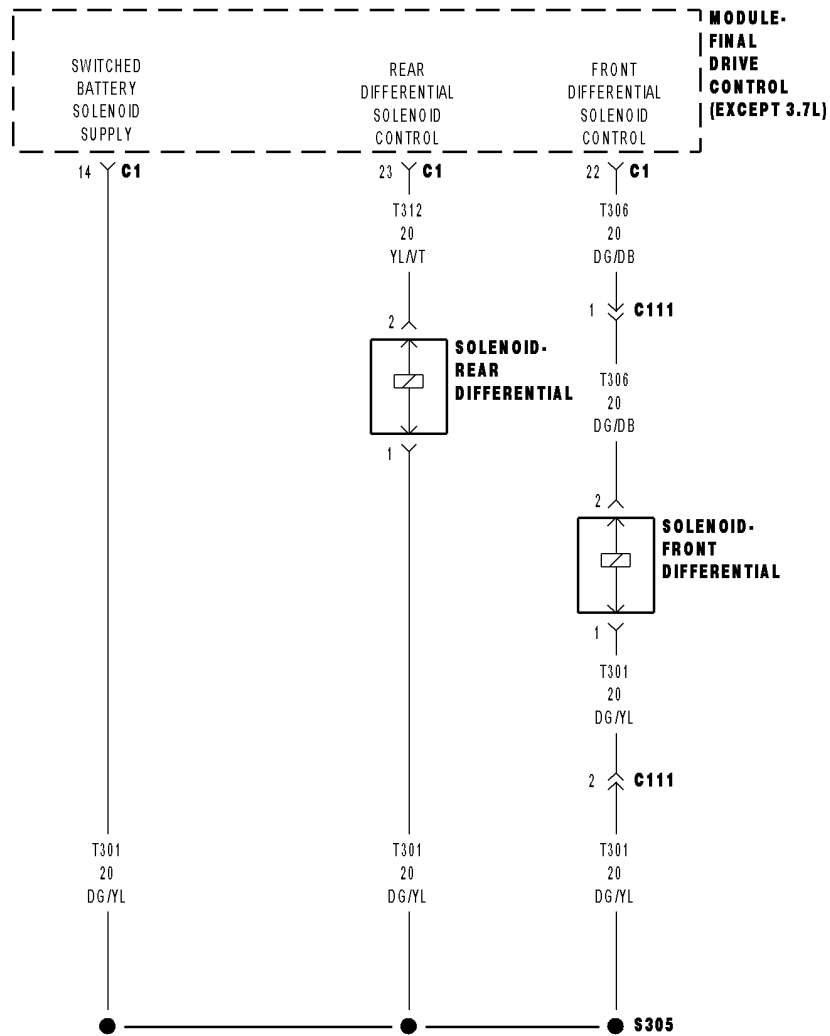

Using the DRBIII®, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

Were there any problems found?

Yes >> Repair as necessary.
Perform FDCM VERIFICATION TEST.

No >> Test Complete.

C141B—FRONT DIFFERENTIAL CLUTCH PERFORMANCE

MODULE-FINAL DRIVE CONTROL C1 (EXCEPT 3.7L)

SOLENOID-FRONT DIFFERENTIAL

SOLENOID-REAR DIFFERENTIAL

C141B—FRONT DIFFERENTIAL CLUTCH PERFORMANCE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
The ignition on. No Solenoid DTCs present.
- **Set Condition:**
The solenoid duty cycle is greater than 95% and the wheel slippage is greater than 50%.

Possible Causes
WIRING HARNESS INSPECTION DIFFERENTIAL (MECHANICAL) FRONT DIFFERENTIAL SOLENOID

Diagnostic Test**1. ACTIVE DTC**

NOTE: You must diagnose any Solenoid circuit (Low or High) DTCs first if set along with this DTC before continuing.

Ignition on, engine not running.

With the DRBIII®, read DTCs.

Is the DTC active at this time?

Yes >> Go To 2

No >> Go To 4

2. WIRING HARNESS INSPECTION

Inspect the wiring harness from both solenoids to the FDCM. Ensure that the harness has routed correctly.

Inspect the FDCM harness connector and Differential Solenoid connectors. Ensure the terminals are clean and no damage is present.

Was the wiring harness and connectors OK?

Yes >> Repair as necessary.
Perform FDCM VERIFICATION TEST.

No >> Go To 3
Perform FDCM VERIFICATION TEST.

3. INSPECTION DIFFERENTIAL

Ensure the Differential is operating properly. Refer to 3–Differential & Driveline Service Information.

Inspect the Differential for external fluid leaks. Repair as necessary, refer to 3–Differential & Driveline Service Information.

Is the Differential operating properly?

Yes >> Replace the Front Differential Solenoid.
Perform FDCM VERIFICATION TEST.

No >> Repair as necessary.
Perform FDCM VERIFICATION TEST.

C141B—FRONT DIFFERENTIAL CLUTCH PERFORMANCE (CONTINUED)**4. INTERMITTENT WIRING AND CONNECTORS**

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the DRBIII®, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

Were there any problems found?

Yes >> Repair as necessary.
Perform FDCM VERIFICATION TEST.

No >> Test Complete.

C141D-REAR DIFFERENTIAL CONTROL CIRCUIT LOW

MODULE-FINAL DRIVE CONTROL C1 (EXCEPT 3.7L)

SOLENOID-FRONT DIFFERENTIAL

SOLENOID-REAR DIFFERENTIAL

C141D-REAR DIFFERENTIAL CONTROL CIRCUIT LOW (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
The Solenoid is active, no solenoid supply circuit DTCs are present and battery voltage is normal.
- **Set Condition:**
The FDCM detects the Rear Differential Solenoid Control is shorted low.

Possible Causes
REAR DIFFERENTIAL SOLENOID (T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT SHORTED TO GROUND (T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT OPEN (T301) SWITCHED BATTERY SOLENIOD SUPPLY OPEN/SHORTED TO GROUND FDCM

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

With the DRBIII®, read DTCs.

Is the DTC active at this time?

Yes >> Go To 2

No >> Go To 8

2. REAR DIFFERENTIAL SOLENOID OPERATION

Turn the ignition off.

Disconnect the Rear Differential Solenoid harness connector.

Ignition on, engine not running.

Using a 12-volt test light, jump across from the (T301) Switch Battery Solenoid Supply circuit and the (T312) Rear Differential Solenoid Control circuit in the Rear Differential Solenoid harness connector.

With the DRBIII®, actuate the Rear Differential Solenoid.

Does the test light illuminate brightly and flash on and off?

Yes >> Inspect the Rear Differential Solenoid Jumper harness, repair/replace as necessary. If OK, replace the Rear Differential Solenoid.

Perform FDCM VERIFICATION TEST.

No >> Go To 3

C141D-REAR DIFFERENTIAL CONTROL CIRCUIT LOW (CONTINUED)

3. (T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the FDCM harness connector.

Measure the resistance of the (T312) Rear Differential Solenoid Control circuit at the FDCM harness connector to ground.

Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the Rear Differential Solenoid Control circuit.
Perform FDCM VERIFICATION TEST.

No >> Go To 4

4. (T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT OPEN

Measure the resistance of the (T312) Rear Differential Solenoid Control circuit between the Rear Differential Solenoid harness connector and the FDCM harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 5

No >> Repair the open in the (T312) Rear Differential Solenoid Control circuit.
Perform FDCM VERIFICATION TEST

5. (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance of the (T301) Switched Battery Solenoid Supply circuit at the FDCM harness connector to ground.

Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (T301) Switched Battery Solenoid Supply circuit.
Perform FDCM VERIFICATION TEST.

No >> Go To 6

6. (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT OPEN

Measure the resistance of the (T301) Switched Battery Solenoid Supply circuit between the Rear Differential Solenoid harness connector and the FDCM harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 7

No >> Repair the open in the (T301) Switched Battery Solenoid Supply circuit.
Perform FDCM VERIFICATION TEST

Go To 7

C141D-REAR DIFFERENTIAL CONTROL CIRCUIT LOW (CONTINUED)**7. FDCM**

NOTE: Before continuing, check the FDCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

- Yes** >> Repair as necessary.
Perform FDCM VERIFICATION TEST
- No** >> Replace and program the Final Drive Control Module in accordance with Service Information.
Perform FDCM VERIFICATION TEST.
-

8. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the DRBIII®, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

Were there any problems found?

- Yes** >> Repair as necessary.
Perform FDCM VERIFICATION TEST.
- No** >> Test Complete.
-

C141E-REAR DIFFERENTIAL CONTROL CIRCUIT HIGH

MODULE-FINAL DRIVE CONTROL C1 (EXCEPT 3.7L)

SOLENOID-FRONT DIFFERENTIAL

SOLENOID-REAR DIFFERENTIAL

C141E-REAR DIFFERENTIAL CONTROL CIRCUIT HIGH (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
The Solenoid is active, no solenoid supply circuit DTCs are present and battery voltage is normal.
- **Set Condition:**
The FDCM detects the Rear Differential Solenoid Control is high.

Possible Causes
REAR DIFFERENTIAL SOLENOID (T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE (T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT SHORTED TO (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT FDCM

Diagnostic Test**1. ACTIVE DTC**

Ignition on, engine not running.

With the DRBIII®, read DTCs.

Is the DTC active at this time?

Yes >> Go To 2

No >> Go To 6

2. REAR DIFFERENTIAL SOLENOID OPERATION

Turn the ignition off.

Disconnect the Rear Differential Solenoid harness connector.

Ignition on, engine not running.

Using a 12-volt test light, jump across from the (T312) Rear Differential Solenoid Control circuit and the (T301) Switched Battery Solenoid Supply circuit in the Rear Differential Solenoid harness connector.

With a DRBIII®, actuate the Rear Differential Solenoid.

Does the test light flash on and off?

Yes >> Inspect the Rear Differential Solenoid Jumper harness connector, repair/replace as necessary. If OK, replace the Rear Differential Solenoid.
Perform FDCM VERIFICATION TEST.

No >> Go To 3

C141E-REAR DIFFERENTIAL CONTROL CIRCUIT HIGH (CONTINUED)**3. (T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE**

Turn the ignition off.

Disconnect the FDCM harness connector.

Turn the ignition on.

Measure the voltage on the (T312) Rear Differential Solenoid Control circuit at the FDCM harness connector.

Does the voltmeter indicate voltage present?

Yes >> Repair the short to voltage in the (T312) Rear Differential Solenoid Control circuit.
Perform FDCM VERIFICATION TEST.

No >> Go To 4

4. (T312) REAR DIFFERENTIAL SOLENOID CONTROL CIRCUIT SHORTED TO (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT

Measure the resistance between the (T312) Rear Differential Solenoid Control circuit and the (T301) Switched Battery Solenoid Supply circuit in the FDCM harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the short between the (T312) Rear Differential Solenoid Control circuit and the (T301) Switched Battery Solenoid Supply circuit.
Perform FDCM VERIFICATION TEST

No >> Go To 5

5. FDCM

NOTE: Before continuing, check the FDCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes >> Repair as necessary.
Perform FDCM VERIFICATION TEST

No >> Replace and program the Final Drive Control Module in accordance with Service Information.
Perform FDCM VERIFICATION TEST.

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the DRBIII®, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

Were there any problems found?

Yes >> Repair as necessary.
Perform FDCM VERIFICATION TEST.

No >> Test Complete.

C1420— REAR DIFFERENTIAL CONTROL CIRCUIT “CURRENT” PERFORMANCE

C1420— REAR DIFFERENTIAL CONTROL CIRCUIT “CURRENT” PERFORMANCE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
The ignition on. No Solenoid DTCs present.
- **Set Condition:**
The FDCM detects a current feedback when the solenoid is not active.

Possible Causes
WIRING HARNESS INSPECTION
FDCM

Diagnostic Test**1. ACTIVE DTC**

NOTE: You must diagnose any Solenoid circuit (Low or High) DTCs first if set along with this DTC before continuing.

Ignition on, engine not running.

With the DRBIII®, read DTCs.

Is the DTC active at this time?

Yes >> Go To 2

No >> Go To 3

2. WIRING HARNESS INSPECTION

Inspect the wiring harness from both solenoids to the FDCM. Ensure that the harness has routed correctly.

Inspect the FDCM harness connector and Differential Solenoid connectors. Ensure the terminals are clean and no damage is present.

Was the wiring harness and connectors OK?

Yes >> Repair as necessary.

Perform FDCM VERIFICATION TEST.

No >> Replace the FDCM in accordance with the Service Manual.

Perform FDCM VERIFICATION TEST.

3. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the DRBIII®, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

Were there any problems found?

Yes >> Repair as necessary.

Perform FDCM VERIFICATION TEST.

No >> Test Complete.

C1421— REAR DIFFERENTIAL CLUTCH PERFORMANCE

MODULE-FINAL DRIVE CONTROL C1 (EXCEPT 3.7L)

SOLENOID-FRONT DIFFERENTIAL

SOLENOID-REAR DIFFERENTIAL

C1421— REAR DIFFERENTIAL CLUTCH PERFORMANCE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
The ignition on. No Solenoid DTCs present.
- **Set Condition:**
The solenoid duty cycle is greater than 95% and the wheel slippage is greater than 50%.

Possible Causes
WIRING HARNESS INSPECTION DIFFERENTIAL (MECHANICAL) REAR DIFFERENTIAL SOLENOID

Diagnostic Test**1. ACTIVE DTC**

NOTE: You must diagnose any Solenoid circuit (Low or High) DTCs first if set along with this DTC before continuing.

Ignition on, engine not running.

With the DRBIII®, read DTCs.

Is the DTC active at this time?

Yes >> Go To 2

No >> Go To 4

2. WIRING HARNESS INSPECTION

Inspect the wiring harness from both solenoids to the FDCM. Ensure that the harness has routed correctly.

Inspect the FDCM harness connector and Differential Solenoid connectors. Ensure the terminals are clean and no damage is present.

Was the wiring harness and connectors OK?

Yes >> Repair as necessary.
Perform FDCM VERIFICATION TEST.

No >> Go To 3
Perform FDCM VERIFICATION TEST.

3. INSPECTION DIFFERENTIAL

Ensure the Differential is operating properly. Refer to 3–Differential & Driveline Service Information.

Inspect the Differential for external fluid leaks. Repair as necessary, refer to 3–Differential & Driveline Service Information.

Is the Differential operating properly?

Yes >> Replace the Rear Differential Solenoid.
Perform FDCM VERIFICATION TEST.

No >> Repair as necessary.
Perform FDCM VERIFICATION TEST.

C1421— REAR DIFFERENTIAL CLUTCH PERFORMANCE (CONTINUED)

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the DRBIII®, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

Were there any problems found?

Yes >> Repair as necessary.
Perform FDCM VERIFICATION TEST.

No >> Test Complete.

C2109-DRIVETRAIN SUPPLY VOLTAGE CIRCUIT LOW

MODULE-FINAL DRIVE CONTROL C1 (EXCEPT 3.7L)

SOLENOID-FRONT DIFFERENTIAL

SOLENOID-REAR DIFFERENTIAL

C2109-DRIVETRAIN SUPPLY VOLTAGE CIRCUIT LOW (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Ignition on.
- **Set Condition:**
The FDCM recognizes the Switched Battery Solenoid Supply circuit voltage is too low.

Possible Causes
FRONT DIFFERENTIAL SOLENOID REAR DIFFERENTIAL SOLENOID (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT SHORTED TO GROUND FDCM

Diagnostic Test**1. ACTIVE DTC**

Ignition on, engine not running.

With a DRBIII®, read DTCs.

Is the DTC active at this time?

Yes >> Go To 2

No >> Go To 6

2. FRONT DIFFERENTIAL SOLENOID

Turn the ignition off.

Disconnect the Front Differential Solenoid harness connector.

Turn the ignition on.

With the DRBIII®, actuate the Front Differential Solenoid.

Measure the voltage of the (T301) Switched Battery Solenoid Supply circuit in the Front Differential Solenoid harness connector.

Is the voltage 12 volts?

Yes >> Inspect the Front Differential Solenoid Jumper harness, repair/replace as necessary. If OK, replace the Front Differential Solenoid.
Perform FDCM VERIFICATION TEST.

No >> Go To 3

C2109-DRIVETRAIN SUPPLY VOLTAGE CIRCUIT LOW (CONTINUED)**3. REAR DIFFERENTIAL SOLENOID**

Turn the ignition off.

Disconnect the Rear Differential Solenoid harness connector.

Turn the ignition on.

With the DRBIII®, actuate the Rear Differential Solenoid.

Measure the voltage of the (T301) Switched Battery Solenoid Supply circuit in the Rear Differential Solenoid harness connector.

Is the voltage 12 volts?

Yes >> Inspect the Rear Differential Solenoid Jumper harness, repair/replace as necessary. If OK, replace the Rear Differential Solenoid.

Perform FDCM VERIFICATION TEST.

No >> Go To 4

4. (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the FDCM harness connector.

Measure the resistance of the (T301) Switch Battery Solenoid Supply circuit at the FDCM harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (T301) Switch Battery Solenoid Supply circuit.

Perform FDCM VERIFICATION TEST.

No >> Go To 5

5. FDCM

NOTE: Before continuing, check the FDCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform FDCM VERIFICATION TEST

No >> Replace and program the Final Drive Control Module in accordance with Service Information.

Perform FDCM VERIFICATION TEST.

C2109-DRIVETRAIN SUPPLY VOLTAGE CIRCUIT LOW (CONTINUED)**6. INTERMITTENT WIRING AND CONNECTORS**

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle test the wiring harness and connectors while checking for shorted and open circuits.

Using the DRBIII®, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

Were there any problems found?

Yes >> Repair as necessary.
Perform FDCM VERIFICATION TEST.

No >> Test Complete.

FDCM VERIFICATION TEST

Diagnostic Test

1. PERFORM FDCM VERIFICATION TEST

NOTE: If the SKIM, PCM or FCM was replaced, refer to the service information for proper programming procedures.

1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
2. Ensure that all accessories are turned off.
3. Ensure that the battery is fully charged.
4. If the FDCM was replaced as part of the repair you must program the new FDCM using the scan tool.
5. With the scan tool, record and erase all DTC(s) from the FDCM
6. Start and run the engine for 2 minutes while operating all functions of the system that caused the original concern.
7. Turn the ignition off, wait 5 seconds, then turn the ignition on. Using the scan tool, read DTC(s) from the FDCM.

Are any FDCM DTC(s) present or is the original condition still present?

Yes >> The repair is not complete. Refer to the related category for the DTC or symptom that is still present.

No >> The repair is complete.

DIAGNOSIS AND TESTING

VIBRATION

DRIVELINE VIBRATION

Drive Condition	Possible Cause	Correction
Propeller Shaft Noise	1) Undercoating or other foreign material on shaft. 2) Loose or bent U-joint yoke or excessive runout. 3) Incorrect driveline angularity. 4) Worn U-joint bearings. 5) Propeller shaft damaged or out of balance. 6) Broken rear spring. 7) Excessive runout or unbalanced condition. 8) Excessive drive pinion gear shaft runout.	1) Clean exterior of shaft and wash with solvent. 2) Install new yoke. 3) Measure and correct driveline angles. 4) Install new propeller shaft. 5) Install new propeller shaft. 6) Install new rear spring. 7) Re-index propeller shaft, test, and evaluate. 8) Re-index propeller shaft and evaluate.
Universal Joint Noise	1) Loose U-joint flange screws. 2) Lack of lubrication.	1) Install new screws and tighten to proper torque. 2) Install new propeller shaft.

Tires that are out-of-round, or wheels that are not balanced, will cause a low frequency vibration.

Brake rotors that are unbalanced will cause a harsh, low frequency vibration.

Driveline vibration can also result from loose or damaged engine mounts.

Propeller shaft vibration increases as the vehicle speed is increased. A vibration that occurs within a specific speed range is not usually caused by a propeller shaft being unbalanced. Defective universal joints, or an incorrect propeller shaft angle, are usually the cause of such a vibration.

BALANCE

NOTE: Removing and re-indexing the propeller shaft 90° rear axle 45° trans case or front axle relative to the yoke may eliminate some vibrations.

If propeller shaft is suspected of being unbalanced, it can be verified with the following procedure:

1. Raise the vehicle.
2. Clean all the foreign material from the propeller shaft and the universal joints.
3. Inspect the propeller shaft for missing balance weights, broken welds, and bent areas.
4. Inspect the universal joints to ensure that they are not worn, are properly installed, and are correctly aligned with the shaft.
5. Check the universal joint flange screws torque.
6. Remove the wheels and tires. Install the wheel lug nuts to retain the brake drums or rotors.
7. Mark and number the shaft six inches from the yoke end at four positions 90° or 45° apart depending on flange.
8. Run and accelerate the vehicle until vibration occurs. Note the intensity and speed the vibration occurred. Stop the engine.
9. Install a screw clamp (1) at position 1.
10. Start the engine and re-check for vibration. If there is little or no change in vibration, move the clamp to one of the other three positions. Repeat the vibration test.
11. If there is no difference in vibration at the other positions, the source of the vibration may not be propeller shaft.
12. If the vibration decreased, install a second clamp (1) on the shaft (2) and repeat the test.

13. If the additional clamp causes an additional vibration, separate the first clamp (1) and second clamp (2) (1/4 inch above and below the mark). Repeat the vibration test.
14. Increase distance between the clamp screws and repeat the test until the amount of vibration is at the lowest level. Bend the slack end of the clamps so the screws will not loosen.
15. If the vibration remains unacceptable, apply the same steps to the front end of the propeller shaft.
16. Install the wheel and tires. Lower the vehicle.

STANDARD PROCEDURE

PROPELLER SHAFT ANGLE

To obtain front (output) angle on the C/V front propeller shaft, place Inclinator 7663 on the machined ring of the pinion flange. To obtain propeller shaft angle measurement on the C/V front propeller shaft, place inclinometer on the propeller shaft tube. To obtain rear (output) angle on rear propeller shaft use transfer case/transmission flange.

1. Raise and support the vehicle at the axles as level as possible. Allow the wheels and propeller shaft to turn.
2. Remove universal joint snap rings if equipped, so inclinometer base sits flat.
3. Rotate shaft until transmission/transfer case output yoke bearing cap is facing downward.

NOTE: Always make measurements from front to rear and from the same side of the vehicle.

4. Place inclinometer (1) on yoke bearing cap (2) or pinion flange ring parallel to the shaft. Center bubble in sight glass and record measurement. This measurement will give you the transmission or Output Yoke Angle (A).

5. Rotate propeller shaft 90 degrees and place inclinometer (2) on yoke bearing cap (1) or propeller shaft tube on C/V propeller shaft, parallel to the shaft. Center bubble in sight glass and record measurement. This measurement can also be taken at the rear end of the shaft. This measurement will give you the propeller shaft angle (C)
6. Subtract smaller figure from larger (C minus A) to obtain transmission output operating angle.

7. Rotate propeller shaft 90 degrees and place inclinometer (2) on pinion yoke bearing cap (1) parallel to the shaft. Center bubble in sight glass and record measurement. This measurement will give you the pinion shaft or input yoke angle (B).
8. Subtract smaller figure from larger (C minus B) to obtain axle Input Operating Angle.

RULES

Good cancellation of U-joint operating angles is within 1 degree.

Operating angles less than 3 degrees (U-joint system).

Operating angles less than 10 degrees for constant velocity joint.

At least 1/2 of one degree continuous operating (propeller shaft) angle. On one U-joint system less than 1 1/2 degree operating angle.

DESCRIPTION	N-m	Ft. Lbs.	In. Lbs.
Front Shaft - Pinion Flange Bolts	108	80	-
Front Shaft - Transfer Case Flange Bolts	32	24	-
Rear Shaft - Pinion Flange Bolts	108	80	-
Rear Shaft - Transfer Case Flange Bolts	108	80	-
Rear Shaft - Transmission Flange Bolts	108	80	-

SPECIAL TOOLS

INCLINOMETER 7663

PROPELLER SHAFT-FRONT

REMOVAL

1. With vehicle in neutral, position vehicle on hoist.
2. Mark a line across the axle pinion flange (1), propeller shaft (2), flange yoke (3) and transfer case for installation reference.
3. Support the transmission and the transmission crossmember.

4. Remove propeller shaft (1) from transfer case flange (2).

5. Remove propeller shaft (1) from axle pinion flange (2).

INSTALLATION

1. Install the shaft between companion flanges.
2. Install shaft (2) with reference marks (4) aligned on companion flanges (3).
3. Install bolts to axle pinion flange (1) and tighten bolts to 108 N-m (80 ft. lbs.).

4. Install shaft (1) on transfer case flange (2).
5. Install bolts to transfer case flange (2) and tighten bolts to 32 N·m (24 ft. lbs.).
6. Install transmission crossmember.

PROPELLER SHAFT-REAR

REMOVAL

NOTE: The propeller shaft slip joint boot can be replaced. Place reference marks on both sections of the shaft to ensure proper assemble.

1. With vehicle in neutral, position vehicle on hoist.
2. Mark the propeller shaft (1) pinion flange (2), transmission/transfer case flanges and for installation reference.

3. Remove propeller shaft (1) from axle pinion flange (2).

4. Remove propeller shaft (1) from vehicle transfer case flange (2) or transmission flange (3).
5. Remove propeller shaft from vehicle.

INSTALLATION

NOTE: Inspect propeller shaft boot for damage and replace if necessary.

1. Install propeller shaft (1) with all reference marks aligned.
2. Install shaft (1) on transfer case (2) or transmission (3) with reference marks aligned and tighten flange bolts to 108 N·m (80 ft. lbs.).

3. Install axle pinion flange (2) bolts and tighten to 108 N·m (80 ft. lbs.).

HALF SHAFT

CAUTION

CAUTION:: Failure to follow these instructions will result in damage. Never grasp half shaft assembly by the boots. This may cause the boot to pucker or crease and reduce the service life of the boot.

Avoid over angulating or stroking the C/V joints when handling the half shaft.

Half shafts exposed to battery acid, transmission fluid, brake fluid, differential fluid or gasoline may cause the boots to deteriorate.

DIAGNOSIS AND TESTING

HALF SHAFT

Check inboard and outboard C/V joint for leaking grease. This is a sign of boot or boot clamp damage.

NOISE/VIBRATION IN TURNS

A clicking noise or vibration in turns could be caused by a damaged outer C/V or inner tripod joint seal boot or seal boot clamps. This will result in the loss/contamination of the joint grease, resulting in inadequate lubrication of the joint. Noise could also be caused by another component of the vehicle coming in contact with the half shafts.

CLUNKING NOISE DURING ACCELERATION

This noise may be a damaged or worn C/V joint. A torn boot or loose/missing clamp on the inner/outer joint which has allowed the grease to be lost will damage the C/V joint.

SHUDDER/VIBRATION DURING ACCELERATION

This could be a worn/damaged inner tripod joint or a sticking tripod joint. Improper wheel alignment may also cause a shudder or vibration.

VIBRATION AT HIGHWAY SPEEDS

This problem could be a result of out of balance front tires or tire/wheel runout. Foreign material (mud, etc.) packed on the backside of the wheel(s) will also cause a vibration.

REMOVAL

1. With vehicle in neutral, position vehicle on hoist.
2. Remove half shaft hub/bearing nut.
3. Remove wheel speed sensor (1) from hub/bearing (3).

4. Remove brake calipers bolts (2) and remove calipers (1) from caliper adapters (4).

- 5. Remove lower stabilizer link (3) bolt (6) from control arm.

- 6. Remove outer tie rod end nuts and separate tie rods (3) from knuckles (4) with Remover 8677 (5).

7. Remove upper ball joint nuts (4) and separate ball joints (2) from knuckles (3) with Remover 8677.

8. Remove shock clevis (3) bolt and nut (4) from lower control arm
9. Lean the knuckle out and push half shaft out of the hub/bearing.
10. Pry half shafts from axle/axle tube with pry bar.

INSTALLATION

1. Install half shaft on the axle and through the hub/bearing. Verify half shaft has engaged.
2. Install shock clevis (2) on lower control arm and tighten nut to specifications.
3. Install upper control arm on knuckle and tighten ball joint nut to specifications.

4. Install tie rod end (4) on knuckle and tighten to specifications.
5. Install stabilizer link (3) on lower control arm and tighten to specifications.

6. Install caliper (1) on caliper adapter (3) and tighten to specifications.

7. Install wheel speed sensor (1) on the hub/bearing (3).
8. Install half shaft hub/bearing nut and tighten to 135 N·m (100 ft. lbs.).

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
Half Shaft Hub/Bearing Nut	135	100	-

SPECIAL TOOLS

CLAMP INSTALLER C-4975-A

CV BOOT-OUTER

REMOVAL

NOTE: CV joint is serviced with the shaft, the boot can be serviced separately

1. Remove inner CV boot and joint.
2. Cut outer CV boot (5) clamps (2) (4).
3. Cut boot off CV housing (1) and shaft (3).

INSTALLATION

1. Clean the CV joint then apply new grease to the joint.
2. Slid the new boot (5) on to the shaft (3) and on the CV housing (1).
3. Install boot clamps (2) (4) in original locations.
4. Install inner CV joint and boot,

CV JOINT/BOOT-INNER

REMOVAL

1. Clamp shaft in a vise (with soft jaws) and support C/V joint (1).
2. Remove clamps with a cut-off wheel or grinder.
3. Slide boot down (2) the shaft.

4. Remove lubricant from housing (1) to expose the C/V snap ring (2) and remove snap ring.

5. Remove bearings (4) from the cage (1).
6. Rotate cage (1) 30° and slide cage off the inner race (2) and down the shaft (3).

7. Remove spread inner race (1) snap ring (4) and remove race (1) from the shaft (3).
8. Remove boot from the shaft and discard.

- Clean and inspect housing (1), cage (2), bearings (3), housing snap-ring (4), inner race snap-ring (5) and inner race (6) for wear or damage.

INSTALLATION

- Apply a coat of grease supplied with the joint/boot to the C/V joint components before assembling them.
- Place new clamps on the new boot and slide boot down the shaft.
- Slide cage (2) onto the shaft (1) with the small diameter (3) end towards the boot.

4. Install the inner race (1) onto the shaft (3). Pull on the race to verify snap ring has engaged.

5. Align cage (1) with the inner race (2) and slide over the race.
6. Turn the cage 30° to align the cage windows (4) with the race (2).

7. Apply grease to the inner race and bearings and install the bearings.
8. Apply grease to the housing bore (4) then install the bearing assembly (2) into the housing (1).
9. Install the housing snap ring (3) and verify it is seated in the groove.
10. Fill the housing and boot with the remaining grease.
11. Slide the boot onto the C/V housing into it's original position. Ensure boot is not twisted and remove any excess air.
12. Secure both boot clamps with Clamp Installer C-4975A. Place tool on clamp bridge and tighten tool until the jaws of the tool are closed.

FRONT AXLE - C200F

DIAGNOSIS AND TESTING

FRONT AXLE - C200F

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, tooth contact, worn/damaged gears or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Check for insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion mate shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The axle shaft, differential and pinion bearings can all produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise

occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Axle shaft bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

LOW SPEED KNOCK

Low speed knock is generally caused by a worn U-joint or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

VIBRATION

Vibration at the rear of the vehicle is usually caused by:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out of balance wheels.
- Loose wheel lug nuts.
- Worn U-joints or C/V joints.
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent axle shaft(s).

Check for loose or damaged front end components or engine/transmission mounts. These components can contribute to what appears to be a rear end vibration. Do not overlook engine accessories, brackets and drive belts.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear (or the clutch engaged) can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints or C/V joints.
- Loose spring mounts.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

DIAGNOSTIC CHART

Condition	Possible Causes	Correction
Wheel Noise	<ol style="list-style-type: none"> 1. Wheel loose. 2. Faulty, brinelled wheel bearing. 	<ol style="list-style-type: none"> 1. Tighten loose nuts. 2. Replace bearing.
Axle Shaft Noise	<ol style="list-style-type: none"> 1. Misaligned axle tube. 2. Bent or sprung axle shaft. 3. End-play in pinion bearings. 4. Excessive gear backlash between the ring gear and pinion. 5. Improper adjustment of pinion gear bearings. 6. Loose pinion yoke nut. 7. Scuffed gear tooth contact surfaces. 	<ol style="list-style-type: none"> 1. Inspect axle tube alignment. Correct as necessary. 2. Inspect and correct as necessary. 3. Refer to pinion pre-load information and correct as necessary. 4. Check adjustment of the ring gear and pinion backlash. Correct as necessary. 5. Adjust the pinion bearings pre-load. 6. Tighten the pinion yoke nut. 7. Inspect and replace as necessary.
Axle Shaft Broke	<ol style="list-style-type: none"> 1. Misaligned axle tube. 2. Vehicle overloaded. 3. Erratic clutch operation. 4. Grabbing clutch. 	<ol style="list-style-type: none"> 1. Replace the broken shaft after correcting tube mis-alignment. 2. Replace broken shaft and avoid excessive weight on vehicle. 3. Replace broken shaft and avoid or correct erratic clutch operation. 4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	<ol style="list-style-type: none"> 1. Improper adjustment of the differential bearings. 2. Excessive ring gear backlash. 3. Vehicle overloaded. 4. Erratic clutch operation. 	<ol style="list-style-type: none"> 1. Replace case and inspect gears and bearings for further damage. Set differential bearing pre-load properly. 2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly. 3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight. 4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.

Condition	Possible Causes	Correction
Differential Gears Scored	<ol style="list-style-type: none"> 1. Insufficient lubrication. 2. Improper grade of lubricant. 3. Excessive spinning of one wheel/tire. 	<ol style="list-style-type: none"> 1. Replace scored gears. Fill differential with the correct fluid type and quantity. 2. Replace scored gears. Fill differential with the correct fluid type and quantity. 3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
Loss Of Lubricant	<ol style="list-style-type: none"> 1. Lubricant level too high. 2. Worn axle shaft seals. 3. Cracked differential housing. 4. Worn pinion seal. 5. Worn/scored yoke. 6. Axle cover not properly sealed. 	<ol style="list-style-type: none"> 1. Drain lubricant to the correct level. 2. Replace seals. 3. Repair as necessary. 4. Replace seal. 5. Replace yoke and seal. 6. Remove, clean, and re-seal cover.
Axle Overheating	<ol style="list-style-type: none"> 1. Lubricant level low. 2. Improper grade of lubricant. 3. Bearing pre-loads too high. 4. Insufficient ring gear backlash. 	<ol style="list-style-type: none"> 1. Fill differential to correct level. 2. Fill differential with the correct fluid type and quantity. 3. Re-adjust bearing pre-loads. 4. Re-adjust ring gear backlash.
Gear Teeth Broke	<ol style="list-style-type: none"> 1. Overloading. 2. Erratic clutch operation. 3. Ice-spotted pavement. 4. Improper adjustments. 	<ol style="list-style-type: none"> 1. Replace gears. Examine other gears and bearings for possible damage. 2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation. 3. Replace gears and examine remaining parts for damage. 4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.

Condition	Possible Causes	Correction
Axle Noise	<ol style="list-style-type: none"> 1. Insufficient lubricant. 2. Improper ring gear and pinion adjustment. 3. Unmatched ring gear and pinion. 4. Worn teeth on ring gear and/or pinion. 5. Loose pinion bearings. 6. Loose differential bearings. 7. Mis-aligned or sprung ring gear. 8. Loose differential bearing cap bolts. 9. Housing not machined properly. 	<ol style="list-style-type: none"> 1. Fill differential with the correct fluid type and quantity. 2. Check ring gear and pinion contact pattern. 3. Replace gears with a matched ring gear and pinion. 4. Replace ring gear and pinion. 5. Adjust pinion bearing pre-load. 6. Adjust differential bearing pre-load. 7. Measure ring gear run-out. Replace components as necessary. 8. Inspect differential components and replace as necessary. Ensure that the bearing caps are torqued to the proper specification. 9. Replace housing.

REMOVAL

1. With vehicle in neutral, position vehicle on hoist.
2. Remove skid plate.
3. Remove differential housing drain plug and drain fluid.
4. Mark front propeller shaft and pinion flange. Remove propeller shaft from pinion flange.
5. Remove half shaft hub/bearing nuts.
6. Remove wheel speed sensors (1) from hub/bearings (3).

7. Remove brake calipers bolts (2) and remove calipers (1) from caliper adapters (4).

8. Remove stabilizer links (3) bolts (6) from lower control arms.

9. Remove outer tie rod end nuts and separate tie rods (3) from knuckles (4) with Remover 8677 (5).

10. Remove upper ball joint nuts (4) and separate ball joints (2) from knuckles (3) with Remover 8677.

11. Remove lower shock clevis (3) nuts bolts (2) from lower control arm.
12. Lean the knuckles out and push half shafts out of the hub/bearings.
13. Pry half shafts off the axles.
14. Remove differential vent hose.

15. Support axle with a lift/jack.
16. Remove bolt (1) from differential bushing (2).

17. Remove bolt (1) from axle tube bushing (2).

18. Remove bolts (1) from differential cover bracket (2) bushing.

19. Lower axle and from vehicle.

INSTALLATION

1. Raise axle to vehicle.
2. Install differential cover axle bracket (2) bushing bolts (1) and tighten bolts to 47 N·m (35 ft. lbs.)

3. Install axle tube bushing bolt and nut. Tighten nut to 95 N·m (70 ft. lbs.)

4. Install differential bushing bolt and nut. Tighten nut to 95 N·m (70 ft. lbs.)
5. Install differential vent hose.

6. Install half shaft into axle and knuckles. Verify axle are engaged in the axle.
7. Install clevis (3) bolt and nut (4) on lower control arms and tighten to specification.

8. Install upper control arms on knuckles and tighten ball joint nuts to specifications.
9. Install tie rod ends (4) and nuts (5) on knuckles and tighten to specifications.
10. Install stabilizer bar links (2) and bolts (6) on lower control arms and tighten to specifications.

11. Install brake calipers on knuckles.
12. Install wheel speed sensor (1) on hub/bearing (3).
13. Install half shaft hub nuts and tighten to 135 N·m (100 ft. lbs.).
14. Install propeller shaft on pinion flange with reference marks aligned.
15. Install drain plug and tighten to 60 N·m (44 ft. lbs.).
16. Fill differential housing and install fill plug. Tighten plug to 60 N·m (44 ft. lbs.).
17. Install skid plate.

ADJUSTMENTS

ADJUSTMENT

PINION DEPTH MEASUREMENT

NOTE: Take measurement with pinion shim removed and rear bearing cup in place.

1. Install Pinion Height Block 6739 (3), Pinion Block 9534 (2), and pinion head bearing cone (1) onto Screw 6741. Install assembly into axle housing and through bearing and cups.
2. Install pinion front bearing and Cone 6740. Tighten Cone 6740 by hand until 3.4 N·m (30 in. lbs.) of rotating torque is measured at Screw 6741.

3. Install Arbor Discs 9538 (1).

4. Install Arbor Bar D-115-3 (1).

5. Verify pinion depth setup is as shown.

6. Install Dial Indicator 9524 (1) to Scooter Block D-115-2A (2). Secure with set-screw (3).

7. Install Indicator/Block assembly to top of Height Block 6739 (1). Zero indicator on top surface.

- Slide indicator probe off of height block and onto Arbor Bar D-115-3 (2). As indicator contacts Arbor Bar (2), indicator needle will rotate clockwise. Continue moving indicator probe to the crest of the arbor bar and record the highest reading. Then add 4 mm (0.157 in.) to the recorded reading. This will give you the correct shim selection for pinion height.

DIFFERENTIAL SIDE BEARING PRELOAD

Differential side bearing preload is predetermined. The select snap rings in the differential housing will provide the correct differential side bearing preload. These snap can be adjusted to obtain the correct ring gear backlash measurement.

RING GEAR BACKLASH MEASUREMENT

NOTE: If Spreader W-129-B is installed, make sure tension on axle housing is relieved.

- Set up Dial Indicator Set C-3339-A with Clamp SP-5426 (1), Post SP-5425-B (2) and Metric Dial Indicator 9524 (3) to measure ring gear backlash:
- Rotate ring gear one direction to take up clearance to pinion. Verify indicator tip is in contact with ring gear and zero indicator. Rotate ring gear back and forth and record measurement. Ring gear backlash should be 0.13-0.18 mm (0.005-0.007 in.). Verify back lash measurement in four (4) positions.

3. If backlash measurement is less than 0.13 mm (0.005 in.), it is necessary to decrease the snap ring thickness on the ring gear side, and increase the thickness on the pinion side equal amounts.
4. If backlash measurement is greater than 0.18 mm (0.007 in.), it is necessary to increase the snap ring thickness on the ring gear side, and decrease the thickness on the pinion side equal amounts.

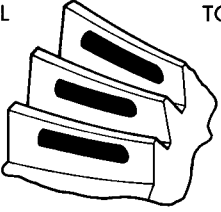

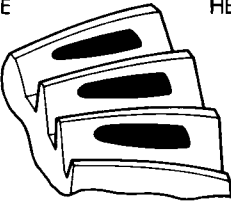

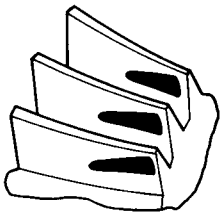

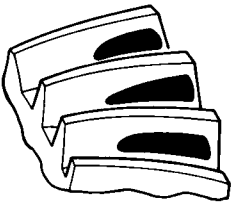

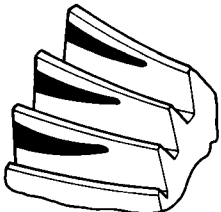

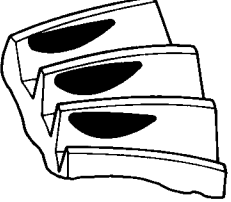

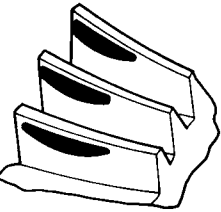

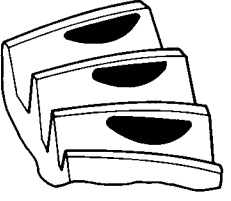

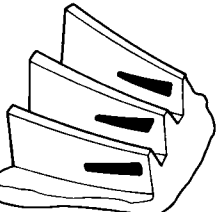

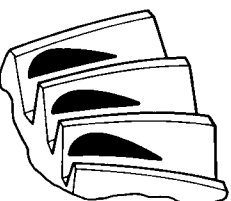

GEAR CONTACT PATTERN

The ring gear and pinion teeth contact patterns will show if the pinion depth is correct in the housing. It will also show if the ring gear backlash has been adjusted correctly. The backlash can be adjusted within specifications to achieve desired tooth contact patterns.

1. Apply a thin coat of hydrated ferric oxide or equivalent to the drive and coast side of the ring gear teeth.
2. Wrap, twist, and hold a shop towel around the pinion yoke to increase the turning resistance of the pinion. This will provide a more distinct contact pattern.
3. With a boxed end wrench on a ring gear bolt, rotate the differential case one complete revolution in both directions while a load is being applied from shop towel.

The areas on the ring gear teeth with the greatest degree of contact against the pinion teeth will squeegee the compound to the areas with the least amount of contact. Note and compare patterns on the ring gear teeth to Gear Tooth Contact Patterns chart and adjust pinion depth and gear backlash as necessary.

<p>DRIVE SIDE OF RING GEAR TEETH</p> <p>HEEL TOE</p> 	<p>COAST SIDE OF RING GEAR TEETH</p> <p>TOE HEEL</p> 	<p>DESIRABLE CONTACT PATTERN. PATTERN SHOULD BE CENTERED ON THE DRIVE SIDE OF TOOTH. PATTERN SHOULD BE CENTERED ON THE COAST SIDE OF TOOTH, BUT MAY BE SLIGHTLY TOWARD THE TOE. THERE SHOULD ALWAYS BE SOME CLEARANCE BETWEEN CONTACT PATTERN AND TOP OF THE TOOTH.</p>
		<p>RING GEAR BACKLASH CORRECT. THINNER PINION GEAR DEPTH SHIM REQUIRED.</p>
		<p>RING GEAR BACKLASH CORRECT. THICKER PINION GEAR DEPTH SHIM REQUIRED.</p>
		<p>PINION GEAR DEPTH SHIM CORRECT. DECREASE RING GEAR BACKLASH.</p>
		<p>PINION GEAR DEPTH SHIM CORRECT. INCREASE RING GEAR BACKLASH.</p>

AXLE SHAFTS

REMOVAL

1. Remove half shaft from vehicle.
2. Clean axle seal area.
3. Remove snap ring and O-ring from the axle shaft.
4. Remove axle (1) with Remove 8420A (2) (3) (4) and slid hammer.

INSTALLATION

1. Lubricate bearing bore and seal lip with gear lubricant.
2. Install axle shaft and engage shaft into side gear. Push firmly on axle shaft to engage snap-ring.
3. Check the differential fluid level and add fluid if necessary.
4. Install half shaft.
5. Install skid plate, if necessary.

AXLE SHAFT SEALS

REMOVAL

1. Remove axle shaft.
2. Remove axle shaft tube (1) seal with Remover 7794-A (2) and slid hammer.

INSTALLATION

1. Install axle (1) seal with Installer 8402 (2) and hammer.
2. Install axle shaft.

AXLE BEARINGS

REMOVAL

1. Remove axle shaft.
2. Remove axle shaft tube (1) seal with Remover 7794-A (2) and slid hammer.

3. Install axle bearing remover C-4660-A (1) into the axle bearing (2) in the axle tube (3) and tighten remover nut (4).

4. Install bearing Receiver 9537 (1) and nut (2) on remover and tube (3). Tighten nut (2) and draw bearing into receiver (1).

INSTALLATION

1. Install axle bushing (1) with Installer 5063 (2) and hammer.
2. Install axle shaft and seal.

PINION SEAL

REMOVAL

1. Remove wheels.
2. Push back brake pads and release hand brake.
3. Remove propeller shaft.
4. Rotate pinion with inch pound torque and record torque to rotate.
5. Mark installation position of collared nut with respect to drive pinion.
6. Bend pinion nut lock back with a punch and hammer.
7. Hold pinion flange (1) with Wrench C-3281(2) and remove pinion nut.

8. Remove pinion flange (1) with Puller C-452 (2).
9. Remove pinion seal with a seal pick.

INSTALLATION

1. Install pinion seal with Installer C-3972A and Handle C-4171.
2. Install pinion flange (1) on pinion with Installer 9616 (2). Tap flange on pinion, then thread installer center bolt on pinion shaft and draw flange onto the pinion.

3. Install **new** pinion collared nut and carefully tighten nut in stages holding flange (1) with Wrench C-3281(2). Check torque to rotate after each stage, until previously value of torque to rotate is exceeded by 0.5 N·m. (4.4 in. lbs.).

4. Cut the pinion nut collar.
5. Bend nut collar so it touches the wall of the slot in the pinion shaft.
6. Connect propeller shaft to pinion flange.
7. Install wheel and tires.
8. Operate brake pedal several times until brake pads contact brake discs (brake pressure built up).

BUSHINGS-AXLE

REMOVAL

1. Remove axle from vehicle.
2. Remove pinion flange.
3. Remove pinion nose bushing with Press C-4212F (1) Receiver 9536 (2) and Remover 9512 (3).

4. Remove axle tube bushing with Press C-4212F (1) Receiver 9536 (2) and Remover 9512 (3).

INSTALLATION

1. Install axle tube bushing with Press C-4212F (1), Installer 9511 (2) and Receiver 9536-2 (3).

2. Install pinion nose bushing with Press C-4212F (1), Installer 9536-2 (2) and Receiver 9511(3).
3. Install new pinion seal, pinion flange and new pinion nut.

DIFFERENTIAL

REMOVAL

1. Remove half shafts and axle shaft.
2. Remove differential cover.
3. Remove three axle tube (1) mounting bolts (2) from differential housing (3).

4. Tap axle tube (1) and pull tube off differential housing flange (2).
5. Remove half shaft differential housing seal with seal pick.

6. Bolt spreader Adapters 9669 (1) to differential housing (2).

7. Install Spreader W-129-B (1) on adapters (2).
8. Spread case .3mm (0.011 in.).

9. Remove select snap-rings (1) from differential housing bearing bores (2).

10. Measure select snap-rings (2) and mark the size and location of the snap-rings.

11. Tilt differential case (1) out of the housing (2) and remove case.
12. Loosen spreader.

DISASSEMBLY

1. Remove **left hand thread** ring gear bolts.
2. Drive ring gear of the case with a soft hammer.
3. Remove pinion mate shaft (1) lock pin with a punch (2) and hammer.

- 4. Remove pinion gears (1) mate shaft (2) from the case.

- 5. Rotate pinion gears (1) with washers to differential window (2) and remove gears through window.

- 6. Remove upper side gear (1) through differential window (2).

- 7. Remove lower side gear (1) through differential window (2).

ASSEMBLY

1. Install lower side gear (1) through differential window (2).

2. Install upper side gear (1) through differential window (2).

3. Install pinion gears (1) with washers into differential window (2) and rotate gears till aligned with pinion shaft hole.

4. Install pinion gears (1) mate shaft (2) into the case.

5. Install

6. Install pinion mate shaft lock pin (1) with a hammer and punch, into the differential case and mate shaft (2).

7. Install **left hand thread** ring gear Installer Bolts 9533 (1) through differential (2) and into ring gear (3). Tighten nuts on installer bolts evenly and draw ring gear onto differential case.
8. Remove installer bolts and install new **left hand thread** ring gear bolts and tighten to 102 N·m (75 ft. lbs.).

INSTALLATION

1. Bolt spreader Adapters 9226 (1) to differential housing (2).

2. Install Spreader W-129-B (1) on adapters (2).

3. Tilt differential case (1) into the housing (2).
4. Install bearing cups into their original housing bores.

5. Install one differential select snap-ring (1) into it's original housing bore (2).
6. Spread the housing and install the other differential select snap-ring.
7. Loosen the spreader.

8. Lube new o-ring and install on axle tube (1).
9. Align axle tube (1) with differential housing flange (3) and push tube into place.

CAUTION: The tube must be perfectly aligned to the housing to prevent damage to the o-ring. Failure to follow these instructions will result in a leak.

10. Install axle tube (1) bolts (2) and tighten to 56 N·m (41 ft. lbs.).
11. Install half shaft seal with Installer 9504 and Handle C-4171.
12. Apply a 6.35 mm (1/4 in.) bead of Mopar® Gear Sealant RTV Silicone Rubber Adhesive MS-GF44D or equivalent to the differential case.

CAUTION: If housing cover is not installed within 3 to 5 minutes, the differential case must be cleaned and new RTV applied. Failure to follow these instructions will result in a leak.

13. Install cover and tighten cover bolts in a criss-cross pattern to 56 N·m (41 ft. lbs.).

SEAL-DIFFERENTIAL

REMOVAL

1. Remove half shaft from axle.
2. Pry seal out with a seal pick.

INSTALLATION

1. Install differential seal with Install 9504 and Handle C-4171.
2. Install half shaft.

DIFFERENTIAL CASE BEARINGS

REMOVAL

1. Remove differential from housing.
2. Remove differential bearings with Puller C-293-PA (1), Plug C-293-3 (2) and four Adapters C-293-48 (3).

INSTALLATION

1. Install differential case (2) bearings (3) with Installer 9535 (4) and Handle C-4171(1).
2. Install differential into the housing.

PINION GEAR/RING GEAR/TONE RING

REMOVAL

1. Remove differential from housing.
2. Bend pinion nut lock tab back.
3. Remove pinion flange (1) nut with flange Holder C-328 (2).

4. Remove pinion flange (1) with Puller C-452 (2).

- 5. Drive pinion gear out of the housing with a soft hammer.
- 6. Remove pinion seal (1) with a pry bar (2).

- 7. Remove collapsible spacer (1) from pinion shaft (2).

8. Remove spacer (1) from pinion shaft (2).

9. Remove rear pinion bearing from pinion shaft (1) with Puller C-293-PA (2) and four Adapters C-293-37.

10. Remove front pinion bearing cup (1) with Handle C-4171 (2) and Remover D-103 (3).

11. Remove rear pinion bearing cup (1) with Remover 9884 (2) and Handle C-4171.

12. Remove pinion height select shim (1) from rear pinion bearing cup bore (2).

INSTALLATION

1. Install **left hand thread** ring gear Installer Bolts 9533 (1) through differential (2) and into ring gear (3). Tighten nuts on installer bolts evenly and draw ring gear onto differential case.
2. Remove installer bolts and install new **left hand thread** ring gear bolts and tighten to 102 N·m (75 ft. lbs.).

3. Install front pinion bearing cup into housing, with Installer D-129 (1) and Handle C-4171 (2).

4. Install pinion depth shim (1) in rear pinion bearing cup bore (2).

5. Install rear pinion bearing cup into housing, with Installer D-111 (1) and Handle C-4171 (2).

WARNING: Use welding gloves when handling heated components.

CAUTION: A bearing heater is used to assembly some components. Use only an approved heater and only heat components to 100 - 177 Celsius (212 - 350 ° Fahrenheit). Never leave components on heater for and extended amount of time. If component is discolored after heating, component has been overheated and must not be used. Failure to follow these instructions will result in damage.

6. Heat rear pinion bearing (1) with bearing heater (2).
7. Using welding gloves, install rear bearing on pinion shaft.

8. Install spacer (1) from pinion shaft (2) with the beveled side facing the gear.

9. Install collapsible spacer (1) from pinion shaft (2).

10. Install pinion in housing.
11. Install front pinion bearing into the housing (1) on the pinion shaft with Installer 9616 (2). Thread installer onto the pinion shaft then tighten installer nut.

12. Install pinion seal with Installer 9514.
13. Install pinion flange (1) on pinion with Installer 9616 (2). Tap flange on pinion, then thread installer center bolt on pinion shaft and draw flange onto the pinion.

14. Hold pinion flange (1) with Flange Wrench C-3281 (2) and tighten pinion nut until torque to rotate is 1.5 to 1.9 N·m (13 to 17 in. lbs.).

15. Cut the pinion nut collar.
16. Bend nut collar so it touches the wall of the slot in the pinion shaft.
17. Install differential.

FRONT AXLE - C200FE

DIAGNOSIS AND TESTING

FRONT AXLE - C200FE

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, tooth contact, worn/damaged gears or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Check for insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion mate shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The axle shaft, differential and pinion bearings can all produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise

occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Axle shaft bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

LOW SPEED KNOCK

Low speed knock is generally caused by a worn U-joint or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

VIBRATION

Vibration at the rear of the vehicle is usually caused by:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out of balance wheels.
- Loose wheel lug nuts.
- Worn U-joints or C/V joints.
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent axle shaft(s).

Check for loose or damaged front end components or engine/transmission mounts. These components can contribute to what appears to be a rear end vibration. Do not overlook engine accessories, brackets and drive belts.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear (or the clutch engaged) can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints or C/V joints.
- Loose spring mounts.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

DIAGNOSTIC CHART

Condition	Possible Causes	Correction
Wheel Noise	<ol style="list-style-type: none"> 1. Wheel loose. 2. Faulty, brinelled wheel bearing. 	<ol style="list-style-type: none"> 1. Tighten loose nuts. 2. Replace bearing.
Axle Shaft Noise	<ol style="list-style-type: none"> 1. Misaligned axle tube. 2. Bent or sprung axle shaft. 3. End-play in pinion bearings. 4. Excessive gear backlash between the ring gear and pinion. 5. Improper adjustment of pinion gear bearings. 6. Loose pinion yoke nut. 7. Scuffed gear tooth contact surfaces. 	<ol style="list-style-type: none"> 1. Inspect axle tube alignment. Correct as necessary. 2. Inspect and correct as necessary. 3. Refer to pinion pre-load information and correct as necessary. 4. Check adjustment of the ring gear and pinion backlash. Correct as necessary. 5. Adjust the pinion bearings pre-load. 6. Tighten the pinion yoke nut. 7. Inspect and replace as necessary.
Axle Shaft Broke	<ol style="list-style-type: none"> 1. Misaligned axle tube. 2. Vehicle overloaded. 3. Erratic clutch operation. 4. Grabbing clutch. 	<ol style="list-style-type: none"> 1. Replace the broken shaft after correcting tube mis-alignment. 2. Replace broken shaft and avoid excessive weight on vehicle. 3. Replace broken shaft and avoid or correct erratic clutch operation. 4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	<ol style="list-style-type: none"> 1. Improper adjustment of the differential bearings. 2. Excessive ring gear backlash. 3. Vehicle overloaded. 4. Erratic clutch operation. 	<ol style="list-style-type: none"> 1. Replace case and inspect gears and bearings for further damage. Set differential bearing pre-load properly. 2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly. 3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight. 4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.

Condition	Possible Causes	Correction
Differential Gears Scored	<ol style="list-style-type: none"> 1. Insufficient lubrication. 2. Improper grade of lubricant. 3. Excessive spinning of one wheel/tire. 	<ol style="list-style-type: none"> 1. Replace scored gears. Fill differential with the correct fluid type and quantity. 2. Replace scored gears. Fill differential with the correct fluid type and quantity. 3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
Loss Of Lubricant	<ol style="list-style-type: none"> 1. Lubricant level too high. 2. Worn axle shaft seals. 3. Cracked differential housing. 4. Worn pinion seal. 5. Worn/scored yoke. 6. Axle cover not properly sealed. 	<ol style="list-style-type: none"> 1. Drain lubricant to the correct level. 2. Replace seals. 3. Repair as necessary. 4. Replace seal. 5. Replace yoke and seal. 6. Remove, clean, and re-seal cover.
Axle Overheating	<ol style="list-style-type: none"> 1. Lubricant level low. 2. Improper grade of lubricant. 3. Bearing pre-loads too high. 4. Insufficient ring gear backlash. 	<ol style="list-style-type: none"> 1. Fill differential to correct level. 2. Fill differential with the correct fluid type and quantity. 3. Re-adjust bearing pre-loads. 4. Re-adjust ring gear backlash.
Gear Teeth Broke	<ol style="list-style-type: none"> 1. Overloading. 2. Erratic clutch operation. 3. Ice-spotted pavement. 4. Improper adjustments. 	<ol style="list-style-type: none"> 1. Replace gears. Examine other gears and bearings for possible damage. 2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation. 3. Replace gears and examine remaining parts for damage. 4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.

Condition	Possible Causes	Correction
Axle Noise	<ol style="list-style-type: none">1. Insufficient lubricant.2. Improper ring gear and pinion adjustment.3. Unmatched ring gear and pinion.4. Worn teeth on ring gear and/or pinion.5. Loose pinion bearings.6. Loose differential bearings.7. Mis-aligned or sprung ring gear.8. Loose differential bearing cap bolts.9. Housing not machined properly.	<ol style="list-style-type: none">1. Fill differential with the correct fluid type and quantity.2. Check ring gear and pinion contact pattern.3. Replace gears with a matched ring gear and pinion.4. Replace ring gear and pinion.5. Adjust pinion bearing pre-load.6. Adjust differential bearing pre-load.7. Measure ring gear run-out. Replace components as necessary.8. Inspect differential components and replace as necessary. Ensure that the bearing caps are torqued to the proper specification.9. Replace housing.

REMOVAL

1. With vehicle in neutral, position vehicle on hoist.
2. Remove skid plate.
3. Remove differential housing drain plug and drain fluid.
4. Mark front propeller shaft and pinion flange. Remove propeller shaft from pinion flange.
5. Remove half shaft hub/bearing nuts.
6. Remove wheel speed sensors (1) from hub/bearings (3).

7. Remove brake calipers bolts (2) and remove calipers (1) from caliper adapters (4).

8. Remove stabilizer links (3) bolts (6) from lower control arms.

9. Remove outer tie rod end nuts and separate tie rods (3) from knuckles (4) with Remover 8677 (5).

10. Remove upper ball joint nuts (4) and separate ball joints (2) from knuckles (3) with Remover 8677.

11. Remove lower shock clevis (3) nuts bolts (2) from lower control arm.
12. Lean the knuckles out and push half shafts out of the hub/bearings.
13. Pry half shafts off the axles.

- 14. Remove ELSD connector (1) from axle.
- 15. Remove differential vent hose (2).

- 16. Remove bolt (1) from axle tube bushing (2).

17. Remove bolt (1) from pinion nose bushing (2).

- 18. Support axle with a lift/jack.
- 19. Remove bolts (1) from differential cover bracket bushing (2).
- 20. Lower axle from vehicle.

INSTALLATION

1. Raise axle to vehicle.
2. Install differential cover bracket bushing (2) bolts (1) and tighten bolts to 47 N-m (35 ft. lbs.)

3. Install axle tube bushing (2) bolt (1) and nut. Tighten nut to 95 N-m (70 ft. lbs.)

4. Install differential bushing (2) bolt (1) and nut.
Tighten nut to 95 N·m (70 ft. lbs.)

5. Install ELSD connector (1) and differential vent hose (2).

6. Install half shaft into axle and knuckles. Verify axle are engaged in the axle.
7. Install clevis (3) bolt and nut (4) on lower control arms and tighten to specification.

8. Install upper control arms on knuckles and tighten ball joint nuts to specifications.
9. Install tie rod ends (4) and nuts (5) on knuckles and tighten to specifications.
10. Install stabilizer bar links (2) and bolts (6) on lower control arms and tighten to specifications.

11. Install brake calipers on knuckles.
12. Install wheel speed sensor (1) on hub/bearing (3).
13. Install half shaft hub nuts and tighten to 135 N·m (100 ft. lbs.).
14. Install propeller shaft on pinion flange with reference marks aligned.
15. Install drain plug and tighten to 60 N·m (44 ft. lbs.).
16. Fill differential housing and install fill plug. Tighten plug to 60 N·m (44 ft. lbs.).
17. Install skid plate.

8140f6f1

ADJUSTMENTS

ADJUSTMENT

PINION DEPTH MEASUREMENT

NOTE: Take measurement with pinion shim removed and rear bearing cup in place.

1. Install Pinion Height Block 6739 (3), Pinion Block 9534 (2), and pinion head bearing cone (1) onto Screw 6741. Install assembly into axle housing and through bearing and cups.
2. Install pinion front bearing and Cone 6740. Tighten Cone 6740 by hand until 3.4 N·m (30 in. lbs.) of rotating torque is measured at Screw 6741.

814d91b8

3. Install Arbor Discs 9538 (1) and Arbor Bar D-115-3 (2).

4. Install Dial Indicator 9524 (1) to Scooter Block D-115-2A (2). Secure with set-screw (3).

5. Install Indicator/Block assembly to top of Height Block 6739 (1). Zero indicator on top surface.

6. Slide indicator probe off of height block and onto Arbor Bar D-115-3 (2). As indicator contacts Arbor Bar (2), indicator needle will rotate clockwise. Continue moving indicator probe to the crest of the arbor bar and record the highest reading. Then add 4 mm (0.157 in.) to the recorded reading. This will give you the correct shim selection for pinion height.

DIFFERENTIAL SIDE BEARING PRELOAD

Differential side bearing preload is predetermined. The select snap rings in the differential housing will provide the correct differential side bearing preload. These snap can be adjusted to obtain the correct ring gear backlash measurement.

RING GEAR BACKLASH MEASUREMENT

1. Set up Dial Indicator Set C-3339-A with Clamp SP-5426 (1), Post SP-5425-B (2) and Metric Dial Indicator 9524 (3) to measure ring gear backlash:
2. Rotate ring gear one direction to take up clearance to pinion. Verify indicator tip is in contact with ring gear and zero indicator. Rotate ring gear back and forth and record measurement. Ring gear backlash should be 0.13-0.18 mm (0.005-0.007 in.). Verify back lash measurement in four (4) positions.
3. If backlash measurement is less than 0.13 mm (0.005 in.), it is necessary to decrease the snap ring thickness on the ring gear side, and increase the thickness on the pinion side equal amounts.
4. If backlash measurement is greater than 0.18 mm (0.007 in.), it is necessary to increase the snap ring thickness on the ring gear side, and decrease the thickness on the pinion side equal amounts.

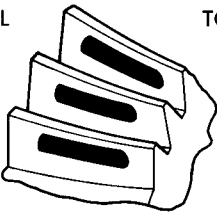

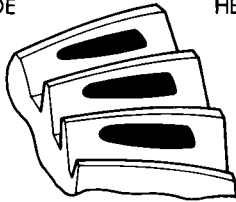

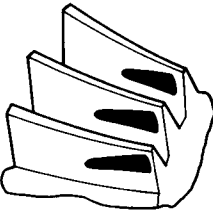

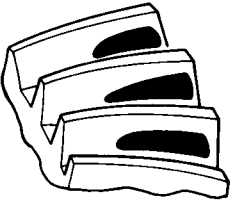

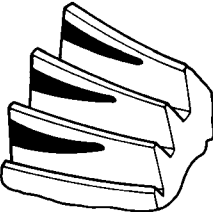

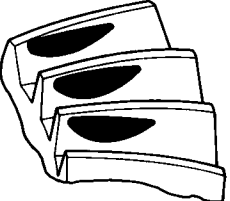

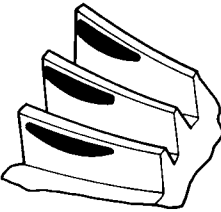

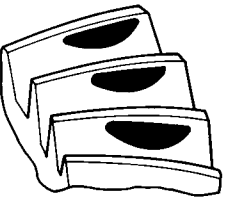

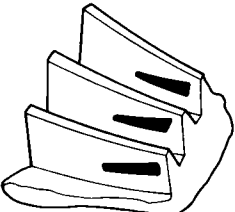

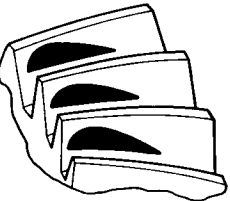

GEAR CONTACT PATTERN

The ring gear and pinion teeth contact patterns will show if the pinion depth is correct in the housing. It will also show if the ring gear backlash has been adjusted correctly. The backlash can be adjusted within specifications to achieve desired tooth contact patterns.

1. Apply a thin coat of hydrated ferric oxide or equivalent to the drive and coast side of the ring gear teeth.
2. Wrap, twist, and hold a shop towel around the pinion yoke to increase the turning resistance of the pinion. This will provide a more distinct contact pattern.
3. With a boxed end wrench on a ring gear bolt, rotate the differential case one complete revolution in both directions while a load is being applied from shop towel.

The areas on the ring gear teeth with the greatest degree of contact against the pinion teeth will squeegee the compound to the areas with the least amount of contact. Note and compare patterns on the ring gear teeth to Gear Tooth Contact Patterns chart and adjust pinion depth and gear backlash as necessary.

<p>DRIVE SIDE OF RING GEAR TEETH</p> <p>HEEL TOE</p> 	<p>COAST SIDE OF RING GEAR TEETH</p> <p>TOE HEEL</p> 	<p>DESIRABLE CONTACT PATTERN. PATTERN SHOULD BE CENTERED ON THE DRIVE SIDE OF TOOTH. PATTERN SHOULD BE CENTERED ON THE COAST SIDE OF TOOTH, BUT MAY BE SLIGHTLY TOWARD THE TOE. THERE SHOULD ALWAYS BE SOME CLEARANCE BETWEEN CONTACT PATTERN AND TOP OF THE TOOTH.</p>
		<p>RING GEAR BACKLASH CORRECT. THINNER PINION GEAR DEPTH SHIM REQUIRED.</p>
		<p>RING GEAR BACKLASH CORRECT. THICKER PINION GEAR DEPTH SHIM REQUIRED.</p>
		<p>PINION GEAR DEPTH SHIM CORRECT. DECREASE RING GEAR BACKLASH.</p>
		<p>PINION GEAR DEPTH SHIM CORRECT. INCREASE RING GEAR BACKLASH.</p>

SPREADER ADAPTERS 9669

BUSHING RECEIVER 9536

ARBOR DISC 9538

JAWS 9641

SHAFT-AXLE

REMOVAL

1. Remove half shaft from vehicle.
2. Clean axle seal area.
3. Remove snap ring and O-ring from the axle shaft.
4. Remove axle (1) with Remove 8420A (2) (3) (4) and slid hammer.

INSTALLATION

1. Lubricate bearing bore and seal lip with gear lubricant.
2. Install axle shaft and engage shaft into side gear. Push firmly on axle shaft to engage snap-ring.
3. Check the differential fluid level and add fluid if necessary.
4. Install half shaft.
5. Install skid plate, if necessary.

BEARINGS-AXLE

REMOVAL

1. Remove axle shaft.
2. Remove axle shaft tube (1) seal with Remover 7794-A (2) and slid hammer.

3. Install axle bearing remover C-4660-A (1) into the axle bearing (2) in the axle tube (3) and tighten remover nut (4).

4. Install bearing Receiver 9537 (1) and nut (2) on remover and tube (3). Tighten nut (2) and draw bearing into receiver (1).

INSTALLATION

1. Install axle bushing (1) with Installer 5063 (2) and hammer.
2. Install axle shaft and seal.

SEAL-AXLE SHAFT

REMOVAL

1. Remove axle shaft.
2. Remove axle shaft tube (1) seal with Remover 7794-A (2) and slid hammer.

INSTALLATION

1. Install axle (1) seal with Installer 8402 (2) and hammer.
2. Install axle shaft.

SEAL-PINION

REMOVAL

1. Remove wheels.
2. Push back brake pads and release hand brake.
3. Remove propeller shaft.
4. Rotate pinion with inch pound torque and record torque to rotate.
5. Mark installation position of collared nut with respect to drive pinion.
6. Bend pinion nut lock back with a punch and hammer.
7. Hold pinion flange (1) with Wrench C-3281(2) and remove pinion nut.

8. Remove pinion flange (1) with Puller C-452 (2).
9. Remove pinion seal with a seal pick.

INSTALLATION

1. Install pinion seal with Installer C-3972A and Handle C-4171.
2. Install pinion flange (1) on pinion with Installer 9616 (2). Tap flange on pinion, then thread installer center bolt on pinion shaft and draw flange onto the pinion.

3. Install **new** pinion collared nut and carefully tighten nut in stages holding flange (1) with Wrench C-3281(2). Check torque to rotate after each stage, until previously value of torque to rotate is exceeded by 0.5 N·m. (4.4 in. lbs.).

4. Cut the pinion nut collar.
5. Bend nut collar so it touches the wall of the slot in the pinion shaft.
6. Connect propeller shaft to pinion flange.
7. Install wheel and tires.
8. Operate brake pedal several times until brake pads contact brake discs (brake pressure built up).

BUSHINGS-AXLE

REMOVAL

1. Remove axle from vehicle.
2. Remove pinion flange.
3. Remove pinion nose bushing with Press C-4212F (1) Receiver 9536 (2) and Remover 9512 (3).

4. Remove axle tube bushing with Press C-4212F (1) Receiver 9536 (2) and Remover 9512 (3).

INSTALLATION

1. Install axle tube bushing with Press C-4212F (1), Installer 9511 (2) and Receiver 9536-2 (3).

2. Install pinion nose bushing with Press C-4212F (1), Installer 9536-2 (2) and Receiver 9511(3).
3. Install new pinion seal, pinion flange and new pinion nut.

SEAL-DIFFERENTIAL

REMOVAL

1. Remove half shaft from axle.
2. Pry seal out with a seal pick.

INSTALLATION

1. Install differential seal with Install 9504 and Handle C-4171.
2. Install half shaft.

DIFFERENTIAL-ELSD

OPERATION

A gerotor pump (1) creates oil flow through the filter (4) whenever left and right wheels spin at different speeds and the solenoid valve is activated. The oil flow is restricted by a Pressure Regulating Valve (PRV) to build oil pressure. Pressurized oil is then fed to a piston (2) chamber. The piston compresses the clutch pack (3) providing additional torque to the lower speed wheel.

When the antilock brakes are activated the differential solenoid is switched off and pressure is bleed off the clutch pack.

DIAGNOSIS AND TESTING

DIFFERENTIAL-ELSD

HYDRAULIC

CONDITION	POSSIBLE CAUSES	CORRECTION
No Lock Up	<ol style="list-style-type: none"> 1. Pump Seals Leaking 2. Clutch Worn 3. Solenoid Valve 4. Plugged Filter 5. Final Drive Control Module 	<ol style="list-style-type: none"> 1. Replace Differential 2. Replace Differential 3. Replace Solenoid 4. Clean Filter 5. Replace Control Module

Raise vehicle and rotate tires in the opposite direction at the same time. This will make any oil left in the piston chamber apply pressure to the clutch and create some drag on the wheels. The wheels will not lock because the differential solenoid is not activated.

SOLENOID

With solenoid disconnected resistance across the solenoid should be 13.5 to 14.5 ohms at 25°Celsius (77° Fahrenheit). To replace the solenoid disconnect wire connector then squeeze the retension clip and pull solenoid up.

REMOVAL

1. Remove half shafts and axle shaft.
2. Remove differential cover.
3. Remove three axle tube (1) mounting bolts (2) from differential housing (3).
4. Tap axle tube (1) and pull tube off differential housing (3) flange.
5. Bolt spreader Adapters 9669 to differential housing (2).
6. Install Spreader W-129-B on adapters.
7. Spread case .3mm (0.011 in.).

8. Remove differential housing seal with seal pick.
9. Remove differential housing (1) snap ring (2).

10. Measure (1) snap ring (2) and mark ring for location.

11. Remove solenoid valve connector (1) from ELSD solenoid valve (2).

12. Remove differential bearing cap bolts (1) and cap (2).

13. Remove axle tube side differential housing (1) snap ring (2).

14. Measure (1) snap ring (2) and mark ring for location.

15. Slid differential assembly (1) to the right and tilt ELSD pump (2) and differential out of the housing.

INSTALLATION

1. Bolt spreader Adapters 9669 to the differential housing.
2. Install Spreader W-129-B on adapters and spread case 3mm (0.011in.).
3. Slide differential assembly (1) into the right of the housing. Then slide ELSD pump (2) and differential into housing.

4. Install differential bearing cups into their original locations.
5. Install axle tube side differential housing (1) snap ring (2).

6. Install snap ring (1) into differential housing (2).
7. Install differential housing seal with Installer 9505 and Handle C-4171.

8. Install differential bearing cap (2) between ELSD anti rotation tabs. Install bearing cap bolts (1) finger tight. Remove spreader then tighten bearing cap bolts to 135 N·m (100 ft. lbs.).

9. Install solenoid valve connector (1) to ELSD solenoid valve (2).

10. Lube new o-ring and install on axle tube (1).
11. Align axle tube (1) with differential housing flange (3) and push tube into place.

CAUTION: The tube must be perfectly aligned to the housing to prevent damage to the o-ring. Failure to follow these instructions will result in a leak.

12. Install three axle tube (1) mounting bolts (2) and tighten to 56 N·m (41 ft. lbs.).
13. Apply a 6.35mm (1/4 in.) bead of Mopar® Gear Sealant RTV Silicone Rubber Adhesive MS-GF44D or equivalent to the differential case.

CAUTION: If housing cover is not installed within 3 to 5 minutes, the differential case must be cleaned and new RTV applied. Failure to follow these instructions will result in a leak.

14. Install cover and tighten cover bolts in a criss-cross pattern to 56 N·m (41 ft. lbs.).

BEARINGS- ELSD DIFFERENTIAL CASE

REMOVAL

CAUTION: Do not disturb the ELSD pump after bearing has been removed. Failure to follow these instructions will damage the pump seals.

1. Install Plug SP 3298 (3) Into the differential axle shaft hole.
2. Remove differential case bearings with Puller 6444 (1), Puller Rods 6444-4 (2) and Puller Flange 6444-1(4). Position puller on the differential.

3. Position Puller (1) Jaws 9641(2) around the case bearing and puller flange.

4. Position Puller (1) Collar 6444-8 (2) around the puller jaws.
5. Tighten the puller nut and remove differential case bearing.

INSTALLATION

CAUTION: Do not disturb the ELSD pump after bearing has been removed. Failure to follow these instructions will damage the pump seals.

1. Install differential case bearing with Installer 9535 (1) and Handle C-4171 (2).

GEAR-PINION/RING

REMOVAL

1. Remove differential from housing.
2. Bend pinion nut lock tab back.
3. Remove pinion flange (1) nut with flange Holder C-328 (2).

4. Remove pinion flange (1) with Puller C-452 (2).

5. Drive pinion gear out of the housing with a soft hammer.
6. Remove pinion seal (1) with a pry bar (2).

7. Remove collapsible spacer (1) from pinion shaft (2).

8. Remove spacer (1) from pinion shaft (2).

9. Remove rear pinion bearing from pinion shaft (1) with Puller C-293-PA (2) and four Adapters C-293-37.

10. Remove front pinion bearing cup (1) with Handle C-4171 (2) and Remover D-103 (3).

11. Remove rear pinion bearing cup (1) with Remover 9884 (2) and Handle C-4171.

12. Remove pinion height select shim (1) from rear pinion bearing cup bore (2).

INSTALLATION

1. Install **left hand thread** ring gear Installer Bolts 9533 (1) through differential (2) and into ring gear (3). Tighten nuts on installer bolts evenly and draw ring gear onto differential case.
2. Remove installer bolts and install new **left hand thread** ring gear bolts and tighten to 102 N·m (75 ft. lbs.).

3. Install front pinion bearing cup into housing, with Installer D-129 (1) and Handle C-4171 (2).

4. Install pinion depth shim (1) in rear pinion bearing cup bore (2).

5. Install rear pinion bearing cup into housing, with Installer D-111 (1) and Handle C-4171 (2).

WARNING: Use welding gloves when handling heated components.

CAUTION: A bearing heater is used to assembly some components. Use only an approved heater and only heat components to 100 - 177 Celsius (212 - 350 ° Fahrenheit). Never leave components on heater for an extended amount of time. If component is discolored after heating, component has been overheated and must not be used. Failure to follow these instructions will result in damage.

6. Heat rear pinion bearing (1) with bearing heater (2).
7. Using welding gloves, install rear bearing on pinion shaft.

8. Install spacer (1) from pinion shaft (2) with the beveled side facing the gear.

9. Install collapsible spacer (1) from pinion shaft (2).

10. Install pinion in housing.

11. Install front pinion bearing into the housing (1) on the pinion shaft with Installer 9616 (2). Thread installer onto the pinion shaft then tighten installer nut.

12. Install pinion seal with Installer 9514.
13. Install pinion flange (1) on pinion with Installer 9616 (2). Tap flange on pinion, then thread installer center bolt on pinion shaft and draw flange onto the pinion.

14. Hold pinion flange (1) with Flange Wrench C-3281 (2) and tighten pinion nut until torque to rotate is 1.5 to 1.9 N·m (13 to 17 in. lbs.).

15. Cut the pinion nut collar.
16. Bend nut collar so it touches the wall of the slot in the pinion shaft.
17. Install differential.

REAR AXLE - C213R

DIAGNOSIS AND TESTING

REAR AXLE - C213R

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly check for:

- Insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side and pinions gears, usually do not cause noise during straight-ahead driving, when the gears are unloaded. The side gears are loaded during turns. A worn pinion mate shaft can also cause a snapping or a knocking noise.

BEARING NOISE

Bearing noise can be either a whining or a growling sound.

Pinion bearings have a constant high pitch noise, because it rotates at a faster rate. This noise changes with vehicle speed. If noise is heard under a load, the rear pinion bearing is the source. If noise is heard during a coast, the front pinion bearing is the source.

Differential bearings usually produce a low pitch noise. The differential bearing noise is constant and varies only with vehicle speed.

Axle shaft bearing noise generally changes when the bearings are loaded. Turn vehicle sharply to the left and the right during a road test. This will load and unload the bearings and change the noise level. If axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 m.p.h.

LOW SPEED KNOCK

Low speed knock is generally caused by:

- Worn U-joints/CV joint.
- Worn side-gear thrust washers.
- Worn pinion shaft bore.

VIBRATION

Vibration at the rear of the vehicle is usually caused by:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn U-joints/CV joint.
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent axle shaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be an axle vibration. Also look at engine accessories, brackets and drive belts.

NOTE: All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear or the clutch engaged, can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints/CV joint.
- Loose spring mounts.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

To determine the source of a snap/clunk noise, raise vehicle on a hoist with the wheels free to rotate. Have a helper shift the transmission into gear and listen for the noise.

DIAGNOSTIC CHART

Condition	Possible Causes	Correction
Wheel Noise	<ol style="list-style-type: none"> 1. Wheel loose. 2. Faulty, brinelled wheel bearing. 	<ol style="list-style-type: none"> 1. Tighten loose nuts. 2. Replace bearing.
Axle Shaft Noise	<ol style="list-style-type: none"> 1. Misaligned axle tube. 2. Bent or sprung axle shaft. 	<ol style="list-style-type: none"> 1. Inspect axle tube alignment. Correct as necessary. 2. Inspect and correct as necessary.
Axle Shaft Broke	<ol style="list-style-type: none"> 1. Misaligned axle tube. 2. Vehicle overloaded. 3. Erratic clutch operation. 4. Grabbing clutch. 	<ol style="list-style-type: none"> 1. Replace the broken shaft after correcting tube mis-alignment. 2. Replace broken shaft and avoid excessive weight on vehicle. 3. Replace broken shaft and avoid or correct erratic clutch operation. 4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	<ol style="list-style-type: none"> 1. Improper adjustment of the differential bearings. 2. Excessive ring gear backlash. 3. Vehicle overloaded. 4. Erratic clutch operation. 	<ol style="list-style-type: none"> 1. Replace case and inspect gears and bearings for further damage. Set differential bearing pre-load properly. 2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly. 3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight. 4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.
Differential Gears Scored	<ol style="list-style-type: none"> 1. Insufficient lubrication. 2. Improper grade of lubricant. 3. Excessive spinning of one wheel/tire. 	<ol style="list-style-type: none"> 1. Replace scored gears. Fill differential with the correct fluid type and quantity. 2. Replace scored gears. Fill differential with the correct fluid type and quantity. 3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
Loss Of Lubricant	<ol style="list-style-type: none"> 1. Lubricant level too high. 2. Worn axle shaft seals. 3. Cracked differential housing. 4. Worn pinion seal. 5. Worn/scored companion flange. 6. Axle cover not properly sealed. 	<ol style="list-style-type: none"> 1. Drain lubricant to the correct level. 2. Replace seals. 3. Repair as necessary. 4. Replace seal. 5. Replace flange and seal. 6. Remove, clean, and re-seal cover.

Condition	Possible Causes	Correction
Axle Overheating	<ol style="list-style-type: none"> 1. Lubricant level low. 2. Improper grade of lubricant. 3. Bearing pre-loads too high. 4. Insufficient ring gear backlash. 	<ol style="list-style-type: none"> 1. Fill differential to correct level. 2. Fill differential with the correct fluid type and quantity. 3. Re-adjust bearing pre-loads. 4. Re-adjust ring gear backlash.
Gear Teeth Broke	<ol style="list-style-type: none"> 1. Overloading. 2. Erratic clutch operation. 3. Ice-spotted pavement. 4. Improper adjustments. 	<ol style="list-style-type: none"> 1. Replace gears. Examine other gears and bearings for possible damage. 2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation. 3. Replace gears and examine remaining parts for damage. 4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
Axle Noise	<ol style="list-style-type: none"> 1. Insufficient lubricant. 2. Improper ring gear and pinion adjustment. 3. Unmatched ring gear and pinion. 4. Worn teeth on ring gear and/or pinion. 5. Loose pinion bearings. 6. Loose differential bearings. 7. Mis-aligned or sprung ring gear. 8. Loose differential bearing cap bolts. 9. Housing not machined properly. 	<ol style="list-style-type: none"> 1. Fill differential with the correct fluid type and quantity. 2. Check ring gear and pinion contact pattern. Adjust backlash or pinion depth. 3. Replace gears with a matched ring gear and pinion. 4. Replace ring gear and pinion. 5. Adjust pinion bearing pre-load. 6. Adjust differential bearing pre-load. 7. Measure ring gear run-out. Replace components as necessary. 8. Inspect differential components and replace as necessary. Ensure that the bearing caps are torqued to the proper specification. 9. Replace housing.

REMOVAL

1. With vehicle in neutral, position on hoist.
2. Remove differential cover (1) and drain fluid.

3. Remove calipers and rotors.
4. Remove speed sensors (2) from axle tube (1) flange.

5. Remove axle flange nuts (1) from axle (2).

6. Pull axle shaft and backing plate out of axle tube until axle bearing (1) is exposed.
7. Remove O-ring (2) from the axle bearing.

8. Remove axle shaft (1) from axle tube and backing plate.

9. Remove axle vent hose (1) from axle vent (2) and cover bracket.

10. Remove propeller shaft.
11. Remove stabilizer bar (1) clamp (2) from axle.

12. Support axle with jack.
13. Remove track bar from axle.
14. Remove shock absorbers (1) from axle brackets (2).

15. Remove upper control arms (2) from axle brackets (1).

16. Remove lower control arms (1) from axle brackets (2).
17. Lower axle from vehicle and remove coil springs and insulators.

INSTALLATION

1. Install coil springs and insulators. Raise axle into place.
2. Install lower control arms (1) to axle brackets (2).

3. Install upper control arms (2) to axle brackets (1).

4. Install shock absorbers (1) to axle brackets (2).

5. Install stabilizer bar (1) and clamps (2) to axle.

6. Install propeller shaft.

7. Install axle vent hose (1) to axle vent (2) and cover bracket.

8. Install axle shaft (1) into axle tube and backing plate with new o-ring on axle.

9. Slip O-ring (2) through backing plate, then push axle through backing plate until bearing (1) is exposed.
10. Install O-ring (2) axle bearing.

11. Push axle into axle tube.
12. Install axle (2) flange nuts (1) and tighten to 119 N·m (88 ft. lbs.).

13. Install speed sensors (2) in axle tube (1) flange.
14. Install calipers and rotors.
15. Install differential cover, fill differential and install fill plug.

813221e1

ADJUSTMENTS

Ring gear and pinion are supplied as matched sets. Identifying numbers for the ring gear and pinion are painted onto the pinion gear shaft and the side of the ring gear. A plus (+) number, minus (-) number or zero (0) along with the gear set sequence number (2) (01 to 99) is on each gear. This first number (1) the amount (in thousandths of an inch) the depth varies from the standard depth setting of a pinion marked with a (0). The next two numbers are the sequence number of the gear set. The standard depth provides the best teeth contact pattern.

80c07305

Compensation for pinion depth variance is achieved with select shims (4). The shims are placed behind the rear pinion bearing.

If installing a new gear, note the depth variance number of the original and replacement pinion. Add or subtract this number from the original depth shim/oil slinger to compensate for the difference in the depth variances. The numbers represent thousands of an inch deviation from the standard. If the number is negative, add that value to the required thickness of the depth shims. If the number is positive, subtract that value from the thickness of the depth shim.

80a0c4f8

Pinion Gear Depth Variance Chart: Note where Old and New Pinion Marking columns intersect. Intersecting figure represents plus or minus the amount needed.

PINION GEAR DEPTH VARIANCE

PINION DEPTH MEASUREMENT

Measurements are taken with pinion bearing cups and pinion bearings installed in the housing. Take measurements with Pinion Gauge Set and Dial Indicator C-3339 (1).

1. Assemble Pinion Height Block 6739 (2), Pinion Block 8540 (1) and rear pinion bearing onto Screw 6741.
2. Insert assembled height gauge components, rear bearing and screw into housing through pinion bearing cups.

3. Install front pinion bearing and Cone-Nut 6740 on the screw. Tighten Cone-Nut until Torque To Rotate screw is 3.4 N·m (30 in. lbs.).
4. Place Arbor Disc 8541A (1) on Arbor D-115-3 (3) and position in the housing side bearing cradles. Install differential bearing caps on arbor discs and tighten cap bolts to 41 N·m (30 ft. lbs.).

5. Assemble Dial Indicator C-3339 (3) into Scooter Block D-115-2 (2) and secure set screw.
6. Place Scooter Block with Dial Indicator on the pinion height block, so dial probe and scooter block is flush against the pinion height block. Hold scooter block in place and zero the dial indicator. Tighten dial indicator face lock screw.
7. Slide the dial indicator probe over the edge of the pinion height block and on to the arbor bar (1). With the scooter block against the pinion height block.

8. When dial probe contacts the arbor bar, the dial pointer will turn clockwise. Continue moving the dial indicator to the crest of the arbor bar and record the highest reading.
9. Select a shim equal to the dial indicator reading, plus the drive pinion gear depth variance number marked on the shaft of the pinion. For example, if the depth variance is -2 , add $+0.002$ in. to the dial indicator reading. Then subtract 0.04064 mm (0.0016 in.) from the total measurement. This will be the correct shim selection for the pinion height.

DIFFERENTIAL BEARING PRELOAD AND GEAR BACKLASH

The following must be considered when adjusting bearing preload and gear backlash:

- The maximum ring gear backlash variation is 0.003 inch (0.076 mm).
- Mark the gears so the same teeth are meshed during all backlash measurements.
- Maintain the torque while adjusting the bearing preload and ring gear backlash.
- Excessive adjuster torque will introduce a high bearing load and cause premature bearing failure. Insufficient adjuster torque can result in excessive differential case free-play and ring gear noise.
- Insufficient adjuster torque will not support the ring gear correctly and can cause excessive differential case free-play and ring gear noise.

NOTE: The differential bearing cups will not always immediately follow the threaded adjusters as they are moved during adjustment. To ensure accurate bearing cup responses to the adjustments:

- Maintain the gear teeth engaged (meshed) as marked.
- The bearings must be seated by rapidly rotating the pinion gear a half turn back and forth.
- Do this five to ten times each time the threaded adjusters are adjusted.

1. Use Wrench C-4164 to adjust each threaded adjuster inward until the differential bearing free-play is eliminated. Allow some ring gear backlash approximately 0.25 mm (0.01 in.) between the ring and pinion gear. Seat the bearing cups with the procedure described above.
2. Install dial indicator (1) and position the plunger against the drive side of a ring gear tooth (2). Measure the backlash at 4 positions (90 degrees apart) around the ring gear. Locate and mark the area of minimum backlash.
3. Rotate the ring gear to the position of the least backlash. Mark the gear so that all future backlash measurements will be taken with the same gear teeth meshed.

4. Loosen the right-side, tighten the left-side threaded adjuster with Adjuster Wrench C-4164 (3). Obtain backlash of 0.076 - 0.102 mm (0.003 - 0.004 in.) with each adjuster tightened to 14 N·m (10 ft. lbs.). Seat the bearing cups with the procedure described above.
5. Tighten the differential bearing cap bolts to 95 N·m (70 ft. lbs.).
6. Tighten the right-side threaded adjuster to 102 N·m (75 ft. lbs.). Seat the bearing cups with the procedure described above. Continue to tighten the right-side adjuster and seat bearing cups until the torque remains constant at 102 N·m (75 ft. lbs.)
7. Measure the ring gear backlash. The range of backlash is 0.15 - 0.203 mm (0.006 - 0.008 in.).
8. Continue increasing the torque at the right-side threaded adjuster until the specified backlash is obtained.

NOTE: The left-side threaded adjuster torque should have approximately 102 N·m (75 ft. lbs.). If the torque is considerably less, the complete adjustment procedure must be repeated.

9. Tighten the left-side threaded adjuster until 102 N·m (75 ft. lbs.) torque is indicated. Seat the bearing rollers with the procedure described above. Do this until the torque remains constant.

10. Install the threaded adjuster locks and tighten the lock screws to 10 N·m (90 in. lbs.).
11. After the proper backlash is achieved, perform the Gear Contact procedure.

GEAR CONTACT PATTERN

1. Wipe clean each tooth of the ring gear.
2. Apply gear marking compound to all of the ring gear teeth.
3. Verify bearing cap bolts are torque specification.
4. Apply parking brakes lightly to create at 14 N·m (10 ft. lbs.) pinion rotating torque.
5. Rotate the pinion/pinion yoke 4 full revolutions in each directions.
6. Read gear tooth contact pattern.

Gear contact pattern is correct. Backlash and pinion depth is correct.

Ring gear is too far away from the pinion gear, coast side toe (1) drive side heel (2). Decrease backlash by moving ring closer to the pinion gear using the adjusters.

Ring gear is too close to the pinion gear, drive side toe (1) coast side heel (2). Increase backlash by moving ring away from the pinion gear using the adjusters.

Ring gear is too far away from the pinion gear, drive side heel (1) coast side heel (2). Decrease backlash by moving ring gear closer to the pinion gear using the adjusters.

Ring gear is too close to the pinion gear, drive side toe (1) coast side toe (2). Increase backlash by moving ring gear away from the pinion gear using the adjusters.

Pinion gear is set too low. Increase pinion gear height, by increasing pinion depth shim thickness.

Pinion gear is set too high. Decrease pinion height by decreasing the pinion depth shim thickness.

SPECIFICATIONS**AXLE SPECIFICATIONS**

DESCRIPTION	SPECIFICATION
Axle Ratio	3.21, 3.55, 3.73
Differential Case Flange Runout	0.076 mm (0.003 in.)
Differential Case Clearance	0.12 mm (0.005 in.)
Ring Gear Diameter	209.5 mm (8.25 in.)
Ring Gear Backlash	0.12-0.20 mm (0.005-0.008 in.)
Ring Gear Runout	0.12 mm (0.005 in.)
Pinion Bearing Preload - Original Bearings	1-2 N·m (10-20 in. lbs.)
Pinion Bearing Preload - New Bearings	1.7-4 N·m (15-35 in. lbs.)

DIFFERENTIAL COVER

REMOVAL

1. With vehicle in neutral, position on hoist.
2. Remove differential cover (1) fill plug (2).
3. Remove differential cover (1) and drain fluid.

INSTALLATION

1. Apply a 6.35mm (1/4 in.) bead of Mopar® Gear Sealant RTV Silicone Rubber Adhesive MS-GF44D or equivalent to the cover.

CAUTION: If housing cover is not installed within 3 to 5 minutes, the cover must be cleaned and new RTV applied. Failure to follow these instructions will result in a leak.

2. Install cover and tighten cover (1) bolts in a criss-cross pattern to 41 N-m (30 ft. lbs.).

3. Fill differential and install fill plug.

AXLE SHAFTS

REMOVAL

1. With vehicle in neutral, position on hoist.
2. Remove calipers and rotors.
3. Tap axle end plug (1) loose from the axle flange (2) with a hammer and punch. Pull plug (1) out of axle flange (2).

4. Remove speed sensors (2) from axle tube (1) flange.

5. Remove axle flange nuts (1) from axle (2).

6. Pull axle shaft and backing plate out of axle tube until axle bearing (1) is exposed.
7. Remove O-ring (2) from the axle bearing.

8. Slide axle shaft (1) from axle tube and backing plate.
9. Tap axle shaft out of the bearing and axle flange through the plug hole with a hammer and brass drift.

INSTALLATION

1. Tap axle shaft into through axle bearing into axle flange.
2. Install axle shaft (1) into axle tube and backing plate with new o-ring on axle.

3. Slip O-ring (2) through backing plate, then push axle through backing plate until bearing (1) is exposed.
4. Install O-ring (2) axle bearing.

5. Push axle into axle tube.
6. Install axle (2) flange nuts (1) and tighten to 119 N·m (88 ft. lbs.).

7. Install speed sensors (2) in axle tube (1) flange.
8. Coat new axle flange plug with Mopar® Stud N' Bearing Mount Adhesive or equivalent and install plug.
9. Install calipers and rotors.

AXLE BEARINGS

REMOVAL

1. With vehicle in neutral, position on hoist.
2. Remove calipers and rotors.
3. Tap axle end plug (1) loose from the wheel flange (2) with a hammer and punch. Pull plug (1) out of wheel flange (2).

4. Remove speed sensors (2) from axle tube (1) flange.

5. Remove axle flange nuts (1) from axle (2).

6. Pull axle shaft and backing plate out of axle tube until axle bearing (1) is exposed.
7. Remove O-ring (2) from the axle bearing.

8. Slide axle shaft (1) from axle tube and backing plate.
9. Tap axle shaft out of the wheel flange and axle bearing through the plug hole with a hammer and brass drift.
10. Remove axle flange bolts.

INSTALLATION

1. Install axle flange bolts into axle flange.
2. Tap axle shaft through axle bearing into wheel flange.
3. Install axle shaft (1) into axle tube and backing plate with new o-ring on axle.

4. Slip O-ring (2) through backing plate, then push axle through backing plate until bearing (1) is exposed.
5. Install O-ring (2) axle bearing.

6. Push axle into axle tube.
7. Install axle (2) flange nuts (1) and tighten to 119 N·m (88 ft. lbs.).

8. Install speed sensors (2) in axle tube (1) flange.
9. Coat new axle flange plug with Mopar® Stud N' Bearing Mount Adhesive or equivalent and install plug.
10. Install calipers and rotors.

AXLE SHAFT SEALS

REMOVAL

1. With vehicle in neutral, position on hoist.
2. Remove calipers and rotors.
3. Remove speed sensors (2) from axle tube (1) flange.

4. Remove axle flange nuts (1) from axle (2).

5. Pull axle shaft and backing plate out of axle tube until axle bearing (1) is exposed.
6. Remove O-ring (2) from the axle bearing.

7. Remove axle shaft (1) from axle tube and backing plate.

INSTALLATION

1. Install axle shaft (1) into axle tube and backing plate with new o-ring on axle.

2. Slip O-ring (2) through backing plate, then push axle through backing plate until bearing (1) is exposed.
3. Install new O-ring (2) on axle bearing (1).

4. Push axle into axle tube.
5. Install axle (2) flange nuts (1) and tighten to 119 N·m (88 ft. lbs.).

6. Install speed sensors (2) in axle tube (1) flange.
7. Install calipers and rotors.

PINION SEAL

REMOVAL

1. With vehicle in neutral, position vehicle on hoist.
2. Mark a reference line across the axle flange (3) and propeller shaft flange (4).

3. Remove propeller shaft
4. Remove brake calipers and rotors to prevent any drag.
5. Rotate flange three or four times and verify flange rotates smoothly.
6. Measure torque to rotating pinion flange (1) with a inch pound torque wrench (2). Record reading for installation reference.
7. Hold pinion flange with Wrench C-3281 and remove pinion nut and washer.
8. Remove flange with two jaw puller.
9. Remove pinion seal with a seal pick or slide-hammer mounted screw.

INSTALLATION

1. Apply a light coating of gear lubricant on the lip of pinion seal.
2. Install **new** pinion seal with Installer C-3972A (1) and Handle C-4171 (2).
3. Install flange on the end of the shaft with the reference marks aligned.
4. Install flange on pinion shaft with Installer C-3718 and Wrench C-3281.
5. Install pinion washer and a **new** pinion nut. The convex side of the washer must face outward.

CAUTION: Do not exceed the minimum tightening torque when installing the companion flange retaining nut at this point. Failure to follow these instructions can damage the collapsible spacer or bearings.

6. Hold flange with Wrench C-3281 and tighten pinion nut to 285 N·m (210 ft. lbs.). Rotate pinion several revolutions to ensure bearing rollers are seated.

7. Rotate pinion flange (1) with an inch pound torque wrench (2). Rotating torque should be equal to the reading recorded during removal plus an additional 0.56 N·m (5 in. lbs.).

CAUTION: Never loosen pinion nut to decrease pinion bearing rotating torque and never exceed specified preload torque. If rotating torque is exceeded, a new collapsible spacer must be installed. Failure to follow these instructions can damage the collapsible spacer or bearings.

8. If rotating torque is low use Holder 6719, to hold flange and tighten pinion nut in 6.8 N·m (5 ft. lbs.) increments until proper rotating torque is achieved.

NOTE: The seal replacement is unacceptable if final pinion nut torque is less than 285 N·m (210 ft. lbs.).

NOTE: The bearing rotating torque should be constant during a complete revolution of the pinion. If the rotating torque varies, this indicates a binding condition.

9. Install propeller shaft.
10. Install rear brake components.

DIFFERENTIAL

REMOVAL

1. Remove differential cover.
2. Remove axle shafts.
3. Remove ABS sensor from housing.
4. Mark differential housing and bearing caps (3) for installation reference.

5. Remove bearing adjuster lock bolt (3) from bearing caps.

6. Loosen differential bearing cap bolts.
7. Loosen differential bearing adjusters through the axle tubes (1) with Wrench C-4164 (3).
8. Hold differential case while removing bearing caps and adjusters.
9. Remove differential case and tag differential bearing cups and adjusters to indicate location.
10. Clean housing cavity with flushing oil, light engine oil or a lint free cloth.

NOTE: Do not use steam, kerosene or gasoline to clean the housing.

DISASSEMBLY

1. Rotate one pinion gear (2) with thrust washer (3) to the differential window (1). Remove gear and thrust washer.

2. Rotate remaining pinion gear (3) with thrust washer (2) to the differential window (1). Remove gear and washer.

3. Remove differential side gears (1) (2) and thrust washers.

ASSEMBLY

NOTE: If same gears and thrust washers are being used, install them into their original locations.

1. Lubricate all differential components with axle lubricant.
2. Install differential side gears (2) and thrust washers.

3. Install first pinion gear (3) with thrust washer into differential window (1) and side gears (2). Rotate pinion gear into the case.
4. Install remaining pinion gear and thrust washer. Rotate gears to align hole in the pinion gears with hole in the differential case.
5. Slide pinion shaft into the case and through the pinion gears to align the gears.

INSTALLATION

1. Apply a coat of hypoid gear lubricant to differential bearings, bearing cups and threaded adjusters.

NOTE: Grease can be used to keep the adjusters in position.

2. Install differential assembly into the housing.
3. Install differential bearing caps in their original locations.
4. Install bearing cap bolts and tighten upper bolts to 14 N·m (10 ft. lbs.). Tighten lower bolts finger-tight until the bolt head is seated.
5. Perform differential bearing preload and adjustment procedure.
6. Tighten bearing cap bolts (2) to 135 N·m (100 ft. lbs).
7. Install adjuster locks (3) on bearing caps and tighten bolts to 11 N·m (8 ft. lbs.).
8. Install axle shafts.
9. Install differential cover.

DIFFERENTIAL-VARI-LOK

OPERATION

A gerotor pump and clutch pack are used to provide the torque transfer capability. One axle shaft is splined to the gerotor pump and one differential side gear, this provides input to the pump. Anti-rotation tabs (1) on the pump hold the oil feed tube (2) down in the differential lubricant. As a wheel begins to lose traction, the speed differential is transmitted from one side of the differential to the other through the side gears. The motion of one side gear relative to the other turns the inner rotor of the pump. Since the outer rotor of the pump is grounded to the differential case, the inner and outer rotors are moving relative to each other, which creates pressure in the pump. The tuning of the front and rear axle orifices and valves inside the gerotor pump are unique. Each system has a torque-limiting pressure relief valve to protect the clutch pack, which also facilitates vehicle control under extreme side-to-side traction variations. The resulting pressure is applied to the clutch pack and the transfer of torque is completed. Vari-lok® system is less subject to wear, remaining more consistent over time in its ability to transfer torque.

DIAGNOSIS AND TESTING-VARI-LOK

1. Park the vehicle on a level surface or raise vehicle on hoist so that the vehicle is level.
2. Remove the axle fill plug.

3. Verify that the axle fluid level is correct. The fluid level is correct if the fluid is level with the bottom of the fill hole.
4. Shift the transfer case into the 4WD full-time position.
5. Drive the vehicle in a tight circle for 2 minutes at 5mph to fully prime the pump.
6. Block the tires opposite the axle to be tested to prevent the vehicle from moving.
7. Shift the transfer case into the 4WD Low position and the transmission into the Park position.
8. Raise both the wheels of the axle to be tested off of the ground.
9. Rotate the left wheel by hand at a minimum of one revolution per second while an assistant rotates the right wheel in the opposite direction.
10. The left wheel should spin freely at first and then increase in resistance within 5 revolutions until the wheels cannot be continuously rotated in opposite directions.
11. The Vari-lok® differential has engaged properly if the wheels cannot be rotated in opposite directions for a moment. After the wheels stop rotating for a moment, the fluid pressure will drop in the differential and the wheels begin to rotate once again.
12. If the system does not operate properly, replace the Vari-lok® differential.

BEARINGS-VARI-LOK DIFFERENTIAL CASE

REMOVAL

1. Install Plug SP 3298 (3) Into the differential axle shaft hole.
2. Remove differential case bearings with Puller 6444 (1), Puller Rods 6444-4 (2) and Puller Flange 6444-1(4). Position puller on the differential.

8144eced

3. Position Puller (1) Jaws 9639 (2) around the case bearing and puller flange.

4. Position Puller (1) Collar 6444-8 (2) around the puller jaws.
5. Tighten the puller nut and remove differential case bearing.

INSTALLATION

1. Install differential case bearing with Installer C-4340 (1) and Handle C-4171 (2).

CAUTION: Vari-lok®, plenum must be seated against the differential case, prior to installing the ring gear side differential bearing. Failure to follow these instructions will damage the Vari-lok® plenum.

BEARINGS-DIFFERENTIAL CASE

REMOVAL

1. Remove differential case from axle.
2. Remove differential bearings (3) from the case with Puller/Press C-293-PA (1) and Adapters C-293-48 (2) and Plug SP-3289 (5).

INSTALLATION

1. Install differential side bearings (3) with Installer C-4340 (4) and Handle C-4171 (1).
2. Install differential case in axle.

PINION GEAR/RING GEAR

REMOVAL

NOTE: The ring gear and pinion are serviced in a matched set. Never replace one gear without replacing the matching gear.

1. Remove differential from axle housing.
2. Place differential case in vise with soft metal jaw protectors.
3. Remove ring gear bolts and drive ring gear (2) off differential case with a soft hammer (3).

4. Hold pinion flange with Wrench C-3281 and remove pinion nut.
5. Remove pinion flange with two jaw puller.
6. Remove pinion from housing with a soft hammer (1).

7. Remove pinion seal with a pry tool or slide-hammer mounted screw.
8. Remove oil slinger if equipped and front pinion bearing.
9. Remove front pinion bearing cup with Remover C-4345 (1) and Handle C-4171 (2).

10. Remove rear bearing cup from housing with Remover C-4307 (1) and Handle C-4171 (2).

11. Remove collapsible preload spacer (1) from pinion gear.

12. Remove rear bearing from pinion with Puller/Press C-293-PA (1) and Adapters C-293-47 (3).

13. Remove depth shims (1) from pinion gear (2) and record shim thickness.

INSTALLATION

NOTE: Ring and pinion gears are a matched set. Do not replace one gear without replacing the other matching gear. If ring and pinion gears or bearings are replaced, Refer to Adjustments for Pinion Gear Depth Setting.

1. Apply Mopar Door Ease or stick lubricant to outside surface of pinion bearing cups.
2. Install rear pinion bearing cup with Installer C-4308 (1) and Handle C-4171 (20).

3. Install front pinion bearing cup with Installer D-130 (1) and Handle C-4171 (2).

4. Install front pinion bearing.
5. Apply a light coating of gear lubricant on the lip of pinion seal. Install seal with Installer C-3972A (1) and Handle C-4171 (2).

6. Install proper thickness depth shim (1) on pinion gear (2).

7. Install rear bearing (4) and slinger if equipped, on pinion gear (3) with Installer 6448A (2) and a press (1).

8. Install **new** collapsible spacer (1) on pinion gear and install pinion in housing.
9. Tap pinion flange onto the pinion.
10. Install flange washer and a new nut on pinion and tighten pinion nut until there is zero end-play.
11. With a torque wrench and Flange Wrench C-3281 tighten the pinion nut to 285 N·m (210 ft. lbs.).

CAUTION: Never loosen pinion nut to decrease pinion bearing rotating torque and never exceed specified preload torque. If preload torque or rotating torque is exceeded a new collapsible spacer must be installed. Failure to follow these instructions will result in damage.

12. Slowly tighten the nut in 6.8 N·m (5 ft. lbs.) increments until the desired rotating torque is achieved. Measure rotating torque frequently with an inch pound torque wrench (2) to avoid over crushing the collapsible spacer.
13. The pinion rotating torque should be:
 - Original Bearings: 1 to 3 N·m (10 to 20 in. lbs.).
 - New Bearings: 2 to 5 N·m (15 to 35 in. lbs.).

14. Position exciter ring on differential case. With a brass drift slowly and evenly tap the exciter ring into position.
15. Position ring gear on the differential case and start two ring gear bolts. This will provide case-to-ring gear bolt hole alignment.
16. Invert the differential case in the vise.
17. Install **new** ring gear bolts (2) and alternately tighten to 102 N·m (75 ft. lbs.).

CAUTION: Never reuse the ring gear bolts. Failure to follow these instructions may result in fractured bolts causing extensive damage.

18. Install differential in housing and verify gear mesh, backlash and contact pattern.
19. Install differential cover.

REAR AXLE - C213RE

DIAGNOSIS AND TESTING

REAR AXLE - C213RE

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly check for:

- Insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side and pinions gears, usually do not cause noise during straight-ahead driving, when the gears are unloaded. The side gears are loaded during turns. A worn pinion mate shaft can also cause a snapping or a knocking noise.

BEARING NOISE

Bearing noise can be either a whining or a growling sound.

Pinion bearings have a constant high pitch noise, because it rotates at a faster rate. This noise changes with vehicle speed. If noise is heard under a load, the rear pinion bearing is the source. If noise is heard during a coast, the front pinion bearing is the source.

Differential bearings usually produce a low pitch noise. The differential bearing noise is constant and varies only with vehicle speed.

Axle shaft bearing noise generally changes when the bearings are loaded. Turn vehicle sharply to the left and the right during a road test. This will load and unload the bearings and change the noise level. If axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 m.p.h.

LOW SPEED KNOCK

Low speed knock is generally caused by:

- Worn U-joints/CV joint.
- Worn side-gear thrust washers.
- Worn pinion shaft bore.

VIBRATION

Vibration at the rear of the vehicle is usually caused by:

- Damaged drive shaft.
- Missing drive shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn U-joints/CV joint.
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent axle shaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be an axle vibration. Also look at engine accessories, brackets and drive belts.

NOTE: All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear or the clutch engaged, can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints/CV joint.
- Loose spring mounts.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

To determine the source of a snap/clunk noise, raise vehicle on a hoist with the wheels free to rotate. Have a helper shift the transmission into gear and listen for the noise.

DIAGNOSTIC CHART

Condition	Possible Causes	Correction
Wheel Noise	<ol style="list-style-type: none"> 1. Wheel loose. 2. Faulty, brinelled wheel bearing. 	<ol style="list-style-type: none"> 1. Tighten loose nuts. 2. Replace bearing.
Axle Shaft Noise	<ol style="list-style-type: none"> 1. Misaligned axle tube. 2. Bent or sprung axle shaft. 	<ol style="list-style-type: none"> 1. Inspect axle tube alignment. Correct as necessary. 2. Inspect and correct as necessary.
Axle Shaft Broke	<ol style="list-style-type: none"> 1. Misaligned axle tube. 2. Vehicle overloaded. 3. Erratic clutch operation. 4. Grabbing clutch. 	<ol style="list-style-type: none"> 1. Replace the broken shaft after correcting tube mis-alignment. 2. Replace broken shaft and avoid excessive weight on vehicle. 3. Replace broken shaft and avoid or correct erratic clutch operation. 4. Replace broken shaft and inspect and repair clutch as necessary.
Differential Cracked	<ol style="list-style-type: none"> 1. Improper adjustment of the differential bearings. 2. Excessive ring gear backlash. 3. Vehicle overloaded. 4. Erratic clutch operation. 	<ol style="list-style-type: none"> 1. Replace case and inspect gears and bearings for further damage. Set differential bearing pre-load properly. 2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly. 3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight. 4. Replace case and inspect gears and bearings for further damage. Avoid erratic use of clutch.
Differential Gears Scored	<ol style="list-style-type: none"> 1. Insufficient lubrication. 2. Improper grade of lubricant. 3. Excessive spinning of one wheel/tire. 	<ol style="list-style-type: none"> 1. Replace scored gears. Fill differential with the correct fluid type and quantity. 2. Replace scored gears. Fill differential with the correct fluid type and quantity. 3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
Loss Of Lubricant	<ol style="list-style-type: none"> 1. Lubricant level too high. 2. Worn axle shaft seals. 3. Cracked differential housing. 4. Worn pinion seal. 5. Worn/scored companion flange. 6. Axle cover not properly sealed. 	<ol style="list-style-type: none"> 1. Drain lubricant to the correct level. 2. Replace seals. 3. Repair as necessary. 4. Replace seal. 5. Replace flange and seal. 6. Remove, clean, and re-seal cover.

Condition	Possible Causes	Correction
Axle Overheating	<ol style="list-style-type: none"> 1. Lubricant level low. 2. Improper grade of lubricant. 3. Bearing pre-loads too high. 4. Insufficient ring gear backlash. 	<ol style="list-style-type: none"> 1. Fill differential to correct level. 2. Fill differential with the correct fluid type and quantity. 3. Re-adjust bearing pre-loads. 4. Re-adjust ring gear backlash.
Gear Teeth Broke	<ol style="list-style-type: none"> 1. Overloading. 2. Erratic clutch operation. 3. Ice-spotted pavement. 4. Improper adjustments. 	<ol style="list-style-type: none"> 1. Replace gears. Examine other gears and bearings for possible damage. 2. Replace gears and examine the remaining parts for damage. Avoid erratic clutch operation. 3. Replace gears and examine remaining parts for damage. 4. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
Axle Noise	<ol style="list-style-type: none"> 1. Insufficient lubricant. 2. Improper ring gear and pinion adjustment. 3. Unmatched ring gear and pinion. 4. Worn teeth on ring gear and/or pinion. 5. Loose pinion bearings. 6. Loose differential bearings. 7. Mis-aligned or sprung ring gear. 8. Loose differential bearing cap bolts. 9. Housing not machined properly. 	<ol style="list-style-type: none"> 1. Fill differential with the correct fluid type and quantity. 2. Check ring gear and pinion contact pattern. Adjust backlash or pinion depth. 3. Replace gears with a matched ring gear and pinion. 4. Replace ring gear and pinion. 5. Adjust pinion bearing pre-load. 6. Adjust differential bearing pre-load. 7. Measure ring gear run-out. Replace components as necessary. 8. Inspect differential components and replace as necessary. Ensure that the bearing caps are torqued to the proper specification. 9. Replace housing.

REMOVAL

1. With vehicle in neutral, position on hoist.
2. Remove differential cover (1) and drain fluid.

3. Remove calipers and rotors.
4. Remove speed sensors (2) from axle tube (1) flange.

5. Remove axle flange nuts (1) from axle (2).

6. Pull axle shaft and backing plate out of axle tube until axle bearing (1) is exposed.
7. Remove O-ring (2) from the axle bearing.

8. Remove axle shaft (1) from axle tube and backing plate.

9. Remove ELSD connector (1) if equipped.

10. Remove axle vent hose (1) from axle vent (2) and cover bracket.

11. Remove propeller shaft.
12. Remove stabilizer bar (1) clamp (2) from axle.

13. Support axle with jack.
14. Remove track bar from axle.
15. Remove shock absorbers (1) from axle brackets (2).

16. Remove upper control arms (2) from axle brackets (1).

17. Remove lower control arms (1) from axle brackets (2).
18. Lower axle from vehicle and remove coil springs and insulators.

INSTALLATION

1. Install coil springs and insulators. Raise axle into position.
2. Install lower control arms (1) to axle brackets (2).

3. Install upper control arms (2) to axle brackets (1).

4. Install shock absorbers (1) to axle brackets (2).

- 5. Install stabilizer bar (1) and clamps (2) to axle.
- 6. Install propeller shaft.

- 7. Install axle vent hose (1) to axle vent (2) and cover bracket.

8. Install axle shaft (1) into axle tube and backing plate with new o-ring on axle.

9. Slip O-ring (2) through backing plate, then push axle through backing plate until bearing (1) is exposed.
10. Install O-ring (2) on axle bearing.

11. Push axle into axle tube.
12. Install axle (2) flange nuts (1) and tighten nuts to 119 N·m (88 ft. lbs.).

13. Install speed sensors (2) in axle tube (1) flange.

14. Install ELSD connector (1).

15. Install calipers and rotors.

16. Install differential cover (1) fill differential and install fill plug (2).

ADJUSTMENTS

Ring gear and pinion are supplied as matched sets. Identifying numbers for the ring gear and pinion are painted onto the pinion gear shaft and the side of the ring gear. A plus (+) number, minus (-) number or zero (0) along with the gear set sequence number (2) (01 to 99) is on each gear. This first number (1) the amount (in thousandths of an inch) the depth varies from the standard depth setting of a pinion marked with a (0). The next two numbers are the sequence number of the gear set. The standard depth provides

the best teeth contact pattern.

Compensation for pinion depth variance is achieved with select shims (4). The shims are placed behind the rear pinion bearing.

If installing a new gear, note the depth variance number of the original and replacement pinion. Add or subtract this number from the original depth shim/oil slinger to compensate for the difference in the depth variances. The numbers represent thousands of an inch deviation from the standard. If the number is negative, add that value to the required thickness of the depth shims. If the number is positive, subtract that value from the thickness of the depth shim.

Pinion Gear Depth Variance Chart: Note where Old and New Pinion Marking columns intersect. Intersecting figure represents plus or minus the amount needed.

PINION GEAR DEPTH VARIANCE

Original Pinion Gear Depth Variance	Replacement Pinion Gear Depth Variance									
	-4	-3	-2	-1	0	+1	+2	+3	+4

PINION DEPTH MEASUREMENT

Measurements are taken with pinion bearing cups and pinion bearings installed in the housing. Take measurements with Pinion Gauge Set and Dial Indicator C-3339 (1).

1. Assemble Pinion Height Block 6739 (2), Pinion Block 8540 (1) and rear pinion bearing onto Screw 6741.
2. Insert assembled height gauge components, rear bearing and screw into housing through pinion bearing cups.

3. Install front pinion bearing and Cone-Nut 6740 on the screw. Tighten Cone-Nut until Torque To Rotate screw is 3.4 N·m (30 in. lbs.).
4. Place Arbor Disc 8541A (1) on Arbor D-115-3 (3) and position in the housing side bearing cradles. Install differential bearing caps on arbor discs and tighten cap bolts to 41 N·m (30 ft. lbs.).

5. Assemble Dial Indicator C-3339 (3) into Scooter Block D-115-2 (2) and secure set screw.
6. Place Scooter Block with Dial Indicator on the pinion height block, so dial probe and scooter block is flush against the pinion height block. Hold scooter block in place and zero the dial indicator. Tighten dial indicator face lock screw.
7. Slide the dial indicator probe over the edge of the pinion height block and on to the arbor bar (1). With the scooter block against the pinion height block.
8. When dial probe contacts the arbor bar, the dial pointer will turn clockwise. Continue moving the dial indicator to the crest of the arbor bar and record the highest reading.

9. Select a shim equal to the dial indicator reading, plus the drive pinion gear depth variance number marked on the shaft of the pinion. For example, if the depth variance is -2 , add $+0.002$ in. to the dial indicator reading. Then subtract 0.04064 mm (0.0016 in.) from the total measurement. This will be the correct shim selection for the pinion height.

DIFFERENTIAL BEARING PRELOAD AND GEAR BACKLASH

The following must be considered when adjusting bearing preload and gear backlash:

- The maximum ring gear backlash variation is 0.003 inch (0.076 mm).
- Mark the gears so the same teeth are meshed during all backlash measurements.
- Maintain the torque while adjusting the bearing preload and ring gear backlash.
- Excessive adjuster torque will introduce a high bearing load and cause premature bearing failure. Insufficient adjuster torque can result in excessive differential case free-play and ring gear noise.
- Insufficient adjuster torque will not support the ring gear correctly and can cause excessive differential case free-play and ring gear noise.

NOTE: The differential bearing cups will not always immediately follow the threaded adjusters as they are moved during adjustment. To ensure accurate bearing cup responses to the adjustments:

- Maintain the gear teeth engaged (meshed) as marked.
- The bearings must be seated by rapidly rotating the pinion gear a half turn back and forth.
- Do this five to ten times each time the threaded adjusters are adjusted.

1. Use Wrench C-4164 to adjust each threaded adjuster inward until the differential bearing free-play is eliminated. Allow some ring gear backlash approximately 0.25 mm (0.01 in.) between the ring and pinion gear. Seat the bearing cups with the procedure described above.
2. Install dial indicator (1) and position the plunger against the drive side of a ring gear tooth (2). Measure the backlash at 4 positions (90 degrees apart) around the ring gear. Locate and mark the area of minimum backlash.
3. Rotate the ring gear to the position of the least backlash. Mark the gear so that all future backlash measurements will be taken with the same gear teeth meshed.

4. Loosen the right-side, tighten the left-side threaded adjuster with Adjuster Wrench C-4164 (3). Obtain backlash of 0.076 - 0.102 mm (0.003 - 0.004 in.) with each adjuster tightened to 14 N·m (10 ft. lbs.). Seat the bearing cups with the procedure described above.
5. Tighten the differential bearing cap bolts to 95 N·m (70 ft. lbs.).
6. Tighten the right-side threaded adjuster to 102 N·m (75 ft. lbs.). Seat the bearing cups with the procedure described above. Continue to tighten the right-side adjuster and seat bearing cups until the torque remains constant at 102 N·m (75 ft. lbs.)
7. Measure the ring gear backlash. The range of backlash is 0.15 - 0.203 mm (0.006 - 0.008 in.).
8. Continue increasing the torque at the right-side threaded adjuster until the specified backlash is obtained.

NOTE: The left-side threaded adjuster torque should have approximately 102 N·m (75 ft. lbs.). If the torque is considerably less, the complete adjustment procedure must be repeated.

9. Tighten the left-side threaded adjuster until 102 N·m (75 ft. lbs.) torque is indicated. Seat the bearing rollers with the procedure described above. Do this until the torque remains constant.
10. Install the threaded adjuster locks and tighten the lock screws to 10 N·m (90 in. lbs.).
11. After the proper backlash is achieved, perform the Gear Contact procedure.

GEAR CONTACT PATTERN

1. Wipe clean each tooth of the ring gear.
2. Apply gear marking compound to all of the ring gear teeth.
3. Verify bearing cap bolts are torque specification.
4. Apply parking brakes lightly to create at 14 N·m (10 ft. lbs.) pinion rotating torque.
5. Rotate the pinion/pinion yoke 4 full revolutions in each directions.
6. Read gear tooth contact pattern.

Gear contact pattern is correct. Backlash and pinion depth is correct.

Ring gear is too far away from the pinion gear, coast side toe (1) drive side heel (2). Decrease backlash by moving ring closer to the pinion gear using the adjusters.

Ring gear is too close to the pinion gear, drive side toe (1) coast side heel (2). Increase backlash by moving ring away from the pinion gear using the adjusters.

Ring gear is too far away from the pinion gear, drive side heel (1) coast side heel (2). Decrease backlash by moving ring gear closer to the pinion gear using the adjusters.

Ring gear is too close to the pinion gear, drive side toe (1) coast side toe (2). Increase backlash by moving ring gear away from the pinion gear using the adjusters.

Pinion gear is set too low. Increase pinion gear height, by increasing pinion depth shim thickness.

Pinion gear is set too high. Decrease pinion height by decreasing the pinion depth shim thickness.

SPECIFICATIONS**AXLE SPECIFICATIONS**

DESCRIPTION	SPECIFICATION

DIFFERENTIAL COVER

REMOVAL

1. With vehicle in neutral, position on hoist.
2. Remove fill plug (2).
3. Remove differential cover (1).
4. Drain fluid.

INSTALLATION

1. Apply a 6.35mm (1/4 in.) bead of Mopar® Gear Sealant RTV Silicone Rubber Adhesive MS-GF44D or equivalent to the cover.

CAUTION: If housing cover is not installed within 3 to 5 minutes, the cover must be cleaned and new RTV applied. Failure to follow these instructions will result in a leak.

2. Install cover and tighten cover (1) bolts in a criss-cross pattern to 41 N·m (30 ft. lbs.).

3. Fill differential and install fill plug.

AXLE SHAFTS

REMOVAL

1. With vehicle in neutral, position on hoist.
2. Remove calipers and rotors.
3. Tap axle end plug (1) loose from the axle flange (2) with a hammer and punch. Pull plug (1) out of axle flange (2).

4. Remove speed sensors (2) from axle tube (1) flange.

5. Remove axle flange nuts (1) from axle (2).

6. Pull axle shaft and backing plate out of axle tube until axle bearing (1) is exposed.

7. Remove O-ring (2) from the axle bearing.

8. Slide axle shaft (1) from axle tube and backing plate.
9. Tap axle shaft out of the bearing and axle flange through the plug hole with a hammer and brass drift.

INSTALLATION

1. Tap axle shaft into through axle bearing into axle flange.
2. Install axle shaft (1) into axle tube and backing plate with new o-ring on axle.

3. Slip O-ring (2) through backing plate, then push axle through backing plate until bearing (1) is exposed.
4. Install O-ring (2) axle bearing.

5. Push axle into axle tube.
6. Install axle (2) flange nuts (1) and tighten to 119 N·m (88 ft. lbs.).

7. Install speed sensors (2) in axle tube (1) flange.
8. Coat new axle flange plug with Mopar® Stud N' Bearing Mount Adhesive or equivalent and install plug.
9. Install calipers and rotors.

AXLE BEARINGS

REMOVAL

1. With vehicle in neutral, position on hoist.
2. Remove calipers and rotors.
3. Tap axle end plug (1) loose from the wheel flange (2) with a hammer and punch. Pull plug (1) out of wheel flange (2).

4. Remove speed sensors (2) from axle tube (1) flange.

5. Remove axle flange nuts (1) from axle (2).

6. Pull axle shaft and backing plate out of axle tube until axle bearing (1) is exposed.
7. Remove O-ring (2) from the axle bearing.

8. Slide axle shaft (1) from axle tube and backing plate.
9. Tap axle shaft out of the wheel flange and axle bearing through the plug hole with a hammer and brass drift.
10. Remove axle flange bolts.

INSTALLATION

1. Install axle flange bolts into axle flange.
2. Tap axle shaft through axle bearing into wheel flange.
3. Install axle shaft (1) into axle tube and backing plate with new o-ring on axle.

4. Slip O-ring (2) through backing plate, then push axle through backing plate until bearing (1) is exposed.
5. Install O-ring (2) axle bearing.

6. Push axle into axle tube.
7. Install axle (2) flange nuts (1) and tighten to 119 N·m (88 ft. lbs.).

8. Install speed sensors (2) in axle tube (1) flange.
9. Coat new axle flange plug with Mopar® Stud N' Bearing Mount Adhesive or equivalent and install plug.
10. Install calipers and rotors.

AXLE SHAFT SEALS

REMOVAL

1. With vehicle in neutral, position on hoist.
2. Remove calipers and rotors.
3. Remove speed sensors (2) from axle tube (1) flange.

4. Remove axle flange nuts (1) from axle (2).

5. Pull axle shaft and backing plate out of axle tube until axle bearing (1) is exposed.
6. Remove O-ring (2) from the axle bearing.

7. Remove axle shaft (1) from axle tube and backing plate.

INSTALLATION

1. Install axle shaft (1) into axle tube and backing plate with new o-ring on axle.

2. Slip O-ring (2) through backing plate, then push axle through backing plate until bearing (1) is exposed.
3. Install new O-ring (2) on axle bearing (1).

4. Push axle into axle tube.
5. Install axle (2) flange nuts (1) and tighten to 119 N·m (88 ft. lbs.).

6. Install speed sensors (2) in axle tube (1) flange.
7. Install calipers and rotors.

PINION SEAL

REMOVAL

1. With vehicle in neutral, position vehicle on hoist.
2. Mark a reference line across the axle flange (3) and propeller shaft flange (4).

3. Remove propeller shaft
4. Remove brake calipers and rotors to prevent any drag.
5. Rotate flange three or four times and verify flange rotates smoothly.
6. Measure torque to rotating pinion flange (1) with a inch pound torque wrench (2). Record reading for installation reference.
7. Hold pinion flange with Wrench C-3281 and remove pinion nut and washer.
8. Remove flange with two jaw puller.
9. Remove pinion seal with a seal pick or slide-hammer mounted screw.

INSTALLATION

1. Apply a light coating of gear lubricant on the lip of pinion seal.
2. Install **new** pinion seal with Installer C-3972A (1) and Handle C-4171 (2).
3. Install flange on the end of the shaft with the reference marks aligned.
4. Install flange on pinion shaft with Installer C-3718 and Wrench C-3281.
5. Install pinion washer and a **new** pinion nut. The convex side of the washer must face outward.

CAUTION: Do not exceed the minimum tightening torque when installing the companion flange retaining nut at this point. Failure to follow these instructions can damage the collapsible spacer or bearings.

6. Hold flange with Wrench C-3281 and tighten pinion nut to 285 N·m (210 ft. lbs.). Rotate pinion several revolutions to ensure bearing rollers are seated.

7. Rotate pinion flange (1) with an inch pound torque wrench (2). Rotating torque should be equal to the reading recorded during removal plus an additional 0.56 N·m (5 in. lbs.).

CAUTION: Never loosen pinion nut to decrease pinion bearing rotating torque and never exceed specified preload torque. If rotating torque is exceeded, a new collapsible spacer must be installed. Failure to follow these instructions can damage the collapsible spacer or bearings.

8. If rotating torque is low use Holder 6719, to hold flange and tighten pinion nut in 6.8 N·m (5 ft. lbs.) increments until proper rotating torque is achieved.

NOTE: The seal replacement is unacceptable if final pinion nut torque is less than 285 N·m (210 ft. lbs.).

NOTE: The bearing rotating torque should be constant during a complete revolution of the pinion. If the rotating torque varies, this indicates a binding condition.

9. Install propeller shaft.
10. Install rear brake components.

DIFFERENTIAL-ELSD

OPERATION

A gerotor pump (1) creates oil flow through the filter (4) whenever left and right wheels spin at different speeds and the solenoid valve is activated. The oil flow is restricted by a Pressure Regulating Valve (PRV) to build oil pressure. Pressurized oil is then fed to a piston (2) chamber. The piston compresses the clutch pack (3) providing additional torque to the lower speed wheel.

When the antilock brakes are activated the differential solenoid is switched off and pressure is bled off the clutch pack.

DIAGNOSIS AND TESTING

DIFFERENTIAL-ELSD

HYDRAULIC

CONDITION	POSSIBLE CAUSES	CORRECTION
No Lock Up	<ol style="list-style-type: none"> 1. Pump Seals Leaking 2. Clutch Worn 3. Solenoid Valve 4. Plugged Filter 5. Final Drive Control Module 	<ol style="list-style-type: none"> 1. Replace Differential 2. Replace Differential 3. Replace Solenoid 4. Clean Filter 5. Replace Control Module

Raise vehicle and rotate tires in the opposite direction at the same time. This will make any oil left in the piston chamber apply pressure to the clutch and create some drag on the wheels. The wheels will not lock because the differential solenoid is not activated.

SOLENOID

With solenoid disconnected resistance across the solenoid should be 13.5 to 14.5 ohms at 25°Celsius (77° Fahrenheit). To replace the solenoid disconnect wire connector then squeeze the retension clip and pull solenoid up.

REMOVAL

1. Remove differential cover.
2. Remove axle shafts.
3. Remove ABS sensor from housing.
4. Remove solenoid valve connector (1) from ELSD solenoid valve (2).

5. Mark differential housing and bearing caps (3) for installation reference.

- Remove bearing adjuster lock bolt (3) from bearing caps.

- Loosen differential bearing cap bolts.
- Loosen differential bearing adjusters through the axle tubes (1) with Wrench C-4164 (3).
- Hold differential case while removing bearing caps and adjusters.
- Remove differential case and tag differential bearing cups and adjusters to indicate location.
- Clean housing cavity with flushing oil, light engine oil or a lint free cloth.

NOTE: Do not use steam, kerosene or gasoline to clean the housing.

INSTALLATION

- Apply a coat of hypoid gear lubricant to differential bearings, bearing cups and threaded adjusters.

NOTE: Grease can be used to keep the adjusters in position.

- Install differential assembly into the housing.
- Install differential bearing caps in their original locations.
- Install bearing cap bolts and tighten upper bolts to 14 N-m (10 ft. lbs.). Tighten lower bolts finger-tight until the bolt head is seated.
- Perform differential bearing preload and adjustment procedure.
- Tighten bearing cap bolts (2) to 135 N-m (100 ft. lbs).

- 7. Install adjuster locks (3) on bearing caps and tighten bolts to 11 N·m (8 ft. lbs.).
- 8. Install axle shafts (1).

- 9. Install solenoid valve connector (1) to ELSD solenoid valve (2).
- 10. Install differential cover.

BEARINGS-DIFFERENTIAL CASE

REMOVAL

CAUTION: Do not disturb the ELSD pump after bearing has been removed. Failure to follow these instructions will damage the pump seals.

1. Install Plug SP 3298 (3) Into the differential axle shaft hole.
2. Remove differential case bearings with Puller 6444 (1), Puller Rods 6444-4 (2) and Puller Flange 6444-1(4). Position puller on the differential.

3. Position Puller (1) Jaws 9641(2) around the case bearing and puller flange.

4. Position Puller (1) Collar 6444-8 (2) around the puller jaws.
5. Tighten the puller nut and remove differential case bearing.

INSTALLATION

CAUTION: Do not disturb the ELSD pump after bearing has been removed. Failure to follow these instructions will damage the pump seals.

1. Install differential case bearing with Installer C-4340 (1) and Handle C-4171 (2).

PINION GEAR/RING GEAR

REMOVAL

NOTE: The ring gear and pinion are serviced in a matched set. Never replace one gear without replacing the matching gear.

1. Remove differential from axle housing.
2. Place differential case in vise with soft metal jaw protectors.
3. Remove ring gear bolts and drive ring gear (2) off differential case with a soft hammer (3).

4. Hold pinion flange with Wrench C-3281 and remove pinion nut.
5. Remove pinion flange with two jaw puller.
6. Remove pinion from housing with a soft hammer (1).

7. Remove pinion seal with a pry tool or slide-hammer mounted screw.
8. Remove oil slinger if equipped and front pinion bearing.
9. Remove front pinion bearing cup with Remover C-4345 (1) and Handle C-4171 (2).

10. Remove rear bearing cup from housing with Remover C-4307 (1) and Handle C-4171 (2).

11. Remove collapsible preload spacer (1) from pinion gear.

12. Remove rear bearing from pinion with Puller/Press C-293-PA (1) and Adapters C-293-47 (3).

13. Remove depth shims (1) from pinion gear (2) and record shim thickness.

INSTALLATION

NOTE: Ring and pinion gears are a matched set. Do not replace one gear without replacing the other matching gear. If ring and pinion gears or bearings are replaced, Refer to Adjustments for Pinion Gear Depth Setting.

1. Apply Mopar Door Ease or stick lubricant to outside surface of pinion bearing cups.
2. Install rear pinion bearing cup with Installer C-4308 (1) and Handle C-4171 (20).

3. Install front pinion bearing cup with Installer D-130 (1) and Handle C-4171 (2).

4. Install front pinion bearing.
5. Apply a light coating of gear lubricant on the lip of pinion seal. Install seal with Installer C-3972A (1) and Handle C-4171 (2).

6. Install proper thickness depth shim (1) on pinion gear (2).

7. Install rear bearing (4) and slinger if equipped, on pinion gear (3) with Installer 6448A (2) and a press (1).

8. Install **new** collapsible spacer (1) on pinion gear and install pinion in housing.
9. Tap pinion flange onto the pinion.
10. Install flange washer and a new nut on pinion and tighten pinion nut until there is zero end-play.
11. With a torque wrench and Flange Wrench C-3281 tighten the pinion nut to 285 N·m (210 ft. lbs.).

CAUTION: Never loosen pinion nut to decrease pinion bearing rotating torque and never exceed specified preload torque. If preload torque or rotating torque is exceeded a new collapsible spacer must be installed. Failure to follow these instructions will result in damage.

12. Slowly tighten the nut in 6.8 N·m (5 ft. lbs.) increments until the desired rotating torque is achieved. Measure rotating torque frequently with an inch pound torque wrench (2) to avoid over crushing the collapsible spacer.
13. The pinion rotating torque should be:
 - Original Bearings: 1 to 3 N·m (10 to 20 in. lbs.).
 - New Bearings: 2 to 5 N·m (15 to 35 in. lbs.).

14. Position exciter ring on differential case. With a brass drift slowly and evenly tap the exciter ring into position.
15. Position ring gear on the differential case and start two ring gear bolts. This will provide case-to-ring gear bolt hole alignment.
16. Invert the differential case in the vise.
17. Install **new** ring gear bolts (2) and alternately tighten to 102 N·m (75 ft. lbs.).

CAUTION: Never reuse the ring gear bolts. Failure to follow these instructions may result in fractured bolts causing extensive damage.

18. Install differential in housing and verify gear mesh, backlash and contact pattern.
19. Install differential cover.

BRAKES - BASE - SERVICE INFORMATION

DESCRIPTION

Dual piston disc brake calipers are used on the front. Single piston disc brake calipers are used on the rear. Ventilated disc brake rotors are used on the front and solid rotors are used on the rear.

Power brake assist is supplied by a vacuum operated, dual diaphragm power brake booster. The master cylinder used for all applications has an aluminum body and nylon reservoir with single filler cap. A fluid level indicator is mounted to the side of the reservoir.

The braking force of the rear wheels is controlled by electronic brake distribution (EBD). The EBD functions like a rear proportioning valve. The EBD system uses the ABS system to control the slip of the rear wheels in partial braking range. The braking force of the rear wheels is controlled electronically by using the inlet and outlet valves located in the HCU.

Factory installed brake linings on all models consists of organic base material combined with metallic particles.

DIAGNOSIS AND TESTING - BASE BRAKE SYSTEM

Base brake components consist of the brake shoes, calipers, rear park brake drums/rotors, front brake rotors, brake lines, master cylinder, booster, HCU and parking brake shoes.

Brake diagnosis involves determining if the problem is related to a mechanical, hydraulic, electrical or vacuum operated component.

The first diagnosis step is the preliminary check.

PRELIMINARY BRAKE CHECK

1. Check condition of tires and wheels. Damaged wheels and worn, damaged, or underinflated tires can cause pull, shudder, vibration, and a condition similar to grab.
2. If complaint was based on noise when braking, check suspension components. Jounce front and rear of vehicle and listen for noise that might be caused by loose, worn or damaged suspension or steering components.
3. Inspect brake fluid level and condition. Note that the brake reservoir fluid level will decrease in proportion to normal lining wear. **Also note that brake fluid tends to darken over time. This is normal and should not be mistaken for contamination.**
 - a. If fluid level is abnormally low, look for evidence of leaks at calipers, brake lines, master cylinder, and HCU.
 - b. If fluid appears contaminated, drain out a sample to examine. System will have to be flushed if fluid is separated into layers, or contains a substance other than brake fluid. The system seals, cups, hoses, master cylinder, and HCU will also have to be replaced after flushing. Use clean brake fluid to flush the system.
4. Check parking brake operation. Verify free movement and full release of cables and lever. Also note if vehicle was being operated with parking brake partially applied.
5. Check brake pedal operation. Verify that pedal does not bind and has adequate free play. If pedal lacks free play, check pedal and power booster for being loose or for bind condition. Do not road test until condition is corrected.
6. Check booster vacuum check valve and hose.
7. If components checked appear OK, road test the vehicle.

ROAD TESTING

1. If complaint involved low brake pedal, pump pedal and note if it comes back up to normal height.
2. Check brake pedal response with transmission in neutral and engine running. Pedal should remain firm under constant foot pressure.
3. During road test, make normal and firm brake stops in 25-40 mph range. Note faulty brake operation such as low pedal, hard pedal, fade, pedal pulsation, pull, grab, drag, noise, etc.
4. Attempt to stop the vehicle with the parking brake only (do not exceed 25 mph) and note grab, drag, noise, etc.

PEDAL FALLS AWAY

A brake pedal that falls away under steady foot pressure is generally the result of a system leak. The leak point could be at a brake line, fitting, hose, or caliper. If leakage is severe, fluid will be evident at or around the leaking component.

Internal leakage (seal by-pass) in the master cylinder caused by worn or damaged piston cups, may also be the problem cause.

An internal leak in the ABS system may also be the problem with no visual fluid leak.

LOW PEDAL

If a low pedal is experienced, pump the pedal several times. If the pedal comes back up, the most likely causes are worn linings, rotors, or calipers are not sliding on the slide pins. The proper course of action is to inspect and replace all worn component.

SPONGY PEDAL

A spongy pedal is most often caused by air in the system. However substandard brake hoses can cause a spongy pedal. The proper course of action is to bleed the system, and replace substandard quality brake hoses if suspected.

HARD PEDAL OR HIGH PEDAL EFFORT

A hard pedal or high pedal effort may be due to lining that is water soaked, contaminated, glazed, or badly worn. The power booster, check valve, check valve seal/grommet or vacuum leak could also cause a hard pedal or high pedal effort.

PEDAL PULSATION

Pedal pulsation is caused by components that are loose, or beyond tolerance limits.

The primary cause of pulsation are disc brake rotors with excessive lateral runout or thickness variation. Other causes are loose wheel bearings or calipers and worn, damaged tires.

NOTE: Some pedal pulsation may be felt during ABS activation.

BRAKE DRAG

Brake drag occurs when the lining is in constant contact with the rotor or drum. Drag can occur at one wheel, all wheels, fronts only, or rears only.

Drag is a product of incomplete brake release. Drag can be minor or severe enough to overheat the linings, rotors and park brake drums.

Minor drag will usually cause slight surface charring of the lining. It can also generate hard spots in rotors and park brake drums from the overheat-cool down process. In most cases, the rotors, wheels and tires are quite warm to the touch after the vehicle is stopped.

Severe drag can char the brake lining all the way through. It can also distort and score rotors to the point of replacement. The wheels, tires and brake components will be extremely hot. In severe cases, the lining may generate smoke as it chars from overheating.

Common causes of brake drag are:

- Parking brake partially applied.
- Loose/worn wheel bearing.
- Seized caliper.
- Caliper binding.
- Loose caliper mounting.
- Mis-assembled components.
- Damaged brake lines.

If brake drag occurs at the front, rear or all wheels, the problem may be related to a blocked master cylinder return port, faulty power booster (binds-does not release) or the ABS system.

BRAKE FADE

Brake fade is usually a product of overheating caused by brake drag. However, brake overheating and resulting fade can also be caused by riding the brake pedal, making repeated high deceleration stops in a short time span, or constant braking on steep mountain roads. Refer to the Brake Drag information in this section for causes.

BRAKE PULL

Front brake pull condition could result from:

- Contaminated lining in one caliper
- Seized caliper piston
- Binding caliper
- Loose caliper
- Rusty caliper slide surfaces
- Improper brake shoes
- Damaged rotor
- Wheel alignment.
- Tire pressure.

A worn, damaged wheel bearing or suspension component are further causes of pull. A damaged front tire (bruised, ply separation) can also cause pull.

A common and frequently misdiagnosed pull condition is where direction of pull changes after a few stops. The cause is a combination of brake drag followed by fade at one of the brake units.

As the dragging brake overheats, efficiency is so reduced that fade occurs. Since the opposite brake unit is still functioning normally, its braking effect is magnified. This causes pull to switch direction in favor of the normally functioning brake unit.

An additional point when diagnosing a change in pull condition concerns brake cool down. Remember that pull will return to the original direction, if the dragging brake unit is allowed to cool down (and is not seriously damaged).

REAR BRAKE DRAG OR PULL

Rear drag or pull may be caused by improperly adjusted park brake shoes or seized parking brake cables, contaminated lining, bent or binding shoes or improperly assembled components. This is particularly true when only one rear wheel is involved. However, when both rear wheels are affected, the master cylinder or ABS system could be at fault.

BRAKES DO NOT HOLD AFTER DRIVING THROUGH DEEP WATER PUDDLES

This condition is generally caused by water soaked lining. If the lining is only wet, it can be dried by driving with the brakes very lightly applied for a mile or two. However, if the lining is both soaked and dirt contaminated, cleaning and or replacement will be necessary.

BRAKE LINING CONTAMINATION

Brake lining contamination is mostly a product of leaking calipers or worn seals, driving through deep water puddles, or lining that has become covered with grease and grit during repair. Contaminated lining should be replaced to avoid further brake problems.

WHEEL AND TIRE PROBLEMS

Some conditions attributed to brake components may actually be caused by a wheel or tire problem. A damaged wheel can cause shudder, vibration and pull. A worn or damaged tire can also cause pull.

NOTE: Propshaft angle can also cause vibration/shudder.

Severely worn tires with very little tread left can produce a grab-like condition as the tire loses and recovers traction. Flat-spotted tires can cause vibration and generate shudder during brake operation. Tire damage such as a severe bruise, cut, ply separation, low air pressure can cause pull and vibration.

BRAKE NOISES

Some brake noise is common on some disc brakes during the first few stops after a vehicle has been parked overnight or stored. This is primarily due to the formation of trace corrosion (light rust) on metal surfaces. This light corrosion is typically cleared from the metal surfaces after a few brake applications causing the noise to subside.

BRAKE SQUEAK/SQUEAL

Brake squeak or squeal may be due to linings that are wet or contaminated with brake fluid, grease, or oil. Glazed linings and rotors with hard spots can also contribute to squeak. Dirt and foreign material embedded in the brake lining will also cause squeak/squeal.

A very loud squeak or squeal is frequently a sign of severely worn brake lining. If the lining has worn through to the brake shoes in spots, metal-to-metal contact occurs. If the condition is allowed to continue, rotors may become so scored that replacement is necessary.

NOTE: The front outer brake shoes are equipped with a wear indicator. The indicator will produce an audible noise when it contacts the rotor surface.

BRAKE CHATTER

Brake chatter is usually caused by loose or worn components, or glazed/burnt lining. Rotors with hard spots can also contribute to chatter. Additional causes of chatter are out-of-tolerance rotors, brake lining not securely attached to the shoes, loose wheel bearings and contaminated brake lining.

THUMP/CLUNK NOISE

Thumping or clunk noises during braking are frequently **not** caused by brake components. In many cases, such noises are caused by loose or damaged steering, suspension, or engine components.

STANDARD PROCEDURE

MANUAL BLEEDING

Use Mopar brake fluid, or an equivalent quality fluid meeting SAE J1703-F and DOT 3 standards only. Use fresh, clean fluid from a sealed container at all times.

Do not pump the brake pedal at any time while bleeding. Air in the system will be compressed into small bubbles that are distributed throughout the hydraulic system. This will make additional bleeding operations necessary.

Do not allow the master cylinder to run out of fluid during bleed operations. An empty cylinder will allow additional air to be drawn into the system. Check the cylinder fluid level frequently and add fluid as needed.

Bleed only one brake component at a time in the following sequence:

1. Fill the master cylinder reservoir with brake fluid.
2. If calipers are overhauled, open all caliper bleed screws. Then close each bleed screw as fluid starts to drip from it. Top off master cylinder reservoir once more before proceeding.
3. Attach one end of bleed hose to bleed screw and insert opposite end in glass container partially filled with brake fluid. Be sure end of bleed hose is immersed in fluid.
4. Open up bleeder, then have a helper press down the brake pedal. Once the pedal is down close the bleeder. Repeat bleeding until fluid stream is clear and free of bubbles. Then move to the next wheel.

PRESSURE BLEEDING

Use Mopar brake fluid, or an equivalent quality fluid meeting SAE J1703-F and DOT 3 standards only. Use fresh, clean fluid from a sealed container at all times.

Do not pump the brake pedal at any time while bleeding. Air in the system will be compressed into small bubbles that are distributed throughout the hydraulic system. This will make additional bleeding operations necessary.

Do not allow the master cylinder to run out of fluid during bleed operations. An empty cylinder will allow additional air to be drawn into the system. Check the cylinder fluid level frequently and add fluid as needed.

Bleed only one brake component at a time in the following sequence:

Follow the manufacturers instructions carefully when using pressure equipment. Do not exceed the tank manufacturers pressure recommendations. Generally, a tank pressure of 51-67 kPa (15-20 psi) is sufficient for bleeding.

Fill the bleeder tank with recommended fluid and purge air from the tank lines before bleeding.

Do not pressure bleed without a proper master cylinder adapter. The wrong adapter can lead to leakage, or drawing air back into the system. Use adapter provided with the equipment or Adapter 6921.

SPECIAL TOOLS

BASE BRAKES

Handle C-4171

SENSOR-BRAKE FLUID LEVEL

REMOVAL

1. Remove the wire connector from the fluid level sensor (2).

2. From the same side of the master cylinder reservoir (1) release the sensor locking taps with a small screw driver.
3. Pull the sensor (1) out of the reservoir (2) from the connector side of the sensor.

INSTALLATION

1. Install the sensor (1) with a new o-ring into the reservoir (2) until the locking tabs are engaged.

2. Install the wire connector to the fluid level sensor (2).

RED BRAKE WARN INDICATOR SWITCH

DESCRIPTION

A red warning lamp is used for the service brake portion of the hydraulic system. The lamp is located in the instrument cluster.

OPERATION

The lamp is turned on momentarily when the ignition switch is turned to the on position. This is a self test to verify the lamp is operational.

The red warning light alerts the driver if the fluid level is low or the parking brakes are applied. A red warning lamp with an amber warning lamp may indicate a electronic brake distribution fault.

DIAGNOSIS AND TESTING - RED BRAKE WARNING LAMP

The red warning lamp illuminates when the parking brake is applied or when the fluid level in the master cylinder is low. It will also illuminate at start up as part of a bulb check.

If the light comes on, first verify that the parking brakes are fully released. Then check pedal action and fluid level. If a problem is confirmed, inspect the brake hydraulic system for leaks.

A red warning lamp with a amber warning lamp may indicate a electronic brake distribution fault.

ADJUSTABLE PEDAL SWITCH

DESCRIPTION

The adjustable pedals switch are mounted in the instrument panel. The switch is part of the lower instrument panel switch pod assembly. If the switch is damaged or inoperative the complete switch pod assembly must be replaced.

Pressing the switch will either move the pedals forward toward you or rearward away from you.

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument panel center bezel, (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).
3. Remove the lower instrument panel switch pod fasteners.
4. Remove the lower instrument panel switch pod from the vehicle.

INSTALLATION

NOTE: There are different instrument panel switch pods available based on the option content of the vehicle. Ensure the switch pod being installed matches the vehicle options.

1. Position the lower instrument panel switch pod into the instrument panel center bezel.
2. Install the lower instrument panel switch pod fasteners.
3. Install the instrument panel center bezel, (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).
4. Connect the battery negative cable.
5. Verify system operation.

BRAKE LINES

DESCRIPTION

Flexible rubber hose is used at both front brakes, rear brakes and at the rear axle junction block. Double walled steel tubing is used. Double inverted style and ISO style flares are used on the brake lines.

DIAGNOSIS AND TESTING - BRAKE HOSES AND LINES

Flexible rubber hose is used at both front and rear brakes and at the rear axle junction block. Inspect the hoses whenever the brake system is serviced, at every engine oil change, or whenever the vehicle is in for service.

Inspect the hoses for surface cracking, scuffing, or worn spots. Replace any brake hose immediately if the fabric casing of the hose is exposed due to cracks or abrasions.

Also check brake hose installation. Faulty installation can result in kinked, twisted hoses, or contact with the wheels and tires or other chassis components. All of these conditions can lead to scuffing, cracking and eventual failure.

The steel brake lines should be inspected periodically for evidence of corrosion, twists, kinks, leaks, or other damage. Heavily corroded lines will eventually rust through causing leaks. In any case, corroded or damaged brake lines should be replaced.

Factory replacement brake lines and hoses are recommended to ensure quality, correct length and superior fatigue life. Care should be taken to make sure that brake line and hose mating surfaces are clean and free from nicks and burrs. Also remember that right and left brake hoses are not interchangeable.

Use new copper gaskets at all caliper connections. Be sure brake line connections are properly made (not cross threaded) and tightened to recommended torque.

STANDARD PROCEDURE

STANDARD PROCEDURE - DOUBLE INVERTED FLARING

A preformed metal brake tube is recommended and preferred for all repairs. However, double-wall steel tube can be used for emergency repair when factory replacement parts are not readily available.

Special bending tools are needed to avoid kinking or twisting of metal brake tubes. Special flaring tools are needed to make a double inverted flare or ISO flare.

1. Cut off damaged tube with Tubing Cutter.
2. Ream cut edges of tubing to ensure proper flare.

3. Install replacement tube nut on the tube.
4. Insert tube in flaring tool.
5. Place gauge form over the end of the tube.
6. Push tubing through flaring tool jaws until tube contacts recessed notch in gauge that matches tube diameter.
7. Tighten the tool bar on the tube
8. Insert plug on gauge in the tube. Then swing compression disc over gauge and center tapered flaring screw in recess of compression disc.
9. Tighten tool handle until plug gauge is squarely seated on jaws of flaring tool. This will start the inverted flare.
10. Remove the plug gauge and complete the inverted flare.

STANDARD PROCEDURE - ISO FLARING

A preformed metal brake tube is recommended and preferred for all repairs. However, double-wall steel tube can be used for emergency repair when factory replacement parts are not readily available.

Special bending tools are needed to avoid kinking or twisting of metal brake tubes. Special flaring tools are needed to make a double inverted flare or ISO flare.

To make a ISO flare use Snap-On® Flaring Tool TFM-428 or equivalent.

1. Cut off damaged tube with Tubing Cutter.
2. Remove any burrs from the inside of the tube.
3. Install tube nut on the tube.
4. Position the tube in the flaring tool flush with the top of the tool bar. Then tighten the tool bar on the tube.
5. Install the correct size adaptor on the flaring tool yoke screw.
6. Lubricate the adaptor.
7. Align the adaptor and yoke screw over the tube.
8. Turn the yoke screw in until the adaptor is squarely seated on the tool bar.

REMOVAL - PRIMARY/SECONDARY BRAKE TUBES

1. Install a brake pedal prop rod.
2. Siphon the master cylinder reservoir.
3. Remove the Primary or Secondary brake tubes at the master cylinder.
4. Remove the Primary or Secondary brake tubes at the HCU.

INSTALLATION - PRIMARY/SECONDARY BRAKE TUBES

1. Install the primary or secondary brake tubes to the master cylinder.
2. Install the primary or secondary brake tubes to the HCU.
3. Remove the brake pedal prop rod.
4. Fill and bleed the brake system.

BRAKE PADS / SHOES

REMOVAL

FRONT DISC BRAKE SHOES

1. Raise and support vehicle.
2. Remove wheel and tire assembly.
3. Drain small amount of fluid from master cylinder brake reservoir with **clean** suction gun.
4. Remove the 2 caliper mounting bolts (2).
5. Compress the caliper and remove from the adaptor (4).
6. Secure caliper (1) to nearby suspension part with wire. **Do not allow brake hose to support caliper weight.**

7. Remove the inboard and outboard brake pads (4) from the caliper adaptor (2).
8. Remove the anti-rattle clips (3) from the brake caliper adaptor (2).

REAR DISC BRAKE PADS

1. Raise and support vehicle.
2. Remove rear wheel and tire assembly.
3. Drain small amount of fluid from master cylinder brake reservoir with a **clean** suction gun.
4. Bottom caliper pistons into the caliper by prying the caliper over.
5. Remove the caliper slide pins (4).

6. Remove caliper (1) from the anchor.
7. Secure caliper (1) to nearby suspension part with wire. **Do not allow brake hose to support caliper weight.**
8. Remove the inboard & outboard brake pads from the caliper.

INSTALLATION

FRONT DISC BRAKE SHOES

1. Remove and clean all rust and debris from the anti-rattle clip mounting surfaces (3) on the brake caliper adapter (2).
2. Install new anti-rattle clips (3) into the caliper adapter (2).
3. Install the inboard and outboard brake pads (4) onto the caliper adapter (2).
4. Install caliper (5) on the caliper adapter (2).

5. Install the caliper slide pin bolts (2) and tighten to 72 N·m (53 ft. lbs.).
6. Install wheel and tire assembly.
7. Remove support and lower vehicle.
8. Pump brake pedal until caliper pistons and brake pads are seated and a firm brake pedal is obtained.
9. Fill brake fluid.

REAR DISC BRAKE PADS

1. Install the inboard & outboard brake pads onto the caliper.
2. Lubricate the slide pins and slide pin bushings with caliper slide grease or the grease provided with the brake pads.
3. Install caliper (1) on the anchor.

814192a8

4. Install the caliper slide pin bolts (4) and tighten to 25 N·m (18 ft. lbs.).
5. Install wheel and tire assembly.
6. Remove support and lower vehicle.
7. Pump brake pedal until caliper piston and brake pads are seated and a firm brake pedal is obtained.
8. Fill brake fluid level if necessary.

814192ac

DISC BRAKE CALIPERS

DESCRIPTION

The calipers are a single piston type in the rear and dual piston type in the front. The calipers are free to slide laterally, this allows continuous compensation for lining wear.

OPERATION

When the brakes are applied fluid pressure is exerted against the caliper piston (2). The fluid pressure is exerted equally and in all directions. This means pressure exerted against the caliper piston and within the caliper bore will be equal.

Fluid pressure applied to the piston is transmitted directly to the inboard brake pad (5). This forces the pad lining against the inner surface of the disc brake rotor. At the same time, fluid pressure within the piston bore forces the caliper to slide inward on the mounting bolts. This action brings the outboard brake pad lining (6) into contact with the outer surface of the disc brake rotor.

In summary, fluid pressure acting simultaneously on both piston and caliper, produces a strong clamping action. When sufficient force is applied, friction will attempt to stop the rotors from turning and bring the vehicle to a stop.

Application and release of the brake pedal generates only a very slight movement of the caliper and piston. Upon release of the pedal, the caliper and piston return to a rest position. The brake pads do not retract an appreciable distance from the rotor. In fact, clearance is usually at, or close to zero. The reasons for this are to keep road debris from getting between the rotor and lining and in wiping the rotor surface clear each revolution.

The caliper piston seal (4) controls the amount of piston (2) extension needed to compensate for normal lining wear.

During brake application, the seal is deflected outward by fluid pressure and piston movement (6). When the brakes (and fluid pressure) are released, the seal relaxes and retracts the piston (3).

The amount of piston retraction is determined by the amount of seal deflection. Generally the amount is just enough to maintain contact between the piston and inboard brake pad.

REMOVAL

FRONT DISC BRAKE CALIPER

1. Raise and support vehicle.
2. Remove front wheel and tire assembly.
3. Drain small amount of fluid from master cylinder brake reservoir with **clean** suction gun.

4. Bottom caliper pistons into the caliper (5) by prying the caliper over.

5. Remove brake hose banjo bolt and gasket washers (6). Discard gasket washers.
6. Remove the caliper slide bolts (2).
7. Remove the caliper (1) from the adapter (4).

REAR DISC BRAKE CALIPER

1. Raise and support vehicle.
2. Remove rear wheel and tire assembly.
3. Drain small amount of fluid from master cylinder brake reservoir with a **clean** suction gun.

4. Bottom caliper pistons into the caliper by prying the caliper over.
5. Remove brake hose (3) banjo bolt (5) and discard gasket washers.
6. Remove the caliper slide pins (4).

7. Remove caliper (1) from the anchor.
8. Remove the brake pads.

DISASSEMBLY

1. Drain the brake fluid from caliper.
2. C-clamp (2) a block of wood (1) over one piston.

3. Take another piece of wood and pad it with one-inch thickness of shop towels (2). Place this piece in the outboard shoe side of the caliper in front of the other piston. This will cushion and protect caliper piston during removal.
4. To remove the caliper piston direct **short bursts of low pressure air** with a blow gun through the caliper brake hose port. Use only enough air pressure to ease the piston out.

CAUTION: Do not blow the piston out of the bore with sustained air pressure. This could result in a cracked piston.

WARNING: NEVER ATTEMPT TO CATCH THE PISTON AS IT LEAVES THE BORE. THIS COULD RESULT IN PERSONAL INJURY.

5. Remove the C-clamp and block of wood from the caliper and clamp it over the dust boot of the first piston removed. This will seal the empty piston bore.
6. Move the padded piece of wood in front of the other piston.
7. Remove the second piston using the same procedure with **short bursts of low pressure air**.
8. Remove piston dust boots (2) with a suitable pry tool.

CAUTION: Do not scratch piston bore while removing the seals.

9. Remove piston seals (3) from caliper (1).

10. Push caliper mounting bolt bushings (3) out of the boot seals (2) and remove the boot seals from the caliper (1).
11. Remove caliper bleed screw.

CLEANING - DISC BRAKE CALIPER

Clean the caliper components with clean brake fluid or brake clean only. Wipe the caliper and piston dry with lint free towels or use low pressure compressed air.

CAUTION: Do not use gasoline, kerosene, paint thinner, or similar solvents. These products may leave a residue that could damage the piston and seal.

INSPECTION

The piston is made from a phenolic resin (plastic material) and should be smooth and clean.

The piston must be replaced if cracked or scored. Do not attempt to restore a scored piston surface by sanding or polishing.

CAUTION: If the caliper piston is replaced, install the same type of piston in the caliper. Never interchange phenolic resin and steel caliper pistons. The pistons, seals, seal grooves, caliper bore and piston tolerances are different.

The bore can be **lightly** polished with a brake hone (3) to remove very minor surface imperfections. The caliper should be replaced if the bore is severely corroded, rusted, scored, or if polishing would increase bore diameter more than 0.025 mm (0.001 inch).

ASSEMBLY

CAUTION: Dirt, oil, and solvents can damage caliper seals. Insure assembly area is clean and dry.

1. Lubricate caliper pistons, piston seals and piston bores with clean, fresh brake fluid.

NOTE: Verify seal is fully seated and not twisted.

2. Install new piston seals (3) into caliper bores (2).

3. Lightly lubricate lip of new boot with silicone grease. Install boot on piston and work boot lip into the groove at the top of piston (3).

4. Stretch boot (2) rearward to straighten boot folds, then move boot forward until folds snap into place.

5. Install piston (3) into caliper bore and press piston down to the bottom of the caliper bore by hand or with hammer handle.

6. Seat dust boot in caliper (2) with Handle C-4171 (1) and Installer (3):

- 54 mm caliper: Installer C-3716-A

7. Install the second piston and dust boot.

8. Lubricate caliper mounting bolt bushings, boot seals and bores with Mopar brake grease or Dow Corning® 807 grease only.

CAUTION: Use of alternative grease may cause damage to the boots seals.

9. Install the boot seals into the caliper seal bores and center the seals in the bores.

10. Install mounting bolt bushings into the boot seals and insure seal lip is engaged into the bushing grooves at either end of the bushing.

11. Install caliper bleed screw.

INSTALLATION

FRONT DISC BRAKE CALIPER

1. Install the caliper (5) on the adapter (2).

2. Caliper slide pins should be free from debris and lightly lubricated..
3. Install the caliper slide pin bolts (2) and tighten to 72 N·m (53 ft. lbs.).
4. Gently lift one end of the slide pin boot to equalize air pressure, then release the boot and verify that the boot is fully covering the slide pin.

CAUTION: Verify brake hose is not twisted or kinked before tightening banjo bolt.

5. Install brake hose (5) to caliper (1) with **new copper washers (6)** and tighten banjo bolt (6) to 31 N·m (23 ft. lbs.).

6. Fill and bleed brake system.
7. Install wheel and tire assemblies.
8. Remove supports and lower vehicle.
9. Verify brake fluid level.

REAR DISC BRAKE CALIPER

1. Install the brake pads.
2. Lubricate the slide pins and slide pin bushings with caliper slide grease or the grease provided with the caliper.
3. Install the caliper (1) on the anchor.

4. Install the caliper slide pin bolts (4) and tighten to 35 N·m (26 ft. lbs.).

CAUTION: Verify brake hose is not twisted or kinked before tightening fitting bolt.

5. Install brake hose (3) to caliper with a **new** gasket washers and tighten banjo bolt (5) to 31 N·m (23 ft. lbs.).
6. Fill and bleed brake system.
7. Install wheel and tire assemblies.
8. Remove supports and lower vehicle.

FLUID

DIAGNOSIS AND TESTING

BRAKE FLUID CONTAMINATION

Indications of fluid contamination are swollen or deteriorated rubber parts.

Swollen rubber parts indicate the presence of petroleum in the brake fluid.

To test for contamination, put a small amount of drained brake fluid in clear glass jar. If fluid separates into layers, there is mineral oil or other fluid contamination of the brake fluid.

If brake fluid is contaminated, drain and thoroughly flush system. Replace master cylinder, proportioning valve, caliper seals, wheel cylinder seals, Antilock Brakes hydraulic unit and all hydraulic fluid hoses.

STANDARD PROCEDURE

BRAKE FLUID LEVEL

Always clean the master cylinder reservoir (4) and cap before checking fluid level. If not cleaned, dirt could enter the fluid.

The fluid fill level is indicated on the side of the master cylinder reservoir (4).

The correct fluid level is to the MAX indicator on the side of the reservoir. If necessary, add fluid to the proper level.

SPECIFICATIONS

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar brake fluid or an equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from an container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

FLUID RESERVOIR

REMOVAL

1. Install a brake pedal prop rod.
2. Remove reservoir cap and remove fluid with a **cleansuction** gun.
3. Remove the wire connector from the brake fluid level sensor (2).

4. Remove the fluid reservoir (1) from the master cylinder (3).

5. Pull the reservoir straight up out of the cylinder (2).
6. Remove and discard grommets from the cylinder body (2).

7. Remove the fluid level sensor (1) from the reservoir (2) if needed.

INSTALLATION

1. Install the fluid level sensor (1) into the reservoir (2) if removed.

2. Lubricate new o-rings (2) with clean brake fluid.

CAUTION: Do not use tools to install the o-rings. Tools may cut, or tear the o-rings. Install the o-rings using finger pressure only.

3. Start reservoir in o-rings then press the reservoir straight down to seat the reservoir into the cylinder o-rings.

CAUTION: Do not rock the reservoir during installation.

4. Verify retaining tabs are seated.

5. Install the wire connector to the brake fluid level sensor (2).

6. Remove brake pedal prop rod.

7. Fill master cylinder.

MASTER CYLINDER

DESCRIPTION

BASE MASTER CYLINDER WITHOUT ESP

The master cylinder body (5) is made of aluminum and contains a primary and secondary piston assembly. The cylinder body including the piston assemblies are not serviceable. If diagnosis indicates an internal problem with the cylinder body (5), it must be replaced as an assembly. The master cylinder has a removable reservoir (4) and fluid level indicator (6). The reservoir, reservoir grommets, reservoir cap and fluid level switch are the only replaceable parts on the master cylinder.

MASTER CYLINDER WITH ESP

The master cylinder body is made of aluminum and contains a primary and secondary piston assembly. The cylinder body including the piston assemblies are not serviceable. If diagnosis indicates an internal problem with the cylinder body, it must be replaced as an assembly. The master cylinder with ESP has a pressure switch (5) on the master cylinder. The reservoir (2), reservoir grommets, reservoir cap, pressure switch (5), solenoid connector (7) and fluid level switch (9) are the only replaceable parts on the master cylinder.

OPERATION

The master cylinder bore contains a primary and secondary piston. The primary piston supplies hydraulic pressure to the front brakes. The secondary piston supplies hydraulic pressure to the rear brakes. The master cylinder reservoir stores reserve brake fluid for the hydraulic brake circuits.

DIAGNOSIS AND TESTING

MASTER CYLINDER/POWER BOOSTER

1. Start engine and check booster vacuum hose connections. A hissing noise indicates vacuum leak. Correct any vacuum leak before proceeding.
2. Stop engine and shift transmission into Neutral.
3. Pump brake pedal until all vacuum reserve in booster is depleted.
4. Press and hold brake pedal under light foot pressure. The pedal should hold firm, if the pedal falls away master cylinder is faulty (internal leakage).
5. Start engine and note pedal action. It should fall away slightly under light foot pressure then hold firm. If no pedal action is discernible, power booster, vacuum supply, or vacuum check valve is faulty. Proceed to the POWER BOOSTER VACUUM TEST.
6. If the POWER BOOSTER VACUUM TEST passes, rebuild booster vacuum reserve as follows: Release brake pedal. Increase engine speed to 1500 rpm, close the throttle and immediately turn off ignition to stop engine.
7. Wait a minimum of 90 seconds and try brake action again. Booster should provide two or more vacuum assisted pedal applications. If vacuum assist is not provided, booster is faulty.

POWER BOOSTER VACUUM TEST

1. Connect vacuum gauge (6) to booster check valve (4) with short length of hose (3) and T-fitting (2).
2. Start and run engine at curb idle speed for one minute.
3. Observe the vacuum supply. If vacuum supply is not adequate, repair vacuum supply.
4. Clamp (1) hose (7) shut between intake vacuum source (5) and check valve (4).
5. Stop engine and observe vacuum gauge (6).
6. If vacuum drops more than one inch HG (33 millibars) within 15 seconds, booster diaphragm or check valve is faulty.

POWER BOOSTER CHECK VALVE TEST

1. Disconnect vacuum hose from check valve (1).
2. Remove check valve (1) and valve seal (2) from booster (3).
3. Use a hand operated vacuum pump for test.
4. Apply 15-20 inches vacuum at large end of check valve.
5. Plug off the small end to prevent vacuum leakage.
6. Vacuum should hold steady. If gauge on pump indicates vacuum loss, check valve is faulty and should be replaced.

STANDARD PROCEDURE

MASTER CYLINDER BLEEDING

A new master cylinder should be bled before installation on the vehicle. Required bleeding tools include bleed tubes and a wood dowel to stroke the pistons. Bleed tubes can be fabricated from brake line.

1. Mount master cylinder in vise.
2. Attach bleed tubes to cylinder outlet ports (1). Then position each tube end into reservoir (2).
3. Fill reservoir with fresh brake fluid.
4. Press cylinder pistons inward with wood dowel. Then release pistons and allow them to return under spring pressure. Continue bleeding operations until air bubbles are no longer visible in fluid.

REMOVAL

1. Siphon the master cylinder.
2. Remove the primary brake tube at the master cylinder.
3. Remove the primary brake tube from the HCU.
4. Remove the secondary brake tube at the master cylinder.
5. Remove the secondary brake tube at the HCU.
6. Disconnect the brake fluid level switch from the master cylinder.
7. Remove the 2 master cylinder mounting nuts.
8. Remove the master cylinder.

INSTALLATION

NOTE: Bleed new master cylinder on bench before installation.

1. Install the master cylinder with new gasket and nuts.
2. Reconnect the brake fluid level electrical connector.
3. Install the secondary brake tube at the HCU.
4. Install the secondary brake tube at the master cylinder.
5. Install the primary brake tube at the HCU.
6. Install the primary brake tube at the master cylinder.
7. Fill and bleed brake system.

PEDAL

DESCRIPTION

NON—ADJUSTABLE PEDAL

A suspended-type brake pedal is used, the pedal pivots on a shaft mounted in the pedal support bracket. The bracket is attached to the dash panel.

The brake pedal assembly and pedal pad are the only serviceable component.

ADJUSTABLE PEDALS

The Adjustable Pedals System (APS) is designed to enable the fore and aft repositioning of the brake and accelerator pedals. This results in improved ergonomics in relation to the steering wheel for taller and shorter drivers. Being able to adjust the pedal positions also allows the driver to set steering wheel tilt and seat position to the most comfortable position. The position of the brake (4) and accelerator pedals (3) can be adjusted without compromising safety or comfort in actuating the pedals. Repositioning the pedals does not change the effort required for actuation.

Change of pedal position is accomplished by means of a motor driven screw (5). Operating the adjustable pedal switch activates the pedal drive motor (5). The pedal drive motor turns a screw that changes the position of the brake (4) and accelerator pedals (3). The pedal can be moved rearward (closer to the driver) or forward (away from driver). The brake pedal is moved on its drive screw to a position where the driver feels most comfortable.

The accelerator pedal (3) is moved at the same time and the same distance as the brake pedal. The accelerator pedal adjustment screw is turned by a flexible shaft slaved off the brake adjustment screw.

Neither the pedal drive motor nor drive mechanism are subject to the mechanical stress of brake or accelerator application.

- SYSTEM FEATURES:

- Range of Adjustment: The pedals may be adjusted up to 3 in. (75 mm)
- Pedal Adjustment Speed: 0.5 in./sec (12.5 mm/sec)
- Pedal Adjustment Inhibitors: Pedal adjustment is inhibited when the vehicle is in reverse or when cruise control is activated.
- Memory: An optional memory feature is available. This allows storing of one or two preferred pedal positions in the Adjustable Pedal Module (APM). A preferred position can be stored and recalled

using the door-mounted switches. A stored pedal position can be recalled (but not stored) using the Remote Keyless Entry (RKE).

- Adjustable Pedal Feedback Message: The Electronic Vehicle Information Center (EVIC) will display a message when the APS is disabled. ie: "Adjustable Pedal Disabled - Cruise Control Engaged" or "Adjustable Pedal Disabled - Vehicle in Reverse".
- Damage Prevention: Foot pressure or debris can stall pedal adjustment. In order to avoid damage to system components during pedal adjustment, the APM will monitor pedal position sensor voltage. If the APM does not detect expected voltage change within 1.5 seconds, it will cut power to the adjustable pedal motor.

OPERATION

The brake pedal is attached to the booster push rod. When the pedal is depressed, the primary booster push rod is depressed which moves the booster secondary rod. The booster secondary rod depresses the master cylinder piston.

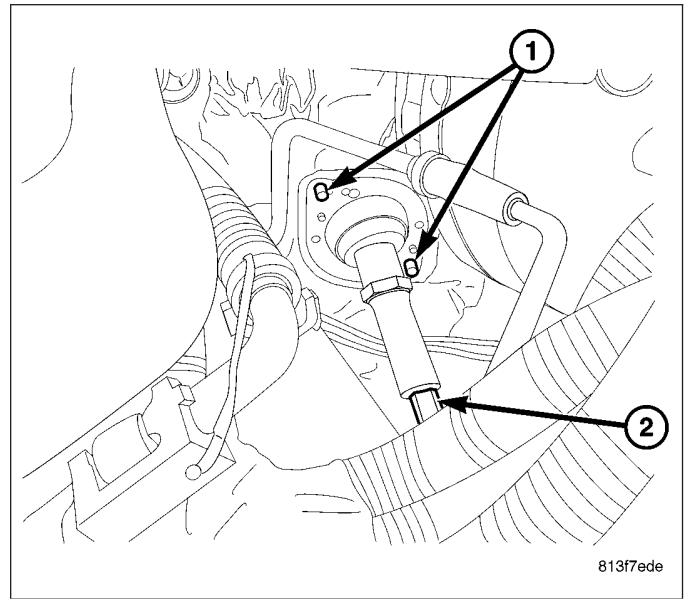

REMOVAL

NON-ADJUSTABLE PEDAL

1. Disconnect the negative battery cable.
2. Remove retainer clip (1) that holds booster to pedal pin (3).
3. Remove the power brake booster (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/POWER BRAKE BOOSTER - REMOVAL).

4. Lock the steering wheel into place.
5. Remove the 2 intermediate shaft bearing nuts (1).

6. Remove the lower steering shaft pinch bolt.
7. Remove the lower steering shaft off the column.
8. Loosen the brake pedal sled upper nuts
9. Remove the brake pedal assembly from the vehicle.

ADJUSTABLE PEDALS

NOTE: If possible put the pedals in the full forward position.

1. Disconnect the negative battery cable.
2. Remove the power brake booster (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/POWER BRAKE BOOSTER - REMOVAL).
3. Remove the 2 intermediate shaft bearing nuts (1).

4. Remove the lower steering shaft pinch bolt.
5. Remove the lower steering shaft off the column.
6. Lock the steering wheel into place.
7. Disconnect the pedal motor electrical connector.

8. Disconnect the accelerator pedal cable.
9. Disconnect the 2 accelerator pedal mounting nuts (4).

10. Loosen the brake pedal sled (1) upper nuts
11. Remove the brake pedal/accelerator pedal assembly (2&3) from the vehicle.

INSTALLATION

NON-ADJUSTABLE PEDAL

1. Install the pedal assembly to the vehicle.
2. Tighten the upper brake pedal sled nuts.

3. Install the lower steering shaft to the column.
4. Install the lower steering shaft pinch bolt at the column.
5. Unlock the steering wheel.
6. Install the 2 intermediate shaft bearing nuts (1).
7. Install the power brake booster (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/POWER BRAKE BOOSTER - INSTALLATION).
8. Install booster push rod (2) on pedal pin (3) and install retainer clip (1) on pedal pin.
9. Reconnect the negative battery cable.
10. Fill and bleed brake system.
11. Check and adjust stop lamp switch if necessary.

ADJUSTABLE PEDAL

1. Install the pedal assembly (2) to the vehicle.
2. Tighten the upper brake pedal sled nuts (4).

3. Install and tighten the 2 accelerator pedal (2) nuts to 28 N·m (21 ft. lbs.).
4. Reconnect the accelerator pedal cable.
5. Reconnect the pedal motor electrical connector.

6. Install the lower steering shaft to the column.
7. Install the lower steering shaft pinch bolt at the column.
8. Unlock the steering wheel.
9. Install the 2 intermediate shaft bearing nuts (1).
10. Install the power brake booster (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/POWER BRAKE BOOSTER - INSTALLATION).
11. Reconnect the negative battery cable.
12. Fill and bleed brake system.

POWER BRAKE BOOSTER

DESCRIPTION

BASE POWER BRAKE BOOSTER WITHOUT ESP

The booster assembly consists of a housing divided into separate chambers by two internal diaphragms. The outer edge of each diaphragm is attached to the booster housing (3).

Two push rods are used in the booster. The primary push rod (1) connects the booster to the brake pedal. The secondary push rod connects the booster to the master cylinder to stroke the cylinder pistons.

POWER BRAKE BOOSTER WITH ESP

The booster assembly consists of a housing divided into separate chambers by two internal diaphragms. The outer edge of each diaphragm is attached to the booster housing (1).

Two push rods are used in the booster. The primary push rod connects the booster to the brake pedal. The secondary push rod connects the booster to the master cylinder to stroke the cylinder pistons.

Power brake boosters with ESP will have a travel sensor (7).

OPERATION

The atmospheric inlet valve is opened and closed by the primary push rod. Booster vacuum supply is through a hose attached to an intake manifold fitting at one end and to the booster check valve (7) at the other. The vacuum check valve in the booster housing is a one-way device that prevents vacuum leak back.

Power assist is generated by utilizing the pressure differential between normal atmospheric pressure and a vacuum. The vacuum needed for booster operation is taken directly from the engine intake manifold. The entry point for atmospheric pressure is through a filter and inlet valve at the rear of the housing.

The chamber areas forward of the booster diaphragms are exposed to vacuum from the intake manifold. The chamber areas to the rear of the diaphragms, are exposed to normal atmospheric pressure of 101.3 kilopascals (14.7 pounds/square in.).

Brake pedal application causes the primary push rod (1) to open the atmospheric inlet valve. This exposes the area behind the diaphragms to atmospheric pressure. The resulting pressure differential provides the extra apply force for power assist.

The booster check valve, check valve grommet (7) and booster seals are serviceable.

REMOVAL

1. Siphon the master cylinder.
2. Remove the primary brake line at the master cylinder.
3. Remove the primary brake line from the HCU (4).
4. Remove the secondary brake line at the master cylinder.
5. Remove the secondary brake line at the HCU (4).
6. Remove the 4 chassis lines (3) at the HCU.
7. Disconnect the HCU electrical connector (5).

8. Remove the 3 mounting nuts at the HCU bracket (2).
9. Remove the HCU(1) with the bracket from the vehicle.

10. Disconnect the brake fluid level sensor electrical connector (8) from the fluid reservoir (2).
11. Remove the 2 master cylinder mounting nuts (9).
12. Remove the master cylinder (6).
13. Disconnect vacuum hose at booster check valve (10).

14. Remove the hush panel (2).

15. Remove the steering column opening cover (2) and hush panel.

16. Remove retainer clip that holds booster push rod (1) on pedal pin (2). Then slide push rod off pin.

17. Disconnect the brake lamp switch wire connector.
18. Remove the brake lamp switch.
19. Remove four nuts (3) that attach booster to dash panel.

- In the engine compartment, disconnect the wire harness routing clips (3) and move the harness (1) to the side and downward.

- Remove the booster (1) from the vehicle.

INSTALLATION

- Check condition of grommet that secures check valve in booster. Replace grommet if cut, torn, or loose.
- Install new booster dash seal.
- Align and position booster in the mounting holes (2) of the dash panel.

4. Inside the vehicle, Lubricate pedal pin Mopar multi-mileage grease.

5. Install booster attaching nuts (3) on studs. Tighten attaching nuts to 39 N·m (29 ft. lbs.).

6. Slide booster push rod (1) on pedal pin. Then secure rod to pin with retainer clip.
7. Install a new brake lamp switch and reconnect the electrical connector.

8. Install the steering column opening cover (2).

9. Install the hush panel (2).

10. In engine compartment, attach vacuum hose to booster check valve (1).

11. Install the master cylinder to the power brake booster (1) with new gasket and nuts.

12. Reroute the wire harness (1) back into position and install the routing clip (3).

13. Reconnect the brake fluid level electrical connector (8).

14. Install the HCU (1) with bracket (2) to the vehicle and tighten the 2 mounting nuts.

15. Reconnect the HCU electrical connector (5).
16. Install the 4 chassis lines (3) at the HCU (4).
17. Install the secondary brake line at the HCU (4).
18. Install the secondary brake line at the master cylinder.
19. Install the primary brake line at the HCU (4).
20. Install the primary brake line at the master cylinder.
21. Fill and bleed brake system.

ROTORS

DIAGNOSIS AND TESTING

FRONT DISC BRAKE ROTOR

ROTOR MINIMUM THICKNESS

Rotor minimum usable thickness is 28.5 mm (1.122 in.). Do not resurface a rotor if machining would cause thickness to fall below this limit.

Measure rotor thickness at the center of the brake shoe contact surface. Replace the rotor if worn below minimum thickness, or if refinishing would reduce thickness below the allowable minimum.

FRONT ROTOR THICKNESS VARIATION

Variations in rotor thickness will cause pedal pulsation, noise and shudder.

Measure rotor thickness a minimum of six points around the rotor face. Position the micrometer approximately 19 mm (3/4 in.) from the rotor outer circumference for each measurement.

Thickness should not vary by more than 0.0127 mm (0.0005 in.) from point to point on the rotor. Refinish or replace the rotor if necessary.

NOTE: A hub mounted on-vehicle lathe is recommended. This type of lathe trues the rotor to the vehicles hub/bearing.

Front rotors and hub/bearings are matched mounted for minimum lateral runout. Before removing the rotor, mark the rotor and hub/bearing to maintain original orientation.

FRONT ROTOR LATERAL RUNOUT

Check rotor lateral runout whenever pedal pulsation, or rapid, uneven brake lining wear has occurred.

The rotor must be securely clamped to the hub to ensure an accurate runout measurement. Secure the rotor with a minimum of 3 lug nuts and large diameter flat washers on each stud.

Use a dial indicator to check lateral runout.

Maximum allowable rotor lateral runout is 0.05 mm (0.002 in.).

REAR DISC BRAKE ROTOR

ROTOR MINIMUM THICKNESS

Minimum usable thickness of the rear disc brake rotor is 12.5 mm (0.492 in.). The thickness specification is located on the center section of the rotor.

Never resurface a rotor if machining would cause thickness to fall below this limit.

Measure rotor thickness at the center of the brake shoe contact surface. Replace the rotor if worn below minimum thickness, or if refinishing would reduce thickness below the allowable minimum.

REAR ROTOR THICKNESS VARIATION

Variations in rotor thickness will cause pedal pulsation, noise and shudder.

Measure rotor thickness at a minimum of six points around the rotor face. Position the micrometer approximately 19 mm (3/4 in.) from the rotor outer circumference for each measurement.

Thickness should not vary by more than 0.0127 mm (0.0005 in.) from point to point on the rotor. Refinish or replace the rotor if necessary.

REAR ROTOR LATERAL RUNOUT

Check rotor lateral runout whenever diagnosis indicates pedal pulsation and rapid, uneven brake lining wear.

The rotor must be securely clamped to the hub to ensure an accurate runout measurement. Secure the rotor with the wheel nuts and 4 or 5 large diameter flat washers on each stud.

Use a dial indicator to check lateral runout. Maximum allowable lateral runout is 0.20 mm (0.0007 in.).

STANDARD PROCEDURE - DISC BRAKE ROTOR MACHINING

NOTE: A hub mounted on-vehicle lathe is recommended. This type of lathe trues the rotor to the vehicles hub/bearing.

The disc brake rotor can be machined if scored or worn. The lathe must machine both sides of the rotor simultaneously with dual cutter heads. The rotor mounting surface must be clean before placing on the lathe. Equipment capable of machining only one side at a time may produce a tapered rotor.

CAUTION: Brake rotors that do not meet minimum thickness specifications before or after machining must be replaced.

REMOVAL

FRONT DISC BRAKE ROTOR

NOTE: Front rotors and hub/bearings are matched mounted for minimum lateral runout. Before removing the rotor, mark the rotor and hub/bearing to maintain original orientation.

1. Raise and support the vehicle.
2. Remove wheel and tire assembly.
3. Remove the caliper adapter mounting bolts (3) and remove the caliper adapter from the steering knuckle.

4. Secure caliper anchor assembly to nearby suspension part with a wire. **Do not allow brake hose to support caliper weight.**
5. Remove and discard the o-ring (2) securing the disc brake rotor (1) on the hub.
6. Remove the disc brake rotor from hub/bearing.

REAR DISC BRAKE ROTOR

1. Raise and support the vehicle.
2. Remove wheel and tire assembly.
3. Remove the caliper slide bolts (4).

4. Remove caliper (1).
5. Secure caliper assembly (1) to nearby suspension part with wire. **Do not allow brake hose to support caliper weight.**

6. Remove and discard the o-ring (2) securing rotor (1) to axle studs.
7. Remove rotor (1) off axle studs.

INSTALLATION

FRONT DISC BRAKE ROTOR

1. Install the rotor (1) on hub studs.

2. Install the caliper adapter (1) on the knuckle (2). Install adapter bolts (3) and tighten to 90-115 N·m (66-85 ft. lbs.).

NOTE: Caliper slide pins should be free from debris and lightly lubricated.

3. Install the caliper (1) to the caliper adapter (4) and tighten the bolts to 72 N·m (53 ft. lbs.).
4. Gently lift one end of the slide pin boot to equalize air pressure, then release the boot and verify that the boot is fully covering the slide pin.
5. Install wheel and tire assembly.
6. Remove support and lower the vehicle.
7. Pump brake pedal to seat caliper pistons and brake pads. Do not move vehicle until firm brake pedal is obtained.

REAR DISC BRAKE ROTOR

1. Install rotor on axle studs.
2. Install the caliper assembly.
3. Install caliper slide bolts (4) and tighten to 90-115 N·m (66-85 ft. lbs.).

4. Install wheel and tire assembly.
5. Remove support and lower the vehicle.
6. Pump brake pedal until caliper pistons and brake shoes are seated.

DISC BRAKE CALIPER ADAPTER

REMOVAL

1. Raise and support the vehicle.
2. Remove the front wheel and tire assembly.
3. Remove the caliper (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
4. Remove the disc brake caliper (1) from the adapter (4).

CAUTION: Never allow the disc brake caliper to hang from the brake hose. Damage to the brake hose will result. Provide a suitable support to hang the caliper securely.

5. Remove the inboard and outboard brake pads. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - REMOVAL).

- Remove the caliper adapter mounting bolts (3).

INSTALLATION

- Install the caliper adapter mounting bolts (3). Tighten the mounting bolts to 169 N·m (125 ft.lbs).
- Install the inboard and outboard pads. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSTALLATION).

- Install the caliper (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
- Install the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

SUPPORT PLATE

REMOVAL

1. Remove wheel and tire assembly.
2. Remove the disc brake caliper slide bolts (4) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).

3. Remove the rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).

4. Remove the wheel speed sensor (2).

5. Remove the axle flange nuts (1).

6. Remove the axle shaft (1) (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - C213R/AXLE SHAFTS - REMOVAL).

- 7. Remove the park brake shoes (1) (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - REMOVAL).

- 8. Remove the parking brake cable from the brake actuator lever (4).

- 9. Remove the support plate from the axle tube.

INSTALLATION

1. Install support plate on axle flange. Tighten attaching bolts (3) to 115 N·m (85 ft. lbs.).
2. Install parking brake cable in the brake actuator lever (4).

3. Install the park brake shoes (1) (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - INSTALLATION).

4. Install axle shaft (1), (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - C213R/AXLE SHAFTS - INSTALLATION).

5. Install the axle shaft flange nuts (1).

6. Install the wheel speed sensor (2).

7. Adjust brake shoes to drum with brake gauge (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - ADJUSTMENTS).

8. Install the rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).

9. Install the caliper and the slide bolts (4) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
10. Install the wheel and tire assembly (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

PARKING BRAKE

OPERATION

The parking brakes operated by a automatic tensioner mechanism built into the hand lever and cable system. The front cable is connected to the hand lever and the equalizer. The rear cables attached to the equalizer and the parking brake shoe actuator.

A set of drum type brake shoes are used for parking brakes. The shoes are mounted to the rear disc brake adaptor. The parking brake drum is integrated into the rear disc brake rotor.

Parking brake cable adjustment is controlled by an automatic tensioner mechanism. The only adjustment if necessary is to the park brake shoes if the linings are worn.

DIAGNOSIS AND TESTING - PARKING BRAKE

NOTE: Parking brake adjustment is controlled by an automatic cable tensioner and does not require adjustment. The only adjustment that may be necessary would be to the park brake shoes if they are worn.

The parking brake switch is in circuit with the red warning lamp in the dash. The switch will cause the lamp to illuminate only when the parking brakes are applied. If the lamp remains on after parking brake release, the switch or wires are faulty.

If the red lamp comes on a fault has occurred in the front or rear brake hydraulic system.

If the red warning lamp and yellow warning lamp come on, the electronic brake distribution may be at fault.

In most cases, the actual cause of an improperly functioning parking brake (too loose/too tight/won't hold), can be traced to a parking brake component.

NOTE: The leading cause of improper parking brake operation, is excessive clearance between the parking brake shoes and the shoe braking surface. Excessive clearance is a result of lining and/or drum wear, drum surface machined oversize.

Excessive parking brake lever travel (sometimes described as a loose lever or too loose condition), is the result of worn brake shoes, improper brake shoe adjustment, or improperly assembled brake parts.

A too loose condition can also be caused by inoperative or improperly assembled parking brake shoe parts.

A condition where the parking brakes do not hold, will most probably be due to a wheel brake component.

Items to look for when diagnosing a parking brake problem, are:

- Brake shoe wear
- Drum surface (in rear rotor) machined oversize
- Front cable not secured to lever
- Rear cable not attached to actuator
- Rear cable seized
- Parking brake lever not seated
- Parking brake lever bind

CABLES

REMOVAL

FRONT PARKING BRAKE CABLE

1. Disconnect the negative battery cable.
2. Remove the drivers seat (Refer to 23 - BODY/ SEATS/SEAT - REMOVAL).

8141ba72

3. Remove the left sill plate.
4. Remove the left B-pillar trim panel (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - REMOVAL).

5. Remove the console rear cover (2) or the DVD player (if equipped).

6. Remove center console (1), (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).

7. Remove the rear seat bottom (Refer to 23 - BODY/ SEATS/SEAT CUSHION - REMOVAL).

8. Disconnect the modules electrical connectors (1).
9. Remove the module mounting nuts from the bracket (2).

10. Remove the rear sill plates.
11. Pull and roll the rear carpet upwards to gain access to the front park brake cable.

12. Lock out the front park brake cable.
13. Remove the front cable (2) at the equalizer (1).

14. Remove the 2 front cable routing clamps and the 3 nuts (2&4).
15. Remove the front cable at the rear floor bracket.
16. Remove the front cable (3) at the hand lever (1).
17. Remove the front cable at the hand lever mounting bracket.

REAR PARKING BRAKE CABLES

1. Remove the rear seat bottom (Refer to 23 - BODY/ SEATS/SEAT CUSHION - REMOVAL).

2. Disconnect the (FDCM) final drive control module electrical connectors (1).
3. Remove the (FDCM) module bracket (2) mounting nuts.

4. Remove the rear sill plates.
5. Roll the carpet back to access the rear park brake cables.

6. Lock-out the park brake cable (1).

7. Disconnect the brake cables from the equalizer (1).

8. Remove the park brake cables (2) thru the floor (1).

9. Raise and support the vehicle.
10. Remove the tire and wheel assembly.
11. Remove the rear caliper (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).

12. Remove the disc brake rotor.

13. Remove the axle flange bolts (1).

14. Remove the axle (1).

813221e9

15. Disconnect the park brake cable at the brake actuator lever (2).

16. Disconnect the rear park brake shoes (1) (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - REMOVAL).

8141b505

17. Remove the park brake cable (2) thru the support plate.

18. Remove the stabilizer bar bushing clamp bolts.

19. Remove the 2 push pins for the park brake cable to the axle.

20. Remove the cable (2) from the vehicle.

814192ac

INSTALLATION

FRONT PARKING BRAKE CABLE

1. Install the front cable (3) at the hand lever mounting bracket (1).
2. Install the front cable (3) at the hand lever (1).
3. Install the front cable at the rear floor bracket.
4. Install the 2 front cable routing clamps and the 3 nuts (2&4).

5. Install the front cable (2) at the equalizer (1).

6. Unlock the front park brake cable (1).

7. Install the rear carpet back in place.
8. Install the module bracket (2) mounting nuts.
9. Reconnect the module electrical connectors (1).

10. Install the rear sill plates.

11. Install the drivers seat (Refer to 23 - BODY/ SEATS/SEAT - INSTALLATION).

12. Install the left B-pillar trim panel (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - INSTALLATION).

13. Install the left sill plate.

14. Install the center console (1) (Refer to 23 - BODY/ INTERIOR/FLOOR CONSOLE - INSTALLATION).

15. Install the console rear cover (2) or the DVD player (if equipped).

16. Install the rear seat bottom (Refer to 23 - BODY/ SEATS/SEAT CUSHION - INSTALLATION).
17. Reconnect the negative battery cable.

REAR PARKING BRAKE CABLES

1. Install the cable (2) to the vehicle.
2. Install the 2 push pins for the park brake cable to the stabilizer bar bracket.
3. Install the stabilizer bar bushing clamp bolts.
4. Install the park brake cable (2) into the support plate.

5. Reconnect the park brake cable at the brake actuator lever (2).
6. Reconnect the rear park brake shoes (1) (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - INSTALLATION).

7. Install the axle shaft (1).

8. Install the axle flange nuts (1). (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - C213R/AXLE SHAFTS - INSTALLATION).

9. Adjust rear park brake shoes (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - ADJUSTMENTS).
10. Install the disc brake rotor.

11. Install the rear caliper (1) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALI-PERS - INSTALLATION).

12. Install the park brake cables (2) thru the floor (1).

- 13. Install the tire and wheel assembly.
- 14. Lower the vehicle.
- 15. Reconnect the brake cables to the equalizer (1).

16. Unlock the park brake cable (1).

17. Fold down the rear carpet.

18. Install the rear sill plates.

19. Install the (FDCM) module bracket (2) mounting nuts.

20. Reconnect the (FDCM) module electrical connectors (1).

21. Install the rear seat bottom (Refer to 23 - BODY/ SEATS/SEAT CUSHION - INSTALLATION).

22. Verify parking brake operation.

LEVER

REMOVAL

1. Remove the console rear cover (2) or DVD player (if equipped).

2. Remove the center console (1), (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).

3. Disconnect the park brake switch wire connector.
4. Lock out the park brake hand lever.

5. Disconnect the front cable (3) at the hand brake lever (1).
6. Remove the 3 hand brake lever mounting bolts (2).
7. Disconnect the wire harness routing clips to the lever.
8. Pull the hand lever (1) up to remove the front cable (3).

INSTALLATION

1. Reconnect the wire harness routing clips to the lever.
2. Reconnect the front cable (3) at the hand brake lever (1).
3. Install the 3 hand brake lever (1) mounting bolts.
4. Unlock out the park brake hand lever (1).
5. Reconnect the park brake switch wire connector.
6. Check the operation of the parking brake lever (1) and cable (3).

7. Install the center console (1), (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE INSTALLATION).

8. Install the rear cover (2) or the DVD player (if equipped).

SHOES

DESCRIPTION

Drum in hat park brakes are dual shoe, internal expanding units with an automatic self adjusting mechanism.

OPERATION

When the parking brake pedal is depressed the brake cable pulls the brake shoes outward against the brake drum. When the brake pedal is released the return springs attached to the brake shoes pull the shoes back to there original position.

REMOVAL

1. Raise vehicle.
2. Remove rear wheel and tire assembly.
3. Remove the 2 caliper bolts (4) then remove the caliper **Support the caliper, Do not let the caliper hang by the brake hose..**

4. Remove rubber access plug (1) from back of rear disc brake support plate (3).
5. If necessary retract parking brake shoes with brake adjuster tool (2). Position tool at top of star wheel and rotate wheel.

6. Remove rotor from axle hub flange.

7. Remove the four axle flange nuts (1).

8. Remove the axle shaft (1) from the rear differential (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - C213R/AXLE SHAFTS - REMOVAL).

9. Remove the shoe to shoe return spring (6) with needle nose pliers & then remove the adjuster (5).
10. Remove the shoe to shoe return spring (3) with brake pliers.
11. Remove shoe hold-down clips (4) and pins. Clip is held in place by pin which fits in clip notch. To remove clip, first push clip ends together and slide clip until head of pin clears narrow part of notch. Then remove clip (4) and pin.
12. Remove shoes (1) off the actuator lever (2) for the park brake then remove the shoes (1).

CLEANING - REAR DRUM IN HAT BRAKE

Clean the individual brake components, including the support plate exterior, with a water dampened cloth or with brake cleaner. Do not use any other cleaning agents. Remove light rust and scale from the brake shoe contact pads on the support plate with fine sandpaper.

INSPECTION - REAR DRUM IN HAT BRAKE

As a general rule, riveted brake shoes should be replaced when worn to within 0.78 mm (1/32 in.) of the rivet heads. Bonded lining should be replaced when worn to a thickness of 1.6 mm (1/16 in.).

Examine the lining contact pattern to determine if the shoes are bent or the drum is tapered. The lining should exhibit contact across its entire width. Shoes exhibiting contact only on one side should be replaced and the drum checked for runout or taper.

Inspect the adjuster screw assembly. Replace the assembly if the star wheel or threads are damaged, or the components are severely rusted or corroded.

Discard the brake springs and retainer components if worn, distorted or collapsed. Also replace the springs if a brake drag condition had occurred. Overheating will distort and weaken the springs.

Inspect the brake shoe contact pads on the support plate, replace the support plate if any of the pads are worn or rusted through. Also replace the plate if it is bent or distorted.

INSTALLATION

1. Install the park brake shoes (1) onto the actuator lever (2).
2. Install shoes on support plate with hold down clips and pins (4). Be sure shoes are properly engaged in the park brake actuator lever (2).
3. Install the return spring (3).
4. Lubricate and install adjuster screw assembly (5). Be sure notched ends of screw assembly are properly seated on shoes and that star wheel is aligned with access hole in the support plate.
5. Install shoe to shoe adjuster spring (6). Needle nose pliers can be used to connect spring to each shoe.

6. Install the axle shaft (1) to the rear differential (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - C213R/AXLE SHAFTS - INSTALLATION).

7. Install and tighten the axle flange nuts (1).

8. Install rotor to the axle hub.

9. Install the caliper and the 2 mounting bolts (4) to 90-115 N·m (66-85 ft. lbs.).

10. Adjust the parking brake shoes.
11. Install wheel and tire assembly.
12. Lower vehicle and verify correct parking brake operation.

ADJUSTMENTS

ADJUSTMENT - REAR DRUM IN HAT PARK BRAKE (ROTOR REMOVED)

Under normal circumstances, the only time adjustment is required is when the shoes are replaced, removed for access to other parts, or when one or both rotors are replaced.

Adjustment can be made with a standard brake gauge or with adjusting tool. Adjustment is performed with the complete brake assembly installed on the backing plate.

CAUTION: Before adjusting the park brake shoes be sure that the park brake pedal is in the fully released position. If park brake pedal is not in the fully released position, the park brake shoes can not be accurately adjusted.

1. Raise vehicle.
2. Remove tire and wheel.
3. Remove disc brake caliper from caliper adapter (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
4. Remove rotor from the axleshaft (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).

NOTE: When measuring the brake drum diameter, the diameter should be measured in the center of the area in which the park brake shoes contact the surface of the brake drum.

5. Using Brake Shoe Gauge, Special Tool C-3919 (1), or equivalent, **accurately** measure the inside diameter of the park brake drum portion of the rotor.
6. Using a ruler (2) that reads in 64th of an inch, accurately read the measurement of the inside diameter of the park brake drum from the special tool.

7. Reduce the inside diameter measurement of the brake drum that was taken using Special Tool C-3919 (2) by 1/64 of an inch. Reset Gauge, Brake Shoe, Special Tool C-3919 (2) or the equivalent used, so that the outside measurement jaws are set to the reduced measurement.
8. Place Gauge, Brake Shoe, Special Tool C-3919 (2) , or equivalent over the park brake shoes. The special tool must be located diagonally across at the top of one shoe and bottom of opposite shoe (widest point) of the park brake shoes.
9. Using the star wheel adjuster, adjust the park brake shoes until the lining on the park brake shoes just touches the jaws on the special tool.
10. Repeat step 8 above and measure shoes in both directions.

11. Install brake rotor on the axleshaft (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
12. Rotate rotor to verify that the park brake shoes are not dragging on the brake drum. If park brake shoes are dragging, remove rotor and back off star wheel adjuster one notch and recheck for brake shoe drag against drum. Continue with the previous step until brake shoes are not dragging on brake drum.
13. Install disc brake caliper on caliper adapter (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
14. Install wheel and tire.
15. Tighten the wheel mounting nuts in the proper sequence until all nuts are torqued to half the specified torque. Then repeat the tightening sequence to the full specified torque of 129 N-m (95 ft. lbs.).
16. Lower vehicle.

CAUTION: Before moving vehicle, pump brake pedal several times to ensure the vehicle has a firm enough pedal to stop the vehicle.

NOTE: After parking brake lining replacement, it is recommended that the parking brake system be conditioned prior to use. This is done by making one stop from 25 mph on dry pavement or concrete using light to moderate force on the parking brake hand lever.

17. Road test the vehicle to ensure proper function of the vehicle's brake system.

ADJUSTMENT - WITH ADJUSTING TOOL

Adjustment can be made with a standard brake gauge or with adjusting tool. Adjustment is performed with the complete brake assembly installed on the backing plate.

1. Be sure parking brake lever is fully released.
2. Raise vehicle so rear wheels can be rotated freely.
3. Remove plug from each access hole in brake support plates.
4. Loosen parking brake cable adjustment nut until there is slack in front cable.
5. Insert adjusting tool through support plate access hole and engage tool in teeth of adjusting screw star wheel.

6. Rotate adjuster screw star wheel (move tool handle upward) until slight drag can be felt when wheel is rotated.
7. Push and hold adjuster lever away from star wheel with thin screwdriver.
8. Back off adjuster screw star wheel until brake drag is eliminated.
9. Repeat adjustment at opposite wheel. Be sure adjustment is equal at both wheels.
10. Install support plate access hole plugs.
11. Adjust parking brake cable and lower vehicle.
12. Depress park brake lever and make sure park brakes hold the vehicle stationary.
13. Release park brake lever.

BRAKES - ABS - SERVICE INFORMATION

DESCRIPTION

ANTILOCK BRAKE SYSTEM WITH TRACTION CONTROL

This vehicle uses the MK25 Antilock braking system (ABS). This system, a combined ABS and Traction Control system is standard on some vehicles and optional on others.

This antilock brake system uses components of the base brake system, but also features the following components:

- Integrated Control Unit (ICU) - Includes Hydraulic Control Unit (HCU) (2) and Antilock Brake Module (ABM) (3)
- Wheel Speed Sensors (WSS) - Four sensors (one at each wheel)

ABS

The purpose of the antilock brake system (ABS) is to prevent wheel lockup under braking conditions on virtually any type of road surface. Antilock braking is desirable because a vehicle that is stopped without locking the wheels retains directional stability and some steering capability. This allows the driver to retain greater control of the vehicle during braking.

ALL-SPEED TRACTION CONTROL

The traction control system is an all-speed traction control. All-Speed Traction Control enhances mobility and prevents wheel slip when accelerating on slippery surfaces. Depending on how slippery, an automatically activated Winter Mode feature will select lower transmission up-shift speeds. It also provides a measure of directional stability control. Using the wheel-speed sensors, it can detect excessive yaw and help keep the car on the intended course, as for instance, when accelerating around a curve.

With rear-wheel drive, All-Speed Traction Control is effective up to 85 mph (137 km/h); with AWD, All-Speed Traction Control is effective up to 45 mph (72 km/h), which is common among competitive AWD vehicles with traction control.

ELECTRONIC STABILITY PROGRAM

ESP® (Electronic Stability Program), which includes a Brake Assist feature, is standard on some models and optional on others. ESP aids the driver in maintaining vehicle directional stability. ESP will do whatever can be done, within the limits of available traction, to keep the car on course.

ESP uses the ABS with Traction Control along with the following components to operate:

- Active Brake Booster
- Brake Pressure Switch
- Dynamics Sensor
- Steering Angle Sensor (SAS)

The Active Brake Booster is part of the Power Brake Booster. The Brake Pressure Switch is mounted to the bottom of the Master Cylinder. The Dynamics Sensor that is mounted under the center console, which is near the center of gravity of the car for effective sensing. The Travel Sensor is mounted in the Power Brake Booster. The Steering Angle Sensor is located in the steering column.

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Vehicles equipped with ABS use electronic variable brake proportioning (EVBP) to balance front-to-rear braking. The EVBP is used in place of a rear proportioning valve. The EVBP system uses the ABS system to control the slip of the rear wheels in partial braking range. The braking force of the rear wheels is controlled electronically by using the inlet and outlet valves located in the integrated control unit (ICU).

EVBP activation is invisible to the customer since there is no pump motor noise or brake pedal feedback.

OPERATION

ANTILOCK BRAKE SYSTEM WITH TRACTION CONTROL

ABS

There are a few performance characteristics of the MK25 Antilock Brake System that may at first seem abnormal, but in fact are normal. These characteristics are described below.

NORMAL BRAKING

Under normal braking conditions, the ABS functions the same as a standard base brake system with a diagonally split master cylinder and conventional vacuum assist.

ABS BRAKING

ABS operation is available at all vehicle speeds above 3–5 mph. If a wheel locking tendency is detected during a brake application, the brake system enters the ABS mode. During ABS braking, hydraulic pressure in the four wheel circuits is modulated to prevent any wheel from locking. Each wheel circuit is designed with a set of electric solenoids to allow modulation, although for vehicle stability, both rear wheel solenoids receive the same electrical signal. Wheel lockup may be perceived at the very end of an ABS stop and is considered normal.

During an ABS event, the integrated control unit (ICU) regulates hydraulic pressure at all 4 of the vehicle's wheels.

The hydraulic pressure at each front wheel is controlled independently (relative to the amount of slip at each wheel) in order to maximize the braking force generated by the front brakes. The rear wheels are controlled such that the hydraulic pressure at either rear wheel does not exceed that of the highest slip rear wheel in order to maintain vehicle stability.

The system can build and release pressure at each wheel, depending on signals generated by the wheel speed sensors (WSS) at each wheel and received at the Antilock Brake Module (ABM).

NOISE AND BRAKE PEDAL FEEL

During ABS braking, some brake pedal movement may be felt. In addition, ABS braking will create ticking, popping, or groaning noises heard by the driver. This is normal and is due to pressurized fluid being transferred between the master cylinder and the brakes. If ABS operation occurs during hard braking, some pulsation may be felt in the vehicle body due to fore and aft movement of the suspension as brake pressures are modulated.

At the end of an ABS stop, ABS is turned off when the vehicle is slowed to a speed of 3–4 mph. There may be a slight brake pedal drop anytime that the ABS is deactivated, such as at the end of the stop when the vehicle speed is less than 3 mph or during an ABS stop where ABS is no longer required. These conditions exist when a vehicle is being stopped on a road surface with patches of ice, loose gravel, or sand on it. Also, stopping a vehicle on a bumpy road surface activates ABS because of the wheel hop caused by the bumps.

TIRE NOISE AND MARKS

Although the ABS system prevents complete wheel lockup, some wheel slip is desired in order to achieve optimum braking performance. Wheel slip is defined as follows: 0 percent slip means the wheel is rolling freely and 100 percent slip means the wheel is fully locked. During brake pressure modulation, wheel slip is allowed to reach up to 25–30 percent. This means that the wheel rolling velocity is 25–30 percent less than that of a free rolling wheel at a given vehicle speed. This slip may result in some tire chirping, depending on the road surface. This sound should not be interpreted as total wheel lockup.

Complete wheel lockup normally leaves black tire marks on dry pavement. The ABS will not leave dark black tire marks since the wheel never reaches a fully locked condition. However, tire marks may be noticeable as light patched marks.

START-UP AND DRIVE-OFF CYCLES

When the ignition is turned on, a popping sound and a slight brake pedal movement may be noticed. The ABS warning lamp will also be on for up to 5 seconds after the ignition is turned on.

When the vehicle is first driven off, a humming may be heard or felt by the driver at approximately 12–25 mph (20–40 km/h). All of these conditions are a normal function of ABS as the system is performing a diagnosis check.

PREMATURE ABS CYCLING

Symptoms of premature ABS cycling include: clicking sounds from the solenoid valves; pump/motor running; and pulsations in the brake pedal. Premature ABS cycling can occur at any braking rate of the vehicle and on any type of road surface. Neither the red BRAKE indicator lamp, nor the amber ABS indicator lamp, illuminate and no fault codes are stored in the CAB.

Premature ABS cycling is a condition that needs to be correctly assessed when diagnosing problems with the antilock brake system. It may be necessary to use a scan tool to detect and verify premature ABS cycling.

Check the following common causes when diagnosing premature ABS cycling: damaged wheel bearings (causing tone wheel issues); damaged wheel bearing housings where wheel speed sensors mount; and loose wheel speed sensor mounting bolts.

After diagnosing the defective component, repair or replace it as required. When the component repair or replacement is completed, test drive the vehicle to verify that premature ABS cycling has been corrected.

ALL-SPEED TRACTION CONTROL

Traction control systems sense impending wheel spin based on a model of the rate of change of wheel speed under normal traction conditions. The All-Speed Traction Control uses signals from the same wheel speed sensors as ABS to determine when to apply the brakes to one or more wheels and when to reduce engine torque output using the electronic throttle control (ETC) to prevent wheel slip during acceleration. Throttle control makes the vehicle less reliant on brake application alone to maintain traction, increasing the operating speed range and more closely modulates speed, resulting in smoother operation. With All-Speed Traction Control reducing engine torque as well as applying the brakes, it is possible to achieve almost seamless torque application at the wheels.

If the wheel slip is severe enough to require throttle intervention, All-Speed Traction Control will reduce engine torque and sometimes upshift the transmission to avoid the condition. In milliseconds, All-Speed Traction Control interrogates the engine control system to determine the current torque output, determines how much the torque output the current conditions will allow, and signals this requirement to the engine control system, which reduces the torque by partially closing the throttle. With execution of the torque reduction, the brake system reduces brake pressure to make the transition smooth, while maintaining forward progress. By reducing engine power, braking effectiveness is maintained and the system can operate throughout the normal vehicle speed range. That is why the system is identified as providing “all-speed” traction control.

With AWD, where front-wheel slip can occur, the degree of throttle intervention is relatively less than with rear-wheel drive. The difference in speed capability and the degree of throttle intervention between rear-wheel drive and all-wheel drive is due to the fact that non-driven front wheels on a rear-wheel drive vehicle give the system an accurate vehicle speed reference on which to base responses. With AWD, the possibility that the front wheels may also be slipping makes appropriate corrective action more difficult to determine, thus limiting the effective speed range. Offsetting this is the fact that loss of traction is less likely with AWD because torque is transmitted through all four wheels to begin with. In actual driving situations on snow or ice, the rear-wheel drive and AWD systems respond in essentially the same way up to the 45 mph (72 km/h) limit of the AWD system.

When severe wheel slippage is detected (as on snow-covered roads), the Winter Mode feature of All-Speed Traction Control causes the transmission to up-shift to higher gears at lower speeds than normal. Once a slippery launch condition is detected, the transmission will remain in Winter Mode for a minimum of three minutes. After that, if the road is providing normal traction, the system returns to providing normal up-shifts.

ELECTRONIC STABILITY PROGRAM

To determine whether the car is responding properly to cornering commands, ESP uses steering wheel angle, yaw (turning) rate and lateral acceleration sensors (combined into Dynamics Sensor). Using signals from these sensors,

in addition to individual wheel speed sensor signals, the system determines appropriate brake and throttle actions. Once initiated, ESP operates much like All-Speed Traction Control, except that the goal is directional stability. If the vehicle yaw response, or rate of turning, is inconsistent with the steering angle and vehicle speed indications, the ESP system applies the brakes and, if necessary closes the throttle, to restore control. This occurs whether the vehicle is turning too rapidly (oversteering) or not rapidly enough (understeering).

ESP notifies the active brake booster electronically of the need for maximum output. A solenoid opens a valve in the booster that immediately applies maximum boost to the master cylinder. A travel sensor in the booster detects the rate and travel of the brake pedal. Above the threshold of an "extreme" brake application, ESP activates the solenoid, thus applying maximum available hydraulic pressure to the brakes. In this type of situation, stopping distance is determined by the ABS system based on available traction, rather than the amount of force that the driver can exert on the brake pedal. This becomes the deciding factor in how quickly the vehicle will stop.

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Upon entry into EVBP the inlet valve for the rear brake circuit is switched ON so that the fluid supply from the master cylinder is shut off. In order to decrease the rear brake pressure, the outlet valve for the rear brake circuit is pulsed. This allows fluid to enter the low pressure accumulator (LPA) in the Hydraulic Control Unit (HCU) resulting in a drop in fluid pressure to the rear brakes. In order to increase the rear brake pressure, the outlet valve is switched off and the inlet valve is pulsed. This increases the pressure to the rear brakes. This back-and-forth process will continue until the required slip difference is obtained. At the end of EVBP braking (brakes released) the fluid in the LPA drains back to the master cylinder by switching on the outlet valve and draining through the inlet valve check valve. At the same time the inlet valve is switched on in case of another brake application.

The EVBP will remain functional during many ABS fault modes. If both the red BRAKE and amber ABS warning indicators are illuminated, the EVBP may not be functioning.

DIAGNOSIS AND TESTING - ANTILOCK BRAKES

The ABS brake system performs several self-tests every time the ignition switch is turned on and the vehicle is driven. The ABM monitors the systems input and output circuits to verify the system is operating correctly. If the on board diagnostic system senses that a circuit is malfunctioning the system will set a trouble code in its memory.

NOTE: An audible noise may be heard during the self-test. This noise should be considered normal.

NOTE: The scan tool is used to diagnose the ABS system. For additional information refer to the Electrical section. For test procedures refer to the Chassis Diagnostic Manual.

STANDARD PROCEDURE - BLEEDING ABS BRAKE SYSTEM

ABS system bleeding requires conventional bleeding methods plus use of the DRB scan tool. The procedure involves performing a base brake bleeding, followed by use of the scan tool to cycle and bleed the HCU pump and solenoids. A second base brake bleeding procedure is then required to remove any air remaining in the system.

1. Perform base brake bleeding. (Refer to 5 - BRAKES - STANDARD PROCEDURE) OR (Refer to 5 - BRAKES - STANDARD PROCEDURE).
2. Connect scan tool to the Data Link Connector.
3. Select ANTILOCK BRAKES, followed by MISCELLANEOUS, then ABS BRAKES. Follow the instructions displayed. When scan tool displays TEST COMPLETE, disconnect scan tool and proceed.
4. Perform base brake bleeding a second time. (Refer to 5 - BRAKES - STANDARD PROCEDURE) OR (Refer to 5 - BRAKES - STANDARD PROCEDURE).
5. Top off master cylinder fluid level and verify proper brake operation before moving vehicle.

SENSOR-FRONT WHEEL SPEED

DESCRIPTION

A wheel speed sensor is used at each wheel. The front sensors are mounted to the steering knuckles. The rear sensors are mounted at the outboard end of the axle. Tone wheels are mounted to the outboard ends of the front and rear axle shafts. The gear type tone wheel serves as the trigger mechanism for each sensor.

OPERATION

The sensors convert wheel speed into a small digital signal. The ABM sends 12 volts to the sensors. The sensor has an internal magneto resistance bridge that alters the voltage and amperage of the signal circuit. This voltage and amperage is changed by magnetic induction when the toothed tone wheel passes the wheel speed sensor. This digital signal is sent to the ABM. The ABM measures the voltage and amperage of the digital signal for each wheel.

REMOVAL

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly.
3. Remove the caliper adaptor bolts. **Support the caliper and adaptor assembly Do Not let assembly hang by the hose.** (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
4. Remove the disc brake rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).

5. Remove the front wheel sensor mounting nut (2) to the hub (3).
6. Remove the wheel speed sensor (1) from the hub (3).

7. Disconnect the wire sensor routing clips (2).
8. Disconnect the wheel speed sensor wire connector (1).
9. Remove the sensor and wire.

INSTALLATION

1. Reconnect the wheel speed sensor wire connector (1).
2. Reroute and connect the wheel speed sensor wire to the routing clips (2).

3. Install the wheel speed sensor into the hub (3) and the install the mounting nut (2) and tighten the nut to 12-14 N·m (106-124 in. lbs.).
4. Check the sensor wire routing (1). Be sure the wire is clear of all chassis components and is not twisted or kinked at any spot.

5. Install the disc brake rotor (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - INSTALLATION).
6. Install the caliper adaptor over the rotor.
7. Install the caliper adaptor bolts and tighten to 90-115 N·m (66-85 ft. lbs.) (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
8. Install the tire and wheel assembly.
9. Remove the support and lower vehicle.

SENSOR-REAR WHEEL SPEED

DESCRIPTION

A wheel speed sensor is used at each wheel. The front sensors are mounted to the steering knuckles. The rear sensors are mounted at the outboard end of the axle. Tone wheels are mounted to the outboard ends of the front and rear axle shafts. The gear type tone wheel serves as the trigger mechanism for each sensor.

OPERATION

The sensors convert wheel speed into a small digital signal. The ABM sends 12 volts to the sensors. The sensor has an internal magneto resistance bridge that alters the voltage and amperage of the signal circuit. This voltage and amperage is changed by magnetic induction when the toothed tone wheel passes the wheel speed sensor. This digital signal is sent to the ABM. The ABM measures the voltage and amperage of the digital signal for each wheel.

REMOVAL

1. Raise and support the vehicle.
2. Remove the wheel speed sensor mounting bolt (2) from the rear support plate (1).

3. Remove the wheel speed sensor (3) from the support plate.
4. Disconnect the wheel speed sensor electrical connector (3).

INSTALLATION

1. Insert the wheel speed sensor (2) through the support plate (1).
2. Tighten the wheel speed sensor bolt (2) to 12-14 N·m (106-124 in. lbs.).

3. Secure the wheel speed sensor wire (3) to the routing clips. Verify that the sensor wire is secure and clear of the rotating components.
4. Reconnect the wheel speed sensor electrical connector (3).
5. Lower the vehicle.

SENSOR-BRAKE PRESSURE

REMOVAL

1. Disconnect wiring harness (4) connector from pressure switch (5).
2. Remove pressure switch (5) on bottom of master cylinder.

INSTALLATION

1. Install pressure switch (5) on bottom of master cylinder. Tighten switch to 28 N·m (250 in. lbs.) torque.
2. Connect wiring harness (4) connector to pressure switch (5).
3. Fill master cylinder fluid reservoir (2) with clean, fresh Mopar® Brake Fluid or equivalent.
4. Perform Verification Test and clear any faults. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING).

SENSOR-DYNAMICS

DESCRIPTION

The Yaw Rate and Lateral Acceleration Sensors are housed into one unit known as the Dynamics Sensor (1). The sensor is used to measure side-to-side (Lateral) motion and vehicle rotational sensing (how fast the vehicle is turning - Yaw).

Yaw and Lateral Acceleration Sensors cannot be serviced separately. The entire Dynamics Sensor (1) must be replaced when necessary.

REMOVAL

1. Remove the center console (Refer to 23 - BODY/ INTERIOR/FLOOR CONSOLE - REMOVAL).
2. Disconnect electrical connector (3) from the dynamics sensor (1).
3. Remove the two nuts (2) securing the sensor to the floor.
4. Remove the sensors.

INSTALLATION

1. Install the dynamics sensor (1) to the vehicle.
2. Install the electrical connector (3)
3. Install the two retaining nuts (2).
4. Install the floor console.

SENSOR-STEERING ANGLE

DESCRIPTION

Under transient cornering conditions the lateral acceleration sensor does not measure the true sway force on the car. In order to compensate for this the system uses the driver's steering command (Steering angle sensor) and vehicle speed to estimate the true sway force. This signal is matched with the lateral acceleration sensor signal to ensure a significantly-reduced transient sway of the vehicle body.

REMOVAL

1. For removal of the steering angle sensor (Refer to 19 - STEERING/COLUMN/STEERING CONTROL MODULE - REMOVAL).

INSTALLATION

1. For installation of the steering angle sensor (Refer to 19 - STEERING/COLUMN/STEERING CONTROL MODULE - INSTALLATION).

SENSOR-G

DESCRIPTION

G-SENSOR - WITH ESP

The G-sensor is housed internally in with the dynamics sensor (1) located under the center console. The dynamics sensor component can be replaced as one component only. The G-sensor is not serviceable separately.

G-SENSOR - WITHOUT ESP

The G-sensor is located inside the ABM (Antilock Brake Module) (1). The sensor is not a separate serviceable part from the ABM (1).

HCU (HYDRAULIC CONTROL UNIT)

DESCRIPTION

The HCU consists of a valve body, pump motor, and wire harness.

OPERATION

Accumulators in the valve body store extra fluid released to the system for ABS mode operation. The pump is used to clear the accumulator of brake fluid and is operated by a DC type motor. The motor is controlled by the ABM.

The valves modulate brake pressure during antilock braking and are controlled by the ABM.

The HCU provides three channel pressure control to the front and rear brakes. One channel controls the rear wheel brakes in tandem. The two remaining channels control the front wheel brakes individually.

During antilock braking, the solenoid valves are opened and closed as needed. The valves are not static. They are cycled rapidly and continuously to modulate pressure and control wheel slip and deceleration.

During normal braking, the HCU solenoid valves and pump are not activated. The master cylinder and power booster operate the same as a vehicle without an ABS brake system.

During antilock braking, solenoid valve pressure modulation occurs in three stages, pressure increase, pressure hold, and pressure decrease. The valves are all contained in the valve body portion of the HCU.

PRESSURE DECREASE

The outlet valve is opened and the inlet valve is closed during the pressure decrease cycle.

A pressure decrease cycle is initiated when speed sensor signals indicate high wheel slip at one or more wheels. At this point, the ABM closes the inlet then opens the outlet valve, which also opens the return circuit to the accumulators. Fluid pressure is allowed to bleed off (decrease) as needed to prevent wheel lock.

Once the period of high wheel slip has ended, the ABM closes the outlet valve and begins a pressure increase or hold cycle as needed.

PRESSURE HOLD

Both solenoid valves are closed in the pressure hold cycle. Fluid apply pressure in the control channel is maintained at a constant rate. The ABM maintains the hold cycle until sensor inputs indicate a pressure change is necessary.

PRESSURE INCREASE

The inlet valve is open and the outlet valve is closed during the pressure increase cycle. The pressure increase cycle is used to counteract unequal wheel speeds. This cycle controls re-application of fluid apply pressure due to changing road surfaces or wheel speed.

REMOVAL

1. Remove the negative battery cable from the battery.
2. Install a brake pedal prop rod.
3. Siphon the master cylinder.

4. Remove the primary brake line at the master cylinder.
5. Remove the primary brake line from the HCU (3).
6. Remove the secondary brake tube at the master cylinder.
7. Remove the secondary brake tube at the HCU (3).
8. Remove the 4 chassis lines (2) at the HCU (3).

9. Disconnect the HCU electrical connectors (5).

10. Remove the 3 mounting nuts at the HCU bracket (1).

11. Remove the HCU (1) with the bracket (2) from the vehicle.

12. Remove the 3 ABM bolts securing the ABM (1) to the HCU (2).

INSTALLATION

NOTE: If the ABM is being replaced with a new ABM is must be reprogrammed with the use of a scan tool.

1. Install the 3 ABM (1) mounting bolts to the HCU (2) if removed tighten mounting bolts to 12 N-m (9 ft. lbs.).

2. Install the HCU (1) with bracket (2) to the vehicle and tighten the 2 mounting nuts.

3. Install the 4 chassis lines (2) at the HCU (3).
4. Install the secondary brake line at the HCU (3).
5. Install the secondary brake line at the master cylinder.
6. Install the primary brake line at the HCU (3).
7. Install the primary brake line at the master cylinder.

8. Reconnect the HCU (4) electrical connector (5).

9. Install negative battery cable to the battery.

10. Remove the brake pedal prop rod.

11. Bleed base and ABS brake systems, (Refer to 5 - BRAKES - STANDARD PROCEDURE).

BOOSTER-ACTIVE BRAKE

DESCRIPTION

The active brake booster is part of the Electronic Stability Program (ESP). It is serviced as part of the power brake booster. For more information on ESP, (Refer to 5 - BRAKES - DESCRIPTION).

BRAKES - BRAKE CONTROLLER ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

APS-INTERMITTENT CONDITION

For the Adjustable Pedals System circuit diagrams. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram Refer to Section 8W.

Diagnostic Test

1.

NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

1. Refer to any Technical Service Bulletins (TSBs) that may apply.
2. Review the scan tool information. If possible, try to duplicate the conditions under which the DTC set.
3. Turn the ignition off.
4. Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.
5. Perform a voltage drop test on the related circuits between the suspected faulty component and the Memory Seat Module.
6. Inspect and clean all grounds that are related to the most current DTC.
7. If numerous trouble codes were set, use a wiring schematic and look for any common ground or supply circuits.
8. Monitor with the scan tool and wiggle the related wire harness to try to interrupt the actuation.
9. Use the scan tool to perform a System Test if one applies to failing component.
10. A co-pilot, data recorder, and/or lab scope should be used to help diagnose intermittent conditions.

Were any problems found during the above inspections?

Yes >> Perform the necessary repairs.
Perform APS VERIFICATION TEST VER - 1.

No >> Test Complete.

B1D56-ADJUSTABLE PEDAL SENSOR CIRCUIT LOW

B1D56-ADJUSTABLE PEDAL SENSOR CIRCUIT LOW (CONTINUED)

For the Adjustable Pedal System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
The Adjustable Pedal Motor is in active operation.
- **Set Condition:**
The Memory Seat Module detects a low signal circuit voltage that is not within voltage specification from the Adjustable Pedal Sensor.

Possible Causes
CONNECTOR/TERMINAL DAMAGE ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT SHORTED TO GROUND, OR OPEN ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT SHORTED TO GROUND, OR OPEN ADJUSTABLE PEDALS SENSOR - INTERNAL FAULT MEMORY SEAT MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC B1D56-ADJUSTABLE PEDAL SENSOR CIRCUIT LOW

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

Cycle the Adjustable Pedals Switch forward and rearward.

With the scan tool, read DTC's

Does the scan tool display: B1D56-ADJUSTABLE PEDAL SENSOR CIRCUIT LOW?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform APS VERIFICATION TEST - VER 1.

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Memory Seat Module harness connector and Adjustable Pedals Motor harness connector.

Is there any connector or terminal damaged?

Yes >> Repair as necessary.

Perform APS VERIFICATION TEST - VER 1.

No >> Go To 3

B1D56-ADJUSTABLE PEDAL SENSOR CIRCUIT LOW (CONTINUED)**3. CHECK ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Disconnect the Memory Seat Module harness connector.

Disconnect the Adjustable Pedals Motor harness connector.

Using a 12-volt test light connected to 12-volts, probe the Adjustable Pedals Sensor Supply circuit.

Does the test light illuminate brightly?

Yes >> Repair the Adjustable Pedals Sensor Supply circuit for a short to ground.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 4

**4. CHECK ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT FOR AN OPEN**

Connect a jumper wire between the Adjustable Pedals Sensor Supply circuit and ground at the Memory Seat Module harness connector.

Using a 12-volt test light connected to 12-volts, probe the Adjustable Pedals Sensor Supply circuit.

Does the test light illuminate brightly

Yes >> Go To 5

No >> Repair the Adjustable Pedals Sensor Supply circuit for an open.
Perform APS VERIFICATION TEST - VER 1.

B1D56-ADJUSTABLE PEDAL SENSOR CIRCUIT LOW (CONTINUED)

5. CHECK ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Using a 12-volt test light connected to 12-volts, probe the Adjustable Pedals Sensor Signal circuit.

Does the test light illuminate brightly?

- Yes** >> Repair the Adjustable Pedals Sensor Signal circuit for a short to ground.
Perform APS VERIFICATION TEST - VER 1.
- No** >> Go To 6

6. CHECK ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT FOR AN OPEN

Connect a jumper wire between the Adjustable Pedals Sensor Signal circuit and ground at the Memory Seat Module harness connector. Using a 12-volt test light connected to 12-volts, probe the Adjustable Pedals Sensor Signal circuit.

Does the test light illuminate brightly?

- Yes** >> Go To 7
- No** >> Repair the Adjustable Pedals Sensor Signal circuit for an open.
Perform APS VERIFICATION TEST - VER 1.

B1D56-ADJUSTABLE PEDAL SENSOR CIRCUIT LOW (CONTINUED)

7. CHECK ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT VOLTAGE

Connect the Memory Seat Module harness connector.

Turn the ignition on.

Measure the voltage between the Adjustable Pedals Sensor Supply circuit and ground at the Adjustable Pedal Motor harness connector.

Is the voltage between 4.0 and 5.2 volts?

Yes >> Go To 8

No >> Replace and reprogram the Memory Seat Module in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

8. CHECK ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT VOLTAGE

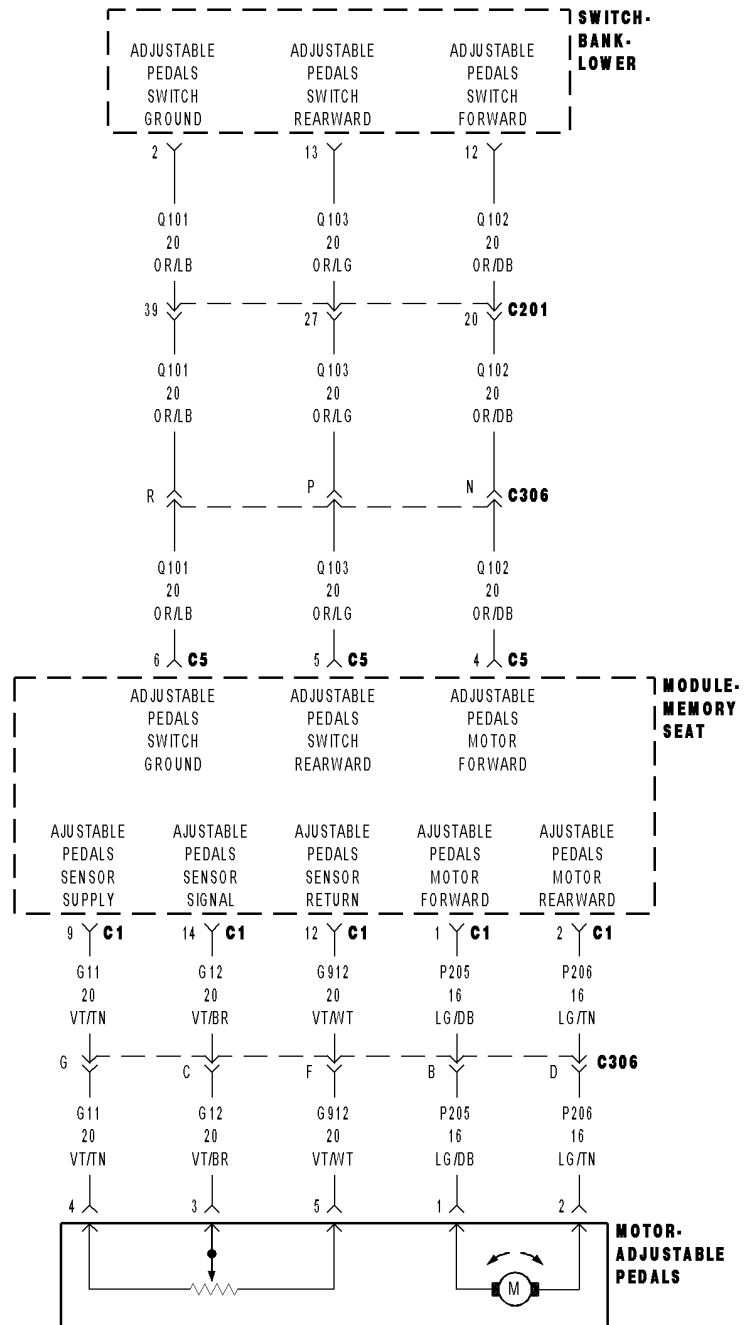

Measure the voltage of the Adjustable Pedals Sensor Signal circuit in the Memory Seat Module harness connector.

Is the voltage above 0.5 volts?

Yes >> Replace and reprogram the Memory Seat Module in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

No >> Replace the Adjustable Pedals Sensor in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

B1D57-ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH

B1D57-ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH (CONTINUED)

For the Adjustable Pedal System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
The Adjustable Pedal Motor is in active operation.
- **Set Condition:**
The Memory Seat Module detects a high signal circuit voltage that is not within voltage specification from the Adjustable Pedal Sensor.

Possible Causes
CONNECTOR/TERMINAL DAMAGE
ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
ADJUSTABLE PEDALS SENSOR - INTERNAL FAULT
MEMORY SEAT MODULE - INTERNAL FAULT

Diagnostic Test**1. CHECK FOR DTC B1D57-ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

Cycle the Adjustable Pedals Switch forward and rearward.

With the scan tool, read DTC's

Does the scan tool display: B1D57-ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform APS VERIFICATION TEST - VER 1.

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Memory Seat Module harness connector and the Adjustable Pedal Motor harness connector.

Is there any connector or terminal damaged?

Yes >> Repair as necessary.

Perform APS VERIFICATION TEST - VER 1.

No >> Go To 3

B1D57-ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH (CONTINUED)

3. CHECK ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Disconnect the Adjustable Pedal Motor harness connector.

Turn the ignition on.

Measure the voltage between the Adjustable Pedals Sensor Supply circuit and ground.

Is voltage present?

Yes >> Repair the Adjustable Pedals Sensor Supply circuit for a short to voltage.

Perform APS VERIFICATION TEST - VER 1.

No >> Go To 4

4. CHECK ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Measure the voltage between the Adjustable Pedals Sensor Signal circuit and ground.

Is voltage present?

Yes >> Repair the Adjustable Pedals Sensor Signal circuit for a short to voltage.

Perform APS VERIFICATION TEST - VER 1.

No >> Go To 5

B1D57-ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH (CONTINUED)

5. ADJUSTABLE PEDAL SENSOR SIGNAL SHORTED TO SENSOR SUPPLY

Measure the resistance between the Adjustable Pedals Sensor Signal circuit and the Sensor Supply circuit.

Is the resistance below 100 ohms?

Yes >> Repair the Adjustable Pedals Sensor Signal circuit for a short to the Sensor Supply circuit.

Perform APS VERIFICATION TEST - VER 1.

No >> Go To 6

6. ADJUSTABLE PEDALS SENSOR RETURN CIRCUIT OPEN

Measure the resistance of the Adjustable Pedals Sensor Return circuit between the Memory Seat Module harness connector and the Adjustable Pedal Motor harness connector.

Is the resistance below 5 ohms?

Yes >> Go To 7

No >> Repair the Adjustable Pedals Sensor Ground circuit for an open.

Perform APS VERIFICATION TEST - VER 1.

B1D57-ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH (CONTINUED)

7. CHECK ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

Measure the voltage of the Adjustable Pedals Sensor Signal circuit in the Memory Seat Module harness connector.

Is the voltage below 4.0 volts?

Yes >> Replace and reprogram the Memory Seat Module in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

No >> Replace the Adjustable Pedals Sensor in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

B1D5B-ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE

B1D5B-ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE (CONTINUED)

For the Adjustable Pedal System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
The Adjustable Pedals Switch is in active operation.
- **Set Condition:**
The Memory Seat Module detects an activation of both pedal switches at the same time.

Possible Causes
CONNECTOR/TERMINAL DAMAGE
ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT SHORTED TO GROUND
ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT SHORTED TO GROUND
ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT AND ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT SHORTED TOGETHER
ADJUSTABLE PEDALS SWITCH - INTERNAL FAULT
MEMORY SEAT MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC B1D5B-ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

Cycle the Adjustable Pedals Switch forward and rearward.

With the scan tool, read DTC's

Does the scan tool display: B1D5B-ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform APS VERIFICATION TEST - VER 1.

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Memory Seat Module harness connector and Lower Switch Bank harness connector.

Is the Lower Switch Bank or any of the connectors/terminals damaged?

Yes >> Repair as necessary.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 3

B1D5B-ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE (CONTINUED)**3. CHECK ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Disconnect the Lower Switch Bank harness connector.

Using a 12-volt test light connected to 12-volts, probe the Adjustable Pedals Switch Rearward circuit.

Does the test light illuminate brightly?

Yes >> Repair the Adjustable Pedals Switch Rearward circuit for a short to ground.

Perform APS VERIFICATION TEST - VER 1.

No >> Go To 4

**4. CHECK ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Disconnect the Lower Switch Bank harness connector.

Using a 12-volt test light connected to 12-volts, probe the Adjustable Pedals Switch Forward circuit.

Does the test light illuminate brightly?

Yes >> Repair the Adjustable Pedals Switch Forward circuit for a short to ground.

Perform APS VERIFICATION TEST - VER 1.

No >> Go To 5

B1D5B-ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE (CONTINUED)

5. CHECK ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT AND ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT FOR A SHORT TOGETHER

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Disconnect the Lower Switch Bank harness connector.

Measure the resistance between the Adjustable Pedals Switch Rearward circuit and Adjustable Pedals Switch Forward circuit.

Is the resistance above 5.0 ohms?

Yes >> Go To 6

No >> Repair the Adjustable Pedals Switch Rearward circuit and Adjustable Pedals Switch Forward circuit for a short together.

Perform APS VERIFICATION TEST - VER 1.

6. CHECK LOWER SWITCH BANK SHORTED

Turn the ignition off.

Disconnect the Lower Switch Bank harness connector.

Measure the resistance between the Adjustable Pedals Switch Rearward and Adjustable Pedals Switch Forward terminals at the Lower Switch Bank.

Is the resistance below 5.0 ohms?

Yes >> Replace and reprogram the Memory Seat Module in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

No >> Replace the Lower Switch Bank in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

B1D5C-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD

B1D5C-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD (CONTINUED)

For the Adjustable Pedal System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
The Adjustable Pedals Switch is in active operation.
- **Set Condition:**
The Memory Seat Module detects that the Adjustable Pedals Switch has been activated for a time period of more than 50 seconds.

Possible Causes
CONNECTOR/TERMINAL DAMAGE
ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT SHORTED TO GROUND
ADJUSTABLE PEDALS SWITCH - INTERNAL FAULT
MEMORY SEAT MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC B1D5C-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

Cycle the Adjustable Pedals Switch forward and rearward.

With the scan tool, read DTC's

Does the scan tool display: B1D5C-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform APS VERIFICATION TEST - VER 1.

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Memory Seat Module harness connector and Lower Switch Bank Switch harness connector.

Is the Adjustable Pedals Switch or any of the connectors/terminals damaged?

Yes >> Repair as necessary.

Perform APS VERIFICATION TEST - VER 1.

No >> Go To 3

B1D5C-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD (CONTINUED)

3. CHECK ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Disconnect the Lower Switch Bank harness connector.

Using a 12-volt test light connected to 12-volts, probe the Adjustable Pedals Switch Forward circuit.

Does the test light illuminate brightly?

Yes >> Repair the Adjustable Pedals Switch Forward circuit for a short to ground.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 4

4. CHECK LOWER SWITCH BANK SHORTED

Measure the resistance between the Adjustable Pedals Switch Rearward and Adjustable Pedals Switch Forward terminals at the Lower Switch Bank.

Is the resistance below 5.0 ohms?

Yes >> Replace and reprogram the Memory Seat Module in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

No >> Replace the Lower Switch Bank in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

B1D5D-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD

B1D5D-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD (CONTINUED)

For the Adjustable Pedal System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
The Adjustable Pedals Switch is in active operation.
- **Set Condition:**
The Memory Seat Module detects that the Adjustable Pedals Switch has been activated for a time period of more than 50 seconds.

Possible Causes
CONNECTOR/TERMINAL DAMAGE
ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT SHORTED TO GROUND
ADJUSTABLE PEDALS SWITCH - INTERNAL FAULT
MEMORY SEAT MODULE - INTERNAL FAULT

Diagnostic Test**1. CHECK FOR DTC B1D5D-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

Cycle the Adjustable Pedals Switch forward and rearward.

With the scan tool, read DTC's

Does the scan tool display: B1D5D-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform APS VERIFICATION TEST - VER 1.

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Memory Seat Module harness connector, and the Lower Switch Bank harness connector.

Is the connectors/terminals damaged?

Yes >> Repair as necessary.

Perform APS VERIFICATION TEST - VER 1.

No >> Go To 3

B1D5D-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD (CONTINUED)

3. CHECK ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Disconnect the Lower Switch Bank harness connector.

Using a 12-volt test light connected to 12-volts, probe the Adjustable Pedals Switch Rearward circuit.

Does the test light illuminate brightly?

Yes >> Repair the Adjustable Pedals Switch Rearward circuit for a short to ground.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 4

4. CHECK ADJUSTABLE PEDALS SWITCH SHORTED

Measure the resistance between the (Adjustable Pedals Switch Rearward and Adjustable Pedals Switch Forward terminals at the Lower Switch Bank.

Is the resistance below 5.0 ohms?

Yes >> Replace and reprogram the Memory Seat Module in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

No >> Replace the Lower Switch Band in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

B1D67-ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE

B1D67-ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE (CONTINUED)

For the Adjustable Pedal System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
The Adjustable Pedals Motor is in active operation.
- **Set Condition:**
The Memory Seat Module detects that the Adjustable Pedals Motor has been activated for a time period and has not spun with three motor direction commands.

Possible Causes
CONNECTOR/TERMINAL DAMAGE
MECHANICAL FAILURE IN THE ADJUSTABLE PEDALS
ADJUSTABLE PEDALS MOTOR FORWARD CIRCUIT OPEN
ADJUSTABLE PEDALS MOTOR REARWARD CIRCUIT OPEN
RETURN CIRCUIT OPEN
ADJUSTABLE PEDALS MOTOR - INTERNAL FAULT
MEMORY SEAT MODULE - INTERNAL FAULT

Diagnostic Test

1. CHECK FOR DTC B1D67-ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

Cycle and hold the Adjustable Pedals Switch forward, rearward, and forward at two second intervals.

With the scan tool, read DTC's

Does the scan tool display: B1D67-ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform APS VERIFICATION TEST - VER 1.

2. CHECK CONNECTOR/TERMINAL FOR DAMAGE

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Memory Seat Module harness connector, Adjustable Pedals Motor, and Adjustable Pedals Motor harness connector.

Is the Adjustable Pedals Motor or any of the connectors/terminals damaged?

Yes >> Repair as necessary.

Perform APS VERIFICATION TEST - VER 1.

No >> Go To 3

B1D67-ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE (CONTINUED)**3. CHECK ADJUSTABLE PEDALS ASSEMBLY FOR MECHANICAL DAMAGE**

Turn the ignition off.

Inspect the Adjustable Pedals Assembly for any physical damage.

NOTE: Check for any conditions that would cause the motor to stall or be stuck.

Is the Adjustable Pedals Assembly damaged or broken?

Yes >> Replace the Adjustable Pedals Assembly in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 4

4. CHECK ADJUSTABLE PEDALS MOTOR FORWARD CIRCUIT FOR AN OPEN

Disconnect the Memory Seat Module harness connector.

Disconnect the Adjustable Pedals Motor harness connector

Connect a jumper wire between the Adjustable Pedals Motor Forward circuit and ground in the Adjustable Pedal Motor harness connector.

Using a 12-volt test light connected to 12-volts, probe the Adjustable Pedals Motor Forward circuit.

Does the test light illuminate brightly?

Yes >> Go To 5

No >> Repair the Adjustable Pedals Motor Forward circuit for an open.
Perform APS VERIFICATION TEST - VER 1.

5. CHECK ADJUSTABLE PEDALS MOTOR REARWARD CIRCUIT FOR AN OPEN

Connect a jumper wire between the Adjustable Pedals Motor Rearward circuit and ground in the Adjustable Pedal Motor harness connector.

Using a 12-volt test light connected to 12-volts, probe the Adjustable Pedals Motor Rearward circuit.

Does the test light illuminate brightly?

Yes >> Go To 6

No >> Repair the Adjustable Pedals Motor Rearward circuit for an open.
Perform APS VERIFICATION TEST - VER 1.

B1D67-ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE (CONTINUED)**6. CHECK SENSOR RETURN CIRCUIT FOR AN OPEN**

Connect a jumper wire between the Sensor Return circuit and ground in the Adjustable Pedal Motor harness connector.

Using a 12-volt test light connected to 12-volts, probe the Sensor Return circuit.

Does the test light illuminate brightly?

Yes >> Go To 7

No >> Repair the Sensor Return circuit for an open.
Perform APS VERIFICATION TEST - VER 1.

**7. CHECK ADJUSTABLE PEDALS MOTOR**

Measure the resistance between the Adjustable Pedals Motor Forward and Adjustable Pedals Motor Rearward terminals at the Adjustable Pedals Motor.

Is the resistance below 100.0 ohms?

Yes >> Replace and reprogram the Memory Seat Module in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

No >> Replace the Adjustable Pedals Motor in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

APS VERIFICATION TEST – VER 1**Diagnostic Test****1.**

1. Ensure all accessories are turned off and the battery is fully charged.
2. Connect all previously disconnected components and connectors.
3. If the Memory Seat Module was replaced, reprogram the the Adjustable Pedals hard stop.
4. Start with the Adjustable Pedals going forward.
5. When the Adjustable Pedals reach full travel, continue to apply the Adjustable Pedals Switch for 10 seconds to learn the hard stop.
6. Repeat this step in both travel directions.
7. Verify that the Adjustable Pedals System is disabled with the vehicle in reverse.
8. Verify that the Adjustable Pedals System is disabled when the speed control is activated.
9. Ensure that the ignition is on, and with the scan tool, erase all Diagnostic Trouble Codes from All modules.
10. Fully operate the Adjustable Pedals System.
11. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the scan tool, read DTC's from all modules.
12. If any Diagnostic Trouble Codes are present, return to symptom list and trouble shoot new or recurring symptom.
13. Again, with the scan tool read DTC's. If any DTC's are present, return to Symptom list.
14. If there are no Diagnostic Trouble Codes (DTC's) present, and the customer's concern can no longer be duplicated, the repair is complete.

Are any DTC's present or is the original concern still present?**Yes** >> Repair is not complete, refer to appropriate symptom.**No** >> Repair is complete.

ABS-INTERMITTENT CONDITION

For the Anti-Lock Brake TCS/ESP circuit diagrams. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram Refer to Section 8W.

Diagnostic Test

1.

NOTE: The Sensor Cluster is the same as the Dynamics sensor.

NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

1. Refer to any Technical Service Bulletins (TSBs) that may apply.
2. Review the scan tool Freeze Frame information. If possible, try to duplicate the conditions under which the DTC set.
3. Turn the ignition off.
4. Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.
5. Perform a voltage drop test on the related circuits between the suspected faulty component and the Anti-Lock Brake Module.
6. Inspect and clean all PCM, ABS, engine, and chassis grounds that are related to the most current DTC.
7. If numerous trouble codes were set, use a wire schematic and look for any common ground or supply circuits
8. For any Relay DTCs, actuate the Relay with the scan tool and wiggle the related wire harness to try to interrupt the actuation.
9. Use the scan tool to perform a System Test if one applies to failing component.
10. A co-pilot, data recorder, and/or lab scope should be used to help diagnose intermittent conditions.

Were any problems found during the above inspections?

Yes >> Perform the necessary repairs.
Perform ABS VERIFICATION TEST VER - 1.

No >> Test Complete.

C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT

**MODULE-
ANTILOCK BRAKES**

**SENSOR-
WHEEL
SPEED-ABS-
LEFT
FRONT**

C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Left Front Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
TERMINAL/CONNECTOR/TONE WHEEL DAMAGE (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORTED TO THE (B9) LEFT FRONT WSS SUPPLY CIRCUIT (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN LEFT FRONT WHEEL SPEED SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

With the scan tool, read DTCs.

Does the scan tool display: C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/TONE WHEEL FOR DAMAGE

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.

NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, Left Front WSS harness connector, and Left Front WSS tone wheel (if applicable).

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)**3. (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORTED TO THE (B9) LEFT FRONT WSS SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Measure the resistance between the (B8) Left Front WSS Signal and the (B9) Left Front WSS Supply circuits at the Left Front WSS harness connector.

Is the resistance above 5.0 ohms?

Yes >> Go To 4

No >> Repair the (B8) Left Front WSS Signal circuit for a short to the (B9) Left Front WSS Supply circuit.

Perform ABS VERIFICATION TEST - VER 1.

**4. CHECK THE VOLTAGE ON THE (B9) LEFT FRONT WSS SUPPLY CIRCUIT**

Turn the ignition off.

Connect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B9) Left Front WSS Supply circuit in the Left Front WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 8

No >> Go To 5

**5. (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B9) Left Front WSS Supply circuit.

Is there any voltage present?

Yes >> Repair the (B9) Left Front WSS Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

6. (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (B9) Left Front WSS Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B9) Left Front WSS Supply circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

7. (B9) LEFT FRONT WSS SUPPLY CIRCUIT OPEN

Measure the resistance of the (B9) Left Front WSS Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (B9) Left Front WSS Supply circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

8. CHECK THE (B9) LEFT FRONT WSS SUPPLY AND THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE

Measure the voltage between the (B9) Left Front WSS Supply and (B8) Left Front WSS Signal circuits at the Left Front WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 11

No >> Go To 9

9. (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B8) Left Front WSS Signal circuit.

Is there any voltage present?

Yes >> Repair the (B8) Left Front WSS Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 10

10. (B8) LEFT FRONT WSS SIGNAL CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (B8) Left Front WSS Signal circuit.

Is the resistance above 5.0 ohms?

Yes >> Repair the (B8) Left Front WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

No >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

11. CHECK THE (B8) LEFT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (B8) Left Front WSS Signal circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B8) Left Front WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 12

12. CHECK THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE AT THE LEFT FRONT WSS HARNESS CONNECTOR

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure the voltage between the (B8) Left Front WSS Signal circuit at the Left Front WSS harness connector and ground.

Slowly rotate the wheel by hand.

Does the (B8) Left Front WSS Signal circuit voltage toggle between approximately 1.6 and .8 volts?

Yes >> Go To 13

No >> Replace the Left Front WSS in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

13. CHECK THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR

Turn the ignition off.

Turn the ignition on.

While back probing, measure the voltage between the (B8) Left Front WSS Signal circuit at the Anti-Lock Brake Module harness connector and ground.

Slowly rotate the wheel by hand.

Does the (B8) Left Front WSS Signal circuit voltage toggle between approximately 1.6 and .8 volts?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B8) Left Front WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

**MODULE-
ANTILOCK BRAKES**

**SENSOR-
WHEEL
SPEED-ABS-
LEFT
FRONT**

C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Left Front Wheel Speed Signal circuit indicates continuously too high or too low wheel speed.

Possible Causes
TERMINAL/CONNECTOR/TONE WHEEL DAMAGE (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORTED TO THE (B9) LEFT FRONT WSS SUPPLY CIRCUIT (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN LEFT FRONT WHEEL SPEED SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

CAUTION: Ensure braking capability is available before road testing.

Drive the vehicle over 25 km/h (15 mph).

Park the vehicle and cycle the ignition switch from off to on.

With the scan tool, read DTCs.

Does the scan tool display: C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

2. CHECK THE TERMINALS/CONNECTORS/TONE WHEEL FOR DAMAGE

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.

NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, Left Front WSS harness connector, and Left Front WSS tone wheel (if applicable).

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

3. (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORTED TO THE (B9) LEFT FRONT WSS SUPPLY CIRCUIT

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Measure the resistance between the (B8) Left Front WSS Signal and the (B9) Left Front WSS Supply circuits at the Left Front WSS harness connector.

Is the resistance above 5.0 ohms?

Yes >> Go To 4

No >> Repair the (B8) Left Front WSS Signal circuit for a short to the (B9) Left Front WSS Supply circuit.
Perform ABS VERIFICATION TEST - VER 1.

4. CHECK THE VOLTAGE ON THE (B9) LEFT FRONT WSS SUPPLY CIRCUIT

Turn the ignition off.

Connect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B9) Left Front WSS Supply circuit in the Left Front WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 8

No >> Go To 5

C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

5. (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.
 Disconnect the Anti-Lock Brake Module harness connector.
 Turn the ignition on.
 Measure the voltage of the (B9) Left Front WSS Supply circuit.

Is there any voltage present?

- Yes** >> Repair the (B9) Left Front WSS Supply circuit for a short to voltage.
 Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 6

6. (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORT TO GROUND

Turn the ignition off.
 Measure the resistance between ground and the (B9) Left Front WSS Supply circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Repair the (B9) Left Front WSS Supply circuit for a short to ground.
 Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 7

7. (B9) LEFT FRONT WSS SUPPLY CIRCUIT OPEN

Measure the resistance of the (B9) Left Front WSS Supply circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
 Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B9) Left Front WSS Supply circuit for an open.
 Perform ABS VERIFICATION TEST - VER 1.

C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

8. CHECK THE (B9) LEFT FRONT WSS SUPPLY AND THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE

Measure the voltage between the (B9) Left Front WSS Supply and (B8) Left Front WSS Signal circuits at the Left Front WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 11

No >> Go To 9

9. (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B8) Left Front WSS Signal circuit.

Is there any voltage present?

Yes >> Repair the (B8) Left Front WSS Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 10

C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

10. (B8) LEFT FRONT WSS SIGNAL CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (B8) Left Front WSS Signal circuit.

Is the resistance above 5.0 ohms?

- Yes** >> Repair the (B8) Left Front WSS Signal circuit for an open. Perform ABS VERIFICATION TEST - VER 1.
- No** >> Replace the Anti-Lock Brake Module in accordance with the Service Information. Perform ABS VERIFICATION TEST - VER 1.

11. CHECK THE (B8) LEFT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (B8) Left Front WSS Signal circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Repair the (B8) Left Front WSS Signal circuit for a short to ground. Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 12

C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

12. CHECK THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE AT THE LEFT FRONT WSS HARNESS CONNECTOR

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure the voltage between the (B8) Left Front WSS Signal circuit at the Left Front WSS harness connector and ground.

Slowly rotate the wheel by hand.

Does the (B8) Left Front WSS Signal circuit voltage toggle between approximately 1.6 and .8 volts?

Yes >> Go To 13

No >> Replace the Left Front WSS in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

13. CHECK THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR

Turn the ignition off.

Turn the ignition on.

While back probing, measure the voltage between the (B8) Left Front WSS Signal circuit at the Anti-Lock Brake Module harness connector and ground.

Slowly rotate the wheel by hand.

Does the (B8) Left Front WSS Signal circuit voltage toggle between approximately 1.6 and .8 volts?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (B8) Left Front WSS Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

**MODULE-
ANTILOCK BRAKES**

**SENSOR-
WHEEL
SPEED-ABS-
LEFT
FRONT**

C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Left Front Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS/TONE WHEEL DAMAGE (B8) LEFT FRONT WSS SIGNAL CIRCUIT OPEN LEFT FRONT WSS ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read DTCs.
- Record DTC and Freeze Frame information.
- With the scan tool, erase DTCs.
- Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle in a straight line to 40 Km/h (25 mph) while monitoring all the WSS speeds with the scan tool.

Did the LF WSS speed differ by 8 Km/h (5 mph) or show NO speed?

- Yes** >> Go To 2
- No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS/TONE WHEEL FOR DAMAGE

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.

NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

- Turn the ignition off.
- Inspect the Anti-Lock Brake Module harness connector, Left Front WSS, Left Front WSS harness connector, and Left Front WSS tone wheel (if applicable).

Were any problems found?

- Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 3

C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)**3. CHECK THE VOLTAGE BETWEEN (B9) LEFT FRONT WSS SUPPLY CIRCUIT AND THE (B8) LEFT FRONT WSS SIGNAL CIRCUIT**

Turn the ignition off.

Disconnect the Left Front WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B9) Left Front WSS Supply and (B8) Left Front WSS Signal circuits at the Left Front WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 4

No >> Refer to DTC-C100A LEFT FRONT WHEEL SPEED SENSOR CIRCUIT and perform the diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

**4. CHECK THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE AT THE LEFT FRONT WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure the voltage between the (B8) Left Front WSS Signal circuit at the Left Front WSS harness connector and ground.

Slowly rotate the wheel by hand.

Does the (B8) Left Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?

Yes >> Go To 5

No >> Replace the Left Front WSS in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

5. CHECK THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR

Turn the ignition off.

Turn the ignition on.

While back probing, measure the voltage between the (B8) Left Front WSS Signal circuit at the Anti-Lock Brake Module harness connector and ground.

Slowly rotate the wheel by hand.

Does the (B8) Left Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (B8) Left Front WSS Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Right Front Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
TERMINAL/CONNECTOR/TONE WHEEL DAMAGE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN RIGHT FRONT WHEEL SPEED SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

With the scan tool, read DTCs.

Does the scan tool display: C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/TONE WHEEL FOR DAMAGE

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.

NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, Right Front WSS harness connector, and Right Front WSS tone wheel (if applicable).

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)**3. (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Measure the resistance between the (B6) Right Front WSS Signal and the (B7) Right Front WSS Supply circuits at the Right Front WSS harness connector.

Is the resistance above 5.0 ohms?

Yes >> Go To 4

No >> Repair the (B6) Right Front WSS Signal circuit for a short to the (B7) Right Front WSS Supply circuit.
Perform ABS VERIFICATION TEST - VER 1.

**4. CHECK THE VOLTAGE ON THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT**

Turn the ignition off.

Connect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B7) Right Front WSS Supply circuit in the Right Front WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 8

No >> Go To 5

**5. (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B7) Right Front WSS Supply circuit.

Is there any voltage present?

Yes >> Repair the (B7) Right Front WSS Supply circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

6. (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (B7) Right Front WSS Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B7) Right Front WSS Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

7. (B7) RIGHT FRONT WSS SUPPLY CIRCUIT OPEN

Measure the resistance of the (B7) Right Front WSS Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (B7) Right Front WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)**8. CHECK THE (B7) RIGHT FRONT WSS SUPPLY AND THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE**

Measure the voltage between the (B7) Right Front WSS Supply and (B6) Right Front WSS Signal circuits at the Right Front WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 11

No >> Go To 9

**9. (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B6) Right Front WSS Signal circuit.

Is there any voltage present?

Yes >> Repair the (B6) Right Front WSS Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 10

C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

10. (B6) RIGHT FRONT WSS SIGNAL CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (B6) Right Front WSS Signal circuit.

Is the resistance above 5.0 ohms?

- Yes** >> Repair the (B6) Right Front WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

11. CHECK THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (B6) Right Front WSS Signal circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Repair the (B6) Right Front WSS Signal circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 12

C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)**12. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE RIGHT FRONT WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure the voltage between the (B6) Right Front WSS Signal circuit at the Right Front WSS harness connector and ground.

Slowly rotate the wheel by hand.

Does the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 and .8 volts?

Yes >> Go To 13

No >> Replace the Right Front WSS in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**13. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure the voltage between the (B6) Right Front WSS Signal circuit at the Anti-Lock Brake Module harness connector and ground.

Slowly rotate the wheel by hand.

Does the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 and .8 volts?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (B6) Right Front WSS Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

**MODULE-
ANTILOCK BRAKES**

**SENSOR-
WHEEL SPEED-ABS-
RIGHT FRONT**

C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Right Front Wheel Speed Signal circuit indicates continuously too high or too low wheel speed.

Possible Causes
TERMINAL/CONNECTOR/TONE WHEEL DAMAGE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN RIGHT FRONT WHEEL SPEED SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

CAUTION: Ensure braking capability is available before road testing.

Drive the vehicle over 25 Km/h (15 mph).

Park the vehicle and cycle the ignition switch from off to on.

With the scan tool, read DTCs.

Does the scan tool display: C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

2. CHECK THE TERMINALS/CONNECTORS/TONE WHEEL FOR DAMAGE

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.

NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, Right Front WSS harness connector, and Right Front WSS tone wheel (if applicable).

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

3. (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Measure the resistance between the (B6) Right Front WSS Signal and the (B7) Right Front WSS Supply circuits at the Right Front WSS harness connector.

Is the resistance above 5.0 ohms?

Yes >> Go To 4

No >> Repair the (B6) Right Front WSS Signal circuit for a short to the (B7) Right Front WSS Supply circuit.
Perform ABS VERIFICATION TEST - VER 1.

4. CHECK THE VOLTAGE ON THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT

Turn the ignition off.

Connect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B7) Right Front WSS Supply circuit in the Right Front WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 8

No >> Go To 5

C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

5. (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B7) Right Front WSS Supply circuit.

Is there any voltage present?

Yes >> Repair the (B7) Right Front WSS Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

6. (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (B7) Right Front WSS Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B7) Right Front WSS Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

7. (B7) RIGHT FRONT WSS SUPPLY CIRCUIT OPEN

Measure the resistance of the (B7) Right Front WSS Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (B7) Right Front WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

8. CHECK THE (B7) RIGHT FRONT WSS SUPPLY AND THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE

Measure the voltage between the (B7) Right Front WSS Supply and (B6) Right Front WSS Signal circuits at the Right Front WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 11

No >> Go To 9

9. (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B6) Right Front WSS Signal circuit.

Is there any voltage present?

Yes >> Repair the (B6) Right Front WSS Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 10

C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

10. (B6) RIGHT FRONT WSS SIGNAL CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (B6) Right Front WSS Signal circuit.

Is the resistance above 5.0 ohms?

- Yes** >> Repair the (B6) Right Front WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

11. CHECK THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (B6) Right Front WSS Signal circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Repair the (B6) Right Front WSS Signal circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 12

C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

12. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE RIGHT FRONT WSS HARNESS CONNECTOR

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure the voltage between the (B6) Right Front WSS Signal circuit at the Right Front WSS harness connector and ground.

Slowly rotate the wheel by hand.

Does the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 and .8 volts?

Yes >> Go To 13

No >> Replace the Right Front WSS in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

13. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR

Turn the ignition off.

Turn the ignition on.

While back probing, measure the voltage between the (B6) Right Front WSS Signal circuit at the Anti-Lock Brake Module harness connector and ground.

Slowly rotate the wheel by hand.

Does the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 and .8 volts?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (B6) Right Front WSS Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

FRONT**

C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Right Front Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS/TONE WHEEL DAMAGE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT OPEN RIGHT FRONT WHEEL SPEED SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read DTCs.
- Record DTC and Freeze Frame information.
- With the scan tool, erase DTCs.
- Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle in a straight line to 40 Km/h (25 mph) while monitoring all the WSS speeds with the scan tool.

Did the RF WSS speed differ by 8 Km/h (5 mph) or show NO speed?

- Yes** >> Go To 2
- No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS/TONE WHEEL FOR DAMAGE

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.

NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

- Turn the ignition off.
- Inspect the Anti-Lock Brake Module harness connector, Right Front WSS, Right Front WSS harness connector, and Right Front WSS tone wheel (if applicable).

Were any problems found?

- Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 3

C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)**3. CHECK THE VOLTAGE BETWEEN (B7) RIGHT FRONT WSS SUPPLY CIRCUIT AND THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT**

Turn the ignition off.

Disconnect the Right Front WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B7) Right Front WSS Supply and (B6) Right Front WSS Signal circuits at the Right Front WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 4

No >> Refer to DTC-C1015 RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT for the diagnostic repair procedure.
Perform ABS VERIFICATION TEST - VER 1.

**4. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE RIGHT FRONT WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure the voltage between the (B6) Right Front WSS Signal circuit at the Right Front WSS harness connector and chassis ground.

Slowly rotate the wheel by hand.

Did the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?

Yes >> Go To 5

No >> Replace the Right Front WSS in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

5. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR

Turn the ignition off.

Turn the ignition on.

While back probing, measure the voltage between the (B6) Right Front WSS Signal circuit at the Anti-Lock Brake Module harness connector and chassis ground.

Slowly rotate the wheel by hand.

Did the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B6) Right Front WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT

MODULE-ANTILOCK BRAKES

SENSOR-WHEEL SPEED-ABS-LEFT REAR

C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Left Rear Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
TERMINAL/CONNECTOR/TONE WHEEL DAMAGE (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORTED TO THE (B4) LEFT REAR WSS SUPPLY CIRCUIT (B4) LEFT REAR WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN LEFT REAR WHEEL SPEED SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

With the scan tool, read DTCs.

Does the scan tool display: C1020–LEFT REAR WHEEL SPEED SENSOR CIRCUIT?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/TONE WHEEL FOR DAMAGE

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.

NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, Left Rear WSS harness connector, and Left Rear WSS tone wheel (if applicable).

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)**3. (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORTED TO THE (B4) LEFT REAR WSS SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Measure the resistance between the (B3) Left Rear WSS Signal and the (B4) Left Rear WSS Supply circuits at the Left Rear WSS harness connector.

Is the resistance above 5.0 ohms?

Yes >> Go To 4

No >> Repair the (B3) Left Rear WSS Signal circuit for a short to the (B4) Left Rear WSS Supply circuit.

Perform ABS VERIFICATION TEST - VER 1.

**4. CHECK THE VOLTAGE ON THE (B4) LEFT REAR WSS SUPPLY CIRCUIT**

Turn the ignition off.

Connect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B4) Left Rear WSS Supply circuit in the Left Rear WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 8

No >> Go To 5

**5. (B4) LEFT REAR WSS SUPPLY CIRCUIT SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B4) Left Rear WSS Supply circuit.

Is there any voltage present?

Yes >> Repair the (B4) Left Rear WSS Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

6. (B4) LEFT REAR WSS SUPPLY CIRCUIT SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (B4) Left Rear WSS Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B4) Left Rear WSS Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

7. (B4) LEFT REAR WSS SUPPLY CIRCUIT OPEN

Measure the resistance of the (B4) Left Rear WSS Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (B4) Left Rear WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

8. CHECK THE (B4) LEFT REAR WSS SUPPLY AND THE (B3) LEFT REAR WSS SIGNAL VOLTAGE

Measure the voltage between the (B4) Left Rear WSS Supply and (B3) Left Rear WSS Signal circuits at the Left Rear WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 11

No >> Go To 9

C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

9. (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B3) Left Rear WSS Signal circuit.

Is there any voltage present?

Yes >> Repair the (B3) Left Rear WSS Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 10

10. (B3) LEFT REAR WSS SIGNAL CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (B3) Left Rear WSS Signal circuit.

Is the resistance above 5.0 ohms?

Yes >> Repair the (B3) Left Rear WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

No >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

11. CHECK THE (B3) LEFT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (B3) Left Rear WSS Signal circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B3) Left Rear WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 12

12. CHECK THE (B3) LEFT REAR WSS SIGNAL VOLTAGE AT THE LEFT REAR WSS HARNESS CONNECTOR

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure the voltage between the (B3) Left Rear WSS Signal circuit at the Left Rear WSS harness connector and ground.

Slowly rotate the wheel by hand.

Does the (B3) Left Rear WSS Signal circuit voltage toggle between approximately 1.6 and .8 volts?

Yes >> Go To 13

No >> Replace the Left Rear WSS in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

13. CHECK THE (B3) LEFT REAR WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR

Turn the ignition off.

Turn the ignition on.

While back probing, measure the voltage between the (B3) Left Rear WSS Signal circuit at the Anti-Lock Brake Module harness connector and ground.

Slowly rotate the wheel by hand.

Does the (B3) Left Rear WSS Signal circuit voltage toggle between approximately 1.6 and .8 volts?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (B3) Left Rear WSS Signal circuit for an open. Perform ABS VERIFICATION TEST - VER 1.

C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

MODULE-ANTILOCK BRAKES

SENSOR-WHEEL SPEED-ABS-LEFT REAR

C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Left Rear Wheel Speed Signal circuit indicates continuously too high or too low wheel speed.

Possible Causes
TERMINAL/CONNECTOR/TONE WHEEL DAMAGE (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORTED TO THE (B4) LEFT REAR WSS SUPPLY CIRCUIT (B4) LEFT REAR WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN LEFT REAR WHEEL SPEED SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

CAUTION: Ensure braking capability is available before road testing.

Drive the vehicle over 25 Km/h (15 mph).

Park the vehicle and cycle the ignition switch from off to on.

With the scan tool, read DTCs.

Does the scan tool display: C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

2. CHECK THE TERMINALS/CONNECTORS/TONE WHEEL FOR DAMAGE

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.

NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, Left Rear WSS harness connector, and Left Rear WSS tone wheel (if applicable).

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

3. (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORTED TO THE (B4) LEFT REAR WSS SUPPLY CIRCUIT

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Measure the resistance between the (B3) Left Rear WSS Signal and the (B4) Left Rear WSS Supply circuits at the Left Rear WSS harness connector.

Is the resistance above 5.0 ohms?

Yes >> Go To 4

No >> Repair the (B3) Left Rear WSS Signal circuit for a short to the (B4) Left Rear WSS Supply circuit.
Perform ABS VERIFICATION TEST - VER 1.

4. CHECK THE VOLTAGE ON THE (B4) LEFT REAR WSS SUPPLY CIRCUIT

Turn the ignition off.

Connect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B4) Left Rear WSS Supply circuit in the Left Rear WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 8

No >> Go To 5

C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

5. (B4) LEFT REAR WSS SUPPLY CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B4) Left Rear WSS Supply circuit.

Is there any voltage present?

Yes >> Repair the (B4) Left Rear WSS Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

6. (B4) LEFT REAR WSS SUPPLY CIRCUIT SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (B4) Left Rear WSS Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B4) Left Rear WSS Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

7. (B4) LEFT REAR WSS SUPPLY CIRCUIT OPEN

Measure the resistance of the (B4) Left Rear WSS Supply circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B4) Left Rear WSS Supply circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

8. CHECK THE (B4) LEFT REAR WSS SUPPLY AND THE (B3) LEFT REAR WSS SIGNAL VOLTAGE

Measure the voltage between the (B4) Left Rear WSS Supply and (B3) Left Rear WSS Signal circuits at the Left Rear WSS harness connector.

Is the voltage above 10 volts?

- Yes** >> Go To 11
- No** >> Go To 9

C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

9. (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.
 Disconnect the Anti-Lock Brake Module harness connector.
 Turn the ignition on.
 Measure the voltage of the (B3) Left Rear WSS Signal circuit.

Is there any voltage present?

- Yes** >> Repair the (B3) Left Rear WSS Signal circuit for a short to voltage.
 Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 10

10. (B3) LEFT REAR WSS SIGNAL CIRCUIT OPEN

Turn the ignition off.
 Measure the resistance of the (B3) Left Rear WSS Signal circuit.

Is the resistance above 5.0 ohms?

- Yes** >> Repair the (B3) Left Rear WSS Signal circuit for an open.
 Perform ABS VERIFICATION TEST - VER 1.
- No** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
 Perform ABS VERIFICATION TEST - VER 1.

C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)**11. CHECK THE (B3) LEFT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (B3) Left Rear WSS Signal circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B3) Left Rear WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 12

**12. CHECK THE (B3) LEFT REAR WSS SIGNAL VOLTAGE AT THE LEFT REAR WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure the voltage between the (B3) Left Rear WSS Signal circuit at the Left Rear WSS harness connector and ground.

Slowly rotate the wheel by hand.

Does the (B3) Left Rear WSS Signal circuit voltage toggle between approximately 1.6 and .8 volts?

Yes >> Go To 13

No >> Replace the Left Rear WSS in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

13. CHECK THE (B3) LEFT REAR WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR

Turn the ignition off.

Turn the ignition on.

While back probing, measure the voltage between the (B3) Left Rear WSS Signal circuit at the Anti-Lock Brake Module harness connector and ground.

Slowly rotate the wheel by hand.

Does the (B3) Left Rear WSS Signal circuit voltage toggle between approximately 1.6 and .8 volts?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (B3) Left Rear WSS Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

MODULE-ANTILOCK BRAKES

SENSOR-WHEEL SPEED-ABS-LEFT REAR

C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Left Rear Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS/TONE WHEEL DAMAGE (B3) LEFT REAR WSS SIGNAL CIRCUIT OPEN LEFT REAR WHEEL SPEED SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle in a straight line to 40 Km/h (25 mph) while monitoring all the WSS speeds with the scan tool.

Did the LR WSS speed differ by 8 Km/h (5 mph) or show NO speed?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS/TONE WHEEL FOR DAMAGE

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.

NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, Left Rear WSS harness connector, and Left Rear WSS tone wheel (if applicable).

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)**3. CHECK THE VOLTAGE BETWEEN (B4) LEFT REAR WSS SUPPLY CIRCUIT AND THE (B3) LEFT REAR WSS SIGNAL CIRCUIT**

Turn the ignition off.

Disconnect the Left Rear WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B4) Left Rear WSS Supply and (B3) Left Rear WSS Signal circuits at the Left Rear WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 4

No >> Refer to DTC-C1020 LEFT REAR WHEEL SPEED SENSOR CIRCUIT for the diagnostic repair procedure.
Perform ABS VERIFICATION TEST - VER 1.

**4. CHECK THE (B3) LEFT REAR WSS SIGNAL VOLTAGE AT THE LEFT REAR WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure the voltage between the (B3) Left Rear WSS Signal circuit at the Left Rear WSS harness connector and chassis ground.

Slowly rotate the wheel by hand.

Did the (B3) Left Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?

Yes >> Go To 5

No >> Replace the Left Rear WSS in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

5. CHECK THE (B3) LEFT REAR WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR

Turn the ignition off.

Turn the ignition on.

While back probing, measure the voltage between the (B3) Left Rear WSS Signal circuit at the Anti-Lock Brake Module harness connector and chassis ground.

Slowly rotate the wheel by hand.

Did the (B3) Left Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (B3) Left Rear WSS Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C102B-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT

MODULE-ANTILOCK BRAKES

SENSOR-WHEEL SPEED-ABS-RIGHT REAR

C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Right Rear Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
TERMINAL/CONNECTOR/TONE WHEEL DAMAGE (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO THE (B2) RIGHT REAR WSS SUPPLY CIRCUIT (B2) RIGHT REAR WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN RIGHT REAR WHEEL SPEED SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

With the scan tool, read DTCs.

Does the scan tool display: C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/TONE WHEEL FOR DAMAGE

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.

NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, Right Rear WSS harness connector, and Right Rear WSS tone wheel (if applicable).

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C102B-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)**3. (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO THE (B2) RIGHT REAR WSS SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Measure the resistance between the (B1) Right Rear WSS Signal and the (B2) Right Rear WSS Supply circuits at the Right Rear WSS harness connector.

Is the resistance above 5.0 ohms?

Yes >> Go To 4

No >> Repair the (B1) Right Rear WSS Signal circuit for a short to the (B2) Right Rear WSS Supply circuit.
Perform ABS VERIFICATION TEST - VER 1.

**4. CHECK THE VOLTAGE ON THE (B2) RIGHT REAR WSS SUPPLY CIRCUIT**

Turn the ignition off.

Connect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B2) Right Rear WSS Supply circuit in the Right Rear WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 8

No >> Go To 5

**5. (B2) RIGHT REAR WSS SUPPLY CIRCUIT SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B2) Right Rear WSS Supply circuit.

Is there any voltage present?

Yes >> Repair the (B2) Right Rear WSS Supply circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

C102B-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

6. (B2) RIGHT REAR WSS SUPPLY CIRCUIT SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (B2) Right Rear WSS Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B2) Right Rear WSS Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

7. (B2) RIGHT REAR WSS SUPPLY CIRCUIT OPEN

Measure the resistance of the (B2) Right Rear WSS Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (B2) Right Rear WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

8. CHECK THE (B2) RIGHT REAR WSS SUPPLY AND THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE

Measure the voltage between the (B2) Right Rear WSS Supply and (B1) Right Rear WSS Signal circuits at the Right Rear WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 11

No >> Go To 9

C102B-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)**9. (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B1) Right Rear WSS Signal circuit.

Is there any voltage present?

Yes >> Repair the (B1) Right Rear WSS Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 10

**10. (B1) RIGHT REAR WSS SIGNAL CIRCUIT OPEN**

Turn the ignition off.

Measure the resistance of the (B1) Right Rear WSS Signal circuit.

Is the resistance above 5.0 ohms?

Yes >> Repair the (B1) Right Rear WSS Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

No >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**11. CHECK THE (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (B1) Right Rear WSS Signal circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B1) Right Rear WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 12

C102B-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

12. CHECK THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE AT THE RIGHT REAR WSS HARNESS CONNECTOR

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure the voltage between the (B1) Right Rear WSS Signal circuit at the Right Rear WSS harness connector and ground.

Slowly rotate the wheel by hand.

Does the (B1) Right Rear WSS Signal circuit voltage toggle between approximately 1.6 and .8 volts?

Yes >> Go To 13

No >> Replace the Right Rear WSS in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

13. CHECK THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR

Turn the ignition off.

Turn the ignition on.

While back probing, measure the voltage between the (B1) Right Rear WSS Signal circuit at the Anti-Lock Brake Module harness connector and ground.

Slowly rotate the wheel by hand.

Does the (B1) Right Rear WSS Signal circuit voltage toggle between approximately 1.6 and .8 volts?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (B1) Right Rear WSS Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

MODULE-ANTILOCK BRAKES

SENSOR-WHEEL SPEED-ABS-RIGHT REAR

C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Right Rear Wheel Speed Signal circuit indicates continuously too high or too low wheel speed.

Possible Causes
TERMINAL/CONNECTOR/TONE WHEEL DAMAGE (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO THE (B2) RIGHT REAR WSS SUPPLY CIRCUIT (B2) RIGHT REAR WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN RIGHT REAR WHEEL SPEED SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

CAUTION: Ensure braking capability is available before road testing.

Drive the vehicle over 25 Km/h (15 mph).

Park the vehicle and cycle the ignition switch from off to on.

With the scan tool, read DTCs.

Does the scan tool display: C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)**2. CHECK THE TERMINALS/CONNECTORS/TONE WHEEL FOR DAMAGE**

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.

NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, Right Rear WSS harness connector, and Right Rear WSS tone wheel (if applicable).

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

3. (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO THE (B2) RIGHT REAR WSS SUPPLY CIRCUIT

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Measure the resistance between the (B1) Right Rear WSS Signal and the (B2) Right Rear WSS Supply circuits at the Right Rear WSS harness connector.

Is the resistance above 5.0 ohms?

Yes >> Go To 4

No >> Repair the (B1) Right Rear WSS Signal circuit for a short to the (B2) Right Rear WSS Supply circuit.
Perform ABS VERIFICATION TEST - VER 1.

**4. CHECK THE VOLTAGE ON THE (B2) RIGHT REAR WSS SUPPLY CIRCUIT**

Turn the ignition off.

Connect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B2) Right Rear WSS Supply circuit in the Right Rear WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 8

No >> Go To 5

C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

5. (B2) RIGHT REAR WSS SUPPLY CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.
 Disconnect the Anti-Lock Brake Module harness connector.
 Turn the ignition on.
 Measure the voltage of the (B2) Right Rear WSS Supply circuit.

Is there any voltage present?

- Yes** >> Repair the (B2) Right Rear WSS Supply circuit for a short to voltage.
 Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 6

6. (B2) RIGHT REAR WSS SUPPLY CIRCUIT SHORT TO GROUND

Turn the ignition off.
 Measure the resistance between ground and the (B2) Right Rear WSS Supply circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Repair the (B2) Right Rear WSS Supply circuit for a short to ground.
 Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 7

7. (B2) RIGHT REAR WSS SUPPLY CIRCUIT OPEN

Measure the resistance of the (B2) Right Rear WSS Supply circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
 Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B2) Right Rear WSS Supply circuit for an open.
 Perform ABS VERIFICATION TEST - VER 1.

C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)**8. CHECK THE (B2) RIGHT REAR WSS SUPPLY AND THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE**

Measure the voltage between the (B2) Right Rear WSS Supply and (B1) Right Rear WSS Signal circuits at the Right Rear WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 11

No >> Go To 9

**9. (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B1) Right Rear WSS Signal circuit.

Is there any voltage present?

Yes >> Repair the (B1) Right Rear WSS Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 10

C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

10. (B1) RIGHT REAR WSS SIGNAL CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (B1) Right Rear WSS Signal circuit.

Is the resistance above 5.0 ohms?

- Yes** >> Repair the (B1) Right Rear WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

11. CHECK THE (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (B1) Right Rear WSS Signal circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Repair the (B1) Right Rear WSS Signal circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 12

C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

12. CHECK THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE AT THE RIGHT REAR WSS HARNESS CONNECTOR

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure the voltage between the (B1) Right Rear WSS Signal circuit at the Right Rear WSS harness connector and ground.

Slowly rotate the wheel by hand.

Does the (B1) Right Rear WSS Signal circuit voltage toggle between approximately 1.6 and .8 volts?

Yes >> Go To 13

No >> Replace the Right Rear WSS in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

13. CHECK THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR

Turn the ignition off.

Turn the ignition on.

While back probing, measure the voltage between the (B1) Right Rear WSS Signal circuit at the Anti-Lock Brake Module harness connector and ground.

Slowly rotate the wheel by hand.

Does the (B1) Right Rear WSS Signal circuit voltage toggle between approximately 1.6 and .8 volts?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (B1) Right Rear WSS Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

MODULE-ANTILOCK BRAKES

SENSOR-WHEEL SPEED-ABS-RIGHT REAR

C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Right Rear Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS/TONE WHEEL DAMAGE (B1) RIGHT REAR WSS SIGNAL CIRCUIT OPEN RIGHT REAR WHEEL SPEED SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle in a straight line to 40 Km/h (25 mph) while monitoring all the WSS speeds with the scan tool.

Did the RR WSS speed differ by 8 Km/h (5 mph) or show NO speed?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS/TONE WHEEL FOR DAMAGE

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.

NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, Right Rear WSS harness connector, and Right Rear WSS tone wheel (if applicable) for damage.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)

3. CHECK THE VOLTAGE BETWEEN (B2) RIGHT REAR WSS SUPPLY CIRCUIT AND THE (B1) RIGHT REAR WSS SIGNAL CIRCUIT

Turn the ignition off.

Disconnect the Right Rear WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B2) Right Rear WSS Supply and (B1) Right Rear WSS Signal circuits at the Right Rear WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 4

No >> Refer to DTC-C102B RIGHT REAR WHEEL SPEED SENSOR CIRCUIT for the diagnostic repair procedure.
Perform ABS VERIFICATION TEST - VER 1.

4. CHECK THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE AT THE RIGHT REAR WSS HARNESS CONNECTOR

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure the voltage between the (B1) Right Rear WSS Signal circuit at the Right Rear WSS harness connector and chassis ground.

Slowly rotate the wheel by hand.

Did the (B1) Right Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?

Yes >> Go To 5

No >> Replace the Right Rear WSS in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)**5. CHECK THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure the voltage between the (B1) Right Rear WSS Signal circuit at the Anti-Lock Brake Module harness connector and chassis ground.

Slowly rotate the wheel by hand.

Did the (B1) Right Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B1) Right Rear WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

C1041-LEFT FRONT TONE WHEEL PERFORMANCE

MODULE-ANTILOCK BRAKES

SENSOR-WHEEL SPEED-ABS-LEFT FRONT

C1041-LEFT FRONT TONE WHEEL PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

Possible Causes
LEFT FRONT TONE WHEEL

Diagnostic Test**1. CHECK FOR A DTC C1041-LEFT FRONT TONE WHEEL PERFORMANCE**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Test drive the vehicle in a straight line to 40 Km/h (25 mph).

With the scan tool, read DTCs.

Does the scan tool display: C1041-LEFT FRONT TONE WHEEL PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE LEFT FRONT TONE WHEEL FOR DAMAGE

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Check the Left Front Tone Wheel for damage.

Were any problems found?

Yes >> Replace the Left Front Tone Wheel in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Test Complete.

C1042-RIGHT FRONT TONE WHEEL PERFORMANCE

**MODULE-
ANTILOCK BRAKES**

**SENSOR-
WHEEL
SPEED-ABS-
RIGHT
FRONT**

C1042-RIGHT FRONT TONE WHEEL PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

Possible Causes
RIGHT FRONT TONE WHEEL

Diagnostic Test**1. CHECK FOR A DTC C1042-RIGHT FRONT TONE WHEEL PERFORMANCE**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Test drive the vehicle in a straight line to 40 Km/h (25 mph).

With the scan tool, read DTCs.

Does the scan tool display: C1042-RIGHT FRONT TONE WHEEL PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE RIGHT FRONT TONE WHEEL FOR DAMAGE

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Check the Right Front Tone Wheel for damage.

Were any problems found?

Yes >> Replace the Right Front Tone Wheel in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Test Complete.

C1043-LEFT REAR TONE WHEEL PERFORMANCE

MODULE-ANTILOCK BRAKES

SENSOR-WHEEL SPEED-ABS-LEFT REAR

C1043-LEFT REAR TONE WHEEL PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

Possible Causes
LEFT REAR TONE WHEEL

Diagnostic Test**1. CHECK FOR A DTC C1043-LEFT REAR TONE WHEEL PERFORMANCE**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Test drive the vehicle in a straight line to 40 Km/h (25 mph).

With the scan tool, read DTCs.

Does the scan tool display: C1043-LEFT REAR TONE WHEEL PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE LEFT REAR TONE WHEEL FOR DAMAGE

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Check the Left Rear Tone Wheel for damage.

Were any problems found?

Yes >> Replace the Left Rear Tone Wheel in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Test Complete.

C1044-RIGHT REAR TONE WHEEL PERFORMANCE

MODULE-ANTILOCK BRAKES

SENSOR-WHEEL SPEED-ABS-RIGHT REAR

C1044-RIGHT REAR TONE WHEEL PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

Possible Causes
RIGHT REAR TONE WHEEL

Diagnostic Test**1. CHECK FOR A DTC C1044-RIGHT REAR TONE WHEEL PERFORMANCE**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Test drive the vehicle in a straight line to 40 Km/h (25 mph).

With the scan tool, read DTCs.

Does the scan tool display: C1044-RIGHT REAR TONE WHEEL PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE RIGHT REAR TONE WHEEL FOR DAMAGE

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Check the Right Rear Tone Wheel for damage.

Were any problems found?

Yes >> Replace the Right Rear Tone Wheel in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Test Complete.

C1046-LEFT FRONT WHEEL PRESSURE PHASE MONITORING

**MODULE-
ANTILOCK BRAKES**

**SENSOR-
WHEEL
SPEED-ABS-
LEFT
FRONT**

C1046-LEFT FRONT WHEEL PRESSURE PHASE MONITORING (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module detects a pressure reduction phase and the following pressure hold phase is too long.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS/TONE WHEEL DAMAGE (B8) LEFT FRONT WSS SIGNAL CIRCUIT OPEN LEFT FRONT WHEEL SPEED SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C1046-LEFT FRONT WHEEL PRESSURE PHASE MONITORING**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle in a straight line to 40 Km/h (25 mph) while monitoring all the WSS speeds with the scan tool.

Did the LF WSS speed differ by 8 Km/h (5 mph) or show NO speed?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS/TONE WHEEL FOR DAMAGE

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.

NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Left Front WSS, Left Front WSS harness connector, and Left Front WSS tone wheel (if applicable) for damage.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C1046-LEFT FRONT WHEEL PRESSURE PHASE MONITORING (CONTINUED)

3. CHECK THE VOLTAGE BETWEEN (B9) LEFT FRONT WSS SUPPLY CIRCUIT AND THE (B8) LEFT FRONT WSS SIGNAL CIRCUIT

Turn the ignition off.

Disconnect the Left Front WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B9) Left Front WSS Supply and (B8) Left Front WSS Signal circuits at the Left Front WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 4

No >> Refer to DTC-C100A LEFT FRONT WHEEL SPEED SENSOR CIRCUIT for the diagnostic repair procedure.
Perform ABS VERIFICATION TEST - VER 1.

4. CHECK THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE AT THE LEFT FRONT WSS HARNESS CONNECTOR

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure the voltage between the (B8) Left Front WSS Signal circuit at the Left Front WSS harness connector and chassis ground.

Slowly rotate the wheel by hand.

Did the (B8) Left Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?

Yes >> Go To 5

No >> Replace the Left Front WSS in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C1046-LEFT FRONT WHEEL PRESSURE PHASE MONITORING (CONTINUED)**5. CHECK THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure the voltage between the (B8) Left Front WSS Signal circuit at the Anti-Lock Brake Module harness connector and chassis ground.

Slowly rotate the wheel by hand.

Did the (B8) Left Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (B8) Left Front WSS Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C1047-RIGHT FRONT WHEEL PRESSURE PHASE MONITORING

**SENSOR-
WHEEL
SPEED-
ABS- RIGHT
FRONT**

**MODULE-
ANTILOCK BRAKES**

**SENSOR-
WHEEL
SPEED-ABS-
RIGHT
FRONT**

C1047-RIGHT FRONT WHEEL PRESSURE PHASE MONITORING (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module detects a pressure reduction phase and the following pressure hold phase is too long.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS/TONE WHEEL DAMAGE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT OPEN RIGHT FRONT WHEEL SPEED SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C1047-RIGHT FRONT WHEEL PRESSURE PHASE MONITORING**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle in a straight line to 40 Km/h (25 mph) while monitoring all the WSS speeds with the scan tool.

Did the RF WSS speed differ by 8 Km/h (5 mph) or show NO speed?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS/TONE WHEEL FOR DAMAGE

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.

NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Right Front WSS, Right Front WSS harness connector, and Right Front WSS tone wheel (if applicable) for damage.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C1047-RIGHT FRONT WHEEL PRESSURE PHASE MONITORING (CONTINUED)

3. CHECK THE VOLTAGE BETWEEN (B7) RIGHT FRONT WSS SUPPLY CIRCUIT AND THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT

Turn the ignition off.

Disconnect the Right Front WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B7) Right Front WSS Supply and (B6) Right Front WSS Signal circuits at the Right Front WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 4

No >> Refer to DTC-C1015 RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT for the diagnostic repair procedure.
Perform ABS VERIFICATION TEST - VER 1.

4. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE RIGHT FRONT WSS HARNESS CONNECTOR

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure the voltage between the (B6) Right Front WSS Signal circuit at the Right Front WSS harness connector and chassis ground.

Slowly rotate the wheel by hand.

Did the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?

Yes >> Go To 5

No >> Replace the Right Front WSS in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C1047-RIGHT FRONT WHEEL PRESSURE PHASE MONITORING (CONTINUED)**5. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure the voltage between the (B6) Right Front WSS Signal circuit at the Anti-Lock Brake Module harness connector and chassis ground.

Slowly rotate the wheel by hand.

Did the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B6) Right Front WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

C1048-LEFT REAR WHEEL PRESSURE PHASE MONITORING

MODULE-ANTILOCK BRAKES

SENSOR-WHEEL SPEED-ABS-LEFT REAR

C1048-LEFT REAR WHEEL PRESSURE PHASE MONITORING (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module detects a pressure reduction phase and the following pressure hold phase is too long.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS/TONE WHEEL DAMAGE (B3) LEFT REAR WSS SIGNAL CIRCUIT OPEN LEFT REAR WHEEL SPEED SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C1048-LEFT REAR WHEEL PRESSURE PHASE MONITORING**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle in a straight line to 40 Km/h (25 mph) while monitoring all the WSS speeds with the scan tool.

Did the LR WSS speed differ by 8 Km/h (5 mph) or show NO speed?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS/TONE WHEEL FOR DAMAGE

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.

NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, Left Rear WSS harness connector, and Left Rear WSS tone wheel (if applicable) for damage.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C1048-LEFT REAR WHEEL PRESSURE PHASE MONITORING (CONTINUED)

3. CHECK THE VOLTAGE BETWEEN (B4) LEFT REAR WSS SUPPLY CIRCUIT AND THE (B3) LEFT REAR WSS SIGNAL CIRCUIT

Turn the ignition off.

Disconnect the Left Rear WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B4) Left Rear WSS Supply and (B3) Left Rear WSS Signal circuits at the Left Rear WSS harness connector.

Is the voltage above 10 volts?

Yes >> Go To 4

No >> Refer to DTC-C1020 LEFT REAR WHEEL SPEED SENSOR CIRCUIT for the diagnostic repair procedure.
Perform ABS VERIFICATION TEST - VER 1.

4. CHECK THE (B3) LEFT REAR WSS SIGNAL VOLTAGE AT THE LEFT REAR WSS HARNESS CONNECTOR

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure the voltage between the (B3) Left Rear WSS Signal circuit at the Left Rear WSS harness connector and chassis ground.

Slowly rotate the wheel by hand.

Did the (B3) Left Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?

Yes >> Go To 5

No >> Replace the Left Rear WSS in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C1048-LEFT REAR WHEEL PRESSURE PHASE MONITORING (CONTINUED)**5. CHECK THE (B3) LEFT REAR WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure the voltage between the (B3) Left Rear WSS Signal circuit at the Anti-Lock Brake Module harness connector and chassis ground.

Slowly rotate the wheel by hand.

Did the (B3) Left Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B3) Left Rear WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

C1049-RIGHT REAR WHEEL PRESSURE PHASE MONITORING

MODULE-ANTILOCK BRAKES

SENSOR-WHEEL SPEED-ABS-RIGHT REAR

C1049-RIGHT REAR WHEEL PRESSURE PHASE MONITORING (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module detects a pressure reduction phase and the following pressure hold phase is too long.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS/TONE WHEEL DAMAGE (B1) RIGHT REAR WSS SIGNAL CIRCUIT OPEN RIGHT REAR WHEEL SPEED SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C1049-RIGHT REAR WHEEL PRESSURE PHASE MONITORING**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle in a straight line to 40 Km/h (25 mph) while monitoring all the WSS speeds with the scan tool.

Did the RR WSS speed differ by 8 Km/h (5 mph) or show NO speed?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS/TONE WHEEL FOR DAMAGE

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.

NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, Right Rear WSS harness connector, and Right Rear WSS tone wheel (if applicable) for damage.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C1049-RIGHT REAR WHEEL PRESSURE PHASE MONITORING (CONTINUED)

3. CHECK THE VOLTAGE BETWEEN (B2) RIGHT REAR WSS SUPPLY CIRCUIT AND THE (B1) RIGHT REAR WSS SIGNAL CIRCUIT

Turn the ignition off.
 Disconnect the Right Rear WSS harness connector.
 Turn the ignition on.
 Measure the voltage between the (B2) Right Rear WSS Supply and (B1) Right Rear WSS Signal circuits at the Right Rear WSS harness connector.

Is the voltage above 10 volts?

- Yes** >> Go To 4
- No** >> Refer to DTC-C102B RIGHT REAR WHEEL SPEED SENSOR CIRCUIT for the diagnostic repair procedure.
 Perform ABS VERIFICATION TEST - VER 1.

4. CHECK THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE AT THE RIGHT REAR WSS HARNESS CONNECTOR

Turn the ignition off.
 Reconnect all connectors.
 Turn the ignition on.
 While back probing, measure the voltage between the (B1) Right Rear WSS Signal circuit at the Right Rear WSS harness connector and chassis ground.
 Slowly rotate the wheel by hand.

Did the (B1) Right Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?

- Yes** >> Go To 5
- No** >> Replace the Right Rear WSS in accordance with the Service Information.
 Perform ABS VERIFICATION TEST - VER 1.

C1049-RIGHT REAR WHEEL PRESSURE PHASE MONITORING (CONTINUED)**5. CHECK THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure the voltage between the (B1) Right Rear WSS Signal circuit at the Anti-Lock Brake Module harness connector and chassis ground.

Slowly rotate the wheel by hand.

Did the (B1) Right Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B1) Right Rear WSS Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

C1073-ABS PUMP MOTOR CONTROL CIRCUIT

MODULE-ANTILOCK BRAKES

C1073-ABS PUMP MOTOR CONTROL CIRCUIT (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module indicates the ABS Pump Motor circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE ABS PUMP MOTOR FUSE OPEN (A107) FUSED B(+) CIRCUIT SHORTED TO GROUND OR OPEN (Z107) GROUND CIRCUIT OPEN ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK THE ABS PUMP MOTOR FOR CONTINUOUS OPERATION**

Cycle the ignition from off to on.

Monitor the ABS Pump Motor for continuous operation.

Is the ABS Pump Motor running continuously?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 2

2. CHECK FOR A DTC C1073-ABS PUMP MOTOR CONTROL CIRCUIT

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

CAUTION: Ensure braking capability is available before road testing.

Drive the vehicle over 40 Km/h (25 mph).

Park the vehicle and cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

Does the scan tool display: C1073-ABS PUMP MOTOR CONTROL CIRCUIT?

Yes >> Go To 3

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

C1073-ABS PUMP MOTOR CONTROL CIRCUIT (CONTINUED)

3. CHECK ABS PUMP OPERATION WITH SCAN TOOL

Cycle the ignition from off to on.

With the scan tool, actuate the ABS Pump Motor.

Did the ABS Pump Motor operate?

Yes >> Refer to the INTERMITTENT CONDITION diagnostic procedure.

No >> Go To 4

4. CHECK THE ABS PUMP MOTOR FUSE FOR AN OPEN

Turn the ignition off.

Remove and visually inspect the ABS Pump Motor fuse.

Is the ABS Pump Motor fuse open?

Yes >> Go To 5

No >> Go To 6

5. CHECK THE (A107) FUSED B(+) FOR A SHORT TO GROUND

Remove ABS Pump Motor fuse.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between ground and the (A107) Fused B(+) circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (A107) Fused B(+) circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

6. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.

NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

Visually inspect the Anti-Lock Brake Module harness connector and (A107) Fused B(+) circuit in the wiring harness for damage.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

C1073-ABS PUMP MOTOR CONTROL CIRCUIT (CONTINUED)

7. CHECK THE VOLTAGE ON THE (A107) FUSED B(+) CIRCUIT

Install the ABS Pump Motor fuse.

Measure the voltage of the (A107) Fused B(+) circuit.

Is the voltage above 10 volts?

Yes >> Go To 8

No >> Repair the (A107) Fused B(+) circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

8. CHECK THE (Z107) GROUND CIRCUIT FOR AN OPEN

Measure the resistance between ground and the (Z107) Ground circuit.

Is the resistance below 5.0 ohms?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (Z107) Ground circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

C1078-TIRE REVOLUTIONS RANGE PERFORMANCE

MODULE-ANTILOCK BRAKES

MODULE-FRONT CONTROL C1

C1078-TIRE REVOLUTIONS RANGE PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module detects a comparison between the tire circumference value contained in EEPROM and the tire circumference value received on the CAN Bus.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE (D65) CAN C (+) BUS AND (D64) CAN C (-) BUS CIRCUITS SHORTED TOGETHER (D65) CAN C (+) BUS CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (D64) CAN C (-) BUS CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C1078-TIRE REVOLUTIONS RANGE PERFORMANCE**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's.

Does the scan tool display: C1078-TIRE REVOLUTIONS RANGE PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C1078-TIRE REVOLUTIONS RANGE PERFORMANCE (CONTINUED)

3. CHECK THE (D65) CAN C (+) BUS CIRCUIT AND (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TOGETHER

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between the (D65) CAN C (+) BUS circuit and the (D64) CAN C (-) BUS circuit.

Is the resistance below 150 ohms?

Yes >> Repair the (D65) CAN C (+) BUS circuit and the (D64) CAN C (-) BUS circuit for a short together.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4

4. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR A SHORT TO GROUND

Disconnect the Front Control Module harness connector.

Measure the resistance between the (D65) CAN C (+) BUS circuit and ground.

Is the resistance below 5.0 ohms?

Yes >> Repair the (D65) CAN C (+) BUS circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

C1078-TIRE REVOLUTIONS RANGE PERFORMANCE (CONTINUED)

5. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (D65) CAN C (+) BUS circuit.

Is there any voltage present?

Yes >> Repair the (D65) CAN C (+) BUS circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

6. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR AN OPEN CIRCUIT

Turn the ignition off.

Measure the resistance of the (D65) CAN C (+) Bus circuit.

Is the resistance below 5.0 ohms?

Yes >> Go To 7

No >> Repair the (D65) CAN C (+) BUS circuit for an open circuit.
Perform ABS VERIFICATION TEST - VER 1.

C1078-TIRE REVOLUTIONS RANGE PERFORMANCE (CONTINUED)

7. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (D64) CAN C (-) BUS circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (D64) CAN C (-) BUS circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 8

8. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (D64) CAN C (+) BUS circuit.

Is there any voltage present?

Yes >> Repair the (D64) CAN C (-) BUS circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 9

C1078-TIRE REVOLUTIONS RANGE PERFORMANCE (CONTINUED)

9. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR AN OPEN CIRCUIT

Turn the ignition off.

Measure the resistance of the (D64) CAN C (-) Bus circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (D64) CAN C (-) BUS circuit for an open circuit.
Perform ABS VERIFICATION TEST - VER 1.

C107D-BRAKE PEDAL SWITCH 1/2 CORRELATION

MODULE-ANTILOCK BRAKES

SWITCH-STOP LAMP

C107D-BRAKE PEDAL SWITCH 1/2 CORRELATION (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module detects an implausible signal from the Stop Lamp Switch.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE STOP LAMP SWITCH (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT OPEN ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C107D-BRAKE PEDAL SWITCH 1/2 CORRELATION**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's.

Does the scan tool display: C107D-BRAKE PEDAL SWITCH 1/2 CORRELATION?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C107D-BRAKE PEDAL SWITCH 1/2 CORRELATION (CONTINUED)

3. CHECK THE (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT WHILE DEPRESSING AND RELEASING BRAKE PEDAL

NOTE: The voltmeter must be connected to 12 volts to perform this test.

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (B15) Brake Switch No. 1 Signal circuit.

Depress and release the brake pedal.

Does the voltage change?

Yes >> Replace the Anti-lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4

4. CHECK THE (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Stop Lamp Switch harness connector.

Measure the resistance of the (B15) Brake Switch No. 1 Signal circuit.

Is the resistance below 5.0 ohms?

Yes >> Replace the Stop Lamp Switch in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (B15) Brake Switch No. 1 Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

C1210-G SENSOR INPUT CIRCUIT PERFORMANCE

- **When Monitored:**

Continuously after power-on reset until vehicle speed exceeds 12.4mph/20 kph for the first time, but not if the sensor voltage is out of range,

Or, during diagnostic mode.

Or, if the monitoring was inhibited by a corresponding diagnostics command.

Or, if the vehicle speed has exceeded 12.4 mph/20 kph during the actual ignition cycle.

Or, if at least one overspinning wheel is detected.

Or, if one of the control functions is active.

- **Set Condition:**

A failure is detected if the measured acceleration signal is higher than 0.8 g longer than the specified detection time.

Possible Causes
MODULE LOOSE OR NOT CORRECTLY MOUNTED
DEFECTIVE SENSOR

Diagnostic Test**1. Module failure**

NOTE: The Sensor Cluster is the same as the Dynamics sensor.

The G-sensor is in the ABM if it is TCS only, or in the Sensor Cluster if it has ESP.

Check the module for correct mounting.

Is the module mounted correctly?

Yes >> Replace the ABM if it is TCS only, or replace the Sensor Cluster if it has ESP.

No >> Mount the module correctly and retest.

C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE

C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module detects a calculated steering wheel angle offset is out of the specified range.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE (A108) FUSED B(+) CIRCUIT OPEN (Z907) GROUND CIRCUIT OPEN (D65) CAN C (+) BUS AND (D64) CAN C (-) BUS CIRCUITS SHORTED TOGETHER (D65) CAN C (+) BUS CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (D64) CAN C (-) BUS CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN STEERING CONTROL MODULE

Diagnostic Test**1. CHECK FOR A DTC C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's.

Does the scan tool display: C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE

Check the Steering Angle Sensor installation.

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE (CONTINUED)

3. CHECK THE VOLTAGE ON THE (A108) FUSED B(+) CIRCUIT

Turn the ignition off.

Disconnect the Steering Control Module harness connector.

Turn the ignition on.

Measure the voltage of the (A108) Fused B(+) circuit.

Is the voltage above 10 volts?

Yes >> Go To 4

No >> Repair the (A108) Fused B(+) circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

4. CHECK THE RESISTANCE OF THE (Z907) GROUND CIRCUIT

Turn the ignition off.

Measure the resistance between the (Z907) Ground circuit and ground.

Is the resistance below 5.0 ohms?

Yes >> Go To 5

No >> Repair the (Z907) Ground circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE (CONTINUED)**5. CHECK THE (D65) CAN C (+) BUS AND (D64) CAN C (-) BUS CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between the (D65) CAN C (+) BUS circuit and the (D64) CAN C (-) BUS circuit.

Is the resistance below 150 ohms?

Yes >> Repair the (D65) CAN C (+) BUS and the (D64) CAN C (-) BUS circuits for a short together.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

**6. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (D65) CAN C (+) BUS circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (D65) CAN C (+) BUS circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE (CONTINUED)

7. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (D65) CAN C (+) BUS circuit.

Is there any voltage present?

- Yes** >> Repair the (D65) CAN C (+) BUS circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 8

8. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR AN OPEN CIRCUIT

Turn the ignition off.

Measure the resistance of the (D65) CAN C (+) Bus circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Go To 9
- No** >> Repair the (D65) CAN C (+) BUS circuit for an open circuit.
Perform ABS VERIFICATION TEST - VER 1.

C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE (CONTINUED)**9. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (D64) CAN C (-) BUS circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (D64) CAN C (-) BUS circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 10

**10. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition on.

Measure the voltage of the (D64) CAN C (+) BUS circuit.

Is there any voltage present?

Yes >> Repair the (D64) CAN C (-) BUS circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 11

C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE (CONTINUED)

11. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR AN OPEN CIRCUIT

Turn the ignition off.

Measure the resistance of the (D64) CAN C (-) Bus circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Steering Control Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (D64) CAN C (-) BUS circuit for an open circuit.
Perform ABS VERIFICATION TEST - VER 1.

C121C-TORQUE REQUEST SIGNAL DENIED

C121C-TORQUE REQUEST SIGNAL DENIED (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module indicates if engine management relevant for Automatic Yaw Control/Traction Control System control can be accomplished.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE (D65) CAN C (+) BUS AND (D64) CAN C (-) BUS CIRCUITS SHORTED TOGETHER (D65) CAN C (+) BUS CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (D64) CAN C (-) BUS CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN POWERTRAIN CONTROL MODULE

Diagnostic Test**1. CHECK FOR A DTC C121C-TORQUE REQUEST SIGNAL DENIED**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's.

Does the scan tool display: C121C-TORQUE REQUEST SIGNAL DENIED?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C121C-TORQUE REQUEST SIGNAL DENIED (CONTINUED)**3. CHECK THE (D65) CAN C (+) BUS AND (D64) CAN C (-) BUS CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between the (D65) CAN C (+) BUS circuit and the (D64) CAN C (-) BUS circuit.

Is the resistance below 150 ohms?

Yes >> Repair the (D65) CAN C (+) BUS and the (D64) CAN C (-) BUS circuits for a short together.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4

**4. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Powertrain Control Module harness connector.

Measure the resistance between ground and the (D65) CAN C (+) BUS circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (D65) CAN C (+) BUS circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

C121C-TORQUE REQUEST SIGNAL DENIED (CONTINUED)

5. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (D65) CAN C (+) BUS circuit.

Is there any voltage present?

Yes >> Repair the (D65) CAN C (+) BUS circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

6. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR AN OPEN CIRCUIT

Turn the ignition off.

Measure the resistance of the (D65) CAN C (+) Bus circuit.

Is the resistance below 5.0 ohms?

Yes >> Go To 7

No >> Repair the (D65) CAN C (+) BUS circuit for an open circuit.
Perform ABS VERIFICATION TEST - VER 1.

C121C-TORQUE REQUEST SIGNAL DENIED (CONTINUED)**7. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (D64) CAN C (-) BUS circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (D64) CAN C (-) BUS circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 8

**8. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition on.

Measure the voltage of the (D64) CAN C (+) BUS circuit.

Is there any voltage present?

Yes >> Repair the (D64) CAN C (-) BUS circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 9

C121C-TORQUE REQUEST SIGNAL DENIED (CONTINUED)

9. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR AN OPEN CIRCUIT

Turn the ignition off.

Measure the resistance of the (D64) CAN C (-) Bus circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Powertrain Control Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (D64) CAN C (-) BUS circuit for an open circuit.
Perform ABS VERIFICATION TEST - VER 1.

C121D-BRAKE PRESSURE SENSOR CIRCUIT

MODULE-ANTILOCK BRAKES

SENSOR-BRAKE PRESSURE

C121D-BRAKE PRESSURE SENSOR CIRCUIT (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is out of range.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE AIR IN BRAKE SYSTEM/WORN MECHANICAL COMPONENTS (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B986) BRAKE PRESSURE SENSOR RETURN CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN BRAKE PRESSURE SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C121D-BRAKE PRESSURE SENSOR CIRCUIT

NOTE: This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Start the engine.
- Depress and release the brake pedal.
- With the scan tool, read and record DTC's.

Does the scan tool display: C121D-BRAKE PRESSURE SENSOR CIRCUIT?

- Yes** >> Go To 2
- No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE

- Check all related wiring for bruised, chafed, pierced, or partially broken wires.
- Check all related connectors for broken, bent, pushed out, or corroded terminals.

Were any problems found?

- Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 3

C121D-BRAKE PRESSURE SENSOR CIRCUIT (CONTINUED)**3. CHECK FOR AIR IN BRAKE SYSTEM AND WORN MECHANICAL COMPONENTS**

NOTE: Before continuing the brake system must be bled to verify there is no air in the brake system.

NOTE: Visually inspect for worn brake linings, undersized rotors, binding or frozen calipers.

Was there any air in the brake system or base brake issues found?

Yes >> Repair as needed.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4

4. CHECK THE VOLTAGE ON THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT

Turn the ignition off.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B83) Brake Pressure Sensor Supply circuit.

Is the voltage above 4 volts?

Yes >> Go To 8

No >> Go To 5

**5. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Measure the resistance between ground and the (B83) Brake Pressure Sensor Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

C121D-BRAKE PRESSURE SENSOR CIRCUIT (CONTINUED)

6. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (B83) Brake Pressure Sensor Supply circuit.

Is there any voltage present?

Yes >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

7. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR AN OPEN

Measure the resistance of the (B83) Brake Pressure Sensor Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (B83) Brake Pressure Sensor Supply circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C121D-BRAKE PRESSURE SENSOR CIRCUIT (CONTINUED)**8. CHECK THE RESISTANCE TO GROUND ON THE (B986) BRAKE PRESSURE RETURN CIRCUIT**

Turn the ignition off.

Measure the resistance between the (B986) Brake Pressure Return Circuit and ground.

Is the resistance below 5.0 ohms?

Yes >> Go To 12

No >> Go To 9

**9. CHECK THE (B986) BRAKE PRESSURE SENSOR RETURN CIRCUIT FOR SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between ground and the (B986) Brake Pressure Sensor Return circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B986) Brake Pressure Sensor Return circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 10

C121D-BRAKE PRESSURE SENSOR CIRCUIT (CONTINUED)

10. CHECK THE (B986) BRAKE PRESSURE SENSOR RETURN CIRCUIT FOR SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (B986) Brake Pressure Sensor Return circuit.

Is there any voltage present?

Yes >> Repair the (B986) Brake Pressure Sensor Return circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 11

11. CHECK THE (B986) BRAKE PRESSURE SENSOR RETURN CIRCUIT FOR AN OPEN

Turn the ignition off.

Measure the resistance of the (B986) Brake Pressure Sensor Return circuit.

Is the resistance below 5.0 ohms?

Yes >> Replace the Anti-Lock Brake Module in accordance with Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (B986) Brake Pressure Sensor Return circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C121D-BRAKE PRESSURE SENSOR CIRCUIT (CONTINUED)**12. CHECK THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT OUTPUT**

Turn the ignition off.

Reconnect the Anti-Lock Brake Module harness connector.

Reconnect the Brake Pressure Sensor harness connector.

Start the engine.

While back probing, measure the voltage of the (B84) Brake Pressure Sensor Signal circuit at the Brake Pressure Sensor harness connector while depressing and releasing the brake pedal.

Is the voltage between 0.50 volts to 4.55 volts?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 13

**13. CHECK THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Measure the resistance between ground and the (B84) Brake Pressure Sensor Signal circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B84) Brake Pressure Sensor Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 14

C121D-BRAKE PRESSURE SENSOR CIRCUIT (CONTINUED)

14. CHECK THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (B84) Brake Pressure Sensor Signal circuit.

Is there any voltage present?

- Yes** >> Repair the (B84) Brake Pressure Sensor Signal circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 15

15. CHECK THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off.

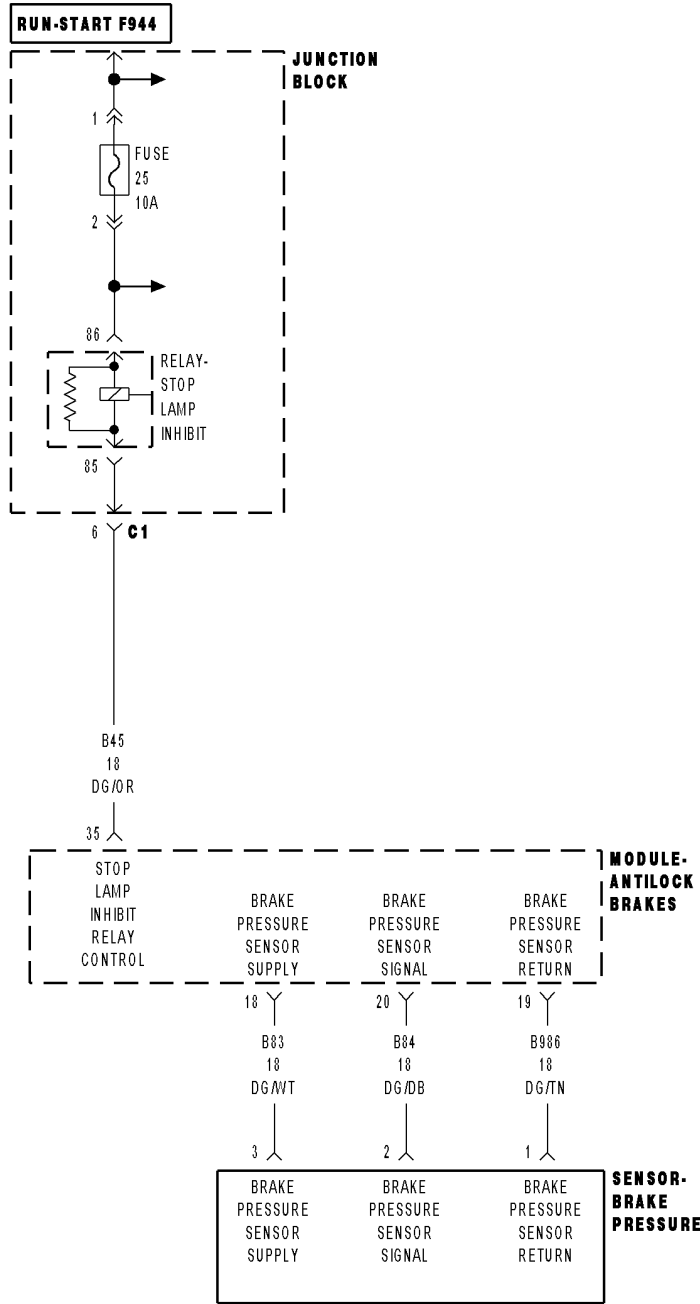

Measure the resistance of the (B84) Brake Pressure Sensor Signal circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Brake Pressure Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B137) Brake Pressure Sensor Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE

MODULE-ANTILOCK BRAKES

SENSOR-BRAKE PRESSURE

C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is out of range.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE AIR IN BRAKE SYSTEM/WORN MECHANICAL COMPONENTS (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B986) BRAKE PRESSURE SENSOR RETURN CIRCUIT OPEN (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT OPEN (B84) BRAKE PRESSURE SENSOR SIGNAL AND (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUITS SHORTED TOGETHER (B84) BRAKE PRESSURE SENSOR SIGNAL AND (B986) BRAKE PRESSURE SENSOR RETURN CIRCUITS SHORTED TOGETHER (B45) STOP LAMP INHIBIT RELAY CONTROL CIRCUIT ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE

NOTE: If any of the following DTC's are present they must be repaired before continuing.

- C122A-BRAKE PEDAL FORCE SWITCH CIRCUIT
- C122B-BRAKE PEDAL FORCE SWITCH CIRCUIT PERFORMANCE

Turn the ignition on.
 With the scan tool, read and record DTC's.
 With the scan tool, read and record Freeze Fame information.
 With the scan tool, erase DTC's.
 Start the engine.
 Depress and release the brake pedal.
 With the scan tool, read and record DTC's.

Does the scan tool display: C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE?

- Yes** >> Go To 2
- No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE (CONTINUED)**2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK FOR AIR IN BRAKE SYSTEM AND WORN MECHANICAL COMPONENTS

NOTE: Before continuing the brake system must be bled to verify there is no air in the brake system.

NOTE: Visually inspect for worn brake linings, undersized rotors, binding or frozen calipers.

Was there any air in the brake system or base brake issues found?

Yes >> Repair as needed.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4

4. CHECK THE VOLTAGE ON THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT

Turn the ignition off.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B83) Brake Pressure Sensor Supply circuit.

Is the voltage above 4 volts?

Yes >> Go To 8

No >> Go To 5

C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE (CONTINUED)

5. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between ground and the (B83) Brake Pressure Sensor Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

6. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (B83) Brake Pressure Sensor Supply circuit.

Is there any voltage present?

Yes >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE (CONTINUED)

7. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR AN OPEN

Turn the ignition off.

Measure the resistance of the (B83) Brake Pressure Sensor Supply circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B83) Brake Pressure Sensor Supply circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

8. CHECK THE RESISTANCE TO GROUND ON THE (B986) BRAKE PRESSURE RETURN CIRCUIT

Turn the ignition off.

Measure the resistance between the (B986) Brake Pressure Return circuit and ground.

Is the resistance below 5.0 ohms?

- Yes** >> Go To 9
- No** >> Repair the (B986) Brake Pressure Return circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE (CONTINUED)

9. CHECK THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT OUTPUT

Turn the ignition off.

Reconnect the Brake Pressure Sensor harness connector.

Start the engine.

While back probing, measure the voltage of the (B84) Brake Pressure Sensor Signal circuit at the Brake Pressure Sensor harness connector while depressing and releasing the brake pedal.

Is the voltage between 0.50 volts to 4.55 volts?

Yes >> Go To 13

No >> Go To 10

10. CHECK THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Measure the resistance of the (B84) Brake Pressure Sensor Signal circuit.

Is the resistance below 5.0 ohms?

Yes >> Go To 11

No >> Repair the (B84) Brake Pressure Sensor Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE (CONTINUED)**11. CHECK FOR A SHORT BETWEEN THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT AND THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT**

Measure the resistance between the (B84) Brake Pressure Sensor Signal circuit and the (B83) Brake Pressure Sensor Supply circuit.

Is the resistance below 150 ohms?

Yes >> Repair the (B83) Brake Pressure Sensor Supply and (B84) Brake Pressure Sensor Signal circuits for a short together.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 12

**12. CHECK FOR A SHORT BETWEEN THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT AND THE (B986) BRAKE PRESSURE SENSOR RETURN CIRCUIT**

Measure the resistance between the (B84) Brake Pressure Sensor Signal and the (B986) Brake Pressure Sensor Return circuit.

Is the resistance below 150 ohms?

Yes >> Repair the (B84) Brake Pressure Sensor Signal and (B986) Brake Pressure Sensor Return circuits for a short together.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 13

C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE (CONTINUED)

13. CHECK THE (B45) STOP LAMP INHIBIT RELAY CONTROL OPERATION

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage on the (B45) Stop Lamp Inhibit Relay Control circuit while depressing and releasing the brake pedal.

Does the voltage toggle from approximately 0 to 12 volts?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

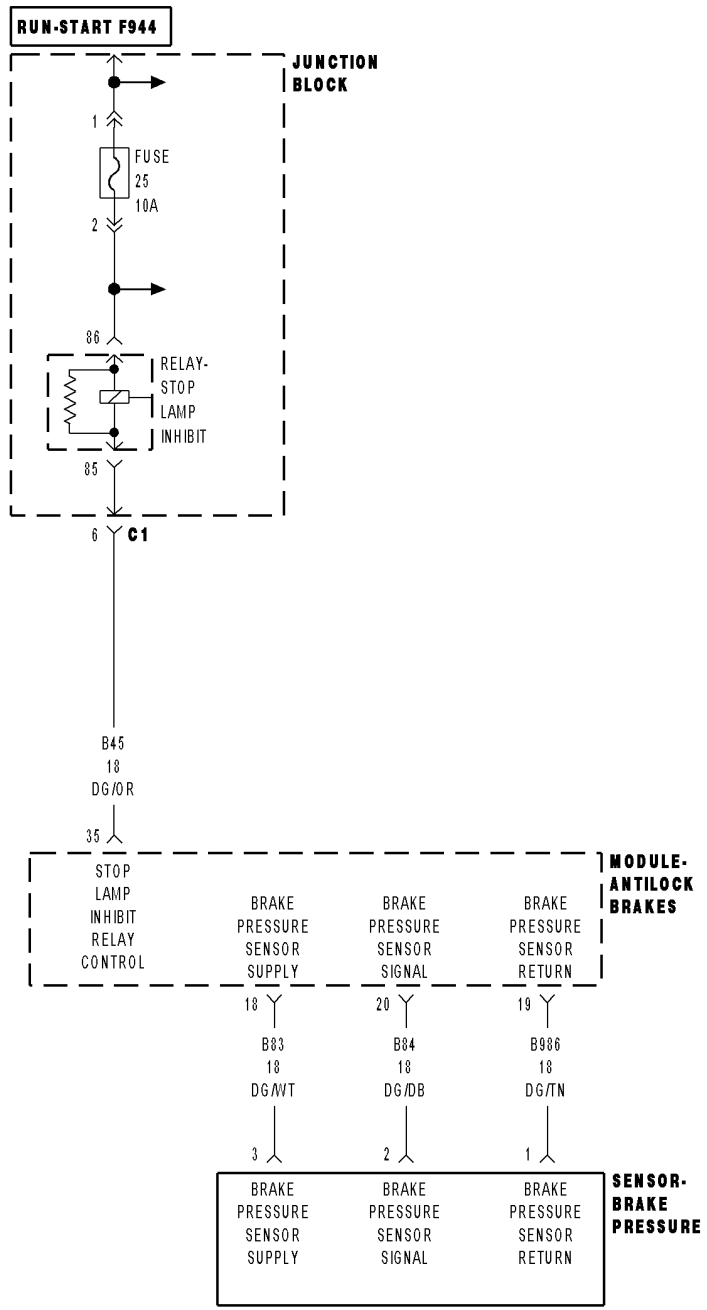

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair as needed.

Perform ABS VERIFICATION TEST - VER 1.

C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION

MODULE-ANTILOCK BRAKES

SENSOR-BRAKE PRESSURE

C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is not plausible.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE AIR IN BRAKE SYSTEM/WORN MECHANICAL COMPONENTS (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B986) BRAKE PRESSURE SENSOR RETURN CIRCUIT OPEN (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT OPEN (B84) BRAKE PRESSURE SENSOR SIGNAL AND (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUITS SHORTED TOGETHER (B84) BRAKE PRESSURE SENSOR SIGNAL AND (B986) BRAKE PRESSURE SENSOR RETURN CIRCUITS SHORTED TOGETHER (D45) STOP LAMP INHIBIT RELAY CONTROL CIRCUIT ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION

NOTE: If any of the following DTC's are present they must be repaired before continuing.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Frame information.
- With the scan tool, erase DTC's.
- Start the engine.
- Depress and release the brake pedal.
- With the scan tool, read and record DTC's.

Does the scan tool display: C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION?

- Yes** >> Go To 2
- No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION (CONTINUED)**2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK FOR AIR IN BRAKE SYSTEM AND WORN MECHANICAL COMPONENTS

NOTE: Before continuing the brake system must be bled to verify there is no air in the brake system.

NOTE: Visually inspect for worn brake linings, undersized rotors, binding or frozen calipers.

Was there any air in the brake system or base brake issues found?

Yes >> Repair as needed.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4

4. CHECK THE VOLTAGE ON THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT

Turn the ignition off.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B83) Brake Pressure Sensor Supply circuit.

Is the voltage above 4 volts?

Yes >> Go To 8

No >> Go To 5

C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION (CONTINUED)

5. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between ground and the (B83) Brake Pressure Sensor Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

6. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (B83) Brake Pressure Sensor Supply circuit.

Is there any voltage present?

Yes >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION (CONTINUED)

7. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR AN OPEN

Turn the ignition off.

Measure the resistance of the (B83) Brake Pressure Sensor Supply circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B83) Brake Pressure Sensor Supply circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

8. CHECK THE RESISTANCE TO GROUND ON THE (B986) BRAKE PRESSURE SENSOR RETURN CIRCUIT

Turn the ignition off.

Measure the resistance between the (B986) Brake Pressure Sensor Return Circuit and ground.

Is the resistance below 5.0 ohms?

- Yes** >> Go To 9
- No** >> Repair the (B986) Brake Pressure Sensor Return circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION (CONTINUED)

9. CHECK THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT OUTPUT

Turn the ignition off.

Reconnect the Brake Pressure Sensor harness connector.

Start the engine.

While back probing, measure the voltage of the (B84) Brake Pressure Sensor Signal circuit at the Brake Pressure Sensor harness connector while depressing and releasing the brake pedal.

Is the voltage between 0.50 volts to 4.55 volts?

Yes >> Go To 13

No >> Go To 10

10. CHECK THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Measure the resistance of the (B84) Brake Pressure Sensor Signal circuit.

Is the resistance below 5.0 ohms?

Yes >> Go To 11

No >> Repair the (B84) Brake Pressure Sensor Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION (CONTINUED)**11. CHECK FOR A SHORT BETWEEN THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT AND THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT**

Measure the resistance between the (B84) Brake Pressure Sensor Signal circuit and the (B83) Brake Pressure Sensor Supply circuit.

Is the resistance below 150 ohms?

Yes >> Repair the (B83) Brake Pressure Sensor Supply and (B84) Brake Pressure Sensor Signal circuits for a short together.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 12

**12. CHECK FOR A SHORT BETWEEN THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT AND THE (B986) BRAKE PRESSURE SENSOR RETURN CIRCUIT**

Measure the resistance between the (B84) Brake Pressure Sensor Signal and the (B986) Brake Pressure Sensor Return circuit.

Is the resistance below 150 ohms?

Yes >> Repair the (B84) Brake Pressure Sensor Signal and (B986) Brake Pressure Sensor Return circuits for a short together.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 13

C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION (CONTINUED)

13. CHECK THE (D45) STOP LAMP INHIBIT RELAY CONTROL OPERATION

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage on the (D45) Stop Lamp Inhibit Relay Control circuit while depressing and releasing the brake pedal.

Does the voltage toggle from approximately 0 to 12 volts?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair as needed.

Perform ABS VERIFICATION TEST - VER 1.

C122A-BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT

MODULE-ANTILOCK BRAKES

SENSOR-BRAKE TRAVEL (ESP/BSC)

C122A-BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module indicates that the Brake Pedal Force Switch signals are invalid or not available.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN BRAKE TRAVEL SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C122A-BRAKE PEDAL FORCE SWITCH CIRCUIT**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

CAUTION: Ensure brake capability is available before road testing.

Test drive vehicle above 24 k/mh (15 mph).

With the scan tool, read and record DTC's.

Does the scan tool display: C122A-BRAKE PEDAL FORCE SWITCH CIRCUIT?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C122A-BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT (CONTINUED)**3. CHECK THE VOLTAGE ON THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT**

Turn the ignition on.

Measure the voltage of the (B134) Brake Pedal Force Switch Close circuit by back probing at the Brake Travel Sensor harness connector.

Is the voltage approximately 6 volts?

Yes >> Go To 7

No >> Go To 4

**4. CHECK THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Travel Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B134) Brake Pedal Force Switch Close circuit.

Is there any voltage present?

Yes >> Repair the (B134) Brake Pedal Force Switch Close circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

**5. CHECK THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (B134) Brake Pedal Force Switch Close circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B134) Brake Pedal Force Switch Close circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

C122A-BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT (CONTINUED)

6. CHECK THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT FOR AN OPEN

Measure the resistance of the (B134) Brake Pedal Force Switch Close circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B134) Brake Pedal Force Switch Close circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

7. CHECK THE VOLTAGE ON THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT

Measure the voltage of the (B135) Brake Pedal Force Switch Open circuit by back probing at the Brake Travel Sensor harness connector.

Is the voltage approximately 12 volts?

- Yes** >> Go To 11
- No** >> Go To 8

C122A-BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT (CONTINUED)**8. CHECK THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Travel Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B135) Brake Pedal Force Switch Open circuit.

Is there any voltage present?

Yes >> Repair the (B135) Brake Pedal Force Switch Open circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 9

**9. CHECK THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (B135) Brake Pedal Force Switch Open circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B135) Brake Pedal Force Switch Open circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 10

C122A-BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT (CONTINUED)

10. CHECK THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT FOR AN OPEN

Measure the resistance of the (B135) Brake Pedal Force Switch Open circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B135) Brake Pedal Force Switch Open circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

11. CHECK THE VOLTAGE ON THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT

Measure the voltage of the (B136) Brake Pedal Force Switch Signal circuit by back probing at the Brake Travel Sensor harness connector.

Is the voltage approximately 6 volts?

- Yes** >> Go To 15
- No** >> Go To 12

C122A-BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT (CONTINUED)**12. CHECK THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Travel Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B136) Brake Pedal Force Switch Signal circuit.

Is there any voltage present?

Yes >> Repair the (B136) Brake Pedal Force Switch Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 13

**13. CHECK THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (B136) Brake Pedal Force Switch Signal circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B136) Brake Pedal Force Switch Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 14

C122A-BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT (CONTINUED)

14. CHECK THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT FOR AN OPEN

Measure the resistance of the (B136) Brake Pedal Force Switch Signal circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B136) Brake Pedal Force Switch Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1

15. CHECK THE VOLTAGE ON THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT

Turn the ignition on.

Measure the voltage of the (B134) Brake Pedal Force Switch Close circuit by back probing at the Brake Travel Sensor harness connector.

Depress and hold the brake pedal.

Is the voltage approximately 12 volts?

- Yes** >> Go To 16
- No** >> Replace the Brake Travel Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C122A-BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT (CONTINUED)**16. CHECK THE VOLTAGE ON THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT**

Measure the voltage of the (B135) Brake Pedal Force Switch Open circuit by back probing at the Brake Travel Sensor harness connector. Depress and hold the brake pedal.

Is the voltage approximately 6 volts?

Yes >> Go To 17

No >> Replace the Brake Travel Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

**17. CHECK THE VOLTAGE ON THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT**

Measure the voltage of the (B136) Brake Pedal Force Switch Signal circuit by back probing at the Brake Travel Sensor harness connector. Depress and hold the brake pedal.

Is the voltage approximately 6 volts?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Replace the Brake Travel Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C122B-BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT PERFORMANCE

MODULE-ANTILOCK BRAKES

SENSOR-BRAKE TRAVEL (ESP/BSC)

C122B-BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module indicates that the Brake Pedal Force Switch signals are implausible.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN BRAKE TRAVEL SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C122B-BRAKE PEDAL FORCE SWITCH CIRCUIT PERFORMANCE**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

CAUTION: Ensure brake capability is available before road testing.

Test drive vehicle above 24 k/mh (15 mph).

With the scan tool, read and record DTC's.

Does the scan tool display: C122B-BRAKE PEDAL FORCE SWITCH CIRCUIT PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C122B-BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT PERFORMANCE (CONTINUED)

3. CHECK THE VOLTAGE ON THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT

Turn the ignition on.

Measure the voltage of the (B134) Brake Pedal Force Switch Close circuit by back probing at the Brake Travel Sensor harness connector.

Is the voltage approximately 6 volts?

Yes >> Go To 7

No >> Go To 4

4. CHECK THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Travel Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B134) Brake Pedal Force Switch Close circuit.

Is there any voltage present?

Yes >> Repair the (B134) Brake Pedal Force Switch Close circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

5. CHECK THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (B134) Brake Pedal Force Switch Close circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B134) Brake Pedal Force Switch Close circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

C122B-BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT PERFORMANCE (CONTINUED)

6. CHECK THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT FOR AN OPEN

Measure the resistance of the (B134) Brake Pedal Force Switch Close circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B134) Brake Pedal Force Switch Close circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

7. CHECK THE VOLTAGE ON THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT

Measure the voltage of the (B135) Brake Pedal Force Switch Open circuit by back probing at the Brake Travel Sensor harness connector.

Is the voltage approximately 12 volts?

- Yes** >> Go To 11
- No** >> Go To 8

C122B-BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT PERFORMANCE (CONTINUED)

8. CHECK THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Travel Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B135) Brake Pedal Force Switch Open circuit.

Is there any voltage present?

Yes >> Repair the (B135) Brake Pedal Force Switch Open circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 9

9. CHECK THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (B135) Brake Pedal Force Switch Open circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B135) Brake Pedal Force Switch Open circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 10

C122B-BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT PERFORMANCE (CONTINUED)

10. CHECK THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT FOR AN OPEN

Measure the resistance of the (B135) Brake Pedal Force Switch Open circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B135) Brake Pedal Force Switch Open circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

11. CHECK THE VOLTAGE ON THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT

Measure the voltage of the (B136) Brake Pedal Force Switch Signal circuit by back probing at the Brake Travel Sensor harness connector.

Is the voltage approximately 6 volts?

- Yes** >> Go To 15
- No** >> Go To 12

C122B-BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT PERFORMANCE (CONTINUED)

12. CHECK THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Travel Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B136) Brake Pedal Force Switch Signal circuit.

Is there any voltage present?

Yes >> Repair the (B136) Brake Pedal Force Switch Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 13

13. CHECK THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (B136) Brake Pedal Force Switch Signal circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B136) Brake Pedal Force Switch Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 14

C122B-BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT PERFORMANCE (CONTINUED)**14. CHECK THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT FOR AN OPEN**

Measure the resistance of the (B136) Brake Pedal Force Switch Signal circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B136) Brake Pedal Force Switch Signal circuit for an open.
Perform ABS VERIFICATION TEST - VER 1

**15. CHECK THE VOLTAGE ON THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT**

Turn the ignition on.

Measure the voltage of the (B134) Brake Pedal Force Switch Close circuit by back probing at the Brake Travel Sensor harness connector.

Depress and hold the brake pedal.

Is the voltage approximately 12 volts?

- Yes** >> Go To 16
- No** >> Replace the Brake Travel Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C122B-BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT PERFORMANCE (CONTINUED)

16. CHECK THE VOLTAGE ON THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT

Measure the voltage of the (B135) Brake Pedal Force Switch Open circuit by back probing at the Brake Travel Sensor harness connector. Depress and hold the brake pedal.

Is the voltage approximately 6 volts?

- Yes** >> Go To 17
- No** >> Replace the Brake Travel Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

17. CHECK THE VOLTAGE ON THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT

Measure the voltage of the (B136) Brake Pedal Force Switch Signal circuit by back probing at the Brake Travel Sensor harness connector. Depress and hold the brake pedal.

Is the voltage approximately 6 volts?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Replace the Brake Travel Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C122C-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT SUPPLY VOLTAGE

**MODULE-
ANTILOCK
BRAKES**

**SENSOR-
BRAKE
TRAVEL
(ESP/BSC)**

C122C-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT SUPPLY VOLTAGE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module indicates the Active Brake Booster circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) CIRCUIT SHORTED TO (B984) BRAKE PRESSURE SENSOR RETURN CIRCUIT (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN BRAKE TRAVEL SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C122C-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT SUPPLY VOLTAGE

NOTE: This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Frame information.
- With the scan tool, erase DTC's.
- Cycle the ignition switch from off to on.
- With the scan tool, read and record DTCs

Does the scan tool display: C122C-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT SUPPLY VOLTAGE?

- Yes** >> Go To 2
- No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any problems found?

- Yes** >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 3

C122C-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT SUPPLY VOLTAGE (CONTINUED)**3. CHECK THE RESISTANCE OF THE ACTIVE BRAKE BOOSTER SOLENOID**

Turn the ignition off.

Disconnect the Brake Travel Sensor harness connector.

Measure the resistance between the (B131) Active Brake Booster Solenoid (+) circuit and the (B984) Brake Pressure Sensor Return circuit terminals of the Brake Travel Sensor.

Is the resistance between 1 to 2 ohms?

Yes >> Go To 4

No >> Replace the Brake Travel Sensor in accordance with the Service information.

Perform ABS VERIFICATION TEST - VER 1.

**4. CHECK THE VOLTAGE ON THE (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) CIRCUIT**

Turn the ignition on.

Measure the voltage of the (B131) Active Brake Booster Solenoid (+) circuit in the Brake Travel Sensor harness connector.

Is the voltage above 10 volts?

Yes >> Go To 9

No >> Go To 5

**5. CHECK FOR A SHORT BETWEEN THE (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) AND (B984) BRAKE PRESSURE SENSOR RETURN CIRCUITS**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between the (B131) Active Brake Booster Solenoid (+) circuit and the (B984) Brake Pressure Sensor Return circuit.

Is the resistance below 150 ohms?

Yes >> Repair the (B131) Active Brake Booster Solenoid (+) circuit for a short to the (B984) Brake Pressure Sensor Return circuit.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

C122C-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT SUPPLY VOLTAGE (CONTINUED)

6. CHECK THE (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (B131) Active Brake Booster Solenoid (+) circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B131) Active Brake Booster Solenoid (+) circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

7. CHECK THE (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (B131) Active Brake Booster Solenoid (+) circuit.

Is there any voltage present?

Yes >> Repair the (B131) Active Brake Booster Solenoid (+) circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 8

C122C-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT SUPPLY VOLTAGE (CONTINUED)**8. CHECK THE (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Measure the resistance of the (B131) Active Brake Booster Solenoid (+) circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B131) Active Brake Booster Solenoid (+) circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

**9. CHECK THE ACTIVE BRAKE BOOSTER SOLENOID ACTUATION**

Turn the ignition off.

Connect the Brake Travel Sensor harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Connect a jumper wire between the (B984) Brake Pressure Sensor Return circuit at the Anti-Lock Brake Module harness connector and ground.

Connect a jumper wire for several seconds between the (B131) Active Brake Booster Solenoid (+) circuit at the Anti-Lock Brake Module harness connector and a fused 12 volt supply.

Is there brake application when the (B131) Active Brake Booster Solenoid (+) circuit is jumped to a 12 volt supply and the (B984) Brake Pressure Sensor Return jumped to ground?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Replace the Brake Travel Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C122D-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT

MODULE-ANTILOCK BRAKES

SENSOR-BRAKE TRAVEL (ESP/BSC)

C122D-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module indicates the Active Brake Booster circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) CIRCUIT AND (B132) ACTIVE BRAKE BOOSTER SOLENOID (-) CIRCUIT SHORTED TO TOGETHER (B132) ACTIVE BRAKE BOOSTER SOLENOID (-) CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN BRAKE TRAVEL SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C122D-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTCs

Does the scan tool display: C122D-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C122D-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT (CONTINUED)

3. CHECK THE RESISTANCE OF THE ACTIVE BRAKE BOOSTER SOLENOID

Turn the ignition off.

Disconnect the Brake Travel Sensor harness connector.

Measure the resistance between the (B131) Active Brake Booster Solenoid (+) circuit and the (B984) Brake Pressure Sensor Return circuit terminals of the Brake Travel Sensor.

Is the resistance between 1 to 2 ohms?

Yes >> Go To 4

No >> Replace the Brake Travel Sensor in accordance with the Service information.
Perform ABS VERIFICATION TEST - VER 1.

4. CHECK FOR A SHORT BETWEEN THE (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) AND (B984) BRAKE PRESSURE SENSOR RETURN CIRCUITS

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between the (B131) Active Brake Booster Solenoid (+) circuit and the (B984) Brake Pressure Sensor Return circuit.

Is the resistance below 150 ohms?

Yes >> Repair the (B131) Active Brake Booster Solenoid (+) circuit for a short to the (B984) Brake Pressure Sensor Return circuit.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

5. CHECK THE (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (B131) Active Brake Booster Solenoid (+) circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B131) Active Brake Booster Solenoid (+) circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

C122D-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT (CONTINUED)

6. CHECK THE (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (B131) Active Brake Booster Solenoid (+) circuit.

Is there any voltage present?

Yes >> Repair the (B131) Active Brake Booster Solenoid (+) circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

7. CHECK THE (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) CIRCUIT FOR AN OPEN

Turn the ignition off.

Measure the resistance of the (B131) Active Brake Booster Solenoid (+) circuit.

Is the resistance below 5.0 ohms?

Yes >> Go To 8

No >> Repair the (B131) Active Brake Booster Solenoid (+) circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C122D-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT (CONTINUED)**8. CHECK THE ACTIVE BRAKE BOOSTER SOLENOID ACTUATION**

Turn the ignition off.

Connect the Brake Travel Sensor harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Connect a jumper wire between the (B984) Brake Pressure Sensor Return circuit at the Anti-Lock Brake Module harness connector and ground.

Connect a jumper wire for several seconds between the (B131) Active Brake Booster Solenoid (+) circuit at the Anti-Lock Brake Module harness connector and a fused 12 volt supply.

Is there brake application when the (B131) Active Brake Booster Solenoid (+) circuit is jumped to a 12 volt supply and the (B984) Brake Pressure Sensor Return jumped to ground?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Replace the Brake Travel Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C123A-ESP SYSTEM SENSORS CALIBRATION

MODULE-ANTILOCK BRAKES

SENSOR-DYNAMICS (ESP)

C123A-ESP SYSTEM SENSORS CALIBRATION (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module indicates the Dynamics Sensor stored calibration values are invalid.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE DYNAMICS SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C123A-ESP SYSTEM SENSORS CALIBRATION**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

Does the scan tool display: C123A-ESP SYSTEM SENSORS CALIBRATION?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C123A-ESP SYSTEM SENSORS CALIBRATION (CONTINUED)

3. CHECK THE DYNAMICS SENSOR OUTPUT

CAUTION: Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle while monitoring the Dynamics Sensor operation.

Was the Lateral Sensor output between 0.02 G to 0.16 G and the Yaw Sensor between 1.30° to 5.70°?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Replace the Dynamics Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
-

C123B-ESP SYSTEM CONTROL TOO LONG

MODULE-ANTILOCK BRAKES

SENSOR-DYNAMICS (ESP)

C123B-ESP SYSTEM CONTROL TOO LONG (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module indicates Dynamics Sensor failure.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
DYNAMICS SENSOR

Diagnostic Test**1. CHECK FOR A DTC C123B-ESP SYSTEM CONTROL TOO LONG**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

Does the scan tool display: C123B-ESP SYSTEM CONTROL TOO LONG?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Replace the Dynamics Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

C1242-GSENSOR INPUT SIGNAL PERFORMANCE

- **When Monitored:**

Continuously after power-on reset until vehicle speed exceeds 12.4mph/20 kph for the first time, but not if the sensor voltage is out of range,

Or, during diagnostic mode.

Or, if the monitoring was inhibited by a corresponding diagnostics command.

Or, if the vehicle speed has exceeded 12.4 mph/20 kph during the actual ignition cycle.

Or, if at least one overspinning wheel is detected.

Or, if one of the control functions is active.

- **Set Condition:**

A failure is detected if the measured acceleratin signal is higher than 0.8 g longer than the specified detection time.

Possible Causes
DEFECTIVE SENSOR

Diagnostic Test

1. Module failure

NOTE: The Sensor Cluster is the same as the Dynamics sensor.

The G-sensor is in the ABM if it is TCS only, or in the Sensor Cluster if it has ESP.

Repair.

Repair

Replace the ABM if it is TCS only, or replace the Sensor Cluster if it has ESP.

C1243-G SENSOR NOT INTIALIZED

- **When Monitored:**

Continuously after power-on reset until vehicle speed exceeds 12.4mph/20 kph for the first time, but not if the sensor voltage is out of range,

Or, during diagnostic mode.

Or, if the monitoring was inhibited by a corresponding diagnostics command.

Or, if the vehicle speed has exceeded 12.4 mph/20 kph during the actual ignition cycle.

Or, if at least one overspinning wheel is detected.

Or, if one of the control functions is active.

- **Set Condition:**

A failure is detected if the measured acceleration signal is higher than 0.8 g longer than the specified detection time.

Possible Causes
DEFECTIVE SENSOR

Diagnostic Test**1. Module failure**

NOTE: The Sensor Cluster is the same as the Dynamics sensor.

The G-sensor is in the ABM if it is TCS only, or in the Sensor Cluster if it has ESP.

Repair

Replace the ABM if it is TCS only, or replace the Sensor Cluster if it has ESP.

C123C-SENSOR CLUSTER MOUNTING/INSTALLATION PERFORMANCE

MODULE-ANTILOCK BRAKES

SENSOR-DYNAMICS (ESP)

C123C-SENSOR CLUSTER MOUNTING/INSTALLATION PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module indicates the Sensor Cluster values are invalid.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE IMPROPERLY INSTALLED SENSOR CLUSTER (G94) SENSOR CLUSTER GROUND CIRCUIT OPEN SENSOR CLUSTER

Diagnostic Test**1. CHECK FOR A DTC C123C-SENSOR CLUSTER MOUNTING/INSTALLATION PERFORMANCE**

NOTE: The Sensor Cluster is the same as the Dynamics sensor.

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

Does the scan tool display: C123C-SENSOR CLUSTER MOUNTING/INSTALLATION PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C123C-SENSOR CLUSTER MOUNTING/INSTALLATION PERFORMANCE (CONTINUED)**3. CHECK THE DYNAMICS SENSOR INSTALLATION**

NOTE: Sensor Cluster installation and mounting bolt torque is crucial for proper operation.

Check the Sensor Cluster for damaged, modified or bent mounting bracket.

Check the Sensor Cluster mounting bolts for loose or over tightened mounting bolts.

Were any problems found?

- Yes** >> Repair as needed.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 4
-

4. CHECK THE RESISTANCE BETWEEN THE (G94) DYNAMICS SENSOR GROUND CIRCUIT AND GROUND

Turn the ignition off.

Disconnect the Sensor Cluster harness connector.

Measure the resistance between the (G94) Sensor Cluster Ground circuit and ground.

Is the resistance below 5.0 ohm?

- Yes** >> Replace the Sensor Cluster in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (G94) Sensor Cluster Ground circuit for an open circuit.
Perform ABS VERIFICATION TEST - VER 1.
-

C2100-BATTERY VOLTAGE LOW

MODULE-ANTILOCK BRAKES

C2100-BATTERY VOLTAGE LOW (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module indicates that voltage is below 7.5 volts.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE STARTING AND CHARGING CONDITION FUSED B(+) CIRCUIT(S) OPEN OR HIGH RESISTANCE GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A C2100-BATTERY VOLTAGE LOW

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition from off to on.

With the scan tool, read and record DTC's.

Does the scan tool display: C2100-BATTERY VOLTAGE LOW?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C2100-BATTERY VOLTAGE LOW (CONTINUED)**3. CHECK THE BATTERY AND CHARGING SYSTEM**

Turn the ignition off.

Perform a battery and charging system test.

NOTE: Refer to the Service Information for related test(s)/symptom(s).

Does the battery and charging system pass?

Yes >> Go To 4

No >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

4. FUSED B(+) CIRCUIT(S) OPEN CIRCUIT OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to ground, check the (A107) and the (A200) Fused B+ circuits.

NOTE: The Test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go To 5

No >> Repair the Fused B+ circuit(s) for an open circuit or high resistance.

**5. GROUND CIRCUIT(S) OPEN CIRCUIT OR HIGH RESISTANCE**

Using a 12-volt test light connected to B+, check (Z107) and (Z127) Ground circuits.

NOTE: The Test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

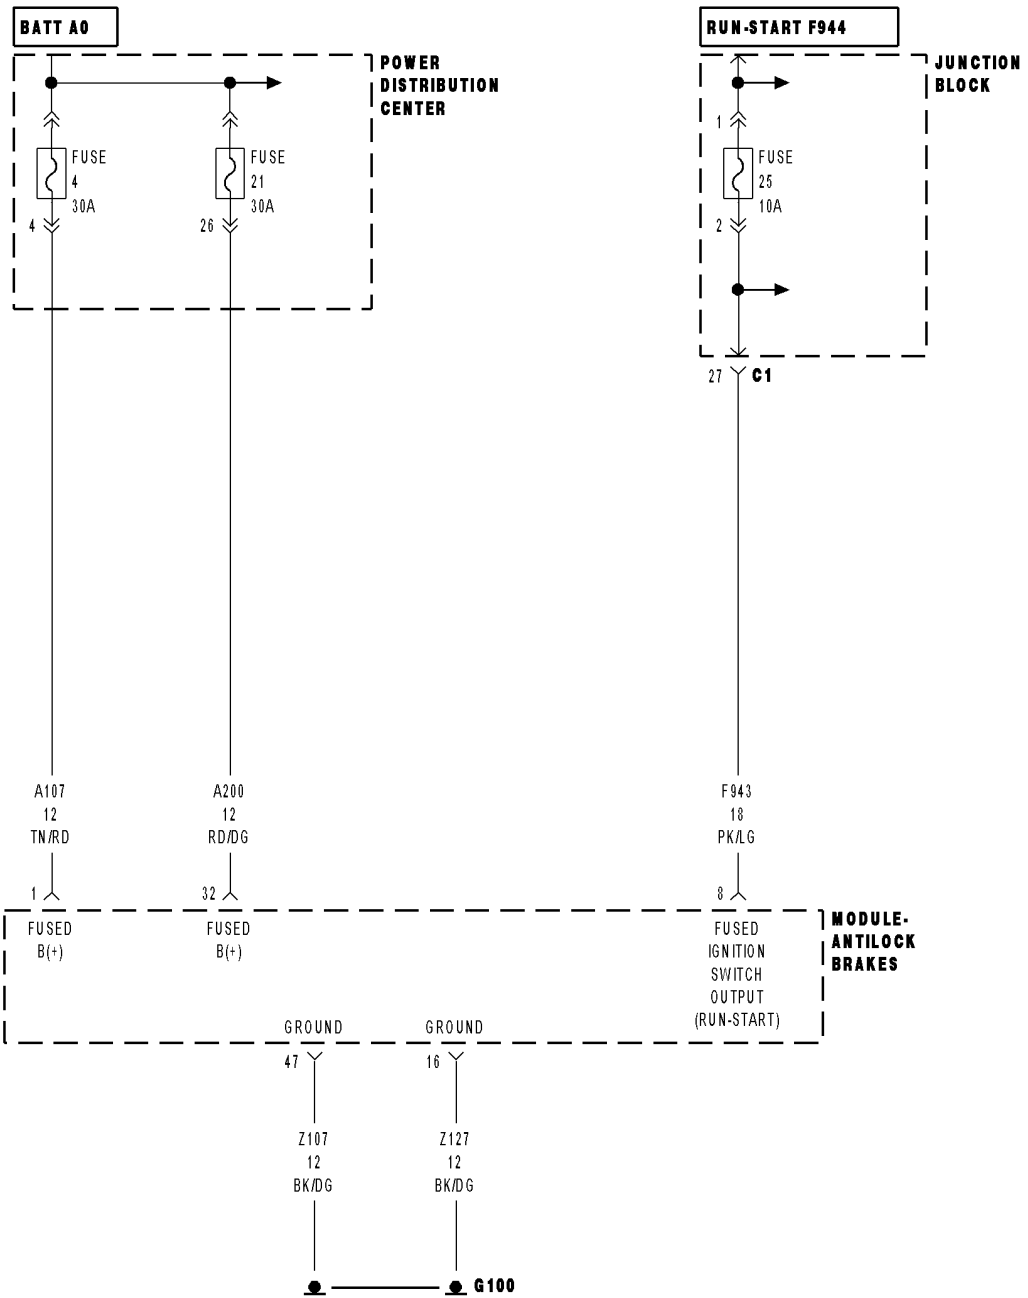

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the Ground circuit(s) for an open circuit or high resistance.

Perform ABS VERIFICATION TEST - VER 1.

C2101-BATTERY VOLTAGE HIGH

MODULE-ANTILOCK BRAKES

C2101-BATTERY VOLTAGE HIGH (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module indicates that voltage is above 17 volts.

Possible Causes
BATTERY CHARGER ON VEHICLE
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE
STARTING AND CHARGING CONDITION
GROUND CIRCUIT(S) OPEN
ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A C2101-BATTERY VOLTAGE HIGH**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition from off to on.

With the scan tool, read and record DTC's.

Does the scan tool display: C2101-BATTERY VOLTAGE HIGH?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK FOR BATTERY CHARGER CONNECTED TO VEHICLE

Is a battery charger connected to the vehicle?

Yes >> Ensure battery is fully charged.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

3. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4

C2101-BATTERY VOLTAGE HIGH (CONTINUED)

4. CHECK THE BATTERY AND CHARGING SYSTEM

Turn the ignition off.

Perform a battery and charging system test.

NOTE: Refer to the Service Information for related test(s)/symptom(s).

Does the battery and charging system pass?

Yes >> Go To 5

No >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

5. GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt Test Light connected to 12 volts, check the (Z107) and (Z127) Ground circuits.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go To 6

No >> Repair the Ground circuit(s) for an open circuit or high resistance.
Perform ABS VERIFICATION TEST - VER 1

6. FUSED B(+) CIRCUIT VOLTAGE

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Start the engine.

Raise engine speed above 1,800 RPM.

Measure the voltage of the (A107) and (A200) Fused B(+) circuits.

Is the voltage above 17 volts?

Yes >> Refer to the appropriate Service Information for Charging System testing and repair.

No >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C2111-SENSOR SUPPLY VOLTAGE CIRCUIT LOW

MODULE-ANTILOCK BRAKES

SENSOR-BRAKE PRESSURE

C2111-SENSOR SUPPLY VOLTAGE CIRCUIT LOW (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is within the low fault area.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO THE (B986) BRAKE PRESSURE SENSOR RETURN CIRCUIT (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C2111-SENSOR SUPPLY VOLTAGE CIRCUIT LOW**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition from off to on.

With the scan tool, read and record DTC's.

Does the scan tool display: C2111-SENSOR SUPPLY VOLTAGE CIRCUIT LOW?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C2111-SENSOR SUPPLY VOLTAGE CIRCUIT LOW (CONTINUED)**3. CHECK THE VOLTAGE ON THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B83) Brake Pressure Sensor Supply circuit.

Is the voltage above 4 volts?

Yes >> Go To 7

No >> Go To 4

**4. (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between the (B83) Brake Pressure Sensor Supply circuit and the (B84) Brake Pressure Sensor Signal circuit.

Is the resistance below 150 ohms?

Yes >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to the (B84) Brake Pressure Sensor Signal circuit. Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

**5. (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO THE (B986) BRAKE PRESSURE SENSOR RETURN CIRCUIT**

Measure the resistance between the (B83) Brake Pressure Sensor Supply circuit and the (B986) Brake Pressure Sensor Return circuit.

Is the resistance below 150 ohms?

Yes >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to the (B986) Brake Pressure Sensor Return circuit. Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

C2111-SENSOR SUPPLY VOLTAGE CIRCUIT LOW (CONTINUED)

6. (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (B83) Brake Pressure Sensor Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

7. (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (B83) Brake Pressure Sensor Supply circuit.

Is there any voltage present?

Yes >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 8

C2111-SENSOR SUPPLY VOLTAGE CIRCUIT LOW (CONTINUED)

8. (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (B83) Brake Pressure Sensor Supply circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B83) Brake Pressure Sensor Supply circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

C2112-SENSOR SUPPLY VOLTAGE CIRCUIT HIGH

MODULE-ANTILOCK BRAKES

SENSOR-BRAKE PRESSURE

C2112-SENSOR SUPPLY VOLTAGE CIRCUIT HIGH (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is within the high fault area.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO THE (B986) BRAKE PRESSURE SENSOR RETURN CIRCUIT (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE OR GROUND ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C2112-SENSOR SUPPLY VOLTAGE CIRCUIT HIGH**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition from off to on.

With the scan tool, read and record DTCs.

Does the scan tool display: C2112-SENSOR SUPPLY VOLTAGE CIRCUIT HIGH?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C2112-SENSOR SUPPLY VOLTAGE CIRCUIT HIGH (CONTINUED)

3. CHECK THE VOLTAGE ON THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT

Turn the ignition off.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B83) Brake Pressure Sensor Supply circuit.

Is the voltage above 6 volts?

Yes >> Go To 4

No >> Replace the Brake Pressure Sensor in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

4. (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between the (B83) Brake Pressure Sensor Supply circuit and the (B84) Brake Pressure Sensor Signal circuit.

Is the resistance below 150 ohms?

Yes >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to the (B84) Brake Pressure Sensor Signal circuit.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

5. (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO THE (986) BRAKE PRESSURE SENSOR RETURN CIRCUIT

Measure the resistance between the (B83) Brake Pressure Sensor Supply circuit and the (986) Brake Pressure Sensor Return circuit.

Is the resistance below 150 ohms?

Yes >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to the (986) Brake Pressure Sensor Return circuit.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

C2112-SENSOR SUPPLY VOLTAGE CIRCUIT HIGH (CONTINUED)**6. (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORT TO GROUND**

Measure the resistance between ground and the (B83) Brake Pressure Sensor Supply circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 7

**7. (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORT TO VOLTAGE**

Turn the ignition on.

Measure the voltage of the (B83) Brake Pressure Sensor Supply circuit.

Is there any voltage present?

- Yes** >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C2114-SENSOR CLUSTER SUPPLY VOLTAGE LOW

MODULE-ANTILOCK BRAKES

SENSOR-DYNAMICS (ESP)

C2114-SENSOR CLUSTER SUPPLY VOLTAGE LOW (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module indicates the operating voltage is out of specified range.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE (G4) SENSOR CLUSTER SUPPLY CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN (G94) SENSOR CLUSTER GROUND CIRCUIT SHORTED TO VOLTAGE OR OPEN SENSOR CLUSTER ANTI-LOCK BRAKE MODULE

1. CHECK FOR A DTC C2114-SENSOR CLUSTER SUPPLY VOLTAGE LOW

NOTE: The Sensor Cluster is the same as the Dynamics sensor.

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition from off to on.

With the scan tool, read and record DTCs

Does the scan tool display: C2114-SENSOR CLUSTER SUPPLY VOLTAGE LOW?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C2114-SENSOR CLUSTER SUPPLY VOLTAGE LOW (CONTINUED)

3. CHECK THE VOLTAGE ON THE (G4) SENSOR CLUSTER SUPPLY CIRCUIT

Turn the ignition off.
 Disconnect the Sensor Cluster harness connector.
 Turn the ignition on.
 Measure the voltage of the (G4) Sensor Cluster Supply Circuit.

Is the voltage above 10 volts?

- Yes** >> Go To 7
- No** >> Go To 4

4. (G4) SENSOR CLUSTER SUPPLY CIRCUIT SHORT TO GROUND

Turn the ignition off.
 Disconnect the Anti-Lock Brake Module harness connector.
 Measure the resistance between ground and the (G4) Sensor Cluster Supply circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Repair the (G4) Sensor Cluster Supply circuit for a short to ground.
 Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 5

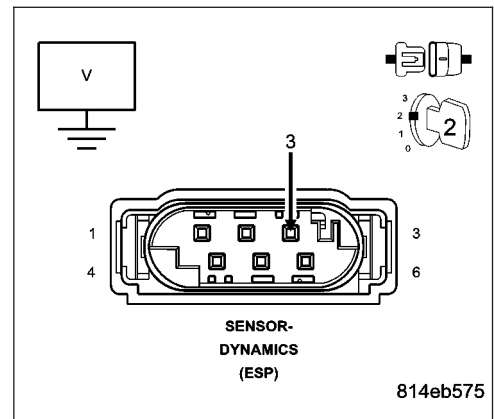

5. (G4) SENSOR CLUSTER SUPPLY CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.
 Measure the voltage of the (G4) Sensor Cluster Supply circuit.

Is there any voltage present?

- Yes** >> Repair the (G4) Sensor Cluster Supply circuit for a short to voltage.
 Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 6

C2114-SENSOR CLUSTER SUPPLY VOLTAGE LOW (CONTINUED)

6. (G4) SENSOR CLUSTER SUPPLY CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (G4) Sensor Cluster Supply circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (G4) Sensor Cluster Supply circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

7. SENSOR CLUSTER

Turn the ignition off.

Measure the resistance between the (G94) Sensor Cluster Ground Circuit and Ground.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Sensor Cluster in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 8

C2114-SENSOR CLUSTER SUPPLY VOLTAGE LOW (CONTINUED)

8. (G94) SENSOR CLUSTER GROUND CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (G94) Sensor Cluster Ground circuit.

Is there any voltage present?

Yes >> Repair the (G94) Sensor Cluster Ground circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 9

9. (G94) SENSOR CLUSTER GROUND CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (G94) Sensor Cluster Ground Circuit.

Is the resistance below 5.0 ohms?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

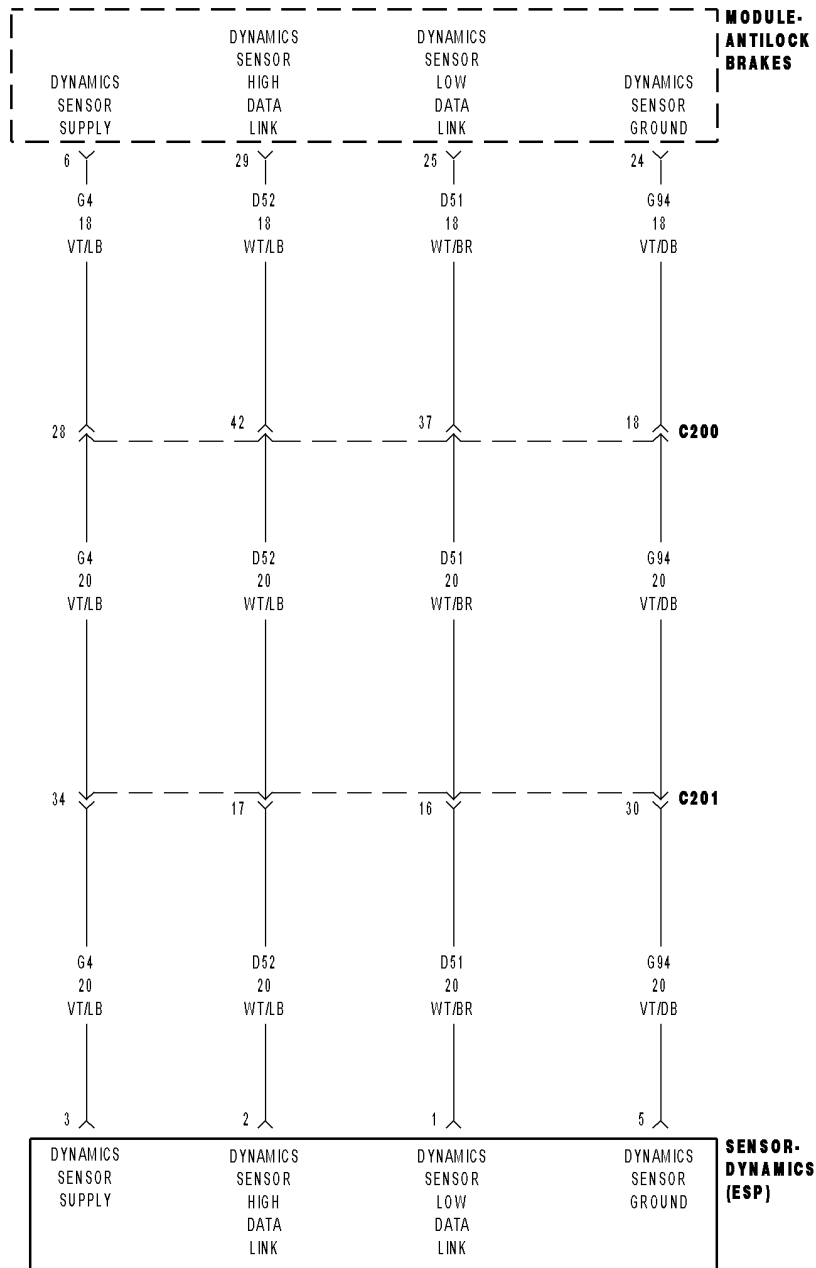

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (G94) Sensor Cluster Ground circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C2115-SENSOR CLUSTER SUPPLY VOLTAGE HIGH

MODULE-ANTILOCK BRAKES

SENSOR-DYNAMICS (ESP)

C2115-SENSOR CLUSTER SUPPLY VOLTAGE HIGH (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module indicates the operating voltage is out of specified range.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE CHARGING SYSTEM (G4) SENSOR CLUSTER SUPPLY CIRCUIT SHORTED TO GROUND OR VOLTAGE (G94) SENSOR CLUSTER GROUND CIRCUIT SHORTED TO VOLTAGE OR OPEN SENSOR CLUSTER ANTI-LOCK BRAKE MODULE

1. CHECK FOR A DTC C2115-SENSOR CLUSTER SUPPLY VOLTAGE HIGH

NOTE: The Sensor Cluster is the same as the Dynamics sensor.

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Fame information.

With the scan tool, erase DTC's.

Cycle the ignition from off to on.

With the scan tool, read and record DTCs

Does the scan tool display: C2115-SENSOR CLUSTER SUPPLY VOLTAGE HIGH?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C2115-SENSOR CLUSTER SUPPLY VOLTAGE HIGH (CONTINUED)

3. CHECK THE VOLTAGE ON THE (G4) SENSOR CLUSTER SUPPLY CIRCUIT

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Disconnect the Sensor Cluster harness connector.

Start the engine.

Raise engine speed above 1800 RPM.

Measure the voltage of the (G4) Sensor Cluster Supply Circuit.

Is the voltage above 17 volts?

Yes >> Go To 4

No >> Go To 7

4. CHECK THE VOLTAGE ON THE FUSED B(+) CIRCUITS

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Start the engine.

Raise engine speed above 1800 RPM.

Measure the voltage of the (A107) and the (A200) Fused B(+) circuits.

Is the voltage above 17 volts?

Yes >> Refer to appropriate Service Information for Charging System testing and repair.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

5. (G4) SENSOR CLUSTER SUPPLY CIRCUIT SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (G4) Sensor Cluster Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (G4) Sensor Cluster Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

C2115-SENSOR CLUSTER SUPPLY VOLTAGE HIGH (CONTINUED)

6. (G4) SENSOR CLUSTER SUPPLY CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (G4) Sensor Cluster Supply circuit.

Is there any voltage present?

Yes >> Repair the (G4) Sensor Cluster Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

7. SENSOR CLUSTER

Turn the ignition off.

If necessary, disconnect the Sensor Cluster harness connector.

If necessary, connect the Anti-Lock Brake Module harness connector.

Measure the resistance between the (G94) Sensor Cluster Ground Circuit at the Sensor Cluster harness connector and ground.

Is the resistance below 5.0 ohms?

Yes >> Replace the Sensor Cluster in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 8

8. (G94) SENSOR CLUSTER GROUND CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (G94) Sensor Cluster Ground circuit.

Is there any voltage present?

Yes >> Repair the (G94) Sensor Cluster Ground circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 9

C2115-SENSOR CLUSTER SUPPLY VOLTAGE HIGH (CONTINUED)

9. (G94) SENSOR CLUSTER GROUND CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (G94) Sensor Cluster Ground circuit

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (G94) Sensor Cluster Ground circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE

MODULE-ANTILOCK BRAKES

C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module indicates the ABS Pump Motor circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE ABS PUMP MOTOR FUSE OPEN (A107) FUSED B(+) CIRCUIT SHORTED TO GROUND OR OPEN GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

CAUTION: Ensure braking capability is available before road testing.

Drive the vehicle over 40 Km/h (25 mph).

Park the vehicle and cycle the ignition switch from off to on.

With the scan tool, read and record DTCs

Does the scan tool display: C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK ABS PUMP OPERATION WITH SCAN TOOL

Cycle the ignition from off to on.

With the scan tool, actuate the ABS Pump Motor.

Did the ABS Pump Motor operate?

Yes >> Refer to the INTERMITTENT CONDITION diagnostic procedure.

No >> Go To 3

C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE (CONTINUED)**3. CHECK THE ABS PUMP MOTOR FUSE FOR AN OPEN**

Turn the ignition off.

Remove and inspect the ABS Pump Motor fuse.

Is the ABS Pump Motor fuse open?

Yes >> Go To 4

No >> Go To 5

4. CHECK THE (A107) FUSED B(+) FOR A SHORT TO GROUND

Turn the ignition off.

Check the (A107) Fused B(+) circuit in the wiring harness for a short to ground.

Is the (A107) Fused B(+) circuit in the wiring harness OK?

Yes >> Go To 5

No >> Repair the (A107) Fused B(+) circuit as necessary. Replace the fuse.
Perform ABS VERIFICATION TEST - VER 1.

5. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires. Check all related connectors for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Anti-Lock Brake Module harness connector and (A107) Fused B(+) circuit in the wiring harness.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

6. (A107) FUSED B(+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to ground, check the (A107) Fused B(+) circuit in the Anti-Lock Brake Module harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go To 7

No >> Repair the (A107) Fused B(+) circuit for an open circuit or high resistance.
Perform ABS VERIFICATION TEST - VER 1.

C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE (CONTINUED)**7. GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE**

Using a 12-volt test light connected to 12-volts, check the (Z107) and (Z127) Ground circuits.

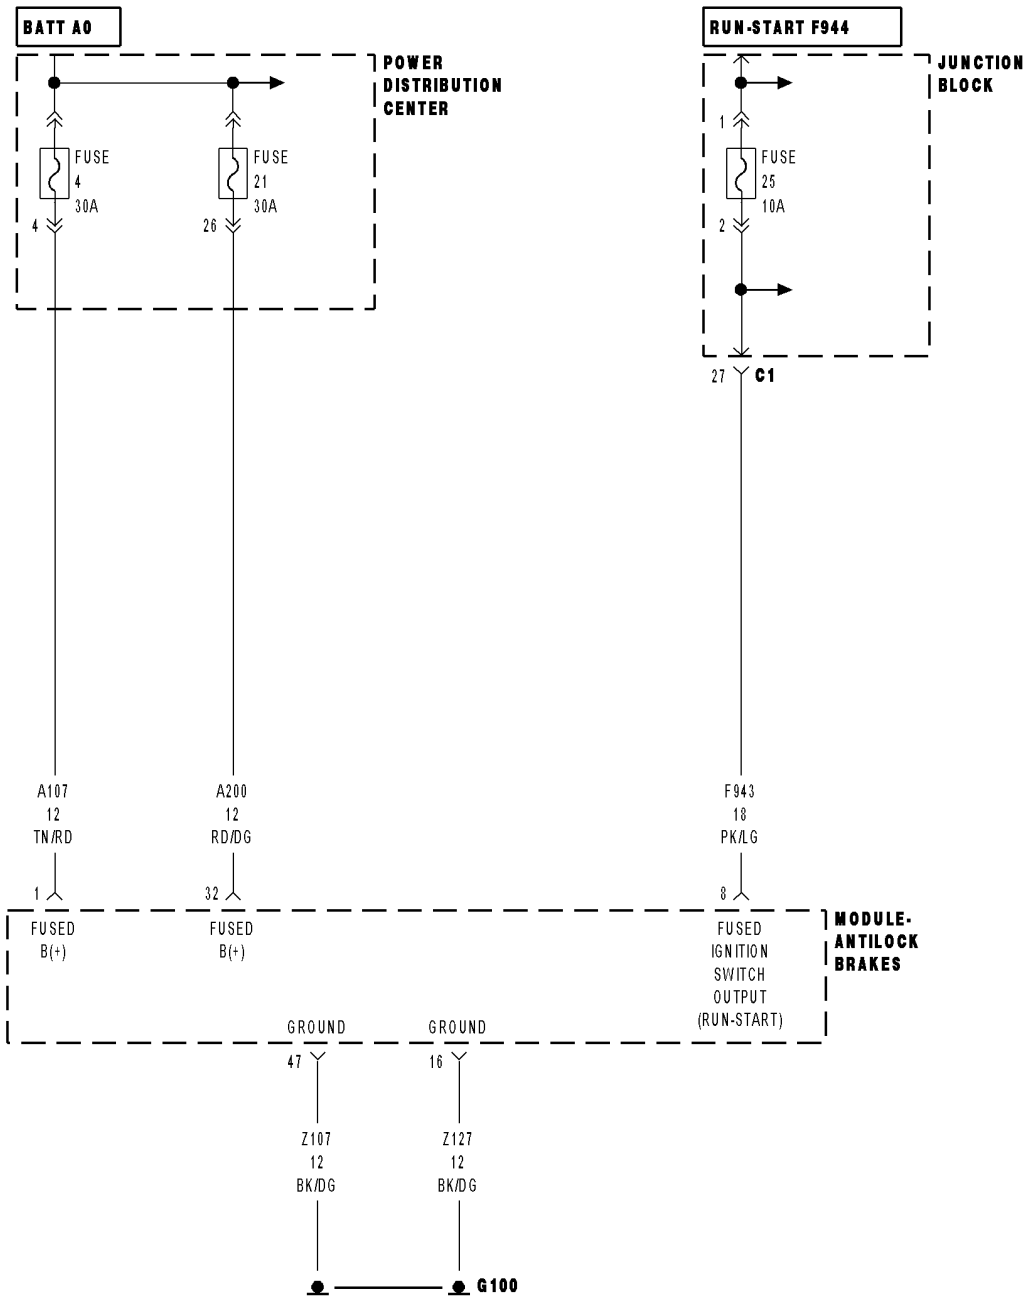

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the Ground circuit(s) for an open circuit or high resistance.
Perform ABS VERIFICATION TEST - VER 1.

C2200-ANTI-LOCK BRAKE MODULE INTERNAL

MODULE-ANTILOCK BRAKES

C2200-ANTI-LOCK BRAKE MODULE INTERNAL (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE FUSED B+ CIRCUIT(S) SHORTED TO GROUND, VOLTAGE, OR OPEN GROUND CIRCUIT(S) OPEN ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C2200-ANTI-LOCK BRAKE MODULE INTERNAL**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTCs.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTCs

Does the scan tool display: C2200-ANTI-LOCK BRAKE MODULE INTERNAL?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C2200-ANTI-LOCK BRAKE MODULE INTERNAL (CONTINUED)

3. FUSED B+ CIRCUIT(S) OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to ground, check the (A107) and (A200) Fused B+ circuits.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go To 4

No >> Repair the Fused B+ circuit(s) for an open circuit or high resistance.

Perform ABS VERIFICATION TEST - VER 1.

4. GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Using a 12-volt test light connected to 12-volts, check the (Z107) and (Z127) Ground circuits.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the Ground circuit(s) for an open circuit or high resistance.

Perform ABS VERIFICATION TEST - VER 1.

C2202-ORIGINAL VIN MISMATCH/MISSING

MODULE-ANTILOCK BRAKES

MODULE-FRONT CONTROL C1

C2202-ORIGINAL VIN MISMATCH/MISSING (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module fails the diagnostic test.

Possible Causes
ANTI-LOCK BRAKE MODULE

1. ANTI-LOCK BRAKE MODULE CONFIGURATION

The Anti-lock Brake Module hardware check has determined that module configuration does not match vehicle configuration. Verify that the correct module part number is installed in the vehicle.

Turn the ignition on.

With the Scan Tool, verify that the VIN stored in the controller matches the vehicle VIN.

With the Scan Tool, select Clear Stored DTCs.

Cycle the ignition off, then on.

With the Scan Tool, select View DTCs.

Does this DTC reset?

- Yes** >> Replace the Anti-lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Test complete.
Perform ABS VERIFICATION TEST - VER 1.
-

C2204-SENSOR CLUSTER INTERNAL

MODULE-ANTILOCK BRAKES

SENSOR-DYNAMICS (ESP)

C2204-SENSOR CLUSTER INTERNAL (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE (G4) SENSOR CLUSTER SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (G94) SENSOR CLUSTER GROUND CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (D52) SENSOR CLUSTER HIGH DATALINK CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (D51) SENSOR CLUSTER LOW DATALINK CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN SENSOR CLUSTER ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C2204-SENSOR CLUSTER INTERNAL

NOTE: The Sensor Cluster is the same as the Dynamics sensor.

NOTE: This DTC must be active for the results of this test to be valid.

CAUTION: Ensure brake capability is available before road testing.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Test drive the vehicle.

With the scan tool, read DTCs

Does the scan tool display: C2204-SENSOR CLUSTER INTERNAL?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS

Check the Sensor Cluster installation and torque of the mounting bolts.

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

C2204-SENSOR CLUSTER INTERNAL (CONTINUED)**3. CHECK THE VOLTAGE ON THE (G4) SENSOR CLUSTER SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Sensor Cluster harness connector.

Turn the ignition on.

Measure the voltage of the (G4) Sensor Cluster Supply Circuit.

Is the voltage above 10 volts?

Yes >> Go To 7

No >> Go To 4

**4. (G4) SENSOR CLUSTER SUPPLY CIRCUIT SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between ground and the (G4) Sensor Cluster Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (G4) Sensor Cluster Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

**5. (G4) SENSOR CLUSTER SUPPLY CIRCUIT SHORT TO VOLTAGE**

Turn the ignition on.

Measure the voltage of the (G4) Sensor Cluster Supply circuit.

Is there any voltage present?

Yes >> Repair the (G4) Sensor Cluster Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 6

C2204-SENSOR CLUSTER INTERNAL (CONTINUED)

6. (G4) SENSOR CLUSTER SUPPLY CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (G4) Sensor Cluster Supply circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (G4) Sensor Cluster Supply circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

7. CHECK THE RESISTANCE BETWEEN THE (G94) SENSOR CLUSTER GROUND CIRCUIT AND GROUND

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (G94) Sensor Cluster Ground Circuit at the Dynamics Sensor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

- Yes** >> Go To 10
- No** >> Go To 8

C2204-SENSOR CLUSTER INTERNAL (CONTINUED)

8. (G94) SENSOR CLUSTER GROUND CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (G94) Sensor Cluster Ground circuit.

Is there any voltage present?

Yes >> Repair the (G94) Sensor Cluster Ground circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 9

9. (G94) SENSOR CLUSTER GROUND CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (G94) Sensor Cluster Return circuit.

Is the resistance below 5.0 ohms?

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (G94) Sensor Cluster Ground circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C2204-SENSOR CLUSTER INTERNAL (CONTINUED)

10. CHECK THE DYNAMICS SENSOR OUTPUT

CAUTION: All previously removed connectors must be connected before test driving the vehicle.

CAUTION: Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle while monitoring the Sensor Cluster operation.

Was the Lateral Sensor output between 0.02 G to 0.16 G and the Yaw Sensor between 1.30° to 5.70°

Yes >> Replace the Anti-Lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 11

11. (D52) SENSOR CLUSTER HIGH DATA LINK CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Sensor Cluster harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage of the (D52) Sensor Cluster High Data Link circuit.

Is there any voltage present?

Yes >> Repair the (D52) Sensor Cluster High Data Link circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 12

12. (D52) SENSOR CLUSTER HIGH DATA LINK CIRCUIT SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D52) Sensor Cluster High Data Link circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (D52) Sensor Cluster High Data Link circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 13

C2204-SENSOR CLUSTER INTERNAL (CONTINUED)

13. CHECK THE (D52) SENSOR CLUSTER HIGH DATA LINK CIRCUIT FOR AN OPEN

Measure the resistance of the (D52) Sensor Cluster High Data Link circuit.

Is the resistance below 5.0 ohms?

Yes >> Go To 14

No >> Repair the (D52) Sensor Cluster High Data Link circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

14. CHECK THE (D51) SENSOR CLUSTER LOW DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (D51) Sensor Cluster Low Data Link circuit.

Is there any voltage present?

Yes >> Repair the (D51) Sensor Cluster Low Data Link circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 15

C2204-SENSOR CLUSTER INTERNAL (CONTINUED)

15. CHECK THE (D51) SENSOR CLUSTER LOW DATA LINK CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D51) Sensor Cluster Low Data Link circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (D51) Sensor Cluster Low Data Link circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 16

16. CHECK THE (D51) SENSOR CLUSTER LOW DATA LINK CIRCUIT FOR AN OPEN

Measure the resistance of the (D51) Sensor Cluster Low Data Link circuit.

Is the resistance below 5.0 ohms?

Yes >> Replace the Sensor Cluster in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (D51) Sensor Cluster High Data Link circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C2205-STEERING ANGLE SENSOR INTERNAL

C2205-STEERING ANGLE SENSOR INTERNAL (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module detects the Steering Angle Sensor has sent the internal failure status.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE COMMUNICATION DTCS PRESENT ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C2205-STEERING ANGLE SENSOR INTERNAL

NOTE: Diagnose and repair any Steering Angle Sensor DTCs in the Steering Column Module before continuing with this test.

NOTE: Diagnose and repair any communication DTCs in the SCM, FCM or PCM before continuing with this test.

NOTE: Diagnose and repair any system under voltage or over voltage DTCs before continuing with this test.

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

With the scan tool, read DTCs

Does the scan tool display: C2205-STEERING ANGLE SENSOR INTERNAL?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Monitor the scan tool data relative to this circuit while performing a wiggle test on the wiring. Look for the data to change other than as expected or for the DTC to reset.

Refer to any Technical Service Bulletins that apply.

Were any problems found?

Yes >> Repair as necessary.
Perform ABS VERIFICATION TEST - VER 1.

No >> Replace the Anti-lock Brake Module in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

C2206-VEHICLE CONFIGURATION MISMATCH

MODULE-ANTILOCK BRAKES

MODULE-FRONT CONTROL C1

C2206-VEHICLE CONFIGURATION MISMATCH (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module detects the signal from the gateway module relevant for vehicle characteristic is missing for a period greater than the specified fault duration.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE COMMUNICATION DTCS PRESENT ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK FOR A DTC C2206-VEHICLE CONFIGURATION MISMATCH**

NOTE: This DTC must be active for the results of this test to be valid.

NOTE: Diagnose and repair any communication DTCs in the FCM or PCM before continuing with this test.

NOTE: Diagnose and repair any system under voltage or over voltage DTCs before continuing with this test.

Turn the ignition on.

With the scan tool, read DTCs.

Record DTC and Freeze Frame information.

With the scan tool, erase DTCs.

Cycle the ignition switch off then on.

With the scan tool, read DTCs

Does the scan tool display: C2206-VEHICLE CONFIGURATION MISMATCH?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Monitor the scan tool data relative to this circuit while performing a wiggle test on the wiring. Look for the data to change other than as expected or for the DTC to reset.

Refer to any Technical Service Bulletins that apply.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Replace the Anti-lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

U0002-CAN C BUS OFF PERFORMANCE

U0002-CAN C BUS OFF PERFORMANCE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The FCM detects a short in either CAN C Bus circuit.

Possible Causes
(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND
(D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND
(D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE
(D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT
ANTILOCK BRAKE MODULE
POWERTRAIN CONTROL MODULE
SHIFTER LEVER ASSEMBLY (NAG1 ONLY)
TRANSMISSION CONTROL MODULE (NAG1 ONLY)
STEERING CONTROL MODULE
FRONT CONTROL MODULE

Diagnostic Test**1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

U0002-CAN C BUS OFF PERFORMANCE (CONTINUED)**2. ANTILOCK BRAKE MODULE — INTERNAL SHORT**

Turn the ignition off.

Disconnect the Antilock Brake Module harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes >> Go To 3

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Antilock Brake Module in accordance with the service information.
Perform ABS VERIFICATION TEST — VER 1.

3. POWERTRAIN CONTROL MODULE — INTERNAL SHORT

Turn the ignition off.

Disconnect the Powertrain Control Module C1 harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes >> Go To 4

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Powertrain Control Module in accordance with the service information.
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

4. SHIFTER LEVER ASSEMBLY (NAG1 ONLY)— INTERNAL SHORT

Turn the ignition off.

NOTE: If the vehicle is not equipped with a NAG1 controller then skip this step.

Disconnect the Shifter Lever Assembly harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes >> Go To 5

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Shifter Lever Assembly in accordance with the service information.
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

U0002-CAN C BUS OFF PERFORMANCE (CONTINUED)

5. TRANSMISSION CONTROL MODULE (NAG1 ONLY)— INTERNAL SHORT

Turn the ignition off.

NOTE: If the vehicle is not equipped with a NAG1 controller then skip this step.

Disconnect the Transmission Control Module C2 harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes >> Go To 6

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Transmission Control Module in accordance with the service information.
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

6. STEERING CONTROL MODULE — INTERNAL SHORT

Turn the ignition off.

Disconnect the Steering Control Module harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?

Yes >> Go To 7

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Steering Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

7. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

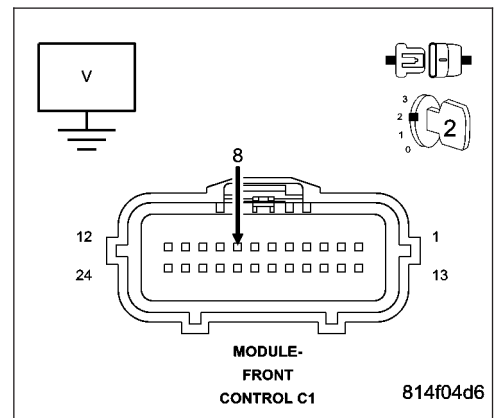

Turn the ignition on.

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is there any voltage present?

Yes >> Repair the (D65) CAN C Bus (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 8

U0002-CAN C BUS OFF PERFORMANCE (CONTINUED)

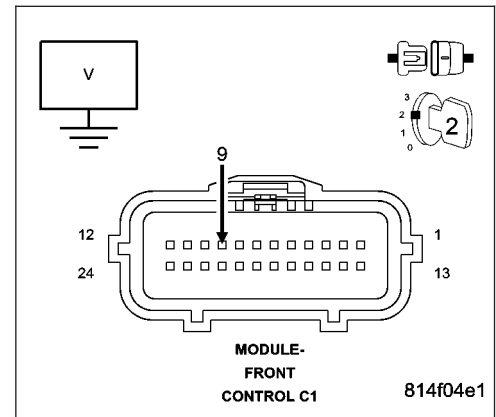

8. (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D64) CAN C Bus (-) circuit and ground.

Is there any voltage present?

Yes >> Repair the (D64) CAN C Bus (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 9

9. (D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D65) CAN C Bus (+) circuit.

Is any resistance present?

Yes >> Repair the (D65) CAN C Bus (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 10

10. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is any resistance present?

Yes >> Repair the (D64) CAN C Bus (-) circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1.

No >> Go To 11

U0002-CAN C BUS OFF PERFORMANCE (CONTINUED)

11. (D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT

Measure the resistance between the (D65) CAN C Bus (+) circuit and the (D64) CAN C Bus (-) circuit.

Is any resistance present?

- Yes** >> Repair the (D65) CAN C Bus (+) circuit for a short to the (D64) CAN C Bus (-) circuit.
Perform BODY VERIFICATION TEST - VER 1.
- No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1.

U0100-LOST COMMUNICATION WITH ECM/PCM

U0100-LOST COMMUNICATION WITH ECM/PCM (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received from the ECM/PCM for approximately 500ms.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
ECM/PCM
ECM/PCM POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0100-LOST COMMUNICATION WITH ECM/PCM (CONTINUED)

3. VERIFY THAT THE ECM/PCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ECM/PCM is active on the bus.

Is the ECM/PCM active on the bus?

Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.
Perform BODY VERIFICATION TEST – VER 1.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the ECM/PCM?

Yes >> Replace/update the ECM/PCM in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

U0101-LOST COMMUNICATION WITH TCM

U0101-LOST COMMUNICATION WITH TCM (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received from the TCM for approximately 500ms.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY TCM TCM POWER AND GROUND MODULE THAT SET THIS DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.
Perform BODY VERIFICATION TEST – VER 1.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.
Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0101-LOST COMMUNICATION WITH TCM (CONTINUED)

3. VERIFY THAT THE TCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the TCM is active on the bus.

Is the TCM active on the bus?

Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.
Perform BODY VERIFICATION TEST – VER 1.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the TCM?

Yes >> Replace/update the TCM in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

U0114-LOST COMMUNICATION WITH FINAL DRIVE MODULE

U0114-LOST COMMUNICATION WITH FINAL DRIVE MODULE (CONTINUED)

For the Engine circuit diagram (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ENGINE CONTROL MODULE - SCHEMATIC - ELECTRICAL)

For a complete wiring diagram **Refer to Section 8W.**

• **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

• **Set Condition:**

Bus messages not received from the Front Control Module for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FDCM NOT CONFIGURED CORRECTLY
FINAL DRIVE CONTROL MODULE
FINAL DRIVE CONTROL MODULE POWER AND GROUND
MODULE THAT SET THIS DTC

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FDCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0114-LOST COMMUNICATION WITH FINAL DRIVE MODULE (CONTINUED)

3. VERIFY THAT THE FDCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the FDCM is active on the bus.

Is the FCM active on the bus?

Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.
Perform BODY VERIFICATION TEST – VER 1.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the FDCM?

Yes >> Replace/update the Final DriveControl Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information
Perform BODY VERIFICATION TEST – VER 1.

U0126-LOST COMMUNICATION WITH STEERING ANGLE SENSOR

U0126-LOST COMMUNICATION WITH STEERING ANGLE SENSOR (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received from the Steering Angle Sensor for approximately 500ms.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
STEERING ANGLE SENSOR
STEERING ANGLE SENSOR POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0126-LOST COMMUNICATION WITH STEERING ANGLE SENSOR (CONTINUED)

3. VERIFY THAT THE STEERING ANGLE SENSOR IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the Steering Angle Sensor is active on the bus.

Is the Steering Angle Sensor active on the bus?

Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.
Perform BODY VERIFICATION TEST – VER 1.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

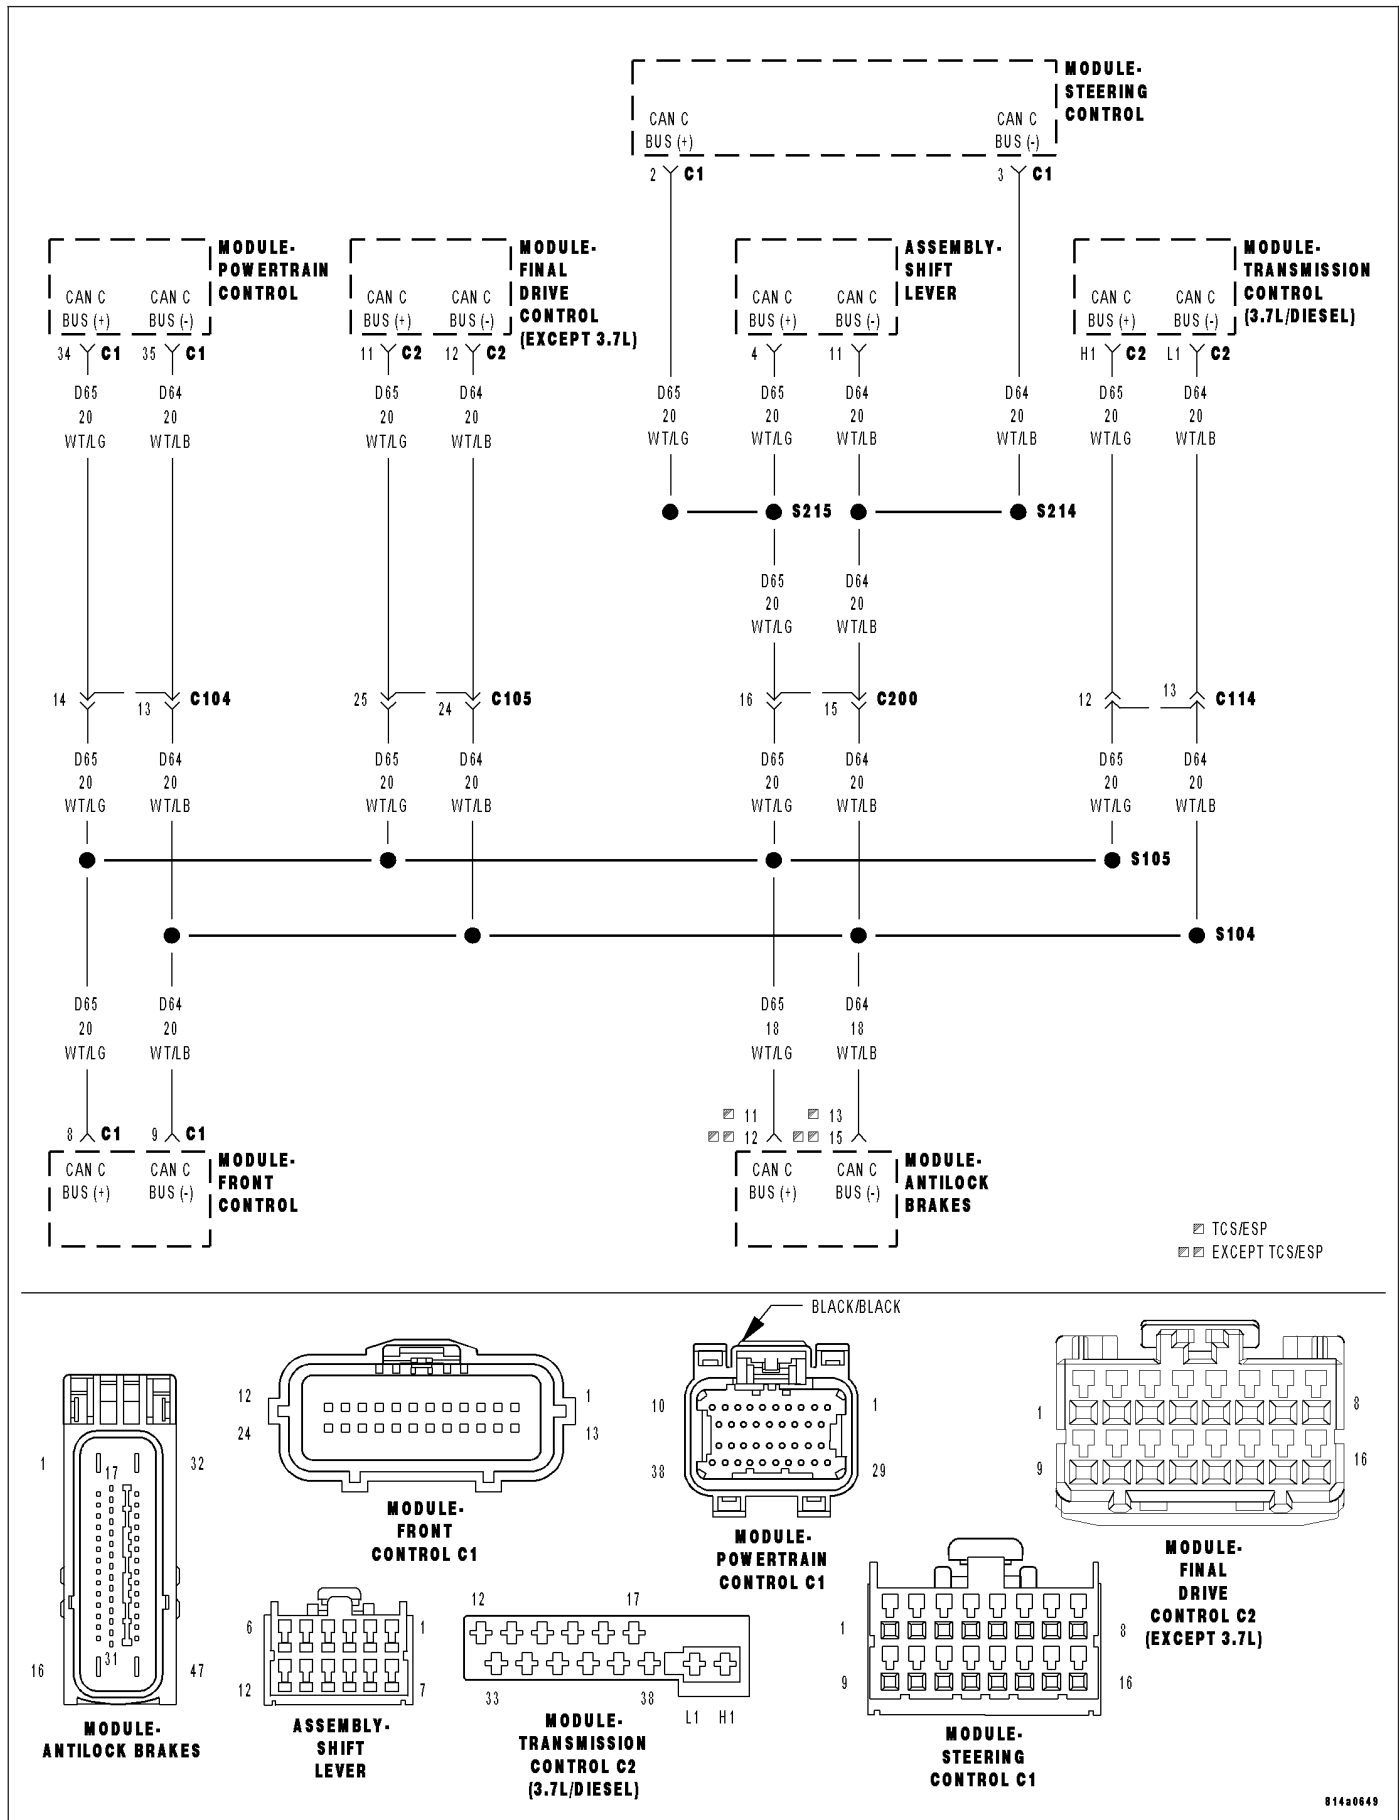

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the STEERING ANGLE SENSOR?

Yes >> Replace/update the Steering Angle Sensor in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the Front Control Module for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
FRONT CONTROL MODULE
FRONT CONTROL MODULES POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (CONTINUED)

3. VERIFY THAT THE FCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the FCM is active on the bus.

Is the FCM active on the bus?

Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.
Perform BODY VERIFICATION TEST – VER 1.

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the FCM?

Yes >> Replace/update the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information
Perform BODY VERIFICATION TEST – VER 1.

U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
Continuously with the ignition on, one valid CAN message received at least once, and no U0002-CAN C Bus Off Performance DTC present.
- **Set Condition:**
When the Anti-Lock Brake Module detects an incorrect CAN message from the Engine Control Module (ECM).

Possible Causes
FCM CAN BUS DTCS ENGINE DTCS ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK IF FCM CAN BUS DTC'S ARE PRESENT**

With the scan tool, read FCM DTCs.

Are there any FCM CAN BUS DTC's present?

- Yes** >> Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING and diagnose the appropriate symptom.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 2

2. CHECK IF ENGINE DTC'S ARE PRESENT

With the scan tool, read Engine DTCs.

Are there any Engine DTC's present?

- Yes** >> Refer to the 9 - ENGINE ELECTRICAL DIAGNOSTICS and diagnose the appropriate symptom.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module per the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

U1003-ESP CAN C BUS PERFORMANCE

U1003-ESP CAN C BUS PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module detects too many CAN Bus off events.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE (D52) SENSOR CLUSTER HIGH DATALINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN (D51) SENSOR CLUSTER LOW DATALINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN SENSOR CLUSTER

Diagnostic Test**1. CHECK FOR A DTC U1003-ESP CAN C BUS PERFORMANCE**

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

Does the scan tool display: U1003-ESP CAN C BUS PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS

NOTE: The Sensor Cluster is the same as the Dynamics sensor.

Check the Sensor Cluster installation and torque of the mounting bolts.

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

U1003-ESP CAN C BUS PERFORMANCE (CONTINUED)

3. CHECK THE (D52) SENSOR CLUSTER HIGH DATALINK CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Sensor Cluster harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D52) Sensor Cluster High Datalink circuit.

Does the test light illuminate brightly?

Yes >> Repair the (D52) Sensor Cluster High Datalink circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4

4. CHECK THE (D52) SENSOR CLUSTER HIGH DATALINK CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Sensor Cluster harness connector.

Using a 12-volt test light connected to 12-volts, check the (D52) Sensor Cluster High Datalink circuit.

Does the test light illuminate brightly?

Yes >> Repair the (D52) Sensor Cluster High Datalink circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

U1003-ESP CAN C BUS PERFORMANCE (CONTINUED)

5. CHECK THE (D52) SENSOR CLUSTER HIGH DATALINK CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Sensor Cluster harness connector.

Connect a jumper wire between the (D52) Sensor Cluster High Datalink circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (D52) Sensor Cluster High Datalink circuit.

Does the test light illuminate brightly?

Yes >> Go To 6

No >> Repair the (D52) Sensor Cluster High Datalink circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**6. CHECK THE (D51) SENSOR CLUSTER LOW DATALINK CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Sensor Cluster harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D51) Sensor Cluster Low Datalink circuit.

Does the test light illuminate brightly?

Yes >> Repair the (D51) Sensor Cluster Low Datalink circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

U1003-ESP CAN C BUS PERFORMANCE (CONTINUED)

7. CHECK THE (D51) SENSOR CLUSTER LOW DATALINK CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Sensor Cluster harness connector.

Using a 12-volt test light connected to 12-volts, check the (D51) Sensor Cluster Low Datalink circuit.

Does the test light illuminate brightly?

Yes >> Repair the (D51) Sensor Cluster Low Datalink circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 8

8. CHECK THE (D51) SENSOR CLUSTER LOW DATALINK CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Sensor Cluster harness connector.

Turn the ignition on.

Connect a jumper wire between the (D51) Sensor Cluster Low Datalink circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (D51) Sensor Cluster Low Datalink circuit.

Does the test light illuminate brightly?

Yes >> Replace the Sensor Cluster in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (D51) Sensor Cluster Low Datalink circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

U1004-CAN C BUS TRANSMIT PERFORMANCE

MODULE-ANTILOCK BRAKES

SENSOR-DYNAMICS (ESP)

U1004-CAN C BUS TRANSMIT PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module detects invalid CAN message from the Sensor Cluster.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE (D52) SENSOR CLUSTER HIGH DATALINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN (D51) SENSOR CLUSTER LOW DATALINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN SENSOR CLUSTER

Diagnostic Test

1. CHECK FOR A DTC U1004-CAN C BUS TRANSMIT PERFORMANCE

NOTE: The Sensor Cluster is the same as the Dynamics sensor.

NOTE: This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTCs

Does the scan tool display: U1004-CAN C BUS TRANSMIT PERFORMANCE?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION diagnostic procedure.
Perform ABS VERIFICATION TEST - VER 1.

2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS

Check the Sensor Cluster installation and torque of the mounting bolts.

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 3

U1004-CAN C BUS TRANSMIT PERFORMANCE (CONTINUED)**3. CHECK THE (D52) SENSOR CLUSTER HIGH DATALINK CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Sensor Cluster harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D52) Sensor Cluster High Datalink circuit.

Does the test light illuminate brightly?

Yes >> Repair the (D52) Sensor Cluster High Datalink circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 4

**4. CHECK THE (D52) SENSOR CLUSTER HIGH DATALINK CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Sensor Cluster harness connector.

Using a 12-volt test light connected to 12-volts, check the (D52) Sensor Cluster High Datalink circuit.

Does the test light illuminate brightly?

Yes >> Repair the (D52) Sensor Cluster High Datalink circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 5

U1004-CAN C BUS TRANSMIT PERFORMANCE (CONTINUED)

5. CHECK THE (D52) SENSOR CLUSTER HIGH DATALINK CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Sensor harness connector.

Connect a jumper wire between the (D52) Sensor Cluster High Datalink circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (D52) Sensor Cluster High Datalink circuit.

Does the test light illuminate brightly?

Yes >> Go To 6

No >> Repair the (D52) Sensor Cluster High Datalink circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

6. CHECK THE (D51) SENSOR CLUSTER LOW DATALINK CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Sensor Cluster harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D51) Sensor Cluster Low Datalink circuit.

Does the test light illuminate brightly?

Yes >> Repair the (D51) Sensor Cluster Low Datalink circuit for a short to voltage.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 7

U1004-CAN C BUS TRANSMIT PERFORMANCE (CONTINUED)

7. CHECK THE (D51) SENSOR CLUSTER LOW DATALINK CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Sensor Cluster harness connector.

Using a 12-volt test light connected to 12-volts, check the (D51) Sensor Cluster Low Datalink circuit.

Does the test light illuminate brightly?

Yes >> Repair the (D51) Cluster Sensor Low Datalink circuit for a short to ground.
Perform ABS VERIFICATION TEST - VER 1.

No >> Go To 8

8. CHECK THE (D51) SENSOR LOW DATALINK CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Sensor Cluster harness connector.

Turn the ignition on.

Connect a jumper wire between the (D51) Sensor Cluster Low Datalink circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (D51) Sensor Cluster Low Datalink circuit.

Does the test light illuminate brightly?

Yes >> Replace the Sensor Cluster in accordance with the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Repair the (D51) Sensor Cluster Low Datalink circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

U140E-IMPLAUSIBLE VEHICLE CONFIGURATION DATA RECEIVED

U140E-IMPLAUSIBLE VEHICLE CONFIGURATION DATA RECEIVED (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
Continuously with the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module detects an incorrect CAN messages from the Engine Control Module (ECM).

Possible Causes
FCM CAN BUS DTCS ENGINE DTCS ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK IF FCM CAN BUS DTC'S ARE PRESENT**

With the scan tool, read FCM DTCs.

Are there any FCM CAN BUS DTC's present?

- Yes** >> Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING and diagnose the appropriate symptom.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 2

2. CHECK IF ENGINE DTC'S ARE PRESENT

With the scan tool, read Engine DTCs.

Are there any Engine DTC's present?

- Yes** >> Refer to the 9 - ENGINE ELECTRICAL DIAGNOSTICS and diagnose the appropriate symptom.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module per the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

U1501-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM PCM

U1501-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM PCM (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
Continuously with the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module detects an incorrect CAN message from the Engine Control Module (ECM).

Possible Causes
FCM CAN BUS DTCS ENGINE DTCS ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK IF FCM CAN BUS DTC'S ARE PRESENT**

With the scan tool, read FCM DTCs.

Are there any FCM CAN BUS DTC's present?

- Yes** >> Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING and diagnose the appropriate symptom.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 2

2. CHECK IF ENGINE DTC'S ARE PRESENT

With the scan tool, read Engine DTCs.

Are there any Engine DTC's present?

- Yes** >> Refer to the 9 - ENGINE ELECTRICAL DIAGNOSTICS and diagnose the appropriate symptom.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module per the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

U1502-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM TCM

U1502-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM TCM (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
Continuously with the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module detects an incorrect CAN message from the Transmission Control Module (TCM).

Possible Causes
FCM CAN BUS DTCS TRANSMISSION DTCS ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK IF FCM CAN BUS DTC'S ARE PRESENT**

With the scan tool, read FCM DTCs.

Are there any FCM CAN BUS DTC's present?

- Yes** >> Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING and diagnose the appropriate symptom.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 2

2. CHECK IF TRANSMISSION DTC'S ARE PRESENT

With the scan tool, read Transmission DTCs.

Are there any Transmission DTC's present?

- Yes** >> Refer to the 21 - TRANSMISSION ELECTRICAL DIAGNOSTICS and diagnose the appropriate symptom.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module per the Service Information.
Perform ABS VERIFICATION TEST - VER 1.

U1503-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM FCM

U1503-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM FCM (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
Continuously with the ignition on.
- **Set Condition:**
When the Anti-Lock Brake Module detects an incorrect CAN message from the Front Control Module (FCM).

Possible Causes
FCM CAN BUS DTCS ANTI-LOCK BRAKE MODULE

Diagnostic Test**1. CHECK IF FCM CAN BUS DTC'S ARE PRESENT**

With the scan tool, read FCM DTCs.

Are there any FCM CAN BUS DTC's present?

- Yes** >> Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING and diagnose the appropriate symptom.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module per the Service Information.
Perform ABS VERIFICATION TEST - VER 1.
-

ABS VERIFICATION TEST — VER 1

Diagnostic Test

1.

NOTE: If the ABM (Anti-Lock Brake Module) was replaced, it must be initialized using the scan tool. If not initialized, the ABS and ESP indicators will flash continuously with no DTC's. To Initialize the ABM, using the scan tool, select ECU VIEW, select ABS, select MISCELLANEOUS, select INITIALIZE ECU, and follow the directions on the scan tool.

NOTE: The Sensor Cluster is the same as the Dynamics sensor.

1. Turn the ignition off.
2. Connect all previously disconnected components and connectors.
3. Ensure all accessories are turned off and the battery is fully charged.

NOTE: If the vehicle is equipped with ESP (Electronic Stability Program) the Steering Angle Sensor must be calibrated anytime an ABS component or the battery is disconnected. To calibrate the Steering Angle Sensor, start the engine and center the steering wheel. Turn the steering wheel all the way to the left until it stops, turn the steering wheel all the way to the right until it stops and bring the steering wheel back to center.

4. Ensure that the ignition is on, and with the scan tool, erase all Diagnostic Trouble Codes from All modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was malfunctioning.

CAUTION: Ensure braking capability is available before road testing.

5. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the scan tool, read DTC's from all modules.
6. If any Diagnostic Trouble Codes are present, return to symptom list and trouble shoot new or recurring symptom.

NOTE: For Sensor Signal and Pump Motor faults, the CAB must sense all 4 wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator.

CAUTION: Ensure braking capability is available before road testing.

7. If there are no DTC's present after turning ignition on, road test the vehicle for at least 5 minutes. Perform several antilock braking stops.
8. Again, with the scan tool read DTC's. If any DTC's are present, return to Symptom list.
9. If there are no Diagnostic Trouble Codes (DTC's) present, and the customer's concern can no longer be duplicated, the repair is complete.

Are any DTC's present or is the original concern still present?

Yes >> Repair is not complete, refer to appropriate symptom.

No >> Repair is complete.

B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW

B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Front Control Module fails the Adjustable Pedal Inhibit Relay circuit.

Possible Causes
TERMINAL/CONNECTOR DAMAGE ADJUSTABLE PEDALS RELAY ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN FRONT CONTROL MODULE INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK FOR A DTC B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW

NOTE: This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition switch from off to on.
- With the scan tool, read and record DTC's

Does the scan tool display: B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW?

- Yes** >> Go To 2
- No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform APS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS FOR DAMAGE

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.
NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

- Turn the ignition off.
- Visually inspect the wiring for damage.

Were any problems found?

- Yes** >> Repair as necessary.
Perform APS VERIFICATION TEST - VER 1.
- No** >> Go To 3

B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW (CONTINUED)**3. SWAP OUT THE ADJUSTABLE PEDALS RELAY**

Turn the ignition off.

Install a substitute relay in place of the Adjustable Pedals Relay.

Turn the ignition on.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

Does the scan tool display: B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW?

Yes >> Go To 4

No >> Replace the Adjustable Pedals Relay in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

4. CHECK THE VOLTAGE ON THE FUSED B(+) CIRCUIT FOR THE ADJUSTABLE PEDALS RELAY

Turn the ignition off.

Remove the Adjustable Pedals Relay from the IPM.

Measure the voltage of the internal Fused B(+) circuit at the IPM.

Is the voltage above 10 volts?

Yes >> Go To 5

No >> Replace the IPM in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

5. CHECK THE ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Remove the Adjustable Pedals Relay from the IPM.

Using a 12-volt test light connected to 12-volts, check the Adjustable Pedals Relay Control circuit.

Does the test light illuminate brightly?

Yes >> Repair the Adjustable Pedals Relay Control circuit for a short to ground.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 6

6. CHECK THE ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Remove the Adjustable Pedals Relay from the IPM.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the Adjustable Pedals Relay Control circuit.

Does the test light illuminate brightly?

Yes >> Repair the Adjustable Pedals Relay Control circuit for a short to voltage.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 7

B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW (CONTINUED)

7. CHECK THE ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Remove the Adjustable Pedals Relay from the IPM.

Connect a jumper wire between the Adjustable Pedals Relay Control circuit and ground.

Using a 12-volt test light connected to 12-volts, check the Adjustable Pedals Relay Control circuit.

Does the test light illuminate brightly

- Yes** >> Replace the Front Control Module in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.
- No** >> Repair the Adjustable Pedals Relay Control circuit for an open.
Perform APS VERIFICATION TEST - VER 1.
-

B1D50-ADJUSTABLE PEDAL INHIBIT CIRCUIT HIGH

B1D50-ADJUSTABLE PEDAL INHIBIT CIRCUIT HIGH (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Front Control Module fails the Adjustable Pedal Inhibit Relay circuit.

Possible Causes
TERMINAL/CONNECTOR DAMAGE ADJUSTABLE PEDALS RELAY ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN FRONT CONTROL MODULE INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK FOR A DTC B1D50-ADJUSTABLE PEDAL INHIBIT CIRCUIT HIGH

NOTE: This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition switch from off to on.
- With the scan tool, read and record DTC's

Does the scan tool display: B1D50-ADJUSTABLE PEDAL INHIBIT CIRCUIT HIGH?

- Yes** >> Go To 2
- No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform APS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS FOR DAMAGE

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.
NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

- Turn the ignition off.
- Visually inspect the wiring for damage.

Were any problems found?

- Yes** >> Repair as necessary.
Perform APS VERIFICATION TEST - VER 1.
- No** >> Go To 3

B1D50-ADJUSTABLE PEDAL INHIBIT CIRCUIT HIGH (CONTINUED)**3. SWAP OUT THE ADJUSTABLE PEDALS RELAY**

Turn the ignition off.

Install a substitute relay in place of the Adjustable Pedals Relay.

Turn the ignition on.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

Does the scan tool display: B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW?

Yes >> Go To 4

No >> Replace the Adjustable Pedals Relay in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

4. CHECK THE VOLTAGE ON THE FUSED B(+) CIRCUIT FOR THE ADJUSTABLE PEDALS RELAY

Turn the ignition off.

Remove the Adjustable Pedals Relay from the IPM.

Measure the voltage of the internal Fused B(+) circuit at the IPM.

Is the voltage above 10 volts?

Yes >> Go To 5

No >> Replace the IPM in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

5. CHECK THE ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Remove the Adjustable Pedals Relay from the IPM.

Using a 12-volt test light connected to 12-volts, check the Adjustable Pedals Relay Control circuit.

Does the test light illuminate brightly?

Yes >> Repair the Adjustable Pedals Relay Control circuit for a short to ground.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 6

6. CHECK THE ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Remove the Adjustable Pedals Relay from the IPM.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the Adjustable Pedals Relay Control circuit.

Does the test light illuminate brightly?

Yes >> Repair the Adjustable Pedals Relay Control circuit for a short to voltage.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 7

B1D50-ADJUSTABLE PEDAL INHIBIT CIRCUIT HIGH (CONTINUED)

7. CHECK THE ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Remove the Adjustable Pedals Relay from the IPM.

Connect a jumper wire between the Adjustable Pedals Relay Control circuit and ground.

Using a 12-volt test light connected to 12-volts, check the Adjustable Pedals Relay Control circuit.

Does the test light illuminate brightly

- Yes** >> Replace the Front Control Module in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.
- No** >> Repair the Adjustable Pedals Relay Control circuit for an open.
Perform APS VERIFICATION TEST - VER 1.
-

B1D51-ADJUSTABLE PEDAL INHIBIT CIRCUIT OPEN

B1D51-ADJUSTABLE PEDAL INHIBIT CIRCUIT OPEN (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
When the Front Control Module fails the Adjustable Pedal Inhibit Relay circuit.

Possible Causes
TERMINAL/CONNECTOR DAMAGE ADJUSTABLE PEDALS RELAY ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN FRONT CONTROL MODULE INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK FOR A DTC B1D51-ADJUSTABLE PEDAL INHIBIT CIRCUIT OPEN

NOTE: This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition switch from off to on.
- With the scan tool, read and record DTC's

Does the scan tool display: B1D51-ADJUSTABLE PEDAL INHIBIT CIRCUIT OPEN?

- Yes** >> Go To 2
- No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
Perform APS VERIFICATION TEST - VER 1.

2. CHECK THE TERMINALS/CONNECTORS FOR DAMAGE

NOTE: Check all related wiring for bruised, chafed, pierced, or partially broken wires.
NOTE: Check all related connectors for broken, bent, pushed out, or corroded terminals.

- Turn the ignition off.
- Visually inspect the wiring for damage.

Were any problems found?

- Yes** >> Repair as necessary.
Perform APS VERIFICATION TEST - VER 1.
- No** >> Go To 3

B1D51-ADJUSTABLE PEDAL INHIBIT CIRCUIT OPEN (CONTINUED)**3. SWAP OUT THE ADJUSTABLE PEDALS RELAY**

Turn the ignition off.

Install a substitute relay in place of the Adjustable Pedals Relay.

Turn the ignition on.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

Does the scan tool display: B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW?

Yes >> Go To 4

No >> Replace the Adjustable Pedals Relay in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

4. CHECK THE VOLTAGE ON THE FUSED B(+) CIRCUIT FOR THE ADJUSTABLE PEDALS RELAY

Turn the ignition off.

Remove the Adjustable Pedals Relay from the IPM.

Measure the voltage of the internal Fused B(+) circuit at the IPM.

Is the voltage above 10 volts?

Yes >> Go To 5

No >> Replace the IPM in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.

5. CHECK THE ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Remove the Adjustable Pedals Relay from the IPM.

Using a 12-volt test light connected to 12-volts, check the Adjustable Pedals Relay Control circuit.

Does the test light illuminate brightly?

Yes >> Repair the Adjustable Pedals Relay Control circuit for a short to ground.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 6

6. CHECK THE ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Remove the Adjustable Pedals Relay from the IPM.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the Adjustable Pedals Relay Control circuit.

Does the test light illuminate brightly?

Yes >> Repair the Adjustable Pedals Relay Control circuit for a short to voltage.
Perform APS VERIFICATION TEST - VER 1.

No >> Go To 7

B1D51-ADJUSTABLE PEDAL INHIBIT CIRCUIT OPEN (CONTINUED)

7. CHECK THE ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Remove the Adjustable Pedals Relay from the IPM.

Connect a jumper wire between the Adjustable Pedals Relay Control circuit and ground.

Using a 12-volt test light connected to 12-volts, check the Adjustable Pedals Relay Control circuit.

Does the test light illuminate brightly

- Yes** >> Replace the Front Control Module in accordance with the Service Information.
Perform APS VERIFICATION TEST - VER 1.
- No** >> Repair the (P201) Adjustable Pedals Relay Control circuit for an open.
Perform APS VERIFICATION TEST - VER 1.

COOLING

DESCRIPTION

3.7L/4.7L ENGINE

The cooling system consists of the following items:

- Electric cooling fan - Standard - 3.7L engine.
- Electric cooling fan and mechanical thermal viscous fan with low disengaged -4.7L engine only
- Radiator
- Radiator pressure cap
- Thermostat
- Coolant pressure bottle/overflow system
- Transmission oil cooler (if equipped with an automatic transmission)
- Power Steering Oil Cooler
- Coolant
- Water pump
- Hoses and hose clamps

5.7L ENGINE

The cooling system consists of the following items:

- Hydraulic cooling fan
- Radiator
- Power steering oil cooler
- Radiator pressure cap
- Thermostat
- Coolant reserve/overflow system
- Transmission oil cooler (if equipped with an automatic transmission)
- Coolant

- Water pump
- Hoses and hose clamps

3.0L DIESEL ENGINE

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible, maintains normal operating temperature and prevents overheating.

The cooling system also provides a means of heating the passenger compartment. The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system. A separate and remotely mounted, pressurized coolant tank using a pressure/vent cap is used.

COOLING SYSTEM COMPONENTS

The cooling system consists of:

- Charge Air Cooler
- Hydraulic Cooling Fans
- A aluminum-core radiator with plastic side tanks
- A separate pressurized coolant bottle
- A pressure/vent cap on the coolant bottle
- Thermostat
- Coolant
- Coolant temperature gauge
- Water pump
- Hoses and hose clamps

DESCRIPTION - HOSE CLAMPS

The cooling system utilizes spring type hose clamps. If a spring type clamp replacement is necessary, replace with the original Mopar® equipment spring type clamp.

CAUTION: A number or letter is stamped into the tongue of constant tension clamps. If replacement is necessary, use only a original equipment clamp with matching number or letter .

80b76ee

OPERATION

OPERATION - COOLING SYSTEM

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible. It also maintains normal operating temperature and prevents overheating.

The cooling system also provides a means of heating the passenger compartment and cooling the automatic transmission fluid (if equipped). The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system.

OPERATION - HOSE CLAMPS

The spring type hose clamp applies constant tension on a hose connection. To remove a spring type hose clamp, only use constant tension clamp pliers designed to compress the hose clamp.

DIAGNOSIS AND TESTING

ON-BOARD DIAGNOSTICS (OBD)

COOLING SYSTEM RELATED DIAGNOSTICS

The powertrain control module (PCM) has been programmed to monitor certain cooling system components:

- If the engine has remained cool for too long a period, such as with a stuck open thermostat, a Diagnostic Trouble Code (DTC) can be set.
- If an open or shorted condition has developed in the relay circuit controlling the electric radiator fan or fan control solenoid circuit controlling the hydraulic fan, a Diagnostic Trouble Code (DTC) can be set.

If the problem is sensed in a monitored circuit often enough to indicated an actual problem, a DTC is stored. The DTC will be stored in the PCM memory for eventual display to the service technician. (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION).

ACCESSING DIAGNOSTIC TROUBLE CODES

To read DTC's and to obtain cooling system data, (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION).

ERASING TROUBLE CODES

After the problem has been repaired, use the scan tool to erase a DTC. Refer to the appropriate Powertrain Diagnostic Procedures service information for operation of the scan tool.

PRELIMINARY CHECKS

ENGINE COOLING SYSTEM OVERHEATING

Establish what driving conditions caused the complaint. Abnormal loads on the cooling system such as the following may be the cause:

- Prolonged idle
- Very high ambient temperature
- Slight tail wind at idle
- Slow traffic
- Traffic jams
- High speed
- Trailer towing
- Steep grades
- Any accessory addition that fully or partially blocks the grill opening

Driving techniques that avoid overheating are:

- Idle with A/C off when temperature gauge is at end of normal range.
- Increase engine speed for more air flow is recommended.

1. TRAILER TOWING:

Consult Trailer Towing section of owners manual. Do not exceed limits.

2. AIR CONDITIONING; ADD-ON OR AFTER MARKET:

A maximum cooling package should have been ordered with vehicle if add-on or after market A/C is installed. If not, maximum cooling system components should be installed for model involved per manufacturer's specifications.

3. RECENT SERVICE OR ACCIDENT REPAIR:

Determine if any recent service has been performed on vehicle that may effect cooling system. This may be:

- Engine adjustments (incorrect timing)
- Slipping engine accessory drive belt(s)

- Brakes (possibly dragging)
- Changed parts. Incorrect water pump, or pump rotating in wrong direction due to belt not correctly routed
- Reconditioned radiator or cooling system refilling (possibly under filled or air trapped in system).

NOTE: If investigation reveals none of the previous items as a cause for an engine overheating complaint, refer to following Cooling System Diagnosis charts.

These charts are to be used as a quick-reference only. Refer to the group text for information.

COOLING SYSTEM DIAGNOSIS CHART

COOLING SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READS LOW	<ol style="list-style-type: none"> 1. Has a Diagnostic Trouble Code (DTC) been set indicating a stuck open thermostat? 2. Is the temperature sending unit connected? 3. Is the temperature gauge operating OK? 4. Coolant level low in cold ambient temperatures accompanied with poor heater performance. 5. Improper operation of internal heater doors or heater controls. 	<ol style="list-style-type: none"> 1. Refer to (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION) for On-Board Diagnostics and DTC information. Replace thermostat if necessary. 2. Check the temperature sensor connector. (Refer to 7 - COOLING/ ENGINE/ENGINE COOLANT TEMP SENSOR - DESCRIPTION). Repair connector if necessary. 3. Check gauge operation. Repair as necessary. 4. Check coolant level in the coolant reserve/overflow tank and the radiator. Inspect system for leaks. Repair leaks as necessary. 5. Inspect heater and repair as necessary. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING)

CONDITION	POSSIBLE CAUSES	CORRECTION
<p>TEMPERATURE GAUGE READS HIGH OR THE COOLANT LAMP ILLUMINATES. COOLANT MAY OR MAY NOT BE LOST OR LEAKING FROM THE COOLING SYSTEM</p>	<p>1. Trailer is being towed, a steep hill is being climbed, vehicle is operated in slow moving traffic, or engine is being idled with very high ambient (outside) temperatures and the air conditioning is on. Higher altitudes could aggravate these conditions.</p> <p>2. Is the temperature gauge reading correctly?</p> <p>3. Is the temperature warning illuminating unnecessarily?</p> <p>4. Coolant low in coolant reserve/overflow tank and radiator?</p> <p>5. Pressure cap not installed tightly. If cap is loose, boiling point of coolant will be lowered. Also refer to the following Step 6.</p> <p>6. Poor seals at the radiator cap.</p> <p>7. Coolant level low in radiator but not in coolant reserve/overflow tank. This means the radiator is not drawing coolant from the coolant reserve/overflow tank as the engine cools</p> <p>8. Incorrect coolant concentration</p>	<p>1. This may be a temporary condition and repair is not necessary. Turn off the air conditioning and attempt to drive the vehicle without any of the previous conditions. Observe the temperature gauge. The gauge should return to the normal range. If the gauge does not return to the normal range, determine the cause for overheating and repair.</p> <p>2. Check gauge. (Refer to Group 8J - INSTRUMENT CLUSTER). Repair as necessary.</p> <p>3. Check warning lamp operation. (Refer to Group 8J - INSTRUMENT CLUSTER). Repair as necessary.</p> <p>4. Check for coolant leaks and repair as necessary. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).</p> <p>5. Tighten cap</p> <p>6. (a) Check condition of cap and cap seals. (Refer to 7 - COOLING/ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING). (b) Check condition of radiator filler neck. If neck is bent or damaged, replace radiator.</p> <p>7. (a) Check condition of radiator cap and cap seals. (Refer to 7 - COOLING/ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING). (b) Check condition of radiator filler neck. If neck is bent or damaged, replace radiator. (c) Check condition of the hose from the radiator to the coolant tank. It should fit tight at both ends without any kinks or tears. Replace hose if necessary. (d) Check coolant reserve/overflow tank and tanks hoses for blockage. Repair as necessary.</p> <p>8. Check coolant. (Refer to 7 - COOLING/ENGINE/COOLANT - DESCRIPTION) for correct coolant/water mixture ratio.</p>

CONDITION	POSSIBLE CAUSES	CORRECTION
	<p>9. Coolant not flowing through system</p> <p>10. Radiator or A/C condenser fins are dirty or clogged.</p> <p>11. Radiator core is corroded or plugged.</p> <p>12. Aftermarket A/C installed without proper radiator.</p> <p>13. Fuel or ignition system problems.</p> <p>14. Dragging brakes.</p> <p>15. Bug screen or cardboard is being used, reducing airflow.</p> <p>16. Thermostat partially or completely shut.</p> <p>17. Viscous fan drive not operating properly.</p> <p>18. Cylinder head gasket leaking.</p> <p>19. Heater core leaking.</p> <p>20. Hydraulic fan speed too low or inoperative.</p>	<p>9. Check for coolant flow at radiator filler neck with some coolant removed, engine warm and thermostat open. Coolant should be observed flowing through radiator. If flow is not observed, determine area of obstruction and repair as necessary.</p> <p>10. Remove insects and debris. (Refer to 7 - COOLING/ENGINE/RADIATOR - CLEANING).</p> <p>11. Have radiator re-cored or replaced.</p> <p>12. Install proper radiator.</p> <p>13. Refer to FUEL and /or IGNITION CONTROL for diagnosis.</p> <p>14. Check and correct as necessary. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING) for correct procedures.</p> <p>15. Remove bug screen or cardboard.</p> <p>16. Check thermostat operation and replaces necessary. (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - DIAGNOSIS AND TESTING).</p> <p>17. Check fan drive operation and replace as necessary. (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - DIAGNOSIS AND TESTING).</p> <p>18. Check for cylinder head gasket leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). For repair, (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).</p> <p>19. Check heater core for leaks. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/HEATER CORE - REMOVAL). Repair as necessary.</p> <p>20. Check for DTC code. Check fan operation speeds. Refer to fan speed operation table. Low power steering pump output. Refer to power steering pump diagnosis - 4.7L engine.</p>

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READING IS INCONSISTENT (FLUCTUATES, CYCLES OR IS ERRATIC)	<ol style="list-style-type: none"> 1. During cold weather operation, with the heater blower in the high position, the gauge reading may drop slightly. 2. Temperature gauge or engine mounted gauge sensor defective or shorted. Also, corroded or loose wiring in this circuit. 3. Gauge reading rises when vehicle is brought to a stop after heavy use (engine still running) 4. Gauge reading high after re-starting a warmed up (hot) engine. 5. Coolant level low in radiator (air will build up in the cooling system causing the thermostat to open late). 6. Cylinder head gasket leaking allowing exhaust gas to enter cooling system causing a thermostat to open late. 7. Water pump impeller loose on shaft. 8. Loose accessory drive belt. (water pump slipping) 9. Air leak on the suction side of the water pump allows air to build up in cooling system causing thermostat to open late. 	<ol style="list-style-type: none"> 1. A normal condition. No correction is necessary. 2. Check operation of gauge and repair if necessary. Refer to Group 8J, Instrument cluster. 3. A normal condition. No correction is necessary. Gauge should return to normal range after vehicle is driven. 4. A normal condition. No correction is necessary. The gauge should return to normal range after a few minutes of engine operation. 5. Check and correct coolant leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). 6. (a) Check for cylinder head gasket leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). (b) Check for coolant in the engine oil. Inspect for white steam emitting from the exhaust system. Repair as necessary. 7. Check water pump and replace as necessary. (Refer to 7 - COOLING/ENGINE/WATER PUMP - DIAGNOSIS AND TESTING). 8. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - DIAGNOSIS AND TESTING). Check and correct as necessary. 9. Locate leak and repair as necessary.
PRESSURE CAP IS BLOWING OFF STEAM AND/OR COOLANT TO COOLANT TANK. TEMPERATURE GAUGE READING MAY BE ABOVE NORMAL BUT NOT HIGH. COOLANT LEVEL MAY BE HIGH IN COOLANT RESERVE/OVERFLOW TANK	<ol style="list-style-type: none"> 1. Pressure relief valve in radiator cap is defective. 	<ol style="list-style-type: none"> 1. Check condition of radiator cap and cap seals. (Refer to 7 - COOLING/ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING). Replace cap as necessary.
COOLANT LOSS TO THE GROUND WITHOUT PRESSURE CAP BLOWOFF. GAUGE READING HIGH OR HOT	<ol style="list-style-type: none"> 1. Coolant leaks in radiator, cooling system hoses, water pump or engine. 	<ol style="list-style-type: none"> 1. Pressure test and repair as necessary. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).

CONDITION	POSSIBLE CAUSES	CORRECTION
<p>DETONATION OR PRE-IGNITION (NOT CAUSED BY IGNITION SYSTEM). GAUGE MAY OR MAY NOT BE READING HIGH</p>	<ol style="list-style-type: none"> 1. Engine overheating. 2. Freeze point of coolant not correct. Mixture is too rich or too lean. 	<ol style="list-style-type: none"> 1. Check reason for overheating and repair as necessary. 2. Check coolant concentration. (Refer to 7 - COOLING/ENGINE/COOLANT - DESCRIPTION) and adjust ratio as required.
<p>HOSE OR HOSES COLLAPSE WHILE ENGINE IS RUNNING</p>	<ol style="list-style-type: none"> 1. Vacuum created in cooling system on engine cool-down is not being relieved through coolant reserve/overflow system. 	<ol style="list-style-type: none"> 1. (a) Radiator cap relief valve stuck. (Refer to 7 - COOLING/ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING). Replace if necessary (b) Hose between coolant reserve/overflow tank and radiator is kinked. Repair as necessary. (c) Vent at coolant reserve/overflow tank is plugged. Clean vent and repair as necessary. (d) Reserve/overflow tank is internally blocked or plugged. Check for blockage and repair as necessary.
<p>NOISY VISCOUS FAN/DRIVE</p>	<ol style="list-style-type: none"> 1. Fan blades loose - 4.7L. 2. Fan blades striking a surrounding object. 3. Air obstructions at radiator or air conditioning condenser. 4. Thermal viscous fan drive has defective bearing - 4.7L 	<ol style="list-style-type: none"> 1. Replace fan blade assembly. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL) 2. Locate point of fan blade contact and repair as necessary. 3. Remove obstructions and/or clean debris or insects from radiator or A/C condenser. 4. Replace fan drive. Bearing is not serviceable. (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

CONDITION	POSSIBLE CAUSES	CORRECTION
INADEQUATE HEATER PERFORMANCE.	<ol style="list-style-type: none"> 1. Thermostat failed in open position 2. Has a Diagnostic trouble Code (DTC) been set? 3. Coolant level low 4. Obstructions in heater hose/ fittings 5. Heater hose kinked 6. Water pump is not pumping water to/through the heater core. When the engine is fully warmed up, both heater hoses should be hot to the touch. If only one of the hoses is hot, the water pump may not be operating correctly or the heater core may be plugged. Accessory drive belt may be slipping causing poor water pump operation. 	<ol style="list-style-type: none"> 1. Check thermostat operation and replaces necessary (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - DIAGNOSIS AND TESTING) 2. (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION) for correct procedures and replace thermostat if necessary 3. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). 4. Remove heater hoses at both ends and check for obstructions 5. Locate kinked area and repair as necessary 6. (Refer to 7 - COOLING/ENGINE/ WATER PUMP - DIAGNOSIS AND TESTING). If a slipping belt is detected, (Refer to 7 - COOLING/ ACCESSORY DRIVE/DRIVE BELTS - REMOVAL). If heater core obstruction is detected, (Refer to 7 - COOLING - STANDARD PROCEDURE) for cooling system reverse flushing.
STEAM IS COMING FROM THE FRONT OF VEHICLE NEAR THE GRILL AREA WHEN WEATHER IS WET, ENGINE IS WARMED UP AND RUNNING, AND VEHICLE IS STATIONARY. TEMPERATURE GAUGE IS IN NORMAL RANGE	<ol style="list-style-type: none"> 1. During wet weather, moisture (snow, ice or rain condensation) on the radiator will evaporate when the thermostat opens. This opening allows heated water into the radiator. When the moisture contacts the hot radiator, steam may be emitted. This usually occurs in cold weather with no fan or airflow to blow it away. 	<ol style="list-style-type: none"> 1. Occasional steam emitting from this area is normal. No repair is necessary.
COOLANT COLOR	<ol style="list-style-type: none"> 1. Coolant color is not necessarily an indication of adequate corrosion or temperature protection. Do not rely on coolant color for determining condition of coolant. 	<ol style="list-style-type: none"> 1. (Refer to 7 - COOLING/ENGINE/ COOLANT - DESCRIPTION) for coolant concentration information. Adjust coolant mixture as necessary.
COOLANT LEVEL CHANGES IN COOLANT RESERVE/OVERFLOW TANK. TEMPERATURE GAUGE IS IN NORMAL RANGE	<ol style="list-style-type: none"> 1. Level changes are to be expected as coolant volume fluctuates with engine temperature. If the level in the tank was between the FULL and ADD marks at normal operating temperature, the level should return to within that range after operation at elevated temperatures. 	<ol style="list-style-type: none"> 1. A normal condition. No repair is necessary.

CONDITION	POSSIBLE CAUSES	CORRECTION
FAN RUNS ALL THE TIME	<ol style="list-style-type: none"> 1. Fan control sensors inoperative. 2. Fan control solenoid stuck "on". 3. Fan control solenoid harness damaged. 4. Transmission temperature too high. 5. Engine coolant temperature too high. 	<ol style="list-style-type: none"> 1. Check for DTC's. Verify sensor readings. 2. Check fan operation speeds. Refer to fan speed operation table. 3. Check for DTC 1499. Repair as required. 4. Check for transmission over temp. DTC. 5. (a) Check coolant level. Correct level as required. (b) Thermostat stuck. Replace thermostat. (c) Water pump failed. Replace water pump. (d) Coolant flow restricted. Clean radiator. (e) Air flow over radiator obstructed. Remove obstruction.

COOLING SYSTEM LEAKS

ULTRAVIOLET LIGHT METHOD

A leak detection additive is available through the parts department that can be added to cooling system. The additive is highly visible under ultraviolet light (black light). Pour one ounce of additive into cooling system. Place heater control unit in HEAT position. Start and operate engine until radiator upper hose is warm to touch. Aim the commercially available black light tool at components to be checked. If leaks are present, black light will cause additive to glow a bright green color.

The black light can be used in conjunction with a pressure tester to determine if any external leaks exist.

J9507-1

PRESSURE TESTER METHOD

The engine should be at normal operating temperature. Recheck the system cold if cause of coolant loss is not located during the warm engine examination.

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING.

Carefully remove radiator pressure cap from filler neck and check coolant level. Push down on cap to disengage it from stop tabs. Wipe inside of filler neck and examine lower inside sealing seat for nicks, cracks, paint, dirt and solder residue. Inspect radiator-to-reserve/overflow tank hose for internal obstructions. Insert a wire through the hose to be sure it is not obstructed.

Inspect cams on outside of filler neck. If cams are damaged, seating of pressure cap valve and tester seal will be affected.

Attach pressure tester (7700 or an equivalent) to radiator filler neck.

Operate tester pump to apply 103.4 kPa (15 psi) pressure to system. If hoses enlarge excessively or bulges while testing, replace as necessary. Observe gauge pointer and determine condition of cooling system according to following criteria:

Holds Steady: If pointer remains steady for two minutes, serious coolant leaks are not present in system. However, there could be an internal leak that does not appear with normal system test pressure. If it is certain that coolant is being lost and leaks cannot be detected, inspect for interior leakage or perform Internal Leakage Test.

Drops Slowly: Indicates a small leak or seepage is occurring. Examine all connections for seepage or slight leakage with a flashlight. Inspect radiator, hoses, gasket edges and heater. Seal small leak holes with a Sealer Lubricant (or equivalent). Repair leak holes and inspect system again with pressure applied.

Drops Quickly: Indicates that serious leakage is occurring. Examine system for external leakage. If leaks are not visible, inspect for internal leakage. Large radiator leak holes should be repaired by a reputable radiator repair shop.

INTERNAL LEAKAGE INSPECTION

Remove engine oil pan drain plug and drain a small amount of engine oil. If coolant is present in the pan, it will drain first because it is heavier than oil. An alternative method is to operate engine for a short period to churn the oil. After this is done, remove engine dipstick and inspect for water globules. Also inspect transmission dipstick for water globules and transmission fluid cooler for leakage.

WARNING: WITH RADIATOR PRESSURE TESTER TOOL INSTALLED ON RADIATOR, DO NOT ALLOW PRESSURE TO EXCEED 110 KPA (20 PSI). PRESSURE WILL BUILD UP QUICKLY IF A COMBUSTION LEAK IS PRESENT. TO RELEASE PRESSURE, ROCK TESTER FROM SIDE TO SIDE. WHEN REMOVING TESTER, DO NOT TURN TESTER MORE THAN 1/2 TURN IF SYSTEM IS UNDER PRESSURE.

Operate engine without pressure cap on radiator until thermostat opens. Attach a Pressure Tester to filler neck. If pressure builds up quickly it indicates a combustion leak exists. This is usually the result of a cylinder head gasket leak or crack in engine. Repair as necessary.

If there is not an immediate pressure increase, pump the Pressure Tester. Do this until indicated pressure is within system range of 110 kPa (16 psi). Fluctuation of gauge pointer indicates compression or combustion leakage into cooling system.

Because the vehicle is equipped with a catalytic converter, **do not** remove spark plug cables or short out cylinders to isolate compression leak.

If the needle on dial of pressure tester does not fluctuate, race engine a few times to check for an abnormal amount of coolant or steam. This would be emitting from exhaust pipe. Coolant or steam from exhaust pipe may indicate a faulty cylinder head gasket, cracked engine cylinder block or cylinder head.

A convenient check for exhaust gas leakage into cooling system is provided by a commercially available Block Leak Check tool. Follow manufacturers instructions when using this product.

COMBUSTION LEAKAGE TEST - WITHOUT PRESSURE TESTER

DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

WARNING: DO NOT REMOVE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN RADIATOR DRAINCOCK WITH SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.

Drain sufficient coolant to allow thermostat removal. (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL). Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

Add coolant to radiator to bring level to within 6.3 mm (1/4 in) of top of thermostat housing.

CAUTION: Avoid overheating. Do not operate engine for an excessive period of time. Open draincock immediately after test to eliminate boil over.

Start engine and accelerate rapidly three times, to approximately 3000 rpm while observing coolant. If internal engine combustion gases are leaking into cooling system, bubbles will appear in coolant. If bubbles do not appear, internal combustion gas leakage is not present.

COOLING SYSTEM DEAERATION

As the engine operates, any air trapped in cooling system gathers under the radiator cap. The next time the engine is operated, thermal expansion of coolant will push any trapped air past radiator cap into the coolant reserve/overflow tank. Here it escapes to the atmosphere into the tank. When the engine cools down the coolant, it will be drawn from the reserve/overflow tank into the radiator to replace any removed air.

STANDARD PROCEDURE

DRAINING COOLING SYSTEM

WARNING: DO NOT REMOVE THE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN THE RADIATOR DRAINCOCK WITH SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.

1. DO NOT remove radiator cap first. With engine cold, raise vehicle on a hoist and locate radiator draincock.

NOTE: Radiator draincock is located on the right/lower side of radiator facing to rear of vehicle.

2. Attach one end of a hose to the draincock. Put the other end into a clean container. Open draincock and drain coolant from radiator. This will empty the coolant reserve/overflow tank. The coolant does not have to be removed from the tank unless the system is being refilled with a fresh mixture. When tank is empty, remove radiator cap and continue draining cooling system.

REFILLING COOLING SYSTEM - 4.7L ENGINE

1. Tighten the radiator draincock and the cylinder block drain plug(s) (if removed).

CAUTION: Failure to purge air from the cooling system can result in an overheating condition and severe engine damage.

2. Remove the cooling system bleed plug from the radiator upper hose inlet housing. Fill cooling system with the antifreeze mixture (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION), until coolant begins coming out of the cooling system bleed hole. Install the cooling system bleed plug. Fill radiator to top and install radiator cap. Add sufficient coolant to the reserve/overflow tank to raise level to FULL mark.
3. With heater control unit in the HEAT position, operate engine with radiator cap in place.
4. After engine has reached normal operating temperature, shut engine off and allow it to cool. When engine is cooling down, coolant will be drawn into the radiator from the reserve/overflow tank.

5. Add coolant to reserve/overflow tank as necessary. **Only add coolant to the reserve/overflow tank when the engine is cold. Coolant level in a warm engine will be higher due to thermal expansion.** To purge the cooling system of all air, this heat up/cool down cycle (adding coolant to cold engine) must be performed three times. Add necessary coolant to raise tank level to the FULL mark after each cool down period.

ADDING ADDITIONAL COOLANT

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (glycol base coolant with corrosion inhibitors called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Do not use coolant additives that are claimed to improve engine cooling.

COOLING SYSTEM - REVERSE FLUSHING

CAUTION: The cooling system normally operates at 97-124 kPa (14-18 psi) pressure. Exceeding this pressure may damage the radiator or hoses.

Reverse flushing of the cooling system is the forcing of water through the cooling system. This is done using air pressure in the opposite direction of normal coolant flow. It is usually only necessary with very dirty systems with evidence of partial plugging.

CHEMICAL CLEANING

If visual inspection indicates the formation of sludge or scaly deposits, use a radiator cleaner (Mopar Radiator Kleen or equivalent) before flushing. This will soften scale and other deposits and aid the flushing operation.

CAUTION: Be sure instructions on the container are followed.

REVERSE FLUSHING RADIATOR

Disconnect the radiator hoses from the radiator fittings. Attach a section of radiator hose to the radiator bottom outlet fitting and insert the flushing gun. Connect a water supply hose and air supply hose to the flushing gun.

CAUTION: The cooling system normally operates at 97-124 kPa (14-18 psi) pressure. Exceeding this pressure may damage the radiator or hoses.

Allow the radiator to fill with water. When radiator is filled, apply air in short blasts allowing radiator to refill between blasts. Continue this reverse flushing until clean water flows out through rear of radiator cooling tube passages. For more information, refer to operating instructions supplied with flushing equipment. Have radiator cleaned more extensively by a radiator repair shop.

REVERSE FLUSHING ENGINE

Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE). Remove the thermostat housing and thermostat. Install the thermostat housing. Disconnect the radiator upper hose from the radiator and attach the flushing gun to the hose. Disconnect the radiator lower hose from the water pump. Attach a lead away hose to the water pump inlet fitting.

CAUTION: Be sure that the heater control valve is closed (heat off). This is done to prevent coolant flow with scale and other deposits from entering the heater core.

Connect the water supply hose and air supply hose to the flushing gun. Allow the engine to fill with water. When the engine is filled, apply air in short blasts, allowing the system to fill between air blasts. Continue until clean water flows through the lead away hose. For more information, refer to operating instructions supplied with flushing equipment.

Remove the lead away hose, flushing gun, water supply hose and air supply hose. Remove the thermostat housing (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL). Install the thermostat and housing with a replacement gasket (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - INSTALLATION). Connect the radiator hoses. Refill the cooling system with the correct antifreeze/water mixture (Refer to 7 - COOLING - STANDARD PROCEDURE).

TENSIONERS-BELT

REMOVAL

3.7L ENGINE

1. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
2. Remove tensioner assembly from engine front cover.

WARNING: BECAUSE OF HIGH SPRING TENSION, DO NOT ATTEMPT TO DISASSEMBLE AUTOMATIC TENSIONER. UNIT IS SERVICED AS AN ASSEMBLY (EXCEPT FOR PULLEY ON TENSIONER).

4.7L ENGINE

1. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
2. Remove tensioner assembly from engine front cover.

WARNING: BECAUSE OF HIGH SPRING TENSION, DO NOT ATTEMPT TO DISASSEMBLE AUTOMATIC TENSIONER. UNIT IS SERVICED AS AN ASSEMBLY (EXCEPT FOR PULLEY ON TENSIONER).

5.7L ENGINE

1. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
2. Remove bolt and tensioner assembly.

3.0L DIESEL

1. Disconnect negative battery cable.
2. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

3. Remove belt tensioner retaining bolt and remove tensioner from bracket.

INSTALLATION

3.7L ENGINE

1. An indexing slot is located on back of tensioner. Align this slot to the head of the bolt on the front cover. Install the mounting bolt. Tighten bolt to 41 N·m (30 ft. lbs.).
2. Install drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
3. Check belt indexing marks (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

4.7L ENGINE

1. An indexing slot is located on back of tensioner. Align this slot to the head of the bolt on the front cover. Install the mounting bolt. Tighten bolt to 41 N·m (30 ft. lbs.).
2. Install drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
3. Check belt indexing marks (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

5.7L ENGINE

1. Align locator tang on tensioner with slot in front cover.
2. Install tensioner and mounting bolt to front cover.. Tighten bolt to 41 N·m (30 ft. lbs.).
3. Install accessory drive belt (Refer to 7 - COOLING/ ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

3.0L DIESEL

1. Install belt tensioner on bracket. Torque retaining bolt to 47.1N·m.

2. Install accessory drive belt (Refer to 7 - COOLING/ ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
3. Connect negative battery cable.

BELTS-DRIVE

DIAGNOSIS AND TESTING

SERPENTINE DRIVE BELT

When diagnosing serpentine drive belts, small cracks that run across ribbed surface of belt from rib to rib , are considered normal. These are not a reason to replace belt. However, cracks running along a rib (not across) are **not** normal. Any belt with cracks running along a rib must be replaced. Also replace belt if it has excessive wear, frayed cords or severe glazing.

Refer to SERPENTINE DRIVE BELT DIAGNOSIS CHART for further belt diagnosis.

SERPENTINE DRIVE BELT DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
RIB CHUNKING (ONE OR MORE RIBS HAS SEPARATED FROM BELT BODY)	<ol style="list-style-type: none"> Foreign objects imbedded in pulley grooves. Installation damage. 	<ol style="list-style-type: none"> Remove foreign objects from pulley grooves. Replace belt. Replace belt.
RIB OR BELT WEAR	<ol style="list-style-type: none"> Pulley(s) misaligned. Abrasive environment. Rusted pulley(s). Sharp or jagged pulley groove tips. Rubber deteriorated. 	<ol style="list-style-type: none"> Align pulley(s). Clean pulley(s). Replace belt if necessary. Clean rust from pulley(s). Replace pulley. Replace belt.
LONGITUDINAL BELT CRACKING (CRACKS BETWEEN TWO RIBS)	<ol style="list-style-type: none"> Belt has mistracked from pulley groove. Pulley groove tip has worn away rubber to tensile member. 	<ol style="list-style-type: none"> Replace belt. Replace belt.
BELT SLIPS	<ol style="list-style-type: none"> Belt slipping because of insufficient tension. Belt routed incorrectly Incorrect belt. Belt or pulley subjected to substance (belt dressing, oil ethylene glycol) that has reduced friction. Driven component bearing failure. Belt glazed and hardened from heat and excessive slippage. 	<ol style="list-style-type: none"> Replace automatic belt tensioner. Verify belt routing. Replace belt. Replace belt and clean pulleys. Replace faulty component bearing. Replace belt.

CONDITION	POSSIBLE CAUSES	CORRECTION
"GROOVE JUMPING" (BELT DOES NOT MAINTAIN CORRECT POSITION ON PULLEY)	<ol style="list-style-type: none"> 1. Belt tension either too high or too low. 2. Belt routed incorrectly. 3. Incorrect belt. 4. Pulley(s) not within design tolerance. 5. Foreign object(s) in grooves. 6. Pulley misalignment. 7. Belt cord line is broken. 	<ol style="list-style-type: none"> 1. Replace automatic belt tensioner. 2. Verify belt routing. 3. Replace belt. 4. Replace pulley(s). 5. Remove foreign objects from grooves. 6. Check and replace. 7. Replace belt.
BELT BROKEN (NOTE: IDENTIFY AND CORRECT PROBLEM BEFORE NEW BELT IS INSTALLED)	<ol style="list-style-type: none"> 1. Excessive tension. 2. Incorrect belt. 3. Tensile member damaged during belt installation. 4. Severe misalignment. 5. Bracket, pulley, or bearing failure. 	<ol style="list-style-type: none"> 1. Replace belt and automatic belt tensioner. 2. Replace belt. 3. Replace belt. 4. Check and replace. 5. Replace defective component and belt.
NOISE (OBJECTIONABLE SQUEAL, SQUEAK, OR RUMBLE IS HEARD OR FELT WHILE DRIVE BELT IS IN OPERATION)	<ol style="list-style-type: none"> 1. Belt slippage. 2. Bearing noise. 3. Belt misalignment. 4. Belt-to-pulley mismatch. 	<ol style="list-style-type: none"> 1. Replace belt or automatic belt tensioner. 2. Locate and repair. 3. Replace belt. 4. Install correct belt.

REMOVAL

3.7L ENGINE

NOTE: The belt routing schematics are published from the latest information available at the time of publication. If anything differs between these schematics and the Belt Routing Label, use the schematics on Belt Routing Label. This label is located in the engine compartment.

CAUTION: DO NOT LET TENSIONER ARM SNAP BACK TO THE FREEARM POSITION, SEVERE DAMAGE MAY OCCUR TO THE TENSIONER.

Belt tension is not adjustable. Belt adjustment is maintained by an automatic (spring load) belt tensioner.

1. Disconnect negative battery cable from battery.
2. Rotate belt tensioner until it contacts its stop. Remove belt, then slowly rotate the tensioner into the freearm position..

REMOVAL - 4.7L ENGINE

NOTE: The belt routing schematics are published from the latest information available at the time of publication. If anything differs between these schematics and the Belt Routing Label, use the schematics on Belt Routing Label. This label is located in the engine compartment.

CAUTION: DO NOT LET TENSIONER ARM SNAP BACK TO THE FREEARM POSITION, SEVERE DAMAGE MAY OCCUR TO THE TENSIONER.

Belt tension is not adjustable. Belt adjustment is maintained by an automatic (spring load) belt tensioner.

1. Disconnect negative battery cable from battery.
2. Rotate belt tensioner until it contacts its stop. Remove belt, then slowly rotate the tensioner into the freearm position..

5.7L ENGINE

1. Remove the air intake tube between intake manifold and air filter assembly..
2. Release the belt tension by rotating the tensioner **counterclockwise** with a 15 mm wrench on the tensioner pulley bolt. Rotate belt tensioner until belt can be removed from pulleys.
3. Remove belt.
4. Gently release tensioner.

3.0L DIESEL

NOTE: The belt routing schematics are published from the latest information available at the time of publication. If anything differs between these schematics and the Belt Routing Label, use the schematics on Belt Routing Label. This label is located in the engine compartment.

CAUTION: DO NOT LET TENSIONER ARM SNAP BACK TO THE FREEARM POSITION, SEVERE DAMAGE MAY OCCUR TO THE TENSIONER.

Belt tension is not adjustable. Belt adjustment is maintained by an automatic (spring loaded) belt tensioner.

1. Disconnect negative battery cable.
2. Rotate belt tensioner until it contacts its stop. Remove belt, then slowly rotate the tensioner into the freearm position.

80cdd35c

INSTALLATION

3.7L ENGINE

NOTE: The belt routing schematics are published from the latest information available at the time of publication. If anything differs between these schematics and the Belt Routing Label, use the schematics on Belt Routing Label. This label is located in the engine compartment.

Belt tension is not adjustable. Belt adjustment is maintained by an automatic (spring load) belt tensioner.

1. Check condition of all pulleys.

CAUTION: When installing the serpentine accessory drive belt, the belt **MUST** be routed correctly. If not, the engine may overheat due to the water pump rotating in the wrong direction.

80ba780b

2. Install new belt. Route the belt around all pulleys except the idler pulley. Rotate the tensioner arm until it contacts its stop position. Route the belt around the idler and slowly let the tensioner rotate into the belt. Make sure the belt is seated onto all pulleys.
3. With the drive belt installed, inspect the belt wear indicator. On 3.7L Engines the gap between the tang and the housing stop (measurement A) must not exceed 24 mm (.94 inches).

INSTALLATION - 4.7L ENGINE

NOTE: The belt routing schematics are published from the latest information available at the time of publication. If anything differs between these schematics and the Belt Routing Label, use the schematics on Belt Routing Label. This label is located in the engine compartment.

Belt tension is not adjustable. Belt adjustment is maintained by an automatic (spring load) belt tensioner.

1. Check condition of all pulleys.
2. Install new belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION). Route the belt around all pulleys except the idler pulley. Rotate the tensioner arm until it contacts its stop position. Route the belt around the idler and slowly let the tensioner rotate into the belt. Make sure the belt is seated onto all pulleys.
3. With the drive belt installed, inspect the belt wear indicator. On 4.7L Engines the gap between the tang and the housing stop (measurement A) must not exceed 24 mm (.94 inches).

5.7L ENGINE

NOTE: When installing accessory drive belt onto pulleys, make sure that belt is properly routed and all V-grooves make proper contact with pulleys.

1. Position the drive belt over all pulleys except for the water pump pulley.
2. Rotate tensioner **counterclockwise** and slip the belt over the water pump pulley.
3. Gently release tensioner.
4. Install the air intake tube between intake manifold and air filter assembly.

3.0L DIESEL

NOTE: The belt routing schematics are published from the latest information available at the time of publication. If anything differs between these schematics and the Belt Routing Label, use the schematics on Belt Routing Label. This label is located in the engine compartment.

Belt tension is not adjustable. Belt adjustment is maintained by an automatic (spring load) belt tensioner.

1. Check condition of all pulleys.

CAUTION: When installing the serpentine accessory drive belt, the belt **MUST** be routed correctly. If not, the engine may overheat due to the water pump rotating in the wrong direction.

2. Install new belt. Route the belt around all pulleys except the idler pulley. Rotate the tensioner arm until it contacts its stop position. Route the belt around the idler and slowly let the tensioner rotate into the belt. Make sure the belt is seated onto all pulleys.

COOLANT

DESCRIPTION - ENGINE COOLANT

WARNING: ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASE COOLANT PROPERLY, CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE, PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED, PERSONAL INJURY CAN RESULT.

CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze protection and less boiling protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene glycol base coolant with hybrid organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% Ethylene Glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

The green coolant **MUST NOT BE MIXED** with the orange or magenta coolants. When replacing coolant the complete system flush must be performed before using the replacement coolant.

CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Doing so will reduce the corrosion protection and may result in premature water pump seal failure. If non-HOAT coolant is introduced into the cooling system in an emergency, it should be replaced with the specified coolant as soon as possible.

OPERATION

Coolant flows through the engine block absorbing the heat from the engine, then flows to the radiator where the cooling fins in the radiator transfers the heat from the coolant to the atmosphere. During cold weather the ethylene-glycol or propylene-glycol coolant prevents water present in the cooling system from freezing within temperatures indicated by mixture ratio of coolant to water.

DIAGNOSIS AND TESTING - COOLANT CONCENTRATION TESTING

Coolant concentration should be checked when any additional coolant was added to system or after a coolant drain, flush and refill. The coolant mixture offers optimum engine cooling and protection against corrosion when mixed to a freeze point of -37°C (-34°F) to -46°C (-50°F). The use of a hydrometer or a refractometer can be used to test coolant concentration.

A hydrometer will test the amount of glycol in a mixture by measuring the specific gravity of the mixture. The higher the concentration of ethylene glycol, the larger the number of balls that will float, and higher the freeze protection (up to a maximum of 60% by volume glycol).

A refractometer (Special Tool 8286) (Refer to 7 - COOLING - SPECIAL TOOLS) will test the amount of glycol in a coolant mixture by measuring the amount a beam of light bends as it passes through the fluid.

Some coolant manufactures use other types of glycols into their coolant formulations. Propylene glycol is the most common new coolant. However, propylene glycol based coolants do not provide the same freezing protection and corrosion protection and is not recommended.

CAUTION: Do not mix types of coolant—corrosion protection will be severely reduced.

STANDARD PROCEDURE - COOLANT SERVICE

For engine coolant recommended service schedule, (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION).

CONTAINER-COOLANT RECOVERY

DESCRIPTION

This system works along with the radiator pressure cap. This is done by using thermal expansion and contraction of the coolant to keep the coolant free of trapped air. It provides:

- A volume for coolant expansion and contraction.
- A convenient and safe method for checking/adjusting coolant level at atmospheric pressure. This is done without removing the radiator pressure cap.
- Some reserve coolant to the radiator to cover minor leaks and evaporation or boiling losses.

As the engine cools, a vacuum is formed in the cooling system of both the radiator and engine. Coolant will then be drawn from the coolant tank and returned to a proper level in the radiator.

The coolant reservoir/overflow system has a radiator mounted pressurized cap, an overflow tube and a plastic coolant reservoir/overflow tank mounted to the right inner fender.

REMOVAL

1. Disconnect the coolant overflow hose (2).
2. Remove two mounting bolts (3).
3. Remove the coolant reservoir/overflow tank (1).

INSTALLATION

1. Position the coolant reservoir/overflow tank (1) in the vehicle.
2. Install two mounting bolts (3).
3. Install the coolant overflow hose (2).

FAN-RADIATOR

DESCRIPTION

3.7L ENGINE The radiator cooling fan used on the 3.7L engine is an electrical fan and is integral to the fan shroud.

4.7L ENGINE The radiator cooling fan used on the 4.7L engine is a hybrid design. The hybrid fan system consist of a low speed viscous driven mechanical fan and a electrical fan.

5.7L ENGINE The 5.7L hydraulic cooling fan is integral to the fan shroud and is located between the radiator and the engine.

The power steering pump supplies the hydraulic fluid and pressure to rotate the cooling fan blade, while the electrical part of the fan is controlled by the FCM.

The hydraulic fan drive (motor) consists of the three major following components:

- Steering flow control valve
- Fan control valve
- Two stage G-rotor hydraulic drive

The hydraulic fan and drive is not serviceable. Therefore any failure of the fan blade, hydraulic fan drive or fan shroud requires replacement of the fan module because the fan blade and hydraulic fan drive are matched and balanced as a system and servicing either separately would disrupt this balance.

HYDRAULIC RADIATOR COOLING FAN AND FAN DRIVE - 5.7L

- 1 - RADIATOR
- 2 - HYDRAULIC FAN MOTOR SOLNOID
- 3 - ELECTRICAL CONNECTOR
- 4 - HIGH PRESSURE LINE FROM HYDRAULIC FAN MOTOR TO STEERING GEAR
- 5 - HIGH PRESSURE LINE
- 6 - RETURN LINE
- 7 - FAN MOTOR

HYDRAULIC FAN FLUID FLOW CIRCUIT

- 1 - POWER STEERING RESERVOIR
- 2 - POWER STEERING PUMP
- 3 - HYDRAULIC FAN DRIVE ASSEMBLY
- 4 - FAN BLADE
- 5 - HYDRAULIC FAN CONTROL SOLENOID
- 6 - POWER STEERING OIL COOLER
- 7 - STEERING GEAR

For hydraulic fluid routing information refer to flow chart..

CAUTION: Do not attempt to service the hydraulic cooling fan or fan drive separately, they are serviced as an assembly. Failure to do so may cause severe damage to the hydraulic cooling fan assembly.

OPERATION

The hydraulic radiator cooling fan used on the 5.7L and 3.0L Diesel engines replaces both the electric fan and the engine driven mechanical fan. This provides 5.7L and 3.0L Diesel equipped vehicles with heavy trailer towing capability while at the same time reducing unnecessary power drain on both the engine and the vehicles electrical system.

HYDRAULIC FAN STRATEGY

The hydraulic radiator cooling fan is controlled by the FCM. A PWM (Pulse With Modulated) signal from the JTEC controls the fan speed. There are four inputs to the FCM that determine what speed percentage of fan is required by the vehicle. These inputs are:

- Engine Coolant Temperature
- Transmission Oil Temperature
- A/C System Pressure

By monitoring these three parameters, the FCM can determine if cooling airflow is required. If airflow is required, the FCM will slowly ramp up (speed up) the fan speed until the parameter(s) are under control. Once the temperature

or pressure is reduced to within operating parameters the fan will ramp up, ramp down, or hold its speed to maintain the temperature / pressure requirements.

NOTE: Even if the FCM is not requesting fan on operation the fan blade will usually spin between 100 and 500 RPM when the vehicle is at idle. This is due to a controlled minimum oil flow requirement through the fan drive motor.

ACTIVATING THE HYDRAULIC FAN WITH THE SCAN TOOL

Under the Engine Systems test heading, there is a subheading. "Hydraulic fan solenoid test", that has the selections, on/off. Activating the fan with the scan tool will run the fan at 100% duty cycle, which will help troubleshoot any system problems, and also help with the deaeration procedure.

NOTE: Engine must be running to activate the fan with the scan tool.

RADIATOR COOLING FAN HYDRAULIC FLUID PATH

Hydraulic fluid is pumped through the power steering pump, from the pump the fluid travels through a high pressure delivery line to the fan drive motor. As fluid is diverted through the G-rotors, rotational motion is created as fluid moves from the high-pressure (inlet) side of the motor to the low-pressure (outlet) side. Fluid exiting the drive motor is divided into two paths. Path one continues through a high pressure delivery line to the vehicles steering gear to provide steering assist. and path two sends fluid back to the power steering pump through a low pressure line. Fluid exits the steering gear under low pressure and travels through a low pressure line to the power steering fluid cooler to be cooled before being returned back the power steering fluid reservoir.

NOTE: There is a steering flow control valve located in the fan drive motor. This valve operates like the flow control valve found in the typical power steering pump. Because of the design of the valve steering assist can not be effected by the radiator cooling fan even during fan drive failure.

REMOVAL

5.7L/3.0L DIESEL ENGINES

1. Raise vehicle on hoist.
2. Drain cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)

NOTE: The hydraulic fan drive is driven by the power steering pump. When removing lines or hoses from fan drive assembly use a drain pan to catch any power steering fluid that may exit the fan drive or the lines and hoses.

NOTE: When ever the high pressure line fittings are removed from the hydraulic fan drive the O-rings must be replaced.

3. Disconnect two high pressure lines at hydraulic fan drive. Remove and discard o-rings from line fittings.
4. Disconnect low pressure return hose at hydraulic fan drive.

NOTE: The lower mounting bolts can only be accessed from under vehicle.

5. Remove two lower mounting bolts from the shroud.
6. Lower vehicle.
7. Disconnect the electrical connector for the fan control solenoid.
8. Disconnect the radiator upper hose at the radiator and position out of the way.

9. Disconnect the power steering gear outlet hose and fluid return hose at the cooler.

10. Remove two upper mounting bolts from the shroud.
11. Remove the shroud and fan drive from vehicle.

REMOVAL - ELECTRIC FAN

1. Disconnect electric fan connector.
2. Remove shroud mounting bolts.
3. Remove shroud and fan assembly from vehicle.
4. Remove fan assembly mounting bolts and remove fan from shroud.

CLEANING

Clean the fan blades using a mild soap and water. Do not use an abrasive to clean the blades.

INSPECTION

WARNING: DO NOT ATTEMPT TO BEND OR STRAIGHTEN FAN BLADES IF FAN IS NOT WITHIN SPECIFICATIONS.

CAUTION: If fan blade assembly is replaced because of mechanical damage, water pump and viscous fan drive should also be inspected. These components could have been damaged due to excessive vibration.

1. Remove fan blade assembly from viscous fan drive unit (four bolts).
2. Lay fan on a flat surface with leading edge facing down. With tip of blade touching flat surface, replace fan if clearance between opposite blade and surface is greater than 2.0 mm (.090 inch). Rocking motion of opposite blades should not exceed 2.0 mm (.090 inch). Test all blades in this manner.
3. Inspect fan assembly for cracks, bends, loose rivets or broken welds. Replace fan if any damage is found.

INSTALLATION

5.7L/3.0L DIESEL

CAUTION: There is an external ground wire connected to the hydraulic fan drive located at the electrical connector on the fan assembly. This ground **MUST** remain connected at all times. Failure to ensure ground wire is connected when engine is operating can cause severe damage to the JTEC module.

1. Position fan drive and shroud in vehicle.
2. Install fan shroud upper mounting bolts. Do not tighten at this time.
3. Install radiator upper hose onto radiator.
4. Connect power steering cooler hoses.
5. Raise vehicle on hoist.
6. Install fan shroud lower mounting bolts. Tighten to 6 N·m (50 in. lbs.).

NOTE: When ever the high pressure line fittings are removed from the hydraulic fan drive the o-rings located on the fittings must be replaced.

7. Lubricate the o-rings on the fittings with power steering fluid then connect inlet and outlet high pressure lines to fan drive. Tighten inlet line to 49 N·m (36 ft. lbs.) tighten outlet line to 29 N·m (21.5 ft. lbs.).
8. Connect low pressure return hose to fan drive.
9. Lower vehicle.
10. Install radiator upper hose.
11. Connect electrical connector for hydraulic fan control solenoid.
12. Tighten fan shroud upper mounting bolts to 6 N·m (50 in. lbs.).
13. Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

CAUTION: Do not run engine with power steering fluid below the full mark in the reservoir. Sever damage to the hydraulic cooling fan or the engine can occur.

14. Refill power steering fluid reservoir and bleed air from steering system (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).
15. Run engine and check for leaks.

INSTALLATION - ELECTRIC FAN

1. Position fan assembly on shroud.
2. Install fan to fan shroud mounting nuts. Tighten to 5.5 N·m (50 in. lbs.).
3. Position fan and shroud assembly in vehicle.
4. Install shroud mounting bolts. Tighten to 5.5 N·m (50 in. lbs.).

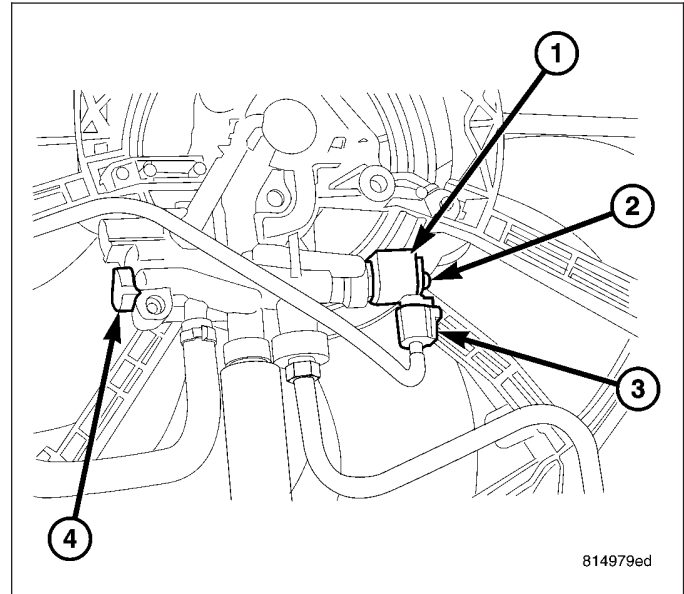

5. Connect electric fan electrical connector.
6. Start engine and check fan operation.

SOLENOID-RADIATOR FAN

REMOVAL

NOTE: If the solenoid removal and replacement steps are performed quickly, then only a small amount of steering fluid will drip from the radiator fan solenoid opening. The small amount of leakage should not require prior fluid removal from the power steering reservoir.

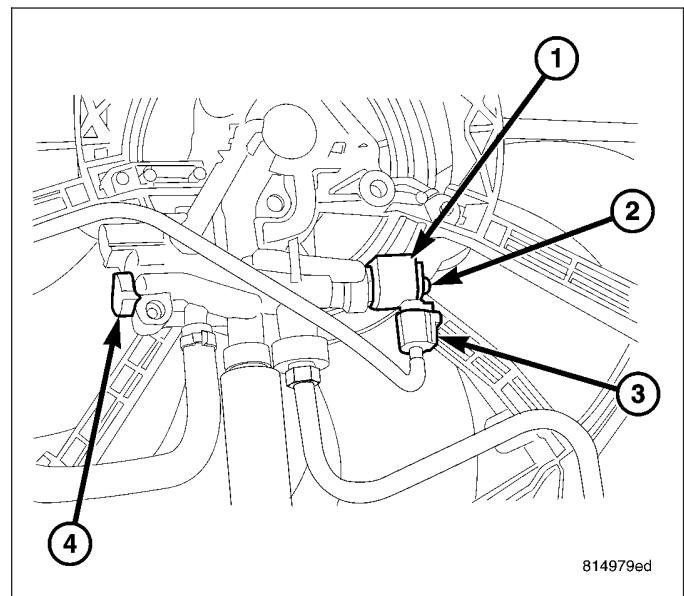

1. Disconnect the battery negative cable.
2. Raise and support the vehicle.
3. Disconnect the radiator fan solenoid connector (3).
4. Clean the area around the radiator fan solenoid (1) of any debris.
5. While holding the solenoid body, use Torx® T40 to remove the radiator fan solenoid.

INSTALLATION

CAUTION: If for any reason the hydraulic fan module ground wire is removed from the hydraulic fan module, reconnect the ground wire and tighten-mounting nut to 10 N·m (89 in. lbs.). Failure to ensure the ground wire is properly connected could result in an electrostatic discharge that could damage the PCM.

1. Make sure that the two o-rings are in place. Notice that the armature of the solenoid can rotate within the body of the solenoid.
2. Install the radiator fan solenoid (1) into the hydraulic fan module (4).
3. While holding the solenoid body, using a Torx® T40 tighten the radiator fan solenoid screw (2) to 16.2 N·m (143 in. lbs.).
4. Connect the radiator fan solenoid connector (3).
5. Lower the vehicle
6. Connect the negative battery cable.
7. Check the power steering fluid level, fill as necessary.

HEATER-ENGINE BLOCK

DESCRIPTION

WARNING: DO NOT OPERATE ENGINE UNLESS BLOCK HEATER CORD HAS BEEN DISCONNECTED FROM POWER SOURCE AND SECURED IN PLACE. THE POWER CORD MUST BE SECURED IN ITS RETAINING CLIPS AND ROUTED AWAY FROM EXHAUST MANIFOLDS AND MOVING PARTS.

An optional engine block heater is available with all models. The heater is equipped with a power cord. The cord is attached to an engine compartment component with tie-straps. The heater warms the engine providing easier engine starting and faster warm-up in low temperatures. The heater is mounted in a core hole of the engine cylinder block in place of a freeze plug with the heating element immersed in engine coolant.

OPERATION

Connecting the power cord to a grounded 110-120 volt AC electrical outlet with a grounded, three wire extension cord activates the heating element warming the engine coolant.

DIAGNOSIS AND TESTING - ENGINE BLOCK HEATER

If the unit does not operate, possible causes can be either the power cord or the heater element. Test the power cord for continuity with a 110-volt voltmeter or 110-volt test light. Test heater element continuity with an ohmmeter or a 12-volt test light.

CAUTION: To prevent damage, the power cord must be secured in it's retainer clips and away from any components that may cause abrasion or damage, such as linkages, exhaust components, etc.

REMOVAL

3.7L ENGINE

1. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
2. Raise vehicle on hoist.
3. Detach power cord plug from heater.
4. Loosen screw in center of heater. Remove heater assembly.

4.7L ENGINE

1. Disconnect negative battery cable from battery.
2. Drain coolant from radiator (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Raise vehicle.
4. Remove engine cylinder block drain plug(s) located on the sides of cylinder block above the oil pan rail.

5. Remove power cord from block heater.
6. Loosen screw at center of block heater. Remove heater assembly.

INSTALLATION

3.7L ENGINE

1. Thoroughly clean core hole and heater seat.
2. Insert heater assembly with element loop positioned **upward**.
3. With heater seated, tighten center screw securely to assure a positive seal.

CAUTION: To prevent damage, the power cord must be secured in its retaining clips, and not positioned so it could contact linkages or exhaust manifold.

4. Connect power cord to heater.
5. Lower vehicle.
6. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

4.7L ENGINE

1. Thoroughly clean cylinder block core hole and block heater seat.
2. Insert block heater assembly with element loop pointing at twelve o'clock.
3. With block heater fully seated, tighten center screw to 2 N·m (17 in. lbs.) torque.
4. Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
5. Start and warm the engine. Check for leaks.

SENSOR-ENGINE COOLANT TEMPERATURE

DESCRIPTION

The Engine Coolant Temperature (ECT) sensor is used to sense engine coolant temperature. The sensor protrudes into an engine water jacket.

The ECT sensor is a two-wire Negative Thermal Coefficient (NTC) sensor. Meaning, as engine coolant temperature increases, resistance (voltage) in the sensor decreases. As temperature decreases, resistance (voltage) in the sensor increases.

OPERATION

At key-on, the Powertrain Control Module (PCM) sends out a regulated 5 volt signal to the ECT sensor. The PCM then monitors the signal as it passes through the ECT sensor to the sensor ground (sensor return).

When the engine is cold, the PCM will operate in Open Loop cycle. It will demand slightly richer air-fuel mixtures and higher idle speeds. This is done until normal operating temperatures are reached.

The PCM uses inputs from the ECT sensor for the following calculations:

- for engine coolant temperature gauge operation through CCD or PCI (J1850) communications
- Injector pulse-width
- Spark-advance curves
- ASD relay shut-down times
- Idle Air Control (IAC) motor key-on steps
- Pulse-width prime-shot during cranking
- O₂ sensor closed loop times
- Purge solenoid on/off times
- EGR solenoid on/off times (if equipped)
- Leak Detection Pump operation (if equipped)
- Radiator fan relay on/off times (if equipped)
- Target idle speed

REMOVAL

3.7L V-6

The Engine Coolant Temperature (ECT) sensor on the 3.7L engine is installed into a water jacket at front of intake manifold near rear of generator.

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. COOLING SYSTEM MUST BE PARTIALLY DRAINED BEFORE REMOVING THE COOLANT TEMPERATURE SENSOR.

1. Partially drain the cooling system.
2. Disconnect the electrical connector from the sensor.
3. Remove the sensor from the intake manifold.

4.7L ENGINE

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. COOLING SYSTEM MUST BE PARTIALLY DRAINED BEFORE REMOVING THE ENGINE COOLANT TEMPERATURE (ECT) SENSOR. REFER TO GROUP 7, COOLING.

The ECT sensor is located near the front of the intake manifold.

1. Partially drain cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE).
2. Disconnect electrical connector from ECT sensor.
3. Remove sensor from intake manifold.

5.7L ENGINE

The Engine Coolant Temperature (ECT) sensor on the 5.7L engine is located under the air conditioning compressor. It is installed into a water jacket at the front of the cylinder block.

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. COOLING SYSTEM MUST BE PARTIALLY DRAINED BEFORE REMOVING THE COOLANT TEMPERATURE SENSOR.

1. Partially drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
2. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
3. Carefully unbolt air conditioning compressor from front of engine. Do not disconnect any A/C hoses from compressor. Temporarily support compressor to gain access to ECT sensor. Refer to Heating and Air Conditioning section for information.
4. Disconnect electrical connector from sensor.
5. Remove sensor from cylinder block.

INSTALLATION

3.7L V-6

1. Apply thread sealant to sensor threads.
2. Install sensor to engine.
3. Tighten sensor to 11 N·m (8 ft. lbs.) torque.
4. Connect electrical connector to sensor.
5. Replace any lost engine coolant. (Refer to 7 - COOLING - STANDARD PROCEDURE).

4.7L ENGINE

1. Install sensor.
2. Tighten to 11 N·m (8 ft. lbs.) torque.
3. Connect electrical connector to sensor.
4. Replace any lost engine coolant. (Refer to 7 - COOLING - STANDARD PROCEDURE).

5.7L ENGINE

1. Apply thread sealant to sensor threads.
2. Install sensor into engine.
3. Tighten sensor to 11 N·m (8 ft. lbs.) torque.
4. Connect electrical connector to sensor.
5. Carefully bolt air conditioning compressor onto the front of engine. Refer to Heating and Air Conditioning section for information.
6. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
7. Replace any lost engine coolant. (Refer to 7 - COOLING - STANDARD PROCEDURE).

THERMOSTAT-ENGINE COOLANT

DESCRIPTION

CAUTION: Do not operate an engine without a thermostat, except for servicing or testing.

A pellet-type thermostat controls the operating temperature of the engine by controlling the amount of coolant flow to the radiator. On all engines the thermostat is closed below 195°F (90°C). Above this temperature, coolant is allowed to flow to the radiator. This provides quick engine warm up and overall temperature control.

The same thermostat is used for winter and summer seasons. An engine should not be operated without a thermostat, except for servicing or testing. Operating without a thermostat causes other problems. These are: longer engine warmup time, unreliable warmup performance, increased exhaust emissions and crankcase condensation. This condensation can result in sludge formation.

OPERATION

The wax pellet is located in a sealed container at the spring end of the thermostat. When heated, the pellet expands, overcoming closing spring tension and water pump pressure to force the valve to open.

DIAGNOSIS AND TESTING - THERMOSTAT

ON-BOARD DIAGNOSTICS

All models are equipped with On-Board Diagnostics for certain cooling system components. If the powertrain control module (PCM) detects low engine coolant temperature, it will record a Diagnostic Trouble Code (DTC). For other DTC numbers, (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION).

The DTC can also be accessed through the DRB scan tool.

REMOVAL

3.7L/4.7L ENGINE

WARNING: DO NOT LOOSEN RADIATOR DRAINCOCK WITH SYSTEM HOT AND PRESSURIZED. SERIOUS BURNS FROM COOLANT CAN OCCUR.

Do not waste reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

If thermostat is being replaced, be sure that replacement is specified thermostat for vehicle model and engine type.

1. Disconnect negative battery cable at battery.
2. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Raise vehicle on hoist.
4. Remove splash shield.
5. Remove lower radiator hose clamp and lower radiator hose at thermostat housing.
6. Remove thermostat housing mounting bolts, thermostat housing and thermostat.

5.7L ENGINE

WARNING: DO NOT LOOSEN THE RADIATOR DRAINCOCK WITH THE COOLING SYSTEM HOT AND PRESSURIZED. SERIOUS BURNS FROM THE COOLANT CAN OCCUR.

Do not waste reusable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

If the thermostat is being replaced, be sure that the replacement is the specified thermostat for the vehicle model and engine type.

1. Disconnect the negative battery cable.
2. Drain the cooling system
3. Remove the radiator hose clamp and radiator hose at the thermostat housing (1).
4. Remove the thermostat housing mounting bolts (2), thermostat housing (1) and thermostat.

INSTALLATION

3.7L/4.7L ENGINE

1. Clean mating areas of timing chain cover and thermostat housing.
2. Install thermostat (spring side down) into recessed machined groove on timing chain cover.
3. Position thermostat housing on timing chain cover.
4. Install two housing-to-timing chain cover bolts. Tighten bolts to 13 N·m (115 in. lbs.) torque.

CAUTION: Housing must be tightened evenly and thermostat must be centered into recessed groove in timing chain cover. If not, it may result in a cracked housing, damaged timing chain cover threads or coolant leaks.

5. Install lower radiator hose on thermostat housing.

6. Install splash shield.
7. Lower vehicle.
8. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
9. Connect negative battery cable to battery.
10. Start and warm the engine. Check for leaks.

5.7L ENGINE

1. Position the thermostat and housing (1) on the front cover.
2. Install thermostat housing bolts (2). Tighten the bolts (2) to 13 N-m (112 in. lbs.).
3. Install the radiator hose onto the thermostat housing (1).
4. Fill the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
5. Connect negative battery cable.
6. Start and warm the engine. Check for leaks.

VISCOUS CLUTCH-FAN DRIVE

DESCRIPTION

CAUTION: Engines equipped with serpentine drive belts have reverse rotating fans and viscous fan drives. They are marked with the word **REVERSE** to designate their usage. Installation of the wrong fan or viscous fan drive can result in engine overheating.

CAUTION: If the viscous fan drive is replaced because of mechanical damage, the cooling fan blades should also be inspected. Inspect for fatigue cracks, loose blades, or loose rivets that could have resulted from excessive vibration. Replace fan blade assembly if any of these conditions are found. Also inspect water pump bearing and shaft assembly for any related damage due to a viscous fan drive malfunction.

The thermal viscous fan drive is a silicone-fluid-filled coupling used to connect the fan blades to the water pump shaft. The coupling allows the fan to be driven in a normal manner. This is done at low engine speeds while limiting the top speed of the fan to a predetermined maximum level at higher engine speeds.

An electrical cooling fan located in the fan shroud aids in low speed cooling, It is designed to augment the viscous fan, However, it does not replace the viscous fan.

OPERATION

A thermostatic bimetallic spring coil is located on the front face of the viscous fan drive unit. This spring coil reacts to the temperature of the radiator discharge air. It engages the viscous fan drive for higher fan speed if the air temperature from the radiator rises above a certain point. Until additional engine cooling is necessary, **the fan will remain at a reduced rpm regardless of engine speed. Normally less than three hundred (300) rpm.**

Only when sufficient heat is present, will the viscous fan drive engage. This is when the air flowing through the radiator core causes a reaction to the bimetallic coil. It then increases fan speed to provide the necessary additional engine cooling.

Once the engine has cooled, the radiator discharge temperature will drop. The bimetallic coil again reacts and the fan speed is reduced to the previous disengaged speed.

DIAGNOSIS AND TESTING - VISCOUS FAN DRIVE

If the fan assembly free-wheels without drag (the fan blades will revolve more than five turns when spun by hand), replace the fan drive. This spin test must be performed when the engine is cool.

For the following test, the cooling system must be in good condition. It also will ensure against excessively high coolant temperature.

WARNING: BE SURE THAT THERE IS ADEQUATE FAN BLADE CLEARANCE BEFORE DRILLING.

1. Drill a 3.18-mm (1/8-in) diameter hole in the top center of the fan shroud.
2. Obtain a dial thermometer with an 8 inch stem (or equivalent). It should have a range of -18° - 105°C (0° - 220° F). Insert thermometer through the hole in the shroud. Be sure that there is adequate clearance from the fan blades.
3. Connect a tachometer and an engine ignition timing light (timing light is to be used as a strobe light).
4. Block the air flow through the radiator. Secure a sheet of plastic in front of the radiator (or air conditioner condenser). Use tape at the top to secure the plastic and be sure that the air flow is blocked.
5. Be sure that the air conditioner (if equipped) is turned off.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

6. Start the engine and operate at 2400 rpm. Within ten minutes the air temperature (indicated on the dial thermometer) should be up to 93° C (200° F). Fan drive **engagement** should have started to occur at between 91° - 96° C (195° - 205° F). Engagement is distinguishable by a definite **increase** in fan flow noise (roaring). The timing light also will indicate an increase in the speed of the fan.
7. When the air temperature reaches 93° C (200° F), remove the plastic sheet. Fan drive **disengagement** should have started to occur at between 62° - 85° C (145° - 185° F). A definite **decrease** of fan flow noise (roaring) should be noticed. If not, replace the defective viscous fan drive unit.

REMOVAL

4.7L ENGINE

NOTE: The thermal viscous fan drive/fan blade assembly is attached (threaded) to water pump hub shaft.

1. Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
2. Remove fan blade/viscous fan drive assembly from water pump using special tool 6958 spanner wrench and 8346 adapters, by turning mounting nut counterclockwise as viewed from front. Threads on viscous fan drive are **RIGHT HAND**.
3. Do not attempt to remove fan/viscous fan drive assembly from vehicle at this time.
4. Do not unbolt fan blade assembly from viscous fan drive at this time.
5. Remove fan shroud to radiator bolts.
6. Remove fan shroud and fan blade/viscous fan drive assembly as a complete unit from vehicle.
7. After removing fan blade/viscous fan drive assembly, **do not** place viscous fan drive in horizontal position. If stored horizontally, silicone fluid in the viscous fan drive could drain into its bearing assembly and contaminate lubricant.

CAUTION: Do not remove water pump pulley-to-water pump bolts. This pulley is under belt tension.

8. Remove four bolts securing fan blade assembly to viscous fan drive.

INSTALLATION

4.7L ENGINE

1. Assemble fan blade to viscous fan drive. Tighten mounting bolts to 27 N·m (20 ft. lbs.) torque.

NOTE: The viscous fan and fan shroud must be installed as an assembly.

2. Gently lay viscous fan into fan shroud.
3. Install the fan shroud to radiator mounting bolts, torque bolts to (5.5N·M or 50 in-lbs).
4. Thread the fan and fan drive onto the water pump pulley, and tighten nut using special tool 6958 spanner wrench and 8346 adapters.
5. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

CAUTION: When installing a serpentine accessory drive belt, the belt **MUST** be routed correctly. If not, the engine may overheat due to the water pump rotating in the wrong direction. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL) for correct belt routing.

RADIATOR

DESCRIPTION

All vehicles are equipped with a cross flow type radiator with plastic side tanks.

Plastic tanks, while stronger than brass, are subject to damage by impact, such as from tools or wrenches. Handle radiator with care.

REMOVAL

GAS ENGINES

WARNING: DO NOT REMOVE THE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN THE RADIATOR DRAINCOCK WITH THE SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR. REFER TO COOLING SYSTEM DRAINING.

Do not waste reusable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

WARNING: CONSTANT TENSION HOSE CLAMPS ARE USED ON MOST COOLING SYSTEM HOSES. WHEN REMOVING OR INSTALLING, USE ONLY TOOLS DESIGNED FOR SERVICING THIS TYPE OF CLAMP, SUCH AS SPECIAL TOOL 6094. ALWAYS WEAR SAFETY GLASSES WHEN SERVICING CONSTANT TENSION CLAMPS.

CAUTION: A number or letter is stamped into the tongue of constant tension clamps. If replacement is necessary, use only an original equipment clamp with matching number or letter.

CAUTION: When removing the radiator or A/C condenser for any reason, note the location of all radiator-to-body and radiator-to-A/C condenser rubber air seals. These are used at the top, bottom and sides of the radiator and A/C condenser. To prevent overheating, these seals must be installed to their original positions.

1. Disconnect the negative battery cable at battery.
2. Drain coolant from radiator (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Remove the front grill (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
4. Remove two radiator mounting bolts.
5. Disconnect both transmission cooler lines from radiator.
6. Disconnect electrical connector for the fan control solenoid.
7. Disconnect the power steering cooler line from cooler and filter.
8. Disconnect the radiator upper and lower hoses.
9. Disconnect the overflow hose from radiator.
10. Remove the air inlet duct at the grill.
11. The lower part of radiator is equipped with two alignment dowel pins. They are located on the bottom of radiator tank and fit into rubber grommets. These rubber grommets are pressed into the radiator lower crossmember.

WARNING: THE AIR CONDITIONING SYSTEM (IF EQUIPPED) IS UNDER A CONSTANT PRESSURE EVEN WITH THE ENGINE OFF. REFER TO REFRIGERANT WARNINGS IN, HEATING AND AIR CONDITIONING BEFORE HANDLING ANY AIR CONDITIONING COMPONENT.

NOTE: The radiator and radiator cooling fan can be removed as an assembly. It is not necessary to remove the cooling fan before removing or installing the radiator.

12. Disconnect the two high pressure fluid lines at the hydraulic fan drive.
13. Disconnect the low pressure return hose at the hydraulic fan drive.
14. Gently lift up and remove radiator from vehicle. Be careful not to scrape the radiator fins against any other component. Also be careful not to disturb the air conditioning condenser (if equipped).

808c05be

80c07222

CLEANING

Clean radiator fins With the engine cold, apply cold water and compressed air to the back (engine side) of the radiator to flush the radiator and/or A/C condenser of debris.

INSPECTION

The radiator cooling fins should be checked for damage or deterioration. Inspect cooling fins to make sure they are not bent or crushed, these areas result in reduced heat exchange causing the cooling system to operate at higher temperatures. Inspect the plastic end tanks for cracks, damage or leaks.

Inspect the radiator neck for damage or distortion.

INSTALLATION

GAS ENGINES

CAUTION: Before installing the radiator or A/C condenser, be sure the radiator-to-body and radiator-to-A/C condenser rubber air seals are properly fastened to their original positions. These are used at the top, bottom and sides of the radiator and A/C condenser. To prevent overheating, these seals must be installed to their original positions.

1. Equipped with air conditioning: Gently lower the radiator and fan shroud into the vehicle. Guide the two radiator alignment dowels through the holes in the rubber air seals first and then through the A/C support brackets. Continue to guide the alignment dowels into the rubber grommets located in lower radiator crossmember. The holes in the L-shaped brackets (located on bottom of A/C condenser) must be positioned between bottom of rubber air seals and top of rubber grommets.
2. Connect the radiator upper and lower hoses and hose clamps to radiator.

CAUTION: The tangs on the hose clamps must be positioned straight down.

3. Install coolant reserve/overflow tank hose at radiator.
4. Connect both transmission cooler lines at the radiator.
5. Install both radiator mounting bolts.
6. Install air inlet duct at grill.
7. Attach electric connector for hydraulic fan control solenoid.
8. Install the grill (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).
9. Connect the two high pressure lines to the hydraulic fan drive. Tighten 1/2 in. pressure line fitting to 49 N·m (36 ft. lbs.) and the 3/8 in. pressure line fitting to 29 N·m (21.5 ft. lbs.).
10. Connect the low pressure hose to the hydraulic fan drive. Position the spring clamp.
11. Connect the power steering filter hoses to the filter. Install new hose clamps.
12. Rotate the fan blades (by hand) and check for interference at fan shroud.
13. Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
14. Refill the power steering reservoir and bleed air from system (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).
15. Connect battery cable at battery.
16. Start and warm engine. Check for leaks.

MOTOR-RADIATOR FAN

DIAGNOSIS AND TESTING—ELECTRIC COOLING FAN

The powertrain control module (PCM) will enter a diagnostic trouble code (DTC) in memory if it detects a problem in the auxiliary cooling fan relay or circuit. (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION).

If the electric cooling fan is inoperative, check the 15A fuse in the junction block and the 40A fuse in the Power Distribution Center (PDC) with a 12 volt test lamp or DVOM. Refer to the inside of the PDC cover for the exact location of the fuse. If fuses are okay, refer to ELECTRICAL SCHEMATICS for the cooling fan and relay circuit schematic.

PUMP-WATER

DESCRIPTION

DESCRIPTION - WATER PUMP - 4.7L

A centrifugal water pump circulates coolant through the water jackets, passages, intake manifold, radiator core, cooling system hoses and heater core. The pump is driven from the engine crankshaft by a single serpentine drive belt.

The water pump impeller is pressed onto the rear of a shaft that rotates in bearings pressed into the housing. The housing has two small holes to allow seepage to escape. The water pump seals are lubricated by the antifreeze in the coolant mixture. No additional lubrication is necessary.

Both heater hoses are connected to fittings on the timing chain front cover. The water pump is also mounted directly to the timing chain cover and is equipped with a non serviceable integral pulley.

DESCRIPTION - WATER PUMP BYPASS

The 4.7L engine uses an internal water/coolant bypass system. The design uses galleries in the timing chain cover to circulate coolant during engine warm-up preventing the coolant from flowing through the radiator. The thermostat uses a stub shaft located at the rear of the thermostat to control flow through the bypass gallery.

OPERATION

OPERATION - WATER PUMP

A centrifugal water pump circulates coolant through the water jackets, passages, intake manifold, radiator core, cooling system hoses and heater core, this coolant absorbs the heat generated when the engine is running. The pump is driven by the engine crankshaft via a drive belt.

WATER PUMP BYPASS – 3.7L/4.7L ENGINE

When the thermostat is in the closed position the bypass gallery is not obstructed allowing 100% flow. When the thermostat is in the open position the pill partially covers the bypass hole, reducing the amount of bypass flow. This design allows the coolant to reach operating temperature quickly when cold, while adding extra cooling during normal temperature operation.

DIAGNOSIS AND TESTING - WATER PUMP

LOOSE IMPELLER - 3.7L/4.7L/5.7L ENGINES

NOTE: Due to the design of the 3.7/4.7L/5.7L engine water pumps, testing the pump for a loose impeller must be done by verifying coolant flow in the radiator. To accomplish this refer to the following procedure.

DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

1. Drain coolant until the first row of cores is visible in the radiator (Refer to 7 - COOLING - STANDARD PROCEDURE) 4.7L Engine or (Refer to 7 - COOLING - STANDARD PROCEDURE) 4.0L Engine.
2. Leaving the radiator cap off, start the engine. Run engine until thermostat opens.
3. While looking into the radiator through the radiator fill neck, raise engine rpm to 2000 RPM. Observe the flow of coolant from the first row of cores.
4. If there is no flow or very little flow visible, replace the water pump.

INSPECTING FOR INLET RESTRICTIONS

Inadequate heater performance may be caused by a metal casting restriction in the heater hose inlet.

DO NOT WASTE reusable coolant. If solution is clean, drain the coolant into a clean container for reuse.

WARNING: DO NOT LOOSEN THE RADIATOR DRAINCOCK WITH THE SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM THE COOLANT CAN OCCUR.

1. Drain sufficient coolant from the radiator to decrease the level below the heater hose inlet. On 4.7L engines this requires complete draining.
2. Remove the heater hose.
3. Inspect the inlet for metal casting flash or other restrictions.

REMOVAL

3.7L

The water pump on 3.7L engines is bolted directly to the engine timing chain case cover.

1. Disconnect negative battery cable from battery.
2. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

WARNING: CONSTANT TENSION HOSE CLAMPS ARE USED ON MOST COOLING SYSTEM HOSES. WHEN REMOVING OR INSTALLING, USE ONLY TOOLS DESIGNED FOR SERVICING THIS TYPE OF CLAMP, SUCH AS SPECIAL CLAMP TOOL (NUMBER 6094). SNAP-ON CLAMP TOOL (NUMBER HPC-20) MAY BE USED FOR LARGER CLAMPS. ALWAYS WEAR SAFETY GLASSES WHEN SERVICING CONSTANT TENSION CLAMPS.

CAUTION: A number or letter is stamped into the tongue of constant tension clamps. If replacement is necessary, use only an original equipment clamp with matching number or letter.

3. Remove two fan shroud-to-radiator screws, Disconnect the coolant overflow hose.
4. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
5. Remove lower radiator hose clamp and remove lower hose at water pump.
6. Remove seven water pump mounting bolts and one stud bolt.

CAUTION: Do not pry water pump at timing chain case/cover. The machined surfaces may be damaged resulting in leaks.

7. Remove water pump and gasket. Discard gasket.

4.7L

The water pump on 4.7L engines is bolted directly to the engine timing chain case/cover.

A gasket is used as a seal between the water pump and timing chain case/cover.

The water pump can be removed without discharging the air conditioning system (if equipped).

1. Disconnect negative battery cable from battery.
2. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE). Do not waste reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

WARNING: CONSTANT TENSION HOSE CLAMPS ARE USED ON MOST COOLING SYSTEM HOSES. WHEN REMOVING OR INSTALLING, USE ONLY TOOLS DESIGNED FOR SERVICING THIS TYPE OF CLAMP, SUCH AS TOOL 6094. ALWAYS WEAR SAFETY GLASSES WHEN SERVICING CONSTANT TENSION CLAMPS.

CAUTION: A number or letter is stamped into the tongue of constant tension clamps. If replacement is necessary, use only an original equipment clamp with matching number or letter.

3. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
4. Remove lower radiator hose clamp and remove lower hose at water pump.
5. Remove seven water pump mounting bolts and one stud bolt.

CAUTION: Do not pry water pump at timing chain case/cover. The machined surfaces may be damaged resulting in leaks.

6. Remove water pump and gasket. Discard gasket.

5.7L

1. Disconnect negative battery cable.
2. Drain coolant.
3. Remove serpentine belt.
4. Remove fan clutch assembly.
5. Remove coolant fill bottle.
6. Disconnect washer bottle wiring and hose.
7. Remove fan shroud assembly.
8. Remove A/C compressor and generator brace.
9. Remove idler pulleys.
10. Remove belt tensioner assembly.
11. Remove upper and lower radiator hoses.
12. Remove heater hoses.
13. Remove water pump mounting bolts and remove pump.

**3.0L DIESEL**

WARNING: RISK OF INJURY TO SKIN AND EYES FROM SCALDING WITH HOT COOLANT. RISK OF POISONING FROM SWALLOWING COOLANT. DO NOT OPEN COOLING SYSTEM UNLESS COOLANT TEMPERATURE IS BELOW 90°C (194°F). OPEN CAP SLOWLY TO RELEASE PRESSURE. STORE COOLANT IN SUITABLE AND APPROPRIATELY MARKED CONTAINER. WEAR PROTECTIVE GLOVES, CLOTHES AND EYE WEAR.

1. Disconnect negative battery cable.

2. Remove engine cover (Refer to 9 - ENGINE - REMOVAL).
3. Drain engine coolant (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
4. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
5. Disconnect coolant hoses at water pump.
6. Remove idler pulley.
7. Remove water pump and clean sealing surfaces.

CLEANING

Clean the gasket mating surface. Use caution not to damage the gasket sealing surface.

INSPECTION

Inspect the water pump assembly for cracks in the housing, Water leaks from shaft seal, Loose or rough turning bearing or Impeller rubbing either the pump body or timing chain case/cover.

INSTALLATION

3.7L ENGINE

The water pump on 3.7L engines is bolted directly to the engine timing chain case cover.

1. Clean gasket mating surfaces.
2. Using a new gasket, position water pump and install mounting bolts. Tighten water pump mounting bolts to 54 N·m (40 ft. lbs.) torque.
3. Spin water pump to be sure that pump impeller does not rub against timing chain case/cover.

4. Connect radiator lower hose to water pump.
5. Relax tension from belt tensioner. Install drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

CAUTION: When installing the serpentine accessory drive belt, belt must be routed correctly. If not, engine may overheat due to water pump rotating in wrong direction. Refer to for correct belt routing. Or, refer to the Belt Routing Label located in the engine compartment. The correct belt with correct length must be used.

6. Be sure the upper and lower portions of the fan shroud are firmly connected. All air must flow through the radiator.
7. Install two fan shroud-to-radiator screws.
8. Be sure of at least 25 mm (1.0 inches) between tips of fan blades and fan shroud.
9. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
10. Connect negative battery cable.
11. Start and warm the engine. Check for leaks.

4.7L

1. Clean gasket mating surfaces.
2. Using a new gasket, position water pump and install mounting bolts as shown.. Tighten water pump mounting bolts to 58 N-m (43 ft. lbs.) torque.
3. Spin water pump to be sure that pump impeller does not rub against timing chain case/cover.
4. Connect radiator lower hose to water pump.
5. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

CAUTION: When installing the serpentine accessory drive belt, belt must be routed correctly. If not, engine may overheat due to water pump rotating in wrong direction.

6. Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
7. Connect negative battery cable.
8. Start and warm the engine. Check for leaks.

5.7L

1. Install water pump and mounting bolts. Tighten mounting bolts to 24 N·m (18 ft. lbs.).
2. Install heater hoses.
3. Install upper and lower radiator hoses.
4. Install belt tensioner assembly.
5. Install idler pulleys.
6. Install A/C compressor and alternator brace. Tighten bolt and nuts to 28 N·m (21 ft. lbs.).
7. Install fan shroud assembly.
8. Connect washer bottle wiring and hose.
9. Install coolant fill bottle.
10. Install fan clutch assembly.
11. Install serpentine belt.
12. Connect negative battery cable.
13. Fill coolant.
14. Pressure test coolant system

**3.0L DIESEL**

1. Clean all sealing surfaces.
2. Position and install waterpump. Tighten M6 bolts to 14N·m (124 lbs. in.) and M8 bolts to 20N·m (177 lbs. in.).
3. Install idler pulley. Tighten bolt to 35N·m (26 lbs. ft.).
4. Install coolant hoses.
5. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

6. Close coolant drain.
7. Install engine cover (Refer to 9 - ENGINE - INSTALLATION).
8. Connect negative battery cable.
9. Fill coolant system to proper level with the appropriate coolant mixture (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).

WARNING: USE EXTREME CAUTION WHEN ENGINE IS OPERATING. DO NOT PUT YOUR HANDS NEAR PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHES.

10. Start engine and inspect for leaks.

CAP-RADIATOR PRESSURE

DESCRIPTION

All radiators are equipped with a pressure cap. This cap releases pressure at some point within a range of 110 - 138 kPa (16 - 20 psi). The pressure relief point (in pounds) is engraved on top of the cap

The cooling system will operate at pressures slightly above atmospheric pressure. This results in a higher coolant boiling point allowing increased radiator cooling capacity. The cap contains a spring-loaded pressure relief valve. This valve opens when system pressure reaches the release range of 110 - 138 kPa (16 - 20 psi).

A rubber gasket seals the radiator filler neck. This is done to maintain vacuum during coolant cool-down and to prevent leakage when system is under pressure.

OPERATION

A vent valve in the center of the cap will remain shut as long as the cooling system is pressurized. As the coolant cools, it contracts and creates a vacuum in cooling system. This causes the vacuum valve to open and coolant in reserve/overflow tank to be drawn through connecting hose into radiator. If the vacuum valve is stuck shut, or overflow hose is kinked, radiator hoses will collapse on cool-down.

DIAGNOSIS AND TESTING - RADIATOR PRESSURE CAP

Remove cap from radiator. Be sure that sealing surfaces are clean. Moisten rubber gasket with water and install the cap on pressure tester (tool 7700 or an equivalent).

Operate the tester pump and observe the gauge pointer at its highest point. The cap release pressure should be 110 to 138 kPa (16 - 20 psi). The cap is satisfactory when the pressure holds steady. It is also good if it holds pressure within the 110 - 138 kPa (16 - 20 psi) range for 30 seconds or more. If the pointer drops quickly, replace the cap.

CAUTION: Radiator pressure testing tools are very sensitive to small air leaks, which will not cause cooling system problems. A pressure cap that does not have a history of coolant loss should not be replaced just because it leaks slowly when tested with this tool. Add water to tool. Turn tool upside down and recheck pressure cap to confirm that cap needs replacement.

J9507-3

CLEANING

Clean the radiator pressure cap using a mild soap and water only.

INSPECTION

Visually inspect the pressure valve gasket on the cap. Replace cap if the gasket is swollen, torn or worn. Inspect the area around radiator filler neck for white deposits that indicate a leaking cap.

TRANSMISSION

TABLE OF CONTENTS

COOLER-TRANSMISSION		REMOVAL	69
DESCRIPTION	67	INSTALLATION	69
STANDARD PROCEDURE			
TRANSMISSION COOLER LINE QUICK			
CONNECT FITTING DISASSEMBLY/ ASSEMBLY	68		

COOLER-TRANSMISSION

DESCRIPTION

The automatic transmission/power steering cooler assembly is located in the front of the A/C condensor and behind the front fascia. The transmission cooler is a heat exchanger that allows heat in the transmission fluid to be transferred to the air passing over the cooler fins.

The transmission oil/power steering cooler assembly is equipped with quick connect fitting for the transmission oil and power steering lines.

The transmission oil/power steering cooler is serviced as an assembly.

STANDARD PROCEDURE**TRANSMISSION COOLER LINE QUICK CONNECT FITTING DISASSEMBLY/
ASSEMBLY****DISCONNECT**

1. Remove dust cap by pulling it straight back off of quick connect fitting.
2. Place disconnect tool Special Tool 8875A onto transmission cooler line with the fingers of the tool facing the quick connect fitting.
3. Slide disconnect tool down the transmission line and engage the fingers of the tool into the retaining clip. When properly engaged in the clip, the tool will fit flush against the quick connect fitting.
4. Rotate the disconnect tool 60° to expand the retaining clip.
5. While holding the disconnect tool against the quick connect fitting, pull back on the transmission cooler line to remove.

CONNECT

1. Align transmission cooler line with quick connect fitting while pushing straight into the fitting.
2. Push in on transmission cooler line until a "click" is heard or felt.
3. Slide dust cap down the transmission cooler line and snap it over the quick connect fitting until it is fully seated and rotates freely. Dust cap will only snap over quick connect fitting when the transmission cooler line is properly installed.

NOTE: If dust cap will not snap into place, repeat assembly step 2.

REMOVAL

1. Remove grill (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
2. Using Tool 8875A, disconnect transmission cooler tubes and power steering lines from the transmission oil/power steering cooler (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE).
3. Remove the transmission cooler mounting bolts.
4. Remove transmission cooler from vehicle.

INSTALLATION

1. Position transmission oil/power steering cooler in vehicle.
2. Install transmission mounting bolts. Tighten to 14 N·m (123 in. lbs.)
3. Install transmission and power steering lines into cooler (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE).
4. Install grill (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).

AUDIO/VIDEO SYSTEMS - ELECTRICAL DIAGNOSIS

DIAGNOSIS AND TESTING

B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW

B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to **Section 8W**.

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is LOW for more than 3 seconds.

Possible Causes

SPEAKER

(X55) (X53) LEFT FRONT SPEAKER OUTPUT CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all Audio DTC's.

Turn the Radio on.

With the Scan Tool, read the DTC information.

Does the Scan Tool read: B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST VER 1.

2. (X53) (X55) SPEAKER OUTPUT CIRCUITS.

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Front Left Audio Speaker connector.

Measure the resistance between ground and each speaker (X53)(+) and (X55)(-) circuit.

Is the resistance below 1000.0 ohms for each circuit?

Yes >> Repair the applicable Speaker (+) or (-) Output circuit for a short to ground condition.

No >> Go To 3

B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

3. SPEAKER

Turn the ignition off.

Disconnect the Front Left Audio Speaker.

Turn the ignition on.

Turn the Radio on.

With the Scan Tool, clear all Audio DTC's.

With the Scan Tool, read the DTC information.

Does the Scan Tool read: B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Replace the Speaker in accordance with the service information.
Perform the BODY VERIFICATION TEST VER 1.

No >> Test Complete.

B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to **Section 8W**.

- **When Monitored:**
- **Set Condition:**

Possible Causes
SPEAKER (X53) SPEAKER OUTPUT CIRCUIT (+) (X55) SPEAKER OUTPUT CIRCUIT (-)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Radio DTCs.

Does the scan tool display active: B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Perform BODY VERIFICATION TEST VER-1.

B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**2. CHECK FOR VOLTAGE ON THE (X53) SPEAKER (+) CIRCUIT**

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Left Front Speaker harness connector.

Measure for voltage on the (X53) Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes >> Repair the (X53) Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

3. CHECK FOR VOLTAGE ON THE (X55) SPEAKER (-) CIRCUIT

Measure for voltage on the (X55) Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes >> Repair the (X55) Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Radio in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is open for more than 3 seconds. The Radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes
SPEAKER (X55) (X53) LEFT FRONT SPEAKER OUTPUT CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all Audio DTC's.

Turn the Radio on.

With the Scan Tool, read the DTC information.

Does the Scan Tool read: B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST VER 1.

2. (X55) (X53) SPEAKER OUTPUT CIRCUITS.

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Front Left Audio Speaker connector.

Measure the resistance of each speaker (X53)(+) and (X55)(-) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes >> Go To 3

No >> Repair the applicable Output Speaker circuit for an open condition.

Perform the BODY VERIFICATION TEST VER 1.

B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

3. SPEAKER

Turn the ignition off.

Disconnect the Front Left Audio Speaker.

Turn the ignition on.

Turn the Radio on.

With the Scan Tool, clear all Audio DTC's.

With the Scan Tool, read the DTC information.

Does the Scan Tool read: B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Replace the Speaker in accordance with the service information.
Perform the BODY VERIFICATION TEST VER 1.

No >> Test Complete.

B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW

B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is LOW for more than 3 seconds.

Possible Causes
SPEAKER (X56) (X54) RIGHT FRONT SPEAKER OUTPUT CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.

With the Scan Tool, clear all Audio DTC's.

Turn the Radio on.

With the Scan Tool, read the DTC information.

Does the Scan Tool read: B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST VER 1.

2. (X54) (X56) SPEAKER OUTPUT CIRCUITS.

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Front Right Audio Speaker connector.

Measure the resistance between ground and each speaker (X54)(+) and (X56)(-) circuit.

Is the resistance below 1000.0 ohms for each circuit?

Yes >> Repair the applicable Speaker (+) or (-) Output circuit for a short to ground condition.

No >> Go To 3

B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

3. SPEAKER

Turn the ignition off.

Disconnect the Front Right Audio Speaker.

Turn the ignition on.

Turn the Radio on.

With the Scan Tool, clear all Audio DTC's.

With the Scan Tool, read the DTC information.

Does the Scan Tool read: B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Replace the Speaker in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1.

No >> Test Complete.

B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
- **Set Condition:**

Possible Causes
SPEAKER (X54) SPEAKER OUTPUT CIRCUIT (+) (X56) SPEAKER OUTPUT CIRCUIT (-)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Radio DTCs.

Does the scan tool display active: B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Perform BODY VERIFICATION TEST VER-1.

B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**2. CHECK FOR VOLTAGE ON THE (X54) SPEAKER (+) CIRCUIT**

Turn the ignition off.

Disconnect the Radio C1 harness connector.

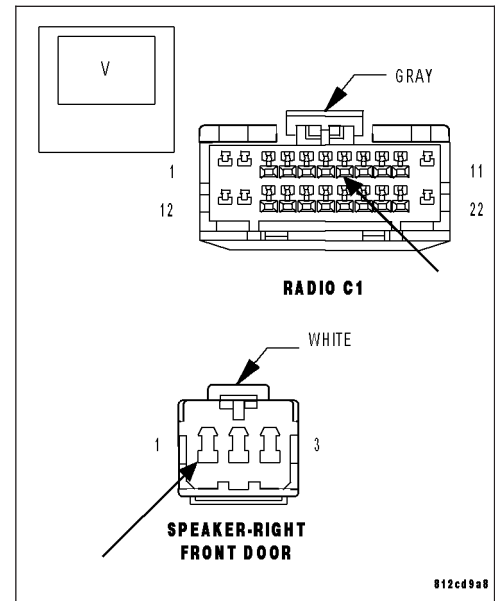

Disconnect the Right Rear Speaker harness connector.

Measure for voltage on the (X52) Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes >> Repair the (X52) Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

**3. CHECK FOR VOLTAGE ON THE (X56) SPEAKER (-) CIRCUIT**

Measure for voltage on the (X58) Speaker (-) circuit.

Is the voltage above 10.0 volts?

Yes >> Repair the (X58) Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Radio in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to **Section 8W**.

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is open for more than 3 seconds. The Radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes
SPEAKER (X56) (X54) RIGHT FRONT SPEAKER OUTPUT CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test**1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all Audio DTC's.

Turn the Radio on.

With the Scan Tool, read the DTC information.

Does the Scan Tool read: B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST VER 1.

**2. (X56) (X54) Speaker Output circuits.**

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Front Right Audio Speaker connector.

Measure the resistance of each speaker (X54)(+) and (X56)(-) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes >> Go To 3

No >> Repair the applicable Output Speaker circuit for an open condition.

Perform the BODY VERIFICATION TEST VER 1.

B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

3. Speaker

Turn the ignition off.

Disconnect the Front Right Audio Speaker.

Turn the ignition on.

Turn the Radio on.

With the Scan Tool, clear all Audio DTC's.

With the Scan Tool, read the DTC information.

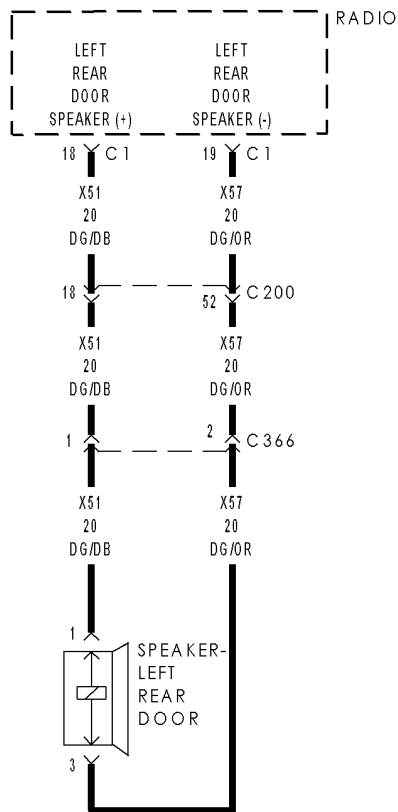

Does the Scan Tool read: B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Replace the Speaker in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1.

No >> Test Complete.

B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW

B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is LOW for more than 3 seconds.

Possible Causes
SPEAKER (X57) (X51) LEFT REAR SPEAKER OUTPUT CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.
 With the Scan Tool, clear all Audio DTC's.
 Turn the Radio on.
 With the Scan Tool, read the DTC information.

Does the Scan Tool read: B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

- Yes** >> Go To 2
- No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
 Perform the BODY VERIFICATION TEST VER 1.

2. (X51) (X57) SPEAKER OUTPUT CIRCUITS.

Turn the ignition off.
 Disconnect the Radio C1 harness connector.
 Disconnect the Rear Left Audio Speaker connector.
 Measure the resistance between ground and each speaker (X51)(+) and (X57)(-) circuit.

Is the resistance below 1000.0 ohms for each circuit?

- Yes** >> Repair the applicable Speaker (+) or (-) Output circuit for a short to ground condition.
- No** >> Go To 3

B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

3. SPEAKER

Turn the ignition off.

Disconnect the Rear Left Audio Speaker.

Turn the ignition on.

Turn the Radio on.

With the Scan Tool, clear all Audio DTC's.

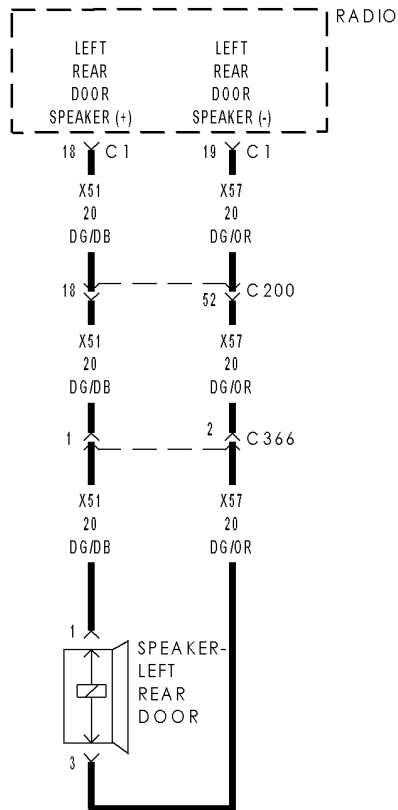

With the Scan Tool, read the DTC information.

Does the Scan Tool read: B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Replace the Speaker in accordance with the service information.
Perform the BODY VERIFICATION TEST VER 1.

No >> Test Complete.

B140A-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

B140A-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
SPEAKER (X51) SPEAKER OUTPUT CIRCUIT (+) (X57) SPEAKER OUTPUT CIRCUIT (-)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test**1. INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Radio DTCs.

Does the scan tool display active: B140A-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

B140A-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

2. CHECK FOR VOLTAGE ON THE (X51) SPEAKER (+) CIRCUIT

Turn the ignition off.

Disconnect the Radio C1 harness connector.

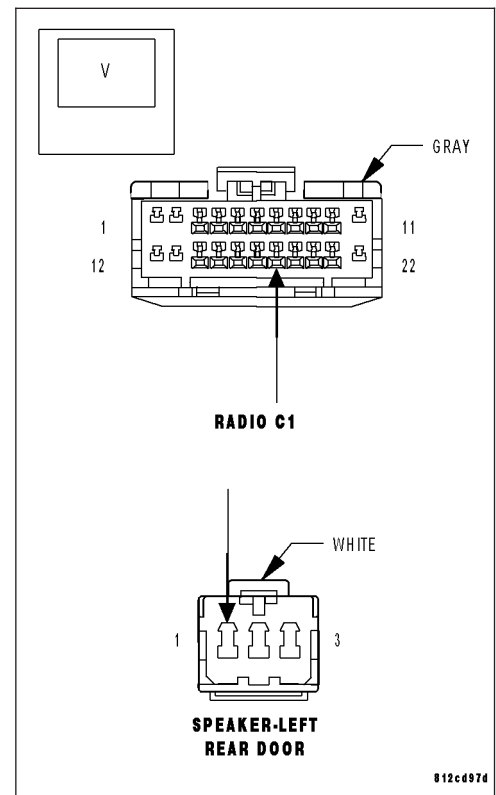

Disconnect the Left Rear Speaker harness connector.

Measure for voltage on the (X51) Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes >> Repair the (X51) Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

B140A-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**3. CHECK FOR VOLTAGE ON THE (X57) SPEAKER (-) CIRCUIT**

Measure for voltage on the (X57) Speaker (-) circuit.

Is the voltage above 10.0 volts?

- Yes** >> Repair the (X57) Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Replace the Radio in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is open for more than 3 seconds. The Radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes
SPEAKER (X57) (X51) LEFT REAR SPEAKER OUTPUT CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. Intermittent Condition

Turn the ignition on.

With the Scan Tool, clear all Audio DTC's.

Turn the Radio on.

With the Scan Tool, read the DTC information.

Does the Scan Tool read: B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST VER 1.

2. (X57) (X51) Speaker Output circuits.

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Rear Left Audio Speaker connector.

Measure the resistance of each speaker (X51)(+) and (X57)(-) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes >> Go To 3

No >> Repair the applicable Output Speaker circuit for an open condition.

Perform the BODY VERIFICATION TEST VER 1.

B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

3. Speaker

Turn the ignition off.

Disconnect the Rear Left Audio Speaker.

Turn the ignition on.

Turn the Radio on.

With the Scan Tool, clear all Audio DTC's.

With the Scan Tool, read the DTC information.

Does the Scan Tool read: B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Replace the Speaker in accordance with the service information.
Perform the BODY VERIFICATION TEST VER 1.

No >> Test Complete.

B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW

B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is LOW for more than 3 seconds.

Possible Causes
SPEAKER (X58) (X52) RIGHT REAR SPEAKER OUTPUT CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. Intermittent Condition

Turn the ignition on.
 With the Scan Tool, clear all Audio DTC's.
 Turn the Radio on.
 With the Scan Tool, read the DTC information.

Does the Scan Tool read: B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

- Yes** >> Go To 2
- No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
 Perform the BODY VERIFICATION TEST VER 1.

2. (X58) (X52) Speaker Output circuits.

Turn the ignition off.
 Disconnect the Radio C1 harness connector.
 Disconnect the Rear Right Audio Speaker connector.
 Measure the resistance between ground and each speaker (X58)(+) and (X52)(-) circuit.

Is the resistance below 1000.0 ohms for each circuit?

- Yes** >> Repair the applicable Speaker (+) or (-) Output circuit for a short to ground condition.
- No** >> Go To 3

B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

3. Speaker

Turn the ignition off.

Disconnect the Rear Right Audio Speaker.

Turn the ignition on.

Turn the Radio on.

With the Scan Tool, clear all Audio DTC's.

With the Scan Tool, read the DTC information.

Does the Scan Tool read: B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Replace the Speaker in accordance with the service information.
Perform the BODY VERIFICATION TEST VER 1.

No >> Test Complete.

B140E-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

B140E-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
SPEAKER (X52) SPEAKER OUTPUT CIRCUIT (+) (X58) SPEAKER OUTPUT CIRCUIT (-)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test**1. INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Radio DTCs.

Does the scan tool display active: B140E-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

B140E-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

2. CHECK FOR VOLTAGE ON THE (X52) SPEAKER (+) CIRCUIT

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Right Rear Speaker harness connector.

Measure for voltage on the (X52) Speaker (+) circuit.

Is the voltage above 10.0 volts?

Yes >> Repair the (X52) Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

B140E-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**3. CHECK FOR VOLTAGE ON THE (X58) SPEAKER (-) CIRCUIT**

Measure for voltage on the (X58) Speaker (-) circuit.

Is the voltage above 10.0 volts?

- Yes** >> Repair the (X58) Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Replace the Radio in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to **Section 8W**.

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is open for more than 3 seconds. The Radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes
SPEAKER (X58) (X52) RIGHT REAR SPEAKER OUTPUT CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test**1. Intermittent Condition**

Turn the ignition on.

With the Scan Tool, clear all Audio DTC's.

Turn the Radio on.

With the Scan Tool, read the DTC information.

Does the Scan Tool read: B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST VER 1.

**2. (X58) (X52) Speaker Output circuits.**

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Rear Right Audio Speaker connector.

Measure the resistance of each speaker (X58)(+) and (X52)(-) circuit between the Radio and the Speaker.

Is the resistance below 5.0 ohms for each circuit?

Yes >> Go To 3

No >> Repair the applicable Output Speaker circuit for an open condition.

Perform the BODY VERIFICATION TEST VER 1.

B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

3. Speaker

Turn the ignition off.

Disconnect the Rear Right Audio Speaker.

Turn the ignition on.

Turn the Radio on.

With the Scan Tool, clear all Audio DTC's.

With the Scan Tool, read the DTC information.

Does the Scan Tool read: B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Replace the Speaker in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1.

No >> Test Complete.

B142A-RADIO UNIT HIGH TEMPERATURE

For the Audio System circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- When Monitored:
- Continuously with the ignition and Radio on.
- Set Condition:
- The code will set if the temperature inside the radio is above +65°C (+145°F)

Possible Causes
HIGH TEMPERATURE FAILURE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. VERIFY THAT DTC B142A—RADIO UNIT HIGH TEMPERATURE IS ACTIVE.

With the Scan Tool, erase the Audio DTC's.

Start the engine and allow the engine to reach normal operating temperature.

If the vehicle has been in the hot sunlight or extreme cold, move the vehicle indoors and open the doors to allow the inside temperature to stabilize.

The Radio should operate between —23°C and 65°C (—10°F and +145°F).

With the Scan Tool, read the DTC's.

Does the Scan Tool display, B142A— Radio Unit High Temperature?

- Yes** >> Replace the Radio in accordance with the service information.
Perform the BODY VERIFICATION TEST — VER 1.
- No** >> Test Complete.

B142D-AUDIO ANTENNA NOT CONNECTED

For the Audio System circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
- With the ignition on and the radio in seek mode.
- **Set Condition:**
- With the radio in seek mode for two loops around the band. The radio does not detect an antenna connection or does not receive a radio station signal.

Possible Causes
BAD ANTENNA CONNECTION RADIO

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. Test Antenna

Turn the ignition off.
Disconnect the Radio Antenna connector.
Inspect the Radio Antenna connection.

Was the Antenna connection clean and secure?

- Yes** >> Go To 2
- No** >> Repair the Antenna connection as needed.
Perform the BODY VERIFICATION TEST — VER1.

2. ANTENNA

Refer to the Audio System in the service information and test the antenna in accordance with the service procedure.

Is the Antenna ok?

- Yes** >> Go To 3
- No** >> Repair or replace the Antenna assembly as necessary.
Perform the BODY VERIFICATION TEST — VER1.

B142D-AUDIO ANTENNA NOT CONNECTED (CONTINUED)

3. RADIO

NOTE: Reconnect all previously disconnected components.

NOTE: Move vehicle outside approximately 30ft from any structure.

Turn the ignition and radio on.

With the Scan Tool, erase the audio DTC's, put the radio in seek up and down mode for 2 loops around the band cycle before proceeding.

With the Scan Tool, read the audio DTC's.

Did this DTC reset?

Yes >> Replace the radio in accordance with the service information.
Perform the BODY VERIFICATION TEST-VER1.

No >> Test Complete.

B142F-SATELLITE RADIO ANTENNA NOT CONNECTED

For the Audio System circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on and the Satellite Radio in seek mode.
- **Set Condition:**
- With the radio in seek mode for two loops around the band. The radio does not detect an antenna connection or does not receive a radio satellite signal.

Possible Causes
BAD ANTENNA CONNECTION
SATELLITE RADIO RECEIVER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. Test Antenna

Turn the ignition off.

Disconnect the Satellite Radio Antenna connector.

Inspect the Satellite Radio Antenna connection.

Was the Antenna connection clean and secure?

Yes >> Go To 2

No >> Repair the Antenna connection as needed.
Perform the BODY VERIFICATION TEST — VER1.

2. SATELLITE RADIO ANTENNA

Refer to the Audio System in the service information and test the antenna in accordance with the service procedure.

Is the Antenna ok?

Yes >> Go To 3

No >> Repair or replace the Antenna assembly as necessary.
Perform the BODY VERIFICATION TEST — VER1.

B142F-SATELLITE RADIO ANTENNA NOT CONNECTED (CONTINUED)

3. SATELLITE RADIO RECEIVER

NOTE: Reconnect all previously disconnected components.

NOTE: Move vehicle outside approximately 30ft from any structure.

Turn the ignition and radio on.

With the Scan Tool, erase the audio DTC's, put the satellite radio in seek up and down mode for 2 loops around the band cycle before proceeding.

With the Scan Tool, read the audio DTC's.

Did this DTC reset?

Yes >> Replace the Satellite Radio Receiver in accordance with the service information.
Perform the BODY VERIFICATION TEST-VER1.

No >> Test Complete.

B221E-RADIO INTERNAL

For the Audio System circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- When Monitored:
- Continuously with the ignition on and radio turned on.
- Set Condition:
- The code will set if the radio detects a radio internal failure.

Possible Causes
RADIO INTERNAL FAILURE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. Verify DTC B221E-RADIO INTERNAL IS ACTIVE

NOTE: If a DTC is set, erase the DTC and attempt to reset the DTC. If the DTC resets, follow test.

This is an internal radio failure

View repair

Does the DTC reset and read B221E-Radio Internal?

Repair

Replace the Radio in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.

B2222-SATELLITE RADIO RECEIVER INTERNAL

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Satellite Radio Receiver detects a software checksum test failure.

Possible Causes
SATELLITE RADIO RECEIVER

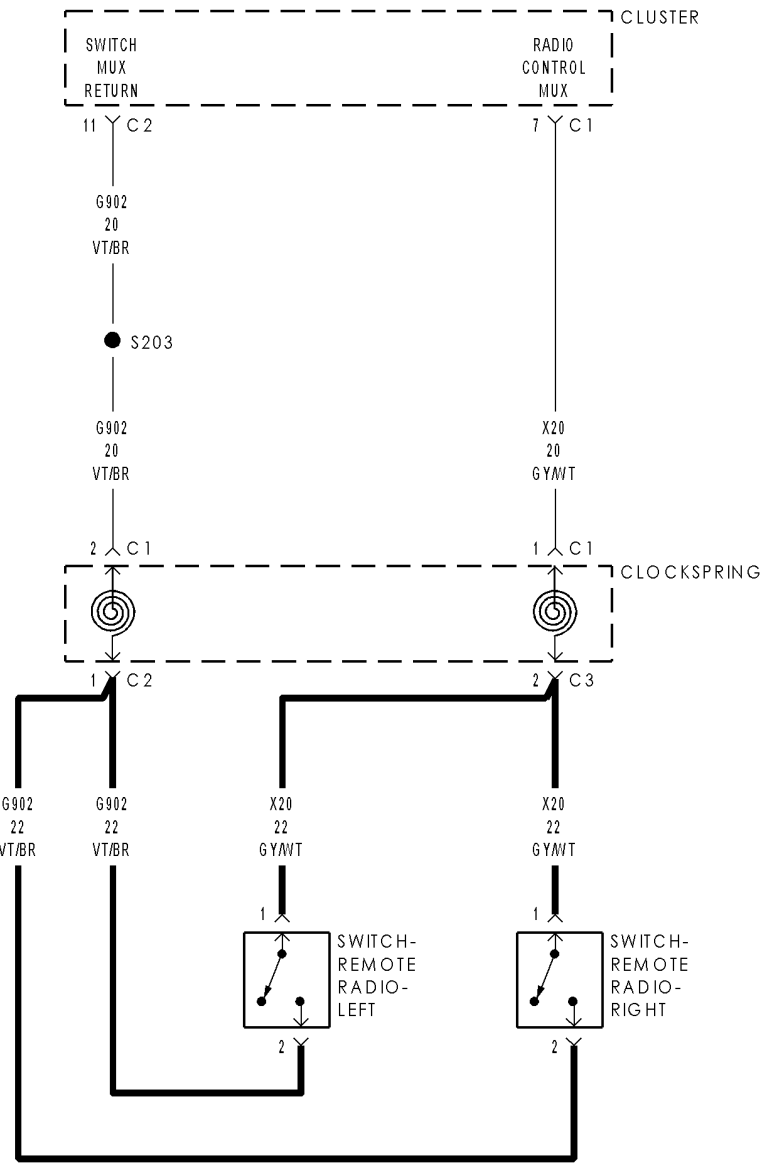

Diagnostic Test**1. REPLACE THE SATELLITE RADIO RECEIVER**

When this code is set, the Satellite Radio must be replaced.

Repair

Replace the Satellite Radio Receiver in accordance with the Service Information.
Perform the BODY VERIFICATION TEST-VER 1.

B1428-REMOTE RADIO SWITCH INPUT CIRCUIT STUCK

B1428-REMOTE RADIO SWITCH INPUT CIRCUIT STUCK (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition in any position except off.
- **Set Condition:**
The Instrument Cluster detects a stuck switch state on the (X20) Radio Control MUX circuit for more than 30 seconds.

Possible Causes
(X20) REMOTE CONTROL MUX CIRCUIT SHORT TO GROUND (X20) REMOTE CONTROL MUX CIRCUIT SHORT TO (G902) SWITCH MUX RETURN CIRCUIT LEFT REMOTE RADIO SWITCH RIGHT REMOTE RADIO SWITCH CLOCKSRING INSTRUMENT CLUSTER (CCN)

Diagnostic Test**1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. LEFT REMOTE RADIO SWITCH

Turn the ignition off.

Disconnect the Left Remote Radio Switch harness connector.

Turn the ignition on.

With the scan tool monitor the Remote Radio Control Switch voltage.

Is the voltage approximately 5.0 volts?

Yes >> Replace the Left Remote Radio Switch in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 3

B1428-REMOTE RADIO SWITCH INPUT CIRCUIT STUCK (CONTINUED)

3. RIGHT REMOTE RADIO SWITCH

Turn the ignition off.
 Disconnect the Right Remote Radio Switch harness connector.
 Turn the ignition on.
 With the scan tool monitor the Remote Radio Control Switch voltage.

Is the voltage approximately 5.0 volts?

Yes >> Replace the Right Remote Radio Switch in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 4

4. CLOCKSPRING

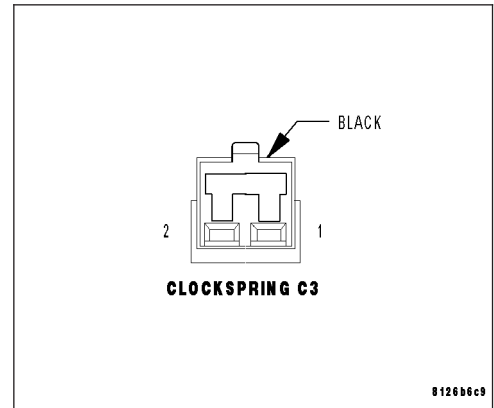

Turn the ignition off.
 Disconnect the Clockspring C1 harness connector.
 Turn the ignition on.
 With the scan tool monitor the Remote Radio Control Switch voltage.

Is the voltage approximately 5.0 volts?

Yes >> Check the (X20) Radio Control MUX circuit for a short between the clockspring and the remote radio switches. If ok, replace the Clockspring in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1.

No >> Go To 5

B1428-REMOTE RADIO SWITCH INPUT CIRCUIT STUCK (CONTINUED)**5. (X20) RADIO CONTROL MUX CIRCUIT SHORT TO GROUND**

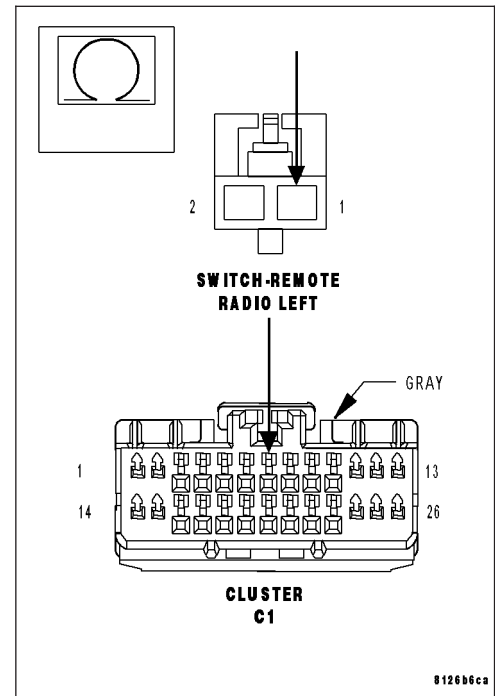

Turn the ignition off.

Disconnect the Instrument Cluster C1 harness connector.

Measure the resistance between ground and the (X20) Radio Control MUX circuit.

Is the resistance below 100.0 ohms?

- Yes** >> Repair the (X20) Radio Control MUX circuit for a short to ground.
Perform BODY VERIFICATION TEST – VER 1.
- No** >> Go To 6

**6. (X20) RADIO CONTROL MUX CIRCUIT SHORT TO (G902) SWITCH MUX RETURN CIRCUIT**

Disconnect the Instrument Cluster C2 harness connector.

Measure the resistance between the (X20) Radio Control MUX circuit and the (G902) Switch MUX Return circuit.

Is the resistance below 100.0 ohms?

- Yes** >> Repair the (X20) Radio Control MUX circuit for a short to the (G902) Switch MUX Return circuit.
Perform BODY VERIFICATION TEST – VER 1.
- No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Instrument Cluster (CCN) in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1.

B1429-RADIO DISPLAY HIGH TEMPERATURE

For the Audio System circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- When Monitored:
- Continuously with the ignition and Navigation Radio on.
- Set Condition:
- The code will set if the temperature inside the display exceeds 158°F

Possible Causes
HIGH TEMPERATURE FAILURE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. VERIFY THAT DTC B1429—RADIO DISPLAY HIGH TEMPERATURE IS ACTIVE.

With the Scan Tool, erase the Audio DTC's.

Start the engine and allow the engine to reach normal operating temperature.

If the vehicle has been in the hot sunlight or extreme cold, move the vehicle indoors and open the doors to allow the inside temperature to stabilize.

The radio display should operate to 158°F.

With the Scan Tool, read the DTC's.

Does the Scan Tool display, B1429— Radio Display High Temperature?

Yes >> Replace the Radio in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.

No >> Test Complete.

B142E-GPS ANTENNA NOT CONNECTED

For the Audio System circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on and the radio in navigation mode.
- **Set Condition:**
- With the radio does not detect GPS antenna connection.

Possible Causes
BAD ANTENNA CONNECTION RADIO

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test**1. TEST ANTENNA**

Turn the ignition off.

Disconnect the GPS Antenna connector.

Inspect the GPS Antenna connection.

Was the Antenna connection clean and secure?

Yes >> Go To 2

No >> Repair the Antenna connection as needed.
Perform the BODY VERIFICATION TEST — VER1.

**2. ANTENNA**

Refer to the Audio System in the service information and test the antenna in accordance with the service procedure.

Is the Antenna ok?

Yes >> Go To 3

No >> Repair or replace the Antenna assembly as necessary.
Perform the BODY VERIFICATION TEST — VER1.

B142E-GPS ANTENNA NOT CONNECTED (CONTINUED)

3. RADIO

NOTE: Reconnect all previously disconnected components.

NOTE: Move vehicle outside approximately 30ft from any structure.

Turn the ignition and radio on.

With the Scan Tool, erase the audio DTC's and operate the navigation system.

With the Scan Tool, read the audio DTC's.

Did this DTC reset?

Yes >> Replace the radio in accordance with the service information.
Perform the BODY VERIFICATION TEST-VER1.

No >> Test Complete.

B1421-AUDIO CD READ ERROR/INOPERABLE DISC

For the Audio System circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- Continuously with the ignition on and the radio CD player turned on.
- **Set Condition:**
- The code will set if a CD that is not formatted as a music CD is installed in the radio CD player.

Possible Causes
CD READ FAILURE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test**1. RADIO**

Replace the problem CD with a good, clean, unscratched, music CD.

Turn the radio CD player on.

With the Scan Tool, read DTC's.

Does the Scan Tool display: B1421 Audio CD Read Error/Inoperable Disc?

Yes >> Eject the inoperative CD and replace the CD in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.

No >> Test Complete.

B1422-AUDIO DVD READ ERROR/INOPERABLE DISC

For the Audio System circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- Continuously with the ignition on and the DVD player turned on.
- **Set Condition:**
- The code will set if a DVD that is not formatted as a DVD is installed in the DVD player.

Possible Causes
DVD READ FAILURE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. DVD PLAYER

Replace the problem DVD with a good, clean, unscratched DVD.

Turn the DVD player on.

With the Scan Tool, read DTC's.

Does the Scan Tool display: B1422 Audio DVD Read Error/Inoperable Disc?

- Yes** >> Eject the inoperative DVD and replace the DVD in accordance with the service information.
Perform the BODY VERIFICATION TEST — VER 1.
- No** >> Test Complete.

B221F-AMPLIFIER INTERNAL

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Amplifier detects a software checksum test failure.

Possible Causes
AMPLIFIER

Diagnostic Test**1. REPLACE THE AMPLIFIER**

When this code is set, the Amplifier must be replaced.

Repair

Replace the Amplifier in accordance with the Service Information.
Perform the BODY VERIFICATION TEST-VER 1.

B210D-BATTERY VOLTAGE LOW

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the module detects that the battery voltage is less than 9.0 volts for 1 second.

Possible Causes
VEHICLE CHARGING SYSTEM
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B210D-BATTERY VOLTAGE LOW?

- Yes** >> Go To
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE BATTERY VOLTAGE TO THE AMPLIFIER

With the scan tool in Data Display, read Amplifier battery voltage.

Is the battery voltage less than 9.0 volts?

- Yes** >> Go To 3
- No** >> Replace the Amplifier in accordance with the Service Information. Perform OCS VERIFICATION TEST - VER 1.

3. CHECK FOR CHARGING SYSTEM RELATED DTCs IN THE POWERTRAIN CONTROL MODULE (PCM)

With the scan tool in ECU View, select PCM and check for any Charging System related DTCs.

Does the scan tool display any Charging System related DTCs?

- Yes** >> Diagnose and repair the DTCs. Refer to (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
- No** >> Replace the Amplifier in accordance with the Service Information. Perform OCS VERIFICATION TEST - VER 1.

B210E-BATTERY VOLTAGE HIGH

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the module detects that the battery voltage is greater 16.5 volts for 1 second.

Possible Causes

VEHICLE CHARGING SYSTEM
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B210E-BATTERY VOLTAGE HIGH?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE BATTERY VOLTAGE TO THE AMPLIFIER

With the scan tool in Data Display, read Amplifier battery voltage.

Is the battery voltage greater than 16.5 volts?

- Yes** >> Go To 3
- No** >> Replace the Amplifier in accordance with the Service Information. Perform OCS VERIFICATION TEST - VER 1.

B210E-BATTERY VOLTAGE HIGH (CONTINUED)

3. CHECK FOR CHARGING SYSTEM RELATED DTCs IN THE POWERTRAIN CONTROL MODULE (PCM)

With the scan tool in ECU View, select PCM and check for any Charging System related DTCs.

Does the scan tool display any Charging System related DTCs?

- Yes** >> Diagnose and repair the DTCs. Refer to (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
- No** >> Replace the Amplifier in accordance with the Service Information.
Perform OCS VERIFICATION TEST - VER 1.

B1488–CABIN EQ MISMATCH PERFORMANCE

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the cabin EQ message is incompatible with the EQ's stored in the amplifier for 10 consecutive cycles, then the amplifier will set this DTC.

POSSIBLE CAUSES
NO COMMUNICATION WITH FRONT CONTROL MODULE ACTIVE FCM DTCs AMPLIFIER

Diagnostic Test**1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1488–CABIN EQ MISMATCH PERFORMANCE?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK AMPLIFIER BUSSED INPUTS/OUTPUTS**

With the scan tool in Amplifier Data Display, read the Cabin EQ# settings in the Bussed Inputs and Bussed Outputs Sections.

NOTE: The Cabin EQ# settings in the Inputs/Outputs section should match one another. The Cabin EQ# in the Inputs section is the information that is received from the FCM. The Cabin EQ# in the Outputs section is the information that is Stored in the Amplifier's memory.

The Cabin EQ# settings are as follows:

- •\$51: HB Premium 1 (w/o Subwoofer)
- •\$52: HB Premium 2 (with Subwoofer)

Do the Cabin EQ# settings match one another?

Yes >> Replace the Amplifier in accordance to the service information.
Perform the BODY VERIFICATION TEST-VER 1.

No >> Go To 3

B1488-CABIN EQ MISMATCH PERFORMANCE (CONTINUED)**3. VERIFY COMMUNICATION WITH FRONT CONTROL MODULE**

With the scan tool in ECU VIEW, read active modules on the bus.

Does the scan tool show the Front Control Module active on the bus?

Yes >> Go To 4

No >> Refer to the Communication category for the related symptoms.
Perform the BODY VERIFICATION TEST VER 1.

4. CHECK FRONT CONTROL MODULE FOR ACTIVE DTCs

With the scan tool, erase FCM DTCs.

Turn the ignition off. Wait approximately 10 seconds.

Turn the ignition on.

With the scan tool, read FCM DTCs.

Are any active DTCs present?

Yes >> Refer to symptom list for problems related to the Front Control Module.
Perform the BODY VERIFICATION TEST VER 1.

No >> Replace the Front Control Module in accordance with the Service Information.
Perform the BODY VERIFICATION TEST-VER.1

B1460-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ± 1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test**1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

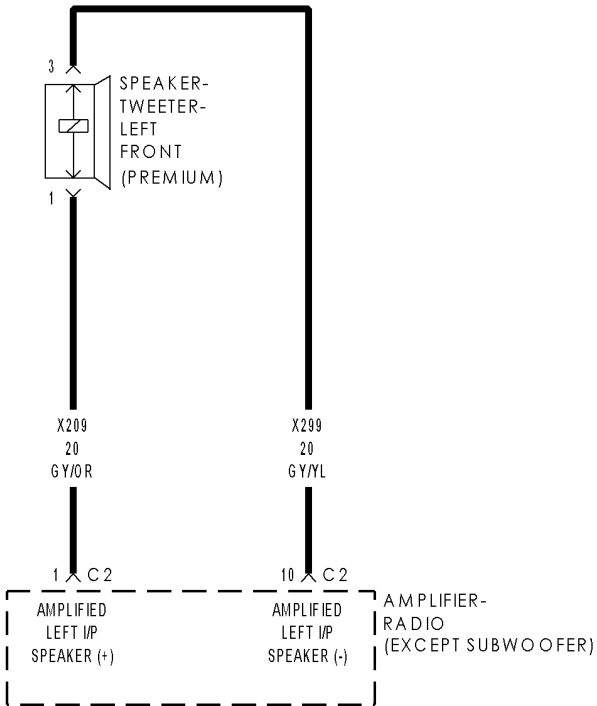

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1460-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

- Yes** >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW

B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X209) AMPLIFIED LEFT FRONT I/P SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X299) AMPLIFIED LEFT FRONT I/P SPEAKER (-) CIRCUIT SHORTED TO GROUND
LEFT FRONT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE (X209) AMPLIFIED LEFT FRONT I/P SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Amplifier C2 harness connector.

Measure the resistance between ground and the (X209) Amplified Left Front I/P Speaker (+) circuit.

Is the resistance below 10K ohms?

- Yes** >> Repair the (X209) Amplified Left Front I/P Speaker (+) circuit for a short to ground. Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 3

B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

3. CHECK THE (X299) AMPLIFIED LEFT FRONT I/P SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (X299) Amplified Left Front I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

- Yes** >> Repair the (X299) Amplified Left Front I/P Speaker (-) for a short to ground.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 4

4. CHECK OPERATION OF THE AMPLIFIED LEFT FRONT I/P SPEAKER

Turn the ignition off.
Reconnect and reinstall the Left Front I/P Speaker.
Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground.

Is the resistance below 10K ohms?

- Yes** >> Replace the Left Front I/P Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1462-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

B1462-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1462-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK FOR VOLTAGE ON THE (X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Amplified Left I/P Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X209) Amplified Left I/P Speaker (+) circuit.

Is the voltage above 10.0 volts?

- Yes** >> Repair the (X209) Amplified Left I/P Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 3

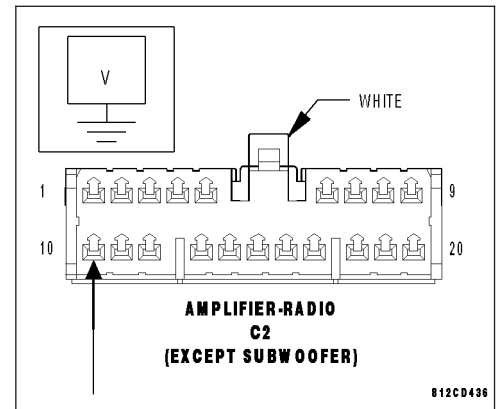

B1462-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**3. CHECK FOR VOLTAGE ON THE (X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT**

Measure for voltage on the (X299) Amplified Left I/P Speaker (-) circuit.

Is the voltage above 10.0 volts?

- Yes** >> Repair the (X299) Amplified Left I/P Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1463-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

B1463-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Amplifier Bus wake-up. Amplifier reset with scan tool.
- **Set Condition:**
The Amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT OPEN (X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT OPEN LEFT FRONT I/P SPEAKER AMPLIFIER

Diagnostic Test**1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1463-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE OPERATION OF THE LEFT FRONT I/P SPEAKER**

Disconnect the Left I/P Speaker harness connector.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left I/P Speaker circuits in the Amplified Left I/P Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes >> Replace the Amplified Left I/P Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

B1463-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

3. CHECK THE (X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X209) Amplified Left I/P Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Left I/P Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

No >> Repair the (X209) Amplified Left I/P Speaker (+) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

4. CHECK THE (X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X299) Amplified Left I/P Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Left I/P Speaker harness connector.

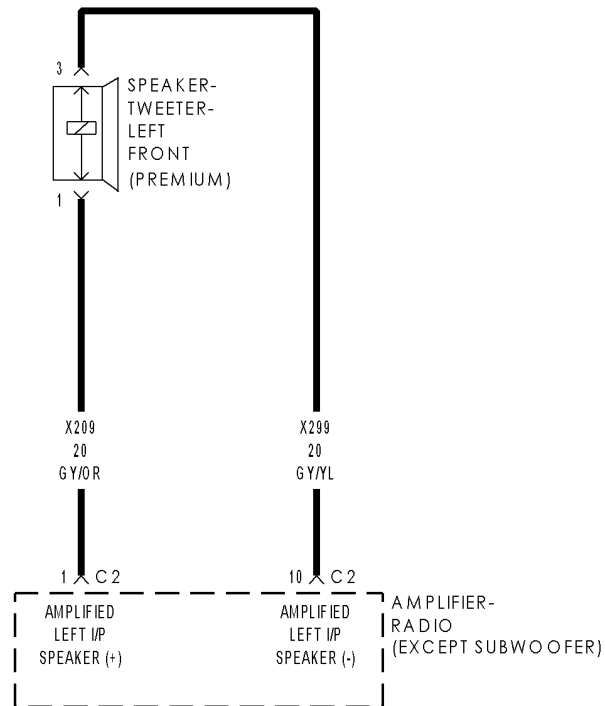

Is the resistance below 5.0 ohms?

Yes >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Repair the (X299) Amplified Left I/P Speaker (-) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

B1464-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

B1464-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**
The amplifier detects that the output circuits are shorted together.

Possible Causes
(X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT SHORTED TO THE (X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT AMPLIFIED LEFT I/P SPEAKER AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1464-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT I/P SPEAKER

Disconnect the Amplified Left I/P Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes >> Replace the Amplified Left I/P Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

B1464-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)**3. CHECK THE (X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT, AND THE (X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance between the (X209) Amplified Left I/P Speaker (+) circuit, and the (X299) Amplified Left I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X209) Amplified Left I/P Speaker (+) circuit, and the (X299) Amplified Left I/P Speaker (-) circuit for a short together.

Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

B1465-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ± 1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1465-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

- Yes** >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW

B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X208) AMPLIFIED RIGHT FRONT I/P SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X298) AMPLIFIED RIGHT FRONT I/P SPEAKER (-) CIRCUIT SHORTED TO GROUND
RIGHT FRONT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE (X208) AMPLIFIED RIGHT FRONT I/P SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Amplifier C2 harness connector.

Measure the resistance between ground and the (X208) Amplified Right Front I/P Speaker (+) circuit.

Is the resistance below 10K ohms?

- Yes** >> Repair the (X208) Amplified Right Front I/P Speaker (+) circuit for a short to ground. Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 3

B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)**3. CHECK THE (X298) AMPLIFIED RIGHT FRONT I/P SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (X298) Amplified Right Front I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X298) Amplified Right Front I/P Speaker (-) for a short to ground.

Perform BODY VERIFICATION TEST VER-1.

No >> Go To 4

**4. CHECK OPERATION OF THE AMPLIFIED RIGHT FRONT I/P SPEAKER**

Turn the ignition off.

Reconnect and reinstall the Right Front I/P Speaker.

Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground..

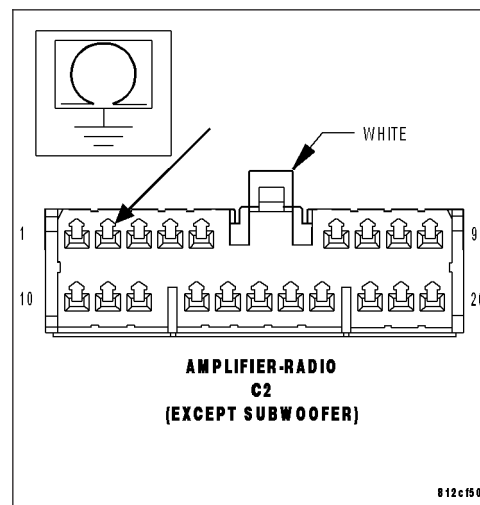

Is the resistance below 10K ohms?

Yes >> Replace the Right Front I/P Speaker in accordance with the service information.

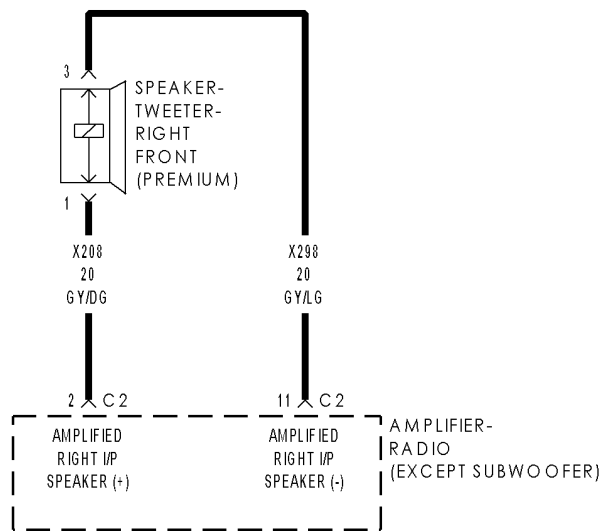

Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

B1467-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

B1467-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to **Section 8W**.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X208) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT SHORT TO VOLTAGE (X298) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT SHORT TO VOLTAGE AMPLIFIER

Diagnostic Test**1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1467-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK FOR VOLTAGE ON THE (X208) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT**

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

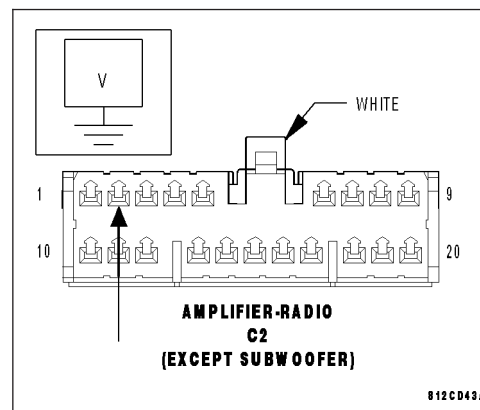

Disconnect the Amplified Right I/P Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X208) Amplified Right I/P Speaker (+) circuit.

Is the voltage above 10.0 volts?

- Yes** >> Repair the (X208) Amplified Right I/P Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 3

B1467-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

3. CHECK FOR VOLTAGE ON THE (X298) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT

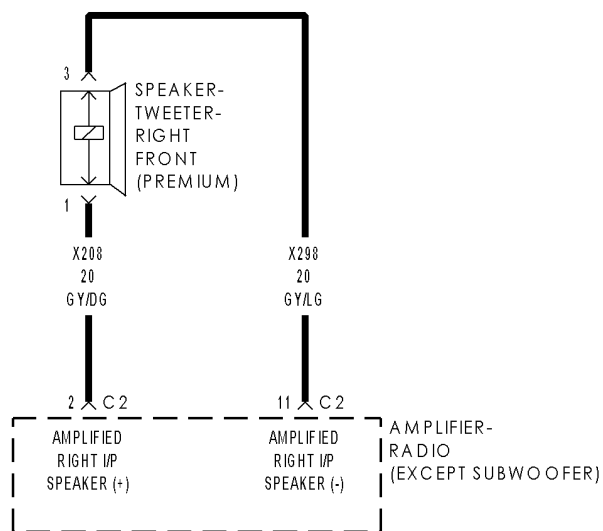

Measure for voltage on the (X298) Amplified Right I/P Speaker (-) circuit.

Is the voltage above 10.0 volts?

- Yes** >> Repair the (X298) Amplified Right I/P Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1468-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

B1468-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Amplifier Bus wake-up. Amplifier reset with scan tool.
- **Set Condition:**
The Amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X208) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT OPEN
(X298) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT OPEN
RIGHT I/P SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

- Turn the ignition on.
- Turn the radio on.
- With the scan tool, erase Amplifier DTCs.
- With the scan tool, reset the amplifier.
- With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1468-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE OPERATION OF THE RIGHT FRONT I/P SPEAKER

- Disconnect the Right I/P Speaker harness connector.
- Turn the radio on and turn the volume to mid level.
- With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Right I/P Speaker circuits in the Amplified Right I/P Speaker harness connector.

Is the voltage present greater than 1 volt?

- Yes** >> Replace the Amplified Right I/P Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 3

B1468-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)**3. CHECK THE (X208) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X208) Amplified Right I/P Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Right I/P Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

No >> Repair the (X208) Amplified Right I/P Speaker (+) circuit for an open.

Perform BODY VERIFICATION TEST VER-1.

**4. CHECK THE (X298) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X298) Amplified Right I/P Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Right I/P Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the Amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

No >> Repair the (X298) Amplified Right I/P Speaker (-) circuit for an open.

Perform BODY VERIFICATION TEST VER-1.

B1469-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

B1469-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**
The amplifier detects that the output circuits are shorted together.

Possible Causes
(X208) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT SHORTED TO THE (X298) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT AMPLIFIED RIGHT I/P SPEAKER AMPLIFIER

Diagnostic Test**1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1469-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT I/P SPEAKER**

Disconnect the Amplified Right I/P Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes >> Replace the Amplified Right I/P Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

B1469-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)

3. CHECK THE (X208) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT, AND THE (X298) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance between the (X208) Amplified Right I/P Speaker (+) circuit, and the (X298) Amplified Right I/P Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X208) Amplified Right I/P Speaker (+) circuit, and the (X298) Amplified Right I/P Speaker (-) circuit for a short together.

Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

B146A-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ± 1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test**1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146A-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

- Yes** >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

B146B-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT LOW

B146B-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X201) AMPLIFIED LEFT FRONT DOOR SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X291) AMPLIFIED LEFT FRONT DOOR SPEAKER (-) CIRCUIT SHORTED TO GROUND
LEFT FRONT DOOR SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146B-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE (X201) AMPLIFIED LEFT FRONT DOOR SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Amplifier C1 harness connector.

Measure the resistance between ground and the (X201) Amplified Left Front Door Speaker (+) circuit.

Is the resistance below 10K ohms?

- Yes** >> Repair the (X201) Amplified Left Front Door Speaker (+) circuit for a short to ground. Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 3

B146B-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

3. CHECK THE (X291) AMPLIFIED LEFT FRONT DOOR SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (X291) Amplified Left Front Door Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X291) Amplified Left Front Door Speaker (-) for a short to ground.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 4

4. CHECK OPERATION OF THE AMPLIFIED LEFT FRONT DOOR SPEAKER

Turn the ignition off.

Reconnect and reinstall the Left Front Door Speaker.

Measure the resistance of the speaker circuit between the Amplifier C1 harness connector and ground..

Is the resistance below 10K ohms?

Yes >> Replace the Left Front Door Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B146C-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

AMPLIFIER-RADIO C1

SPEAKER-LEFT FRONT DOOR

B146C-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X201) AMPLIFIED LEFT FRONT DOOR SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X291) AMPLIFIED LEFT FRONT DOOR SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146C-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK FOR VOLTAGE ON THE (X201) AMPLIFIED LEFT FRONT DOOR SPEAKER (+) CIRCUIT

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Amplified Left Front Door Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X201) Amplified Left Front Door Speaker (+) circuit.

Is the voltage above 10.0 volts?

- Yes** >> Repair the (X201) Amplified Left Front Door Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 3

B146C-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**3. CHECK FOR VOLTAGE ON THE (X291) AMPLIFIED LEFT FRONT DOOR SPEAKER (-) CIRCUIT**

Measure for voltage on the (X291) Amplified Left Front Door Speaker (-) circuit.

Is the voltage above 10.0 volts?

- Yes** >> Repair the (X291) Amplified Left Front Door Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B146D-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

B146D-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Amplifier Bus wake-up. Amplifier reset with scan tool.
- **Set Condition:**
The Amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X201) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT OPEN (X291) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT OPEN LEFT REAR DOOR SPEAKER AMPLIFIER

Diagnostic Test**1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146D-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE OPERATION OF THE LEFT REAR DOOR SPEAKER**

Disconnect the Left Rear Door Speaker harness connector.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left Rear Door Speaker circuits in the Amplified Left Rear Door Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes >> Replace the Amplified Left Rear Door Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

B146D-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

3. CHECK THE (X201) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X201) Amplified Left Rear Door Speaker (+) circuit between the Amplifier C1 harness connector and the Amplified Left Rear Door Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

No >> Repair the (X201) Amplified Left Rear Door Speaker (+) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

4. CHECK THE (X291) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT FOR AN OPEN

Turn the ignition off.

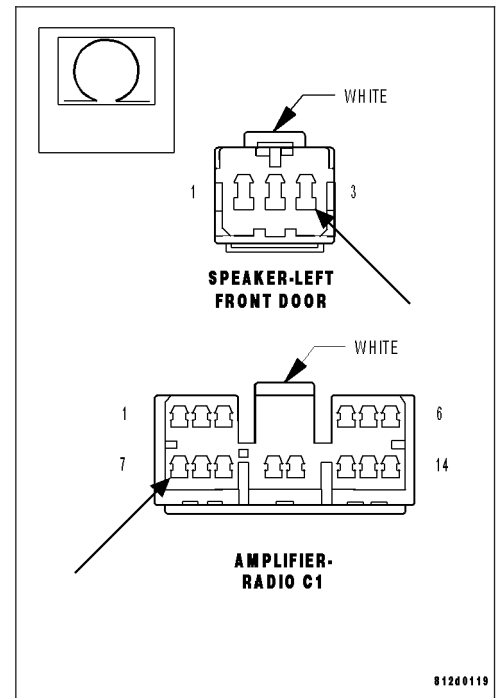

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X291) Amplified Left Rear Door Speaker (-) circuit between the Amplifier C1 harness connector and the Amplified Left Rear Door Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Repair the (X291) Amplified Left Rear Door Speaker (-) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

B146E-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

AMPLIFIER-RADIO C1

SPEAKER-LEFT FRONT DOOR

B146E-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**
The amplifier detects that the output circuits are shorted together.

Possible Causes
(X201) AMPLIFIED LEFT FRONT DOOR SPEAKER (+) CIRCUIT SHORTED TO THE (X291) AMPLIFIED LEFT FRONT DOOR SPEAKER (-) CIRCUIT AMPLIFIED LEFT FRONT DOOR SPEAKER AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146E-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT FRONT DOOR SPEAKER

Disconnect the Amplified Left Front Door Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes >> Replace the Amplified Left Front Door Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

B146E-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)**3. CHECK THE (X201) AMPLIFIED LEFT FRONT DOOR SPEAKER (+) CIRCUIT, AND THE (X291) AMPLIFIED LEFT FRONT DOOR SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance between the (X201) Amplified Left Front Door Speaker (+) circuit, and the (X291) Amplified Left Front Door Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X201) Amplified Left Front Door Speaker (+) circuit, and the (X291) Amplified Left Front Door Speaker (-) circuit for a short together.

Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

B146F-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ± 1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146F-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

- Yes** >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

B1470-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT LOW

B1470-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X202) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT SHORTED TO GROUND (X292) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT SHORTED TO GROUND RIGHT FRONT DOOR SPEAKER AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1470-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

B1470-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)**2. CHECK THE (X202) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

Disconnect the Amplifier C1 harness connector.

Measure the resistance between ground and the (X202) Amplified Right Front Door Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X202) Amplified Left Front Door Speaker (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

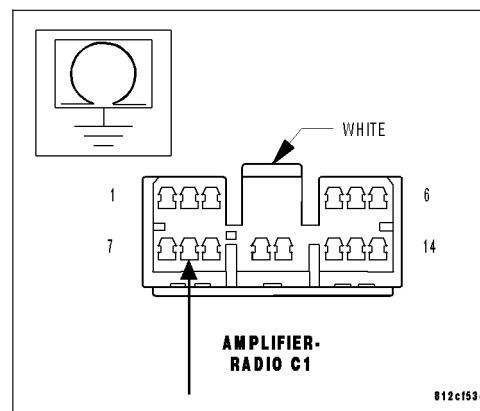

**3. CHECK THE (X292) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (X292) Amplified Right Front Door Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X292) Amplified Right Front Door Speaker (-) for a short to ground.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 4

**4. CHECK OPERATION OF THE AMPLIFIED RIGHT FRONT DOOR SPEAKER**

Turn the ignition off.

Reconnect and reinstall the Right Front Door Speaker.

Measure the resistance of the speaker circuit between the Amplifier C1 harness connector and ground..

Is the resistance below 10K ohms?

Yes >> Replace the Right Front Door Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1471-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

B1471-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X202) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT SHORT TO VOLTAGE (X292) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT SHORT TO VOLTAGE AMPLIFIER

Diagnostic Test**1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1471-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK FOR VOLTAGE ON THE (X202) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

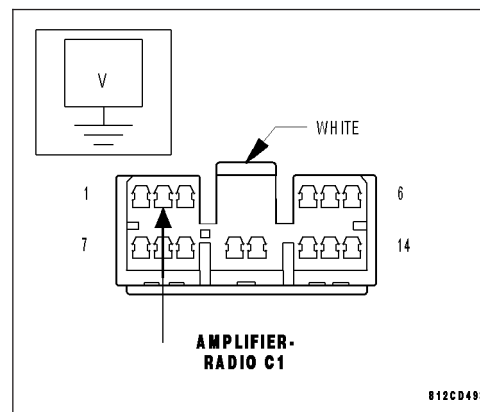

Disconnect the Amplified Right Front Door Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X202) Amplified Right Front Door Speaker (+) circuit.

Is the voltage above 10.0 volts?

- Yes** >> Repair the (X202) Amplified Right Front Door Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 3

B1471-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

3. CHECK FOR VOLTAGE ON THE (X292) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT

Measure for voltage on the (X292) Amplified Right Front Door Speaker (-) circuit.

Is the voltage above 10.0 volts?

- Yes** >> Repair the (X292) Amplified Right Front Door Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1472-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

B1472-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Amplifier Bus wake-up. Amplifier reset with scan tool.
- **Set Condition:**
The Amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X202) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT OPEN
(X292) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT OPEN
RIGHT FRONT DOOR SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

- Turn the ignition on.
- Turn the radio on.
- With the scan tool, erase Amplifier DTCs.
- With the scan tool, reset the amplifier.
- With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1472-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE OPERATION OF THE RIGHT FRONT DOOR SPEAKER

- Disconnect the Right Front Door Speaker harness connector.
- Turn the radio on and turn the volume to mid level.
- With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Right Front Door Speaker circuits in the Amplified Right Front Door Speaker harness connector.

Is the voltage present greater than 1 volt?

- Yes** >> Replace the Amplified Right Front Door Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 3

B1472-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)**3. CHECK THE (X202) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X202) Amplified Right Front Door Speaker (+) circuit between the Amplifier C1 harness connector and the Amplified Right Front Door Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

No >> Repair the (X202) Amplified Right Front Door Speaker (+) circuit for an open.

Perform BODY VERIFICATION TEST VER-1.

**4. CHECK THE (X292) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X292) Amplified Right Front Door Speaker (-) circuit between the Amplifier C1 harness connector and the Amplified Right Front Door Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the Amplifier in accordance with the service information.

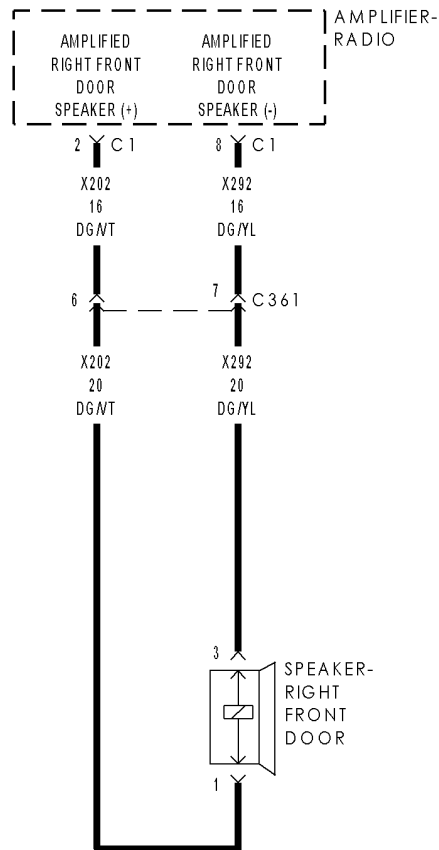

Perform BODY VERIFICATION TEST VER-1.

No >> Repair the (X292) Amplified Right Front Door Speaker (-) circuit for an open.

Perform BODY VERIFICATION TEST VER-1.

B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to **Section 8W**.

- **When Monitored:**
With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**
The amplifier detects that the output circuits are shorted together.

Possible Causes
(X202) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT SHORTED TO THE (X292) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT AMPLIFIED RIGHT FRONT DOOR SPEAKER AMPLIFIER

Diagnostic Test**1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT FRONT DOOR SPEAKER**

Disconnect the Amplified Right Front Door Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes >> Replace the Amplified Right Front Door Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)

3. CHECK THE (X202) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT, AND THE (X292) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance between the (X202) Amplified Right Front Door Speaker (+) circuit, and the (X292) Amplified Right Front Door Speaker (-) circuit.

Is the resistance below 10K ohms?

- Yes** >> Repair the (X202) Amplified Right Front Door Speaker (+) circuit, and the (X292) Amplified Right Front Door Speaker (-) circuit for a short together.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1474-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ± 1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test**1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1474-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

- Yes** >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

B1475-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT LOW

B1475-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to **Section 8W**.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X205) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT SHORTED TO GROUND (X295) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT SHORTED TO GROUND LEFT REAR DOOR SPEAKER AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1475-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE (X205) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Amplifier C1 harness connector.

Measure the resistance between ground and the (X205) Amplified Left Rear Door Speaker (+) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X205) Amplified Left Rear Door Speaker (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

B1475-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

3. CHECK THE (X295) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (X295) Amplified Left Rear Door Speaker (-) circuit.

Is the resistance below 10K ohms?

- Yes** >> Repair the (X295) Amplified Left Rear Door Speaker (-) for a short to ground.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 4

4. CHECK OPERATION OF THE AMPLIFIED LEFT REAR DOOR SPEAKER

Turn the ignition off.
Reconnect and reinstall the Left Rear Door Speaker.
Measure the resistance of the speaker circuit between the Amplifier C1 harness connector and ground..

Is the resistance below 10K ohms?

- Yes** >> Replace the Left Rear Door Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1476-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

B1476-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X205) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X295) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1476-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK FOR VOLTAGE ON THE (X205) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Amplified Left Rear Door Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X205) Amplified Left Rear Door Speaker (+) circuit.

Is the voltage above 10.0 volts?

- Yes** >> Repair the (X205) Amplified Left Rear Door Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 3

B1476-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**3. CHECK FOR VOLTAGE ON THE (X295) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT**

Measure for voltage on the (X295) Amplified Left Rear Door Speaker (-) circuit.

Is the voltage above 10.0 volts?

- Yes** >> Repair the (X295) Amplified Left Rear Door Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1477-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

B1477-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Amplifier Bus wake-up. Amplifier reset with scan tool.
- **Set Condition:**
The Amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X205) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT OPEN (X295) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT OPEN LEFT REAR DOOR SPEAKER AMPLIFIER

Diagnostic Test**1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1477-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE OPERATION OF THE LEFT REAR DOOR SPEAKER**

Disconnect the Left Rear Door Speaker harness connector.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left Rear Door Speaker circuits in the Amplified Left Rear Door Speaker harness connector.

Is the voltage present greater than 1 volt?

Yes >> Replace the Amplified Left I/P Speaker in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

B1477-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

3. CHECK THE (X205) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X205) Amplified Left Rear Door Speaker (+) circuit between the Amplifier C1 harness connector and the Amplified Left Rear Door Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

No >> Repair the (X205) Amplified Left Rear Door Speaker (+) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

4. CHECK THE (X295) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X295) Amplified Left Rear Door Speaker (-) circuit between the Amplifier C1 harness connector and the Amplified Left Rear Door Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Repair the (X295) Amplified Left Rear Door Speaker (-) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

B1478-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

B1478-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**
The amplifier detects that the output circuits are shorted together.

Possible Causes
(X205) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT SHORTED TO THE (X295) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT AMPLIFIED LEFT REAR DOOR SPEAKER AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1478-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE OPERATION OF THE AMPLIFIED LEFT REAR DOOR SPEAKER

Disconnect the Amplified Left Rear Door Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes >> Replace the Amplified Left Rear Door Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

B1478-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)**3. CHECK THE (X205) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT, AND THE (X295) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance between the (X205) Amplified Left Rear Door Speaker (+) circuit, and the (X295) Amplified Left Rear Door Speaker (-) circuit.

Is the resistance below 10K ohms?

- Yes** >> Repair the (X205) Amplified Left Rear Door Speaker (+) circuit, and the (X295) Amplified Left Rear Door Speaker (-) circuit for a short together.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B1479-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ± 1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1479-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

- Yes** >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

B147A-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT LOW

B147A-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X206) AMPLIFIED RIGHT REAR DOOR SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X296) AMPLIFIED RIGHT REAR DOOR SPEAKER (-) CIRCUIT SHORTED TO GROUND
RIGHT REAR DOOR SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147A-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT LOW?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE (X206) AMPLIFIED RIGHT REAR DOOR SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND

Disconnect the Amplifier C1 harness connector.

Measure the resistance between ground and the (X206) Amplified Right Rear Door Speaker (+) circuit.

Is the resistance below 10K ohms?

- Yes** >> Repair the (X206) Amplified Right Rear Door Speaker (+) circuit for a short to ground. Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 3

B147A-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)**3. CHECK THE (X296) AMPLIFIED RIGHT REAR DOOR SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (X296) Amplified Right Rear Door Speaker (-) circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X296) Amplified Right Rear Door Speaker (-) for a short to ground.

Perform BODY VERIFICATION TEST VER-1.

No >> Go To 4

**4. CHECK OPERATION OF THE AMPLIFIED RIGHT REAR DOOR SPEAKER**

Turn the ignition off.

Reconnect and reinstall the Right Rear Door Speaker.

Measure the resistance of the speaker circuit between the Amplifier C1 harness connector and ground..

Is the resistance below 10K ohms?

Yes >> Replace the Right Rear Door Speaker in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

No >> Replace the Amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

B147B-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

B147B-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to **Section 8W**.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X206) AMPLIFIED RIGHT REAR DOOR SPEAKER (+) CIRCUIT SHORT TO VOLTAGE
(X296) AMPLIFIED RIGHT REAR DOOR SPEAKER (-) CIRCUIT SHORT TO VOLTAGE
AMPLIFIER

Diagnostic Test**1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147B-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK FOR VOLTAGE ON THE (X206) AMPLIFIED RIGHT REAR DOOR SPEAKER (+) CIRCUIT**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

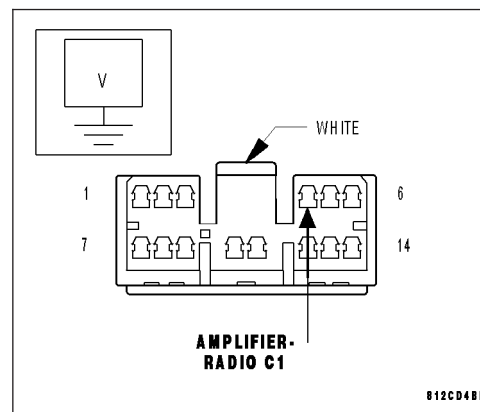

Disconnect the Amplified Right Rear Door Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X206) Amplified Right Rear Door Speaker (+) circuit.

Is the voltage above 10.0 volts?

- Yes** >> Repair the (X206) Amplified Right Rear Door Speaker (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 3

B147B-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)

3. CHECK FOR VOLTAGE ON THE (X296) AMPLIFIED RIGHT REAR SPEAKER SPEAKER (-) CIRCUIT

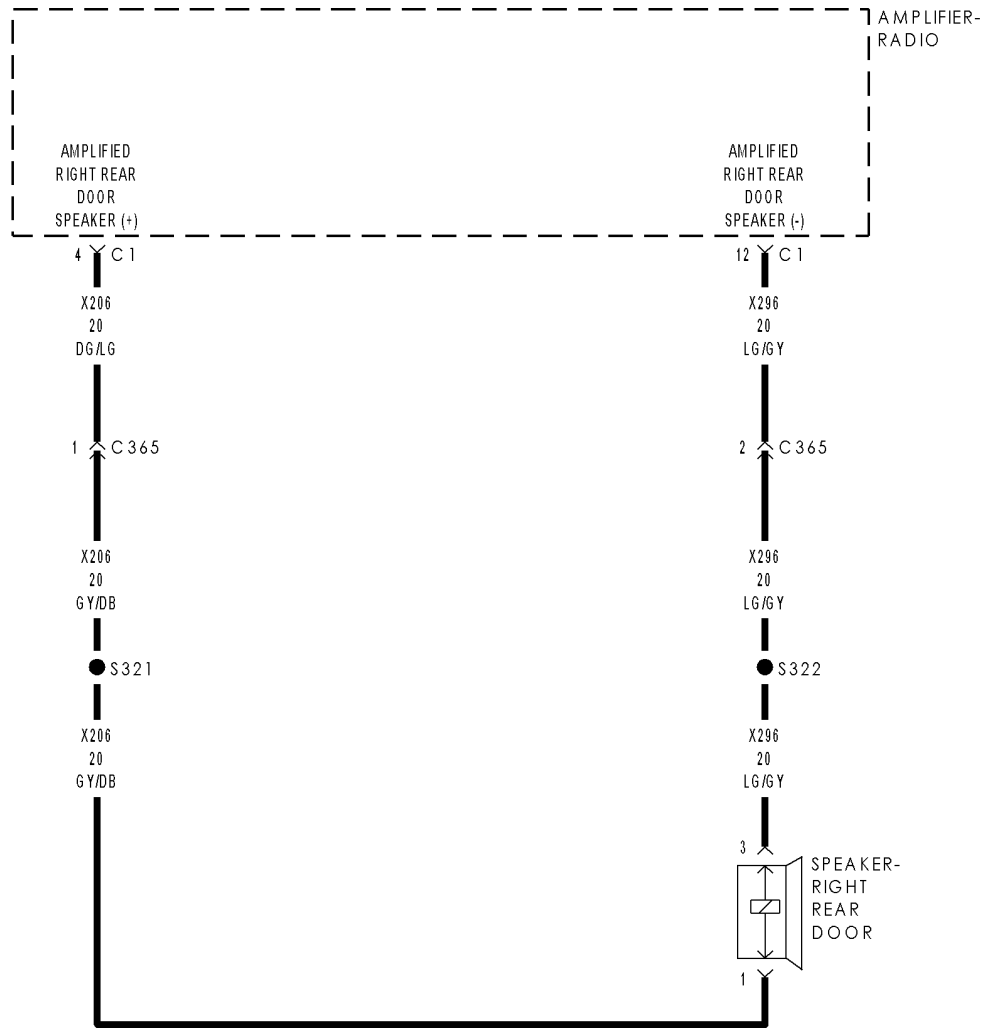

Measure for voltage on the (X296) Amplified Right Rear Door Speaker (-) circuit.

Is the voltage above 10.0 volts?

- Yes** >> Repair the (X296) Amplified Right Rear Door Speaker (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

B147C-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

B147C-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Amplifier Bus wake-up. Amplifier reset with scan tool.
- **Set Condition:**
The Amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X206) AMPLIFIED RIGHT REAR DOOR SPEAKER (+) CIRCUIT OPEN
(X296) AMPLIFIED RIGHT REAR DOOR SPEAKER (-) CIRCUIT OPEN
RIGHT REAR DOOR SPEAKER
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

- Turn the ignition on.
- Turn the radio on.
- With the scan tool, erase Amplifier DTCs.
- With the scan tool, reset the amplifier.
- With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147C-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE OPERATION OF THE RIGHT REAR DOOR SPEAKER

- Disconnect the Right Rear Door Speaker harness connector.
- Turn the radio on and turn the volume to mid level.
- With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Right Rear Door Speaker circuits in the Amplified Right Rear Door Speaker harness connector.

Is the voltage present greater than 1 volt?

- Yes** >> Replace the Amplified Right Rear Door Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 3

B147C-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)**3. CHECK THE (X206) AMPLIFIED RIGHT REAR DOOR SPEAKER (+) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X206) Amplified Right Rear Door Speaker (+) circuit between the Amplifier C1 harness connector and the Amplified Right Rear Door Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

No >> Repair the (X206) Amplified Right Rear Door Speaker (+) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

**4. CHECK THE (X296) AMPLIFIED RIGHT REAR DOOR SPEAKER (-) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X296) Amplified Right Rear Door Speaker (-) circuit between the Amplifier C1 harness connector and the Amplified Right Rear Door Speaker harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Repair the (X296) Amplified Right Rear Door Speaker (-) circuit for an open.
Perform BODY VERIFICATION TEST VER-1.

B147D-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

B147D-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**
The amplifier detects that the output circuits are shorted together.

Possible Causes
(X206) AMPLIFIED RIGHT REAR DOOR SPEAKER (+) CIRCUIT SHORTED TO THE (X296) AMPLIFIED RIGHT REAR DOOR SPEAKER (-) CIRCUIT AMPLIFIED RIGHT REAR DOOR SPEAKER AMPLIFIER

Diagnostic Test**1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B147D-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT REAR DOOR SPEAKER**

Disconnect the Amplified Right Rear Door Speaker.

Measure the resistance of the speaker between the two terminals.

Is the resistance of the speaker less than 1 ohm?

Yes >> Replace the Amplified Right Rear Door Speaker in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

No >> Go To 3

B147D-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)

3. CHECK THE (X206) AMPLIFIED RIGHT REAR DOOR SPEAKER (+) CIRCUIT, AND THE (X296) AMPLIFIED RIGHT REAR DOOR SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance between the (X206) Amplified Right Rear Door Speaker (+) circuit, and the (X296) Amplified Right Rear Door Speaker (-) circuit.

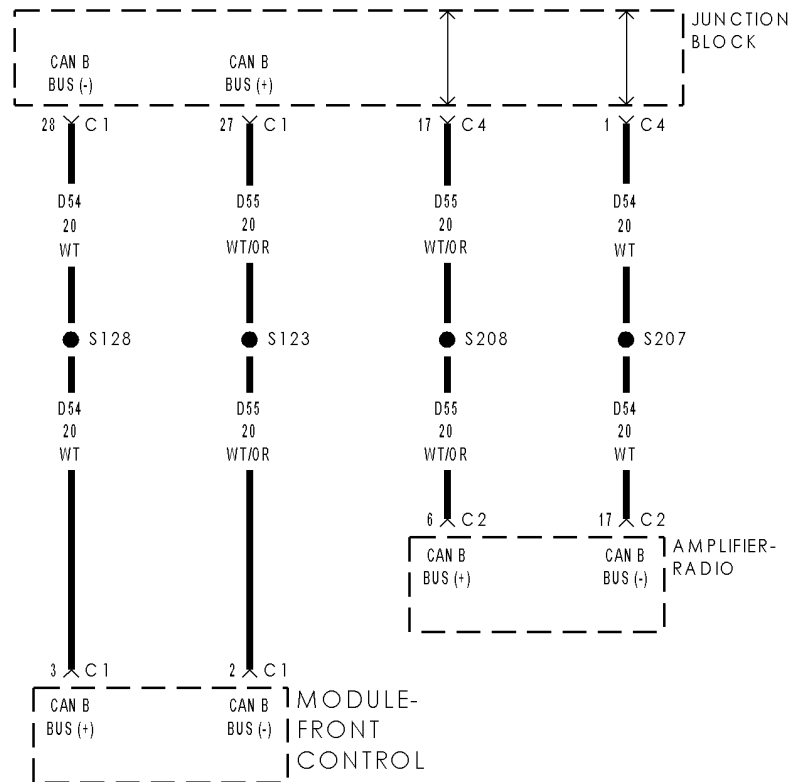

Is the resistance below 10K ohms?

- Yes** >> Repair the (X206) Amplified Right Rear Door Speaker (+) circuit, and the (X296) Amplified Right Rear Door Speaker (-) circuit for a short together.
Perform BODY VERIFICATION TEST VER-1.
- No** >> Replace the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST VER-1.

812CECA3

U0019-CAN B BUS

U0019–CAN B BUS (CONTINUED)

For a complete wiring diagram Refer to **Section 8W**.

- **When Monitored:**
Continuously.
- **Set Condition:**
Whenever the Can B Bus (+) or B Bus (–) circuit is open, shorted to voltage or shorted to ground, this code will set.

Possible Causes
CAN B BUS DTCs IN FRONT CONTROL MODULE (D54) CAN B BUS (–) CIRCUIT OPEN (D55) CAN B BUS (+) CIRCUIT OPEN AMPLIFIER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
 With the scan tool, record and erase DTCs
 Cycle the ignition from on to off 3 times.
 Turn the ignition on.
 With the scan tool, read DTCs.

Does the scan tool display U0019–CAN B BUS CIRCUIT?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
 Perform BODY VERIFICATION TEST - VER 1.

2. CHECK FRONT CONTROL MODULE DTCs

With the scan tool, read Front Control Module DTCs

Does the scan tool display any CAN B BUS DTCs – ACTIVE?

- Yes** >> Refer to the symptom list for problems related to Communication in the ELECTRICAL.– ELECTRONIC CONTROL MODULES – ELECTRICAL DIAGNOSES section.
- No** >> Go to 3

U0019-CAN B BUS (CONTINUED)**3. CAN B BUS (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the Amplifier harness connector.

Disconnect the Front Control Module C1 harness connector.

Measure the resistance of the (D55) Can B Bus (+) circuit between the Front Control Module C1 harness connector and the Amplifier harness connector.

Is the resistance below 2.0 ohms?

- Yes** >> Go To 4
Perform BODY VERIFICATION TEST - VER 1.
- No** >> Repair the Can B Bus (+) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

U0019-CAN B BUS (CONTINUED)

4. CAN B BUS (-) CIRCUIT OPEN

Measure the resistance of the (D54) Can B Bus (-) circuit between the Front Control Module C1 harness connector and the Amplifier harness connector.

Is the resistance below 2.0 ohms?

- Yes** >> Replace the Amplifier in accordance with the service information..
Perform BODY VERIFICATION TEST - VER 1.
- No** >> Repair the Can B Bus (-) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

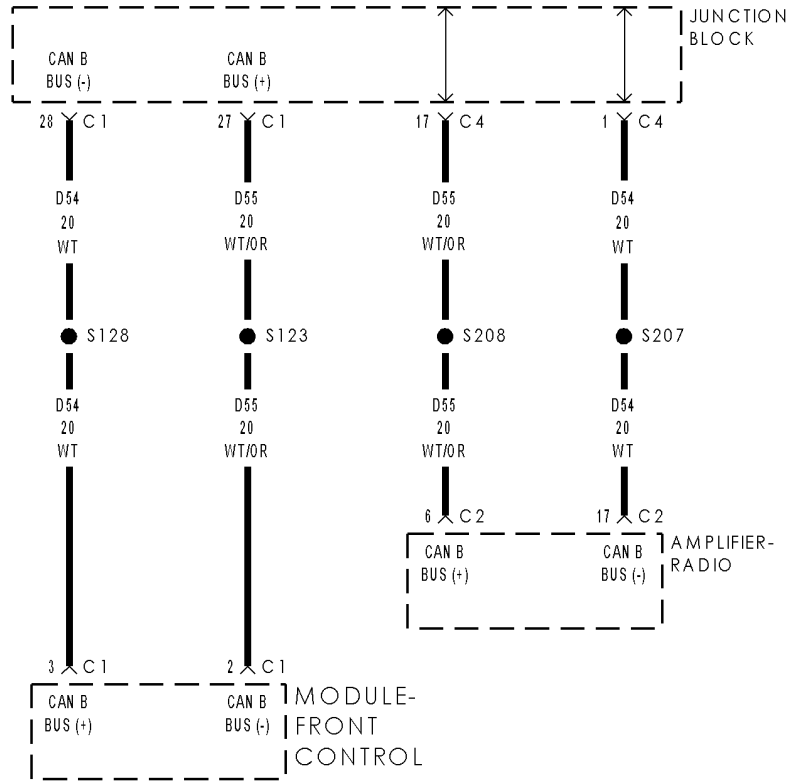

U0020-CAN B BUS OFF PERFORMANCE

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

U0020-CAN B BUS OFF PERFORMANCE (CONTINUED)

U0020-CAN B BUS OFF PERFORMANCE (CONTINUED)

- **When Monitored:**
Continuously.
- **Set Condition:**
Whenever the Can B Bus (+) or B Bus (-) circuit is open, shorted to voltage or shorted to ground, this code will set.

Possible Causes

CAN B BUS DTCs IN FRONT CONTROL MODULE
(D54) CAN B BUS (-) CIRCUIT OPEN
(D55) CAN B BUS (+) CIRCUIT OPEN
AMPLIFIER

Diagnostic Test**1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTCs

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display U0020-CAN B BUS OFF PERFORMANCE?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST - VER 1.

**2. CHECK FRONT CONTROL MODULE DTCs**

With the scan tool, read Front Control Module DTCs

Does the scan tool display any CAN B BUS DTCs – ACTIVE?

Yes >> Refer to the symptom list for problems related to Communication in the ELECTRICAL.– ELECTRONIC CONTROL MODULES – ELECTRICAL DIAGNOSES section.

No >> Go to 3

U0020-CAN B BUS OFF PERFORMANCE (CONTINUED)

3. CAN B BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Amplifier harness connector.

Disconnect the Front Control Module C1 harness connector.

Measure the resistance of the (D55) Can B Bus (+) circuit between the Front Control Module C1 harness connector and the Amplifier harness connector.

Is the resistance below 2.0 ohms?

- Yes** >> Go To 4
Perform BODY VERIFICATION TEST - VER 1.
- No** >> Repair the Can B Bus (+) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

U0020-CAN B BUS OFF PERFORMANCE (CONTINUED)**4. CAN B BUS (-) CIRCUIT OPEN**

Measure the resistance of the (D54) Can B Bus (-) circuit between the Front Control Module C1 harness connector and the Amplifier harness connector.

Is the resistance below 2.0 ohms?

- Yes** >> Replace the Amplifier in accordance with the service information..
Perform BODY VERIFICATION TEST - VER 1.
- No** >> Repair the Can B Bus (-) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0154-LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0155-LOST COMMUNICATION WITH CLUSTER/CCN

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0156-LOST COMMUNICATION WITH EOM

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0164-LOST COMMUNICATION WITH HVAC CONTROL MODULE

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM)

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0184-LOST COMMUNICATION WITH RADIO

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0197-LOST COMMUNICATION WITH HANDS FREE PHONE MODULE

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0199-LOST COMMUNICATION WITH DRIVER DOOR MODULE

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0200-LOST COMMUNICATION WITH PASSENGER DOOR MODULE

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0208-LOST COMMUNICATION WITH HEATED SEAT CONTROL MODULE

For a complete wiring diagram Refer to Section 8W.

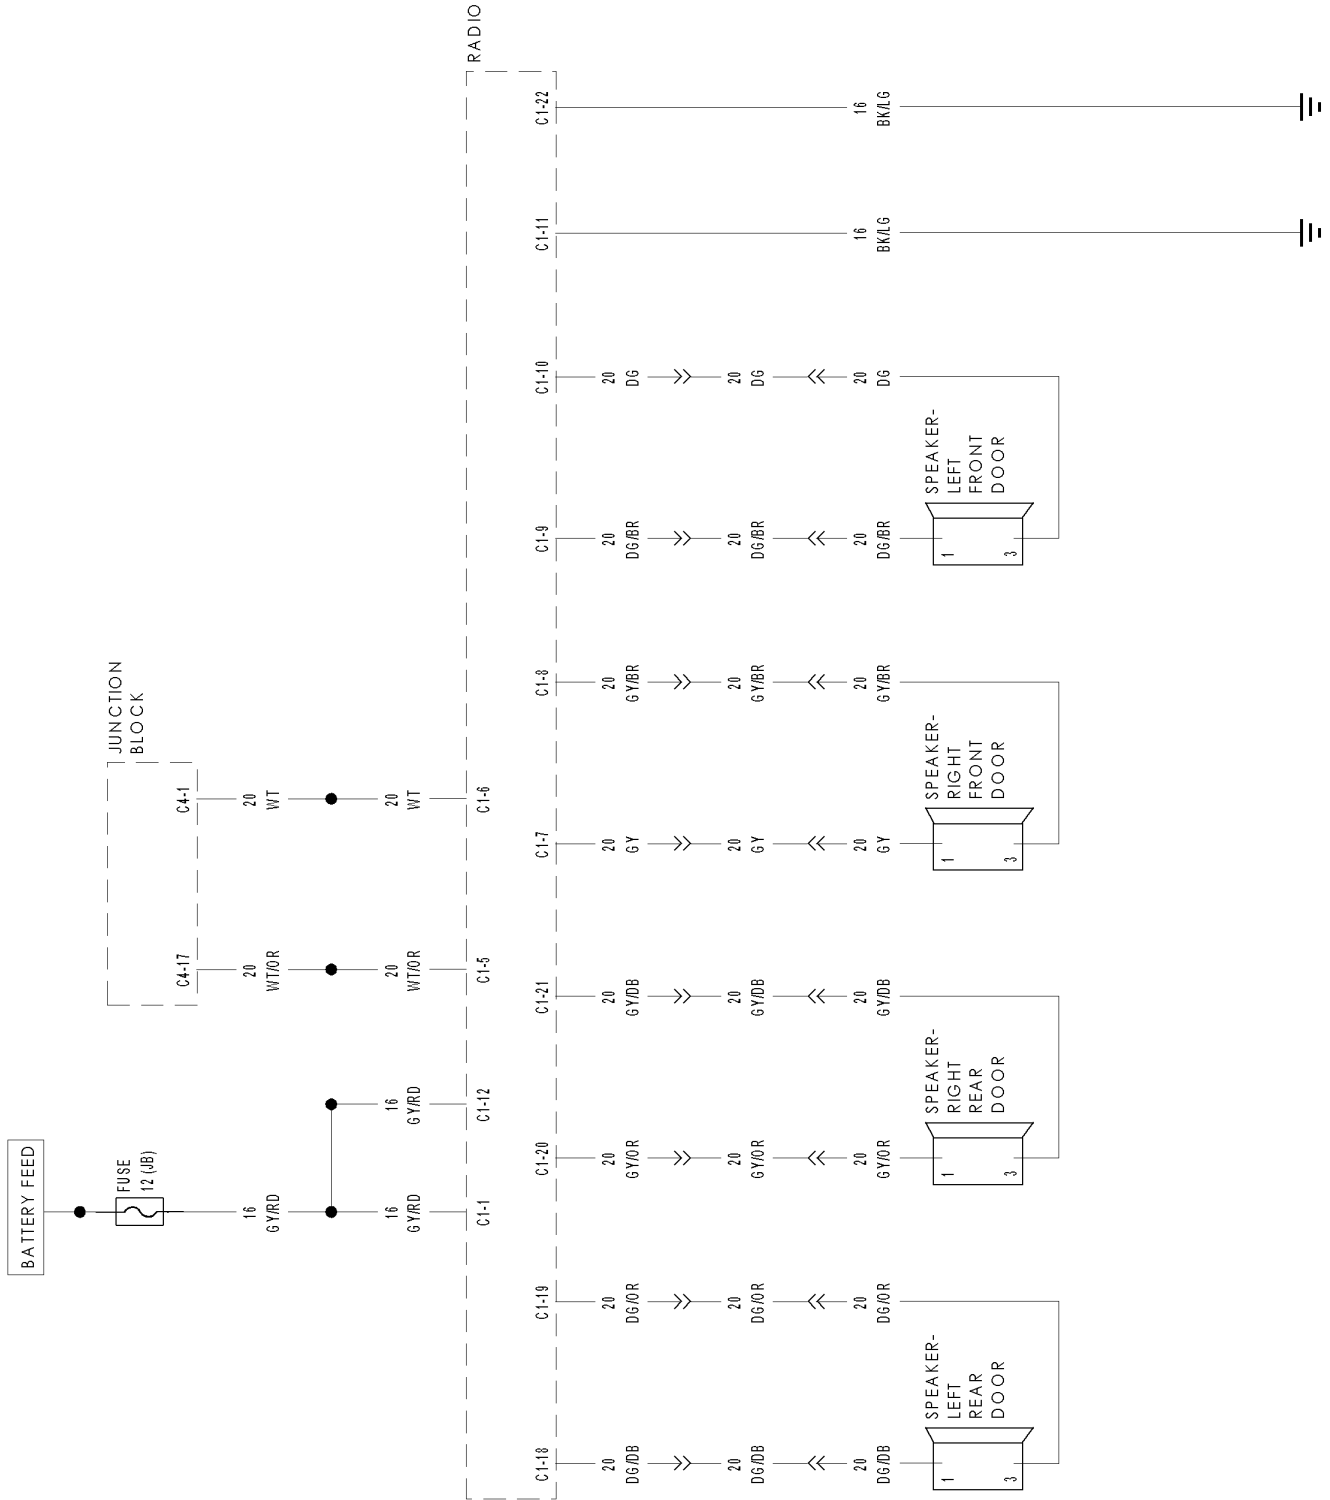

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0209-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE

For a complete wiring diagram Refer to Section 8W.

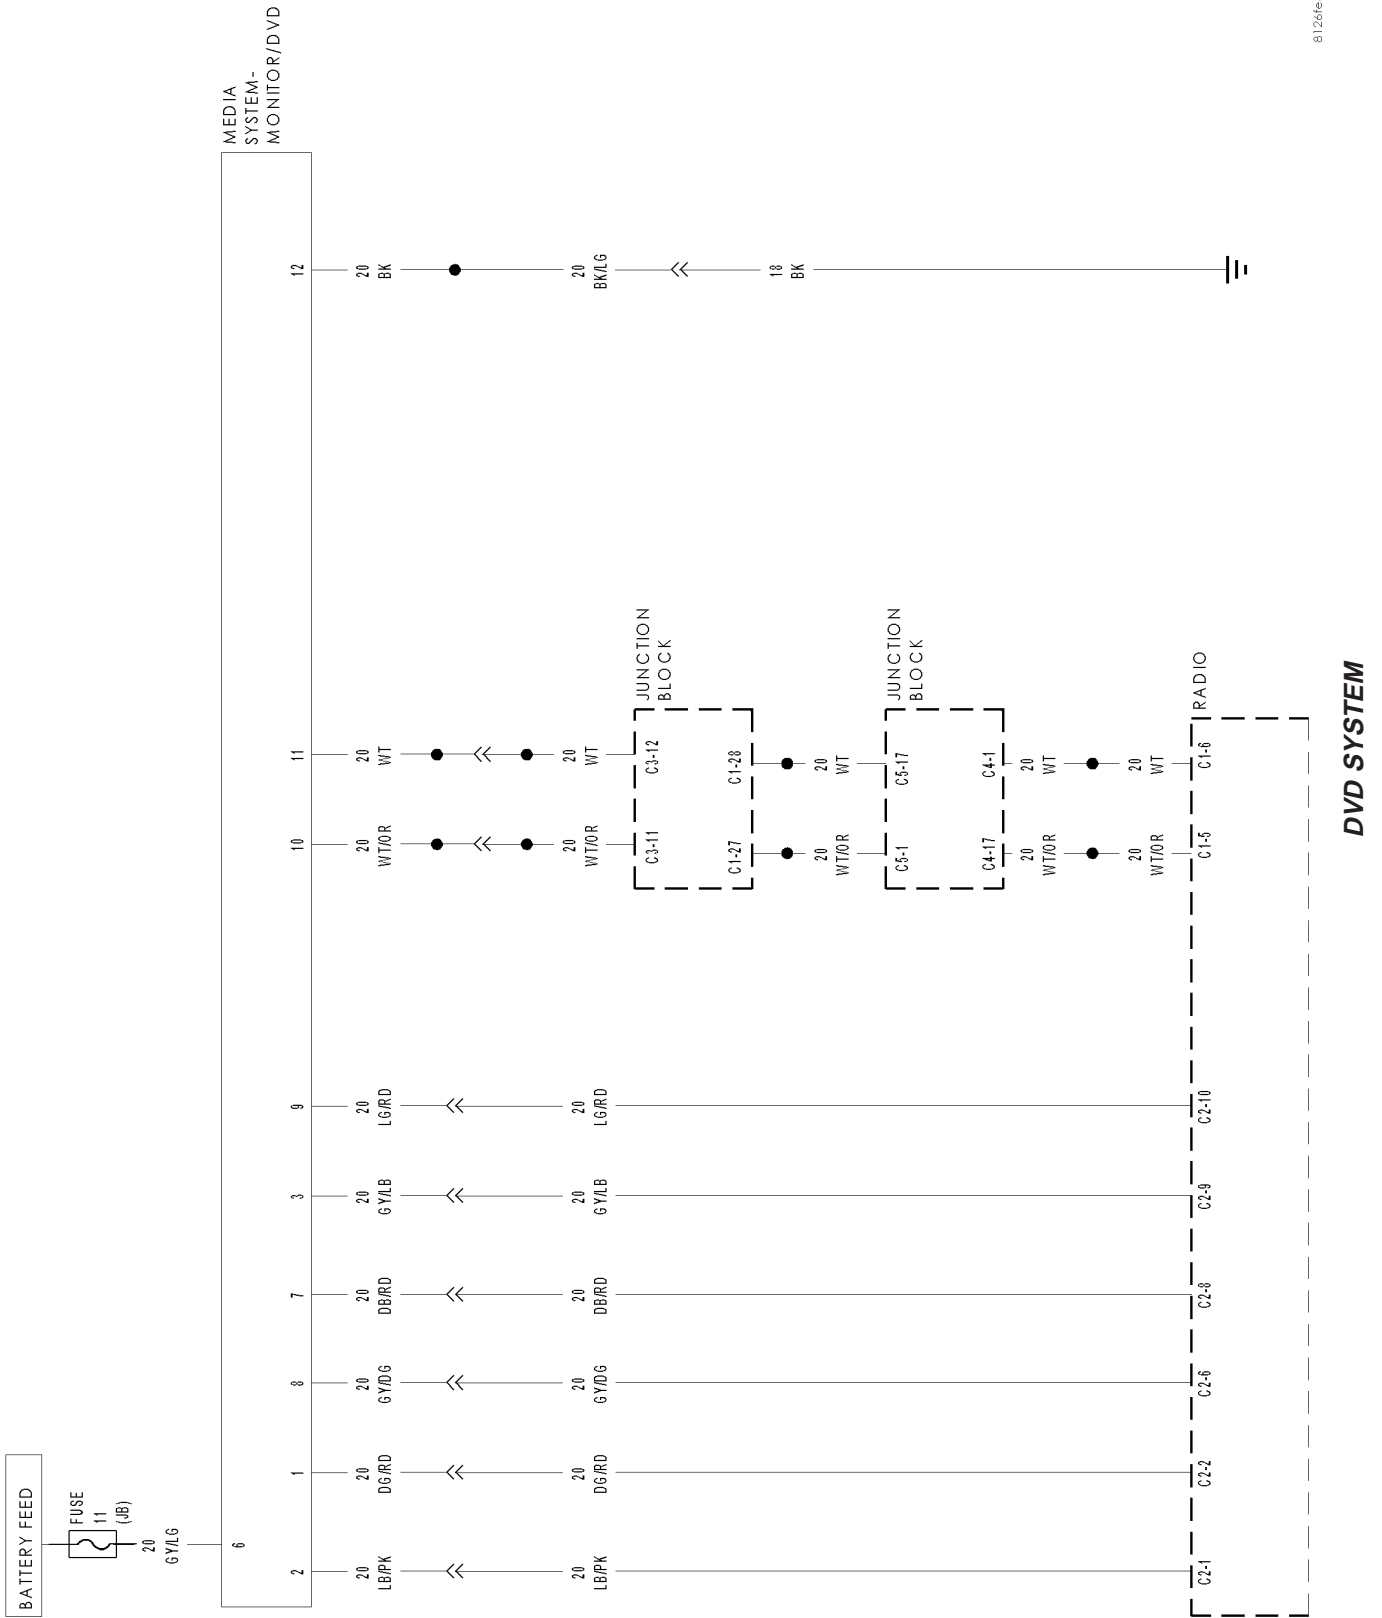

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

AUDIO/VIDEO - SERVICE INFORMATION

DESCRIPTION

Several combinations of radio receivers and speaker systems are offered on this vehicle. A rear seat video system is also available. The audio system receives fused battery current from a fuse in the Integrated Power Module (IPM) at all times.

A navigation radio is available on this vehicle. With this system, the operator has the option of choosing a street address, point of interest, trip itinerary and other features outlined in the operator's manual. The audio/video system includes the following components:

- Amplifier
- Antenna (Radio, Navigation, Satellite)
- Clockspring (with remote radio switches only)
- DVD Player
- Radio noise suppression components
- Radio receiver
- Remote radio switches (if equipped)
- Speakers
- Video Monitor

DIAGNOSIS AND TESTING

AUDIO SYSTEM

Any diagnosis of the Audio system should begin with the use of a scan tool and the appropriate Diagnostic Service information.

Refer to the appropriate wiring information.

NOTE:

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

AUDIO SYSTEM DIAGNOSIS TABLE

CONDITION	POSSIBLE CAUSES	CORRECTION
NO AUDIO	1. Fuse inoperative.	1. Check radio fuse and Ignition-Off Draw (IOD) fuse in the Integrated Power Module (IPM). Replace fuses, if required.
	2. Radio/amplifier (if equipped) connector damaged.	2. Check for loose or corroded radio/amplifier connector. Repair, if required.
	3. Wiring damaged.	3. Check for shorted or open wires. Repair wiring, if required.
	4. Radio/amplifier (if equipped) ground damaged.	4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Radio/amplifier (if equipped) inoperative.	5. Refer to appropriate Diagnostic Service Information.
	6. Speakers inoperative.	6. Refer to speaker diagnosis.
NO RADIO DISPLAY	1. Fuse inoperative.	1. Check radio fuse and Ignition-Off Draw (IOD) fuse in Integrated Power Module (IPM). Replace fuses, if required.
	2. Radio connector damaged.	2. Check for loose or corroded radio connector. Repair, if required.

CONDITION	POSSIBLE CAUSES	CORRECTION
	3. Wiring damaged.	3. Check for battery voltage at radio connector. Repair wiring, if required.
	4. Radio ground damaged.	4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Radio inoperative.	5. Refer to appropriate Diagnostic Service Information.
CLOCK WILL NOT KEEP SET TIME	1. Fuse inoperative.	1. Check Ignition-Off Draw (IOD) fuse in the Integrated Power Module (IPM). Replace fuse, if required.
	2. Radio connector damaged.	2. Check for loose or corroded radio connector. Repair, if required.
	3. Wiring damaged.	3. Check for battery voltage at radio connector. Repair wiring, if required.
	4. Radio ground faulty.	4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Radio inoperative.	5. Refer to appropriate Diagnostic Service Information.
POOR RADIO RECEPTION	1. Antenna inoperative.	1. (Refer to 8 - ELECTRICAL/AUDIO/ANTENNA BODY & CABLE - DIAGNOSIS AND TESTING).
	2. Radio ground damaged.	2. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	3. Radio noise suppression damaged.	3. Repair or replace ground strap as necessary.
	4. Radio inoperative.	4. Refer to appropriate Diagnostic Service Information.
SOUND DISTORTION (VIBRATION FROM SPEAKER AREA, BUZZING - HUMMING)	1. Door trim panel loose or missing fasteners.	1. Inspect door trim panel and correct as necessary. Replace any missing fasteners.
	2. Water shield loose or misaligned.	2. Inspect water shield and adjust as required.
	3. Items placed in door trim panel map pockets vibrating or moving from side to side.	Remove items from door trim panel. Ensure that vibration is no longer present.
NO COMPACT DISC OPERATION		AVOID USING CD'S OR DVD'S WITH HOME-MADE TYPE ADHESIVE LABELS AS THEY MAY CAUSE DISC TO BECOME JAMMED IN PLAYER
	1. CD faulty.	1. Insert known good CD and test operation.
	2. Foreign material on CD.	2. Clean CD and test operation.
	3. Condensation on CD or optics.	3. Allow temperature of vehicle interior to stabilize and test operation.
	4. Radio inoperative.	4. Refer to appropriate Diagnostic Service Information.

VIDEO SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
NO VIDEO (DVD PLAYER WILL NOT LOAD OR EJECT)	1. FUSE INOPERATIVE. 2. LOOSE OR DAMAGED DVD PLAYER CONNECTOR 3. LOOSE OR DAMAGED WIRING/DVD PLAYER INOPERATIVE 4. GROUND CONNECTION DAMAGED 5. DVD PLAYER DAMAGED 6. DVD DAMAGED. AVOID USING CD'S OR DVD'S THAT HAVE ADHESIVE TYPE LABELS, AS THEY MAY CAUSE THE DISC TO BECOME JAMMED.	1. CHECK FUSES. REPLACE FUSES IF REQUIRED. 2. CHECK FOR LOOSE OR CORRODED DVD PLAYER CONNECTOR (16 PIN). REPAIR OR REPLACE AS REQUIRED. 3. CHECK PIN 1 (B+) AND PIN 9 (GROUND) OF THE 16 PIN CONNECTOR, THEN CHECK PIN 1 (B+) AND PIN 7 (GROUND) OF THE 12 PIN CONNECTOR. IF THE 16 PIN CONNECTOR DOES NOT SHOW VOLTAGE, THE 12 PIN CONNECTOR WILL NOT SHOW VOLTAGE (THE 12 PIN IS FED FROM THE 16 PIN). IF VOLTAGE IS OK ON THE 16 PIN, BUT NOT PRESENT ON THE 12 PIN, UNPLUG THE 12 PIN HARNESS FROM THE PLAYER AND CHECK THE CONNECTOR PINSON THE BACK OF THE PLAYER. IF VOLTAGE IS PRESENT ON THE 12 PIN CONNECTOR, THE SCREEN OR THE 12 PIN HARNESS SHOULD BE REPLACED. IF THERE IS STILL NO VOLTAGE ON THE 12 PIN CONNECTOR, THE DVD PLAYER SHOULD BE REPLACED. 4. CHECK FOR CONTINUITY BETWEEN DVD PLAYER AND A KNOWN GOOD GROUND. THERE SHOULD BE CONTINUITY. REPAIR GROUND IF REQUIRED. 5. EXCHANGE OR REPLACE DVD PLAYER IF REQUIRED. 6. INSERT KNOWN GOOD DVD AND TEST OPERATION.
NO DISPLAY. AUDIO HEARD THROUGH SPEAKERS	1. LOOSE OR DAMAGED CONNECTORS	1. CHECK FOR LOOSE OR CORRODED DVD PLAYER CONNECTOR (12 PIN). CHECK FOR LOOSE OR CORRODED VIDEO SCREEN CONNECTOR. REPAIR IF REQUIRED. CHECK FOR LOOSE OR DAMAGED IN-LINE CONNECTOR.

CONDITION	POSSIBLE CAUSES	CORRECTION
	2. WIRING DAMAGED	2. WITH HARNESS CONNECTED, CHECK FOR VIDEO SIGNAL VOLTAGE AT DVD PLAYER AND AT VIDEO SCREEN HARNESS. PLACE KNOWN GOOD DVD INTO DVD PLAYER. PLACE POSITIVE LEAD OF VOLTMETER ON PIN 5 (VIDEO SIGNAL) OF THE 12 PIN CONNECTOR. PLACE NEGATIVE LEAD ON PIN 6 (VIDEO GROUND). READINGS SHOULD BE BETWEEN 0.1V TO 2V DC.
	3. VIDEO SCREEN DAMAGED	3. EXCHANGE OR REPLACE VIDEO SCREEN IF REQUIRED.
WHITE DISPLAY	1. LOW VOLTAGE	1. CHECK FOR BATTERY VOLTAGE (9V-16V) AT DVD PLAYER 12 PIN CONNECTOR (PIN 1-BATTERY, PIN 7-GROUND). DISPLAY WILL BE WHITE IF VOLTAGE DROPS BELOW 6V.
	2. VIDEO SCREEN DAMAGED	2. EXCHANGE OR REPLACE VIDEO SCREEN IF REQUIRED.
DARK OR BRIGHT SPOTS ON SCREEN	1. BRIGHTNESS SETTING REQUIRES ADJUSTMENT.	1. ADJUST BRIGHTNESS SETTING OF VIDEO SCREEN BY PRESSING BUTTONS ON SIDE OF VIDEO SCREEN UNTIL DESIRED LEVEL IS REACHED. START WITH A BLACK SCREEN, THEN PRESS BUTTON UP 16-20 TIMES. THERE ARE 64 TOTAL STEPS OF BRIGHTNESS.
BRIGHT OR DARK DISPLAY	1. VIDEO SCREEN DISPLAY PIXEL DEFECT.	1. THE ACCEPTABLE LEVEL OF DOTS ON THE SCREEN IS (GREEN-1, RED-2) OR A TOTAL (GREEN+RED+BLUE+WHITE+BLACK) = 8. REPLACE OR EXCHANGE VIDEO SCREEN IF NECESSARY.
VIDEO SELECTIONS DO NOT APPEAR FULL SCREEN WIDTH	1. ASPECT RATIO IS SET INCORRECTLY.	1. USING MODE BUTTON, ADJUST UNTIL VIDEO APPEARS CORRECTLY.
	2. SOME DVD'S ARE TWO SIDED. ONE SIDE IS WIDE SCREEN FORMAT AND THE OTHER IS FULL SCREEN OR THERE MAY BE A WIDE SCREEN OR STANDARD SCREEN FORMAT ON THE DISC.	2. ENSURE THAT DVD IS INSERTED CORRECTLY.

CONDITION	POSSIBLE CAUSES	CORRECTION
BUTTONS ON VIDEO SCREEN INOPERATIVE	1. VIDEO SCREEN DAMAGED.	1. PLACE KNOWN GOOD DVD INTO DVD PLAYER. ONCE IMAGE APPEARS ON VIDEO SCREEN, PRESS TOP BUTTON ON SIDE OF VIDEO SCREEN TO ADJUST WIDTH OF DISPLAY. PRESS BOTTOM BUTTONS TO ADJUST BRIGHTNESS. ONCE DVD MENU APPEARS ON VIDEO SCREEN, PRESS MIDDLE BUTTON ON VIDEO SCREEN. HIGHLIGHTED SELECTION WILL BEGIN TO PLAY. IF ANY OF THE BUTTONS DO NOT FUNCTION, REPLACE OR EXCHANGE VIDEO SCREEN.

SPECIAL TOOLS

AUDIO SYSTEMS

AMPLIFIER

DESCRIPTION

Vehicles equipped with the Boston Acoustics speaker package have a separate amplifier unit. The amplifier (2) is rated at 288 watts. The amplifier is mounted to the left rear quarter panel behind the quarter trim panel.

OPERATION

The amplifier receives fused battery current from a fuse in the Integrated Power Module (IPM) at all times. The internal circuitry of the amplifier switches the amplifier on based upon a CAN bus message that is received from the radio receiver whenever the radio is turned on. The amplifier receives the sound signal inputs from the left and right rear outputs of the radio, then sends the amplified speaker outputs for each of those channels to the speakers.

DIAGNOSIS AND TESTING

AMPLIFIER

Any diagnosis of the Audio system should begin with the use of a scan tool and the appropriate Diagnostic Service information.

For complete circuit diagrams, refer to the appropriate wiring information.

The amplifier unit should be checked if there is no sound output noted from the speakers. For diagnosis of the power amplifier, (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - DIAGNOSIS AND TESTING).

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE SUPPLEMENTAL RESTRAINT SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, DRIVER AIRBAG, PASSENGER AIRBAG, SEAT BELT TENSIONER, SIDE CURTAIN AIRBAG, FRONT IMPACT SENSOR, SIDE IMPACT SENSOR, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE SUPPLEMENTAL RESTRAINT SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

1. Disconnect and isolate the battery negative cable.
2. Remove the left quarter trim panel.
3. Disconnect the two wire harness connectors from the amplifier.
4. Remove the mounting fasteners.
5. Remove the amplifier.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE SUPPLEMENTAL RESTRAINT SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, DRIVER AIRBAG, PASSENGER AIRBAG, SEAT BELT TENSIONER, SIDE CURTAIN AIRBAG, FRONT IMPACT SENSOR, SIDE IMPACT SENSOR, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE SUPPLEMENTAL RESTRAINT SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

1. Position the amplifier into place.
2. Install and tighten the mounting fasteners.
3. Connect the two wire harness connectors.
4. Install the left quarter trim panel.
5. Connect the battery negative cable.

ANTENNA BODY & CABLE

DESCRIPTION

DOMESTIC

The antenna body and cable is secured below the fender panel by the antenna cap nut through a mounting hole in the side of the right front fender. The primary coaxial antenna cable is then routed beneath the fender sheet metal and through a entry hole in the right cowl side panel into the interior of the vehicle. Inside the vehicle, the primary coaxial cable is connected to a secondary instrument panel antenna coaxial cable with an in-line connector that is located behind the right kick panel. The instrument panel antenna cable is then routed behind the instrument panel to the back of the radio.

EXPORT

The primary coaxial antenna cable (1) is routed behind the A-pillar trim, up the right side of the roof panel above the headliner. The cable is connected to a secondary instrument panel antenna coaxial cable with an in-line connector that is located behind the A-pillar trim. At the other end, the cable is connected to the antenna module (2). The instrument panel antenna cable is then routed behind the instrument panel to the back of the radio.

OPERATION

The antenna body and cable connects the antenna mast to the radio. The radio antenna is an electromagnetic circuit component used to capture radio frequency signals that are broadcast by local commercial radio stations in both the Amplitude Modulating (AM) and Frequency Modulating (FM) frequency ranges. These electromagnetic radio frequency signals induce small electrical modulations into the antenna as they move past the mast. The antenna body transfers the weak electromagnetic radio waves induced into the rigid antenna mast into the center conductor of the flexible primary antenna coaxial cable. The braided outer shield of the antenna coaxial cable is grounded through both the antenna body and the radio chassis, effectively shielding the radio waves as they are conducted to the radio. The radio then tunes and amplifies the weak radio signals into stronger electrical signals in order to operate the audio system speakers.

DIAGNOSIS AND TESTING

ANTENNA BODY AND CABLE

The following four tests are used to diagnose the antenna with an ohmmeter:

- **Test 1** - Mast to ground test
- **Test 2** - Tip-of-mast to tip-of-conductor test
- **Test 3** - Body ground to battery ground test
- **Test 4** - Body ground to antenna coaxial cable shield test.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

The ohmmeter test lead connections for each test are shown in the illustration.

NOTE: This model has a two-piece antenna coaxial cable. Tests 2 and 4 must be conducted in two steps to isolate an antenna cable problem. First, test the primary antenna cable (integral to the antenna body and cable) from the coaxial cable connector under the right end of the instrument panel near the right cowl side inner panel to the antenna body. Then, test the secondary antenna cable (instrument panel antenna cable) from the coaxial cable connector under the right end of the instrument panel near the right cowl side inner panel to the coaxial cable connector at the radio.

NOTE: Use extreme caution when checking continuity of center conductor to avoid damage.

TEST 1

Test 1 determines if the antenna mast is insulated from ground. Proceed as follows:

1. Disconnect and isolate the antenna coaxial cable connector under the right end of the instrument panel near the right cowl side inner panel.

2. Touch one ohmmeter test lead to the tip of the antenna mast. Touch the other test lead to the antenna cap nut. Check the ohmmeter reading for continuity.
3. There should be no continuity. If OK, go to Test 2. If not OK, replace the faulty antenna body and cable.

TEST 2

Test 2 checks the antenna conductor components for an open circuit. This test should be performed first on the entire antenna circuit, from the antenna mast to the center conductor of the coaxial cable connector at the radio. If an open circuit is detected, each of the three antenna conductor components (antenna mast, antenna body and primary cable unit, instrument panel antenna secondary cable) should be isolated and tested individually to locate the exact component that is the source of the open circuit. To begin this test, proceed as follows:

1. Disconnect the instrument panel (secondary) antenna cable coaxial connector from the back of the radio.
2. Touch one ohmmeter test lead to the tip of the antenna mast. Touch the other test lead to the center conductor pin of the instrument panel antenna cable coaxial connector for the radio. Check the ohmmeter reading for continuity.
3. There should be continuity. The ohmmeter should register only a fraction of an ohm resistance. High or infinite resistance indicates a damaged or open antenna conductor. If OK, go to Test 3. If not OK, isolate and test each of the individual antenna conductor components. Replace only the faulty antenna conductor component.

TEST 3

Test 3 checks the condition of the vehicle body ground connection. To begin this test, proceed as follows:

1. This test must be performed with the battery positive cable disconnected from the battery. Disconnect and isolate both battery cables, negative cable first.
2. Reconnect the battery negative cable.
3. Touch one ohmmeter test lead to a good clean ground point on the vehicle fender. Touch the other test lead to the battery negative terminal post. Check the ohmmeter reading for continuity.
4. There should be continuity. The ohmmeter should register less than one ohm resistance. High or infinite resistance indicates a loose, corroded, or damaged connection between the battery negative terminal and the vehicle body. If OK, go to Test 4. If not OK, check the battery negative cable connection to the vehicle body and the radio noise suppression ground strap connections to the engine and the vehicle body for being loose or corroded. Clean or tighten these connections as required.

TEST 4

Test 4 checks the condition of the connection between the antenna coaxial cable shield and the vehicle body ground as follows:

1. Disconnect and isolate the antenna coaxial cable connector under the right end of the instrument panel near the right cowl side inner panel.
2. Touch one ohmmeter test lead to a good clean ground point on the vehicle fender. Touch the other test lead to the outer crimp on the antenna coaxial cable connector under the right end of the instrument panel near the right cowl side inner panel. Check the ohmmeter reading for continuity.
3. There should be continuity. The ohmmeter should register less than one ohm resistance. High or infinite resistance indicates a loose, corroded, or damaged connection between the antenna body and the vehicle body or between the antenna body and the antenna coaxial cable shield. If not OK, clean the antenna body to fender mating surfaces and tighten the antenna cap nut to specifications.
4. Check the resistance again with an ohmmeter. If the resistance is still more than one ohm, replace the faulty antenna body and cable.

REMOVAL

DOMESTIC

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

1. Disconnect and isolate the battery negative cable.
2. Remove the right side cowl trim cover.
3. Remove the glove box.
4. Reach under the instrument panel outboard of the glove box to access and disconnect the antenna coaxial cable connector (2). Disconnect the connector by pulling it apart while twisting the metal connector halves. Do not pull on the cable.
5. Disengage the antenna coaxial cable retainer at the right cowl side inner panel.

6. Remove the right side wheelhouse splash shield.
7. Unscrew the antenna mast from the antenna body.
8. Remove the antenna cap nut using an antenna nut wrench (Special Tool C-4816)
9. Remove the antenna adapter from the top of the fender.
10. Lower the antenna body through the mounting hole in the top of the fender.
11. Disengage the antenna coaxial cable grommet from the hole in the right cowl side outer panel.
12. Pull the antenna body and cable out through the opening between the right cowl side outer panel and the fender.

EXPORT

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

1. Disconnect and isolate the battery negative cable.
2. Remove the assist handles on the right side of the headliner.
3. Remove the right side visor.
4. Remove the A-pillar trim.
5. Disconnect antenna cable from instrument panel antenna cable.
6. Lower headliner as necessary to access antenna cable.
7. Disconnect antenna cable from antenna module.
8. Remove antenna cable from roof panel by pulling on retaining clips.

INSTALLATION

DOMESTIC

1. Position the antenna body and cable in the opening between the right cowl side outer panel and the fender.
2. Push the antenna coaxial cable into the passenger compartment through the hole in the right cowl side outer panel.
3. Engage the antenna coaxial cable grommet in the hole in the right cowl side outer panel.
4. Position the antenna body through the mounting hole in the top of the fender.
5. Install the adapter over the antenna body from the top of the fender.
6. Install and tighten the antenna cap nut using an antenna nut wrench (Special Tool C-4816).
7. Install and tighten the antenna mast onto the antenna body. **Ensure that the antenna mast is fully seated on antenna base and that there is no gap between the mast and base.**

8. Engage the antenna coaxial cable retainers at the right cowl side inner panel and inside the right front fender.
9. Engage the antenna coaxial cable in the retainer clips on the lower instrument panel support behind the glovebox.
10. Reach under the instrument panel outboard of the glove box to connect the antenna cable (2) to the instrument panel antenna cable (1).
11. Install the glove box.
12. Install the cowl trim cover.
13. Install the wheelhouse splash shield.
14. Connect the battery negative cable.

EXPORT

1. Install antenna cable to the roof panel by pressing retaining clips into position.
2. Connect antenna cable to the antenna module.

3. Connect antenna cable to the instrument panel antenna cable.
4. Raise headliner into position.
5. Install A-pillar trim.
6. Install the right side sunvisor.
7. Install the assist handles.
8. Connect the battery negative cable.

**ANTENNA CABLE - INSTRUMENT PANEL****REMOVAL**

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

DOMESTIC

1. Disconnect and isolate the battery negative cable.
2. Remove radio (Refer to 8 - ELECTRICAL/AUDIO/RADIO - REMOVAL).

CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.

3. Disconnect the antenna cable by pulling the locking antenna connector (2) away from the radio (1).

4. Remove the glove box.
5. Remove instrument panel side panel.
6. Disconnect instrument panel cable (1) from antenna body and cable (2).

7. Remove the antenna retaining straps and remove antenna cable (4).

EXPORT

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument panel (Refer to 23 - BODY/ INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).

CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.

3. Disconnect the antenna cable by pulling the locking antenna connector (2) away from the radio (1).
4. Disengage each of the retainers that secure the cable (2) to the instrument panel and remove cable.

INSTALLATION

DOMESTIC

1. Install cable (3) to instrument panel and secure into place.

2. Connect instrument panel cable (1) to antenna body and cable (2).
3. Install instrument panel side panel.
4. Install glove box.

5. Connect instrument panel cable (3) to radio (1).
6. Install radio (Refer to 8 - ELECTRICAL/AUDIO/RADIO - INSTALLATION).
7. Connect battery negative cable.

EXPORT

1. Install instrument panel cable (2) to instrument panel and secure into place.

2. Connect instrument panel cable (3) to radio.
3. Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).
4. Connect the battery negative cable.

ANTENNA CABLE - SATELLITE RADIO

REMOVAL

1. Disconnect and isolate the battery cable.
2. Remove D-pillar trim.
3. Remove headliner (Refer to 23 - BODY/INTERIOR/ HEADLINER - REMOVAL).
4. Disconnect antenna cable (1) from antenna (2).
5. Remove antenna cable retainers from D-pillar and roof panel.

6. Disconnect antenna cable from satellite receiver.

INSTALLATION

1. Connect antenna cable to satellite receiver.

2. Install antenna cable retainers to D-pillar and roof panel.
3. Connect antenna cable (1) to satellite antenna (2).
4. Install headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).
5. Install D-pillar trim.
6. Connect battery negative cable.

ANTENNA - NAVIGATION RADIO

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the radio (Refer to 8 - ELECTRICAL/AUDIO/RADIO - REMOVAL).
3. Remove the mounting fasteners.
4. Remove the navigation radio antenna.

INSTALLATION

1. Position antenna to instrument panel.
2. Install and tighten mounting fasteners.
3. Install radio (Refer to 8 - ELECTRICAL/AUDIO/RADIO - INSTALLATION).
4. Connect battery negative cable.

ANTENNA - QUARTER GLASS

DESCRIPTION

The integral radio antenna element is bonded to the right rear quarter glass and is replaced with the glass assembly only.

OPERATION

The integral antenna receives RF (Radio Frequencies) and sends them to the antenna module for amplification.

DIAGNOSIS AND TESTING

QUARTER GLASS ANTENNA

For complete circuit diagrams, refer to the appropriate wiring information.

To detect breaks in the integral antenna elements, perform the following procedure:

1. Disconnect the antenna module connector from the antenna.
2. Using an Ohmmeter, place one test lead on the left hand terminal. Place the other test lead on the end of the conductor. Trace down the path to the end of the conductors. There should be continuity to each end of this conductive trace.
3. Place one test lead on the right hand terminal. Place the other test lead on the end of the conductor. Trace down the path to the end of the conductors. There should be continuity to each end of this conductive trace.
4. While keeping the Ohmmeter lead on the left hand terminal, place the other lead on the right hand terminal. There should be an open circuit with no continuity between the terminals.
5. A break in the antenna grid can be repaired using a Mopar Rear Window Defogger Repair Kit or equivalent.

ANTENNA-SATELLITE

DESCRIPTION

The satellite radio antenna is secured by a threaded fastener and two retainers which protrude through a hole in the roof panel. Two wires from the antenna are connected to the satellite receiver module.

OPERATION

The satellite radio antenna receives signals from orbiting satellites and sends these signals to the satellite receiver module. The satellite radio antenna must have open space in which to operate. Items carried on the roof, parking inside etc. can have an effect on the antenna's ability to receive signals.

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Lower the rear portion of the headliner as necessary to access underside of antenna (1) (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
3. Disconnect the wire harness connectors from the antenna.
4. Remove fastener and retainer.

- From inside the vehicle, and using a flat bladed tool, depress one of the retaining tabs on the antenna. Push up the one side of the antenna connector through the roof panel. Depress the other side of the connector and remove the antenna.

INSTALLATION

- Insert wire harness through hole in roof panel. Press antenna into position until both retainers snap into place.

2. Connect wire harness connectors to antenna.
3. Install and tighten retaining fastener.
4. Install headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).
5. Connect battery negative cable.

MODULE - ANTENNA

DESCRIPTION

The antenna module is an electromagnetic circuit component designed to capture and enhance RF (Radio Frequency) signals in both the AM and FM broadcast bands. The antenna module is mounted to the right rear roof rail under the headliner. The mounting brackets also serve as the ground circuit. The antenna module has a two wire electrical connector that connects to the integral radio antenna, located on the right rear quarter glass. A connector for the radio coax cable and battery voltage are on the top of the antenna module.

OPERATION

The antenna module receives both AM and FM radio signals supplied by the side window integral radio antenna system and selectively amplifies them while at the same time avoiding unusable or unwanted signals. The amplified signal is then sent through the body length coax cable to the radio input.

DIAGNOSIS AND TESTING

MODULE - ANTENNA

ANTENNA MODULE DIAGNOSIS TABLE

CONDITION	POSSIBLE CAUSES	CORRECTION
NO AM RECEPTION, WEAK FM RECEPTION	<ol style="list-style-type: none"> 1. Antenna module to antenna connector open or disconnected. 2. Coax open or disconnected. 3. No battery power at antenna module. 	<ol style="list-style-type: none"> 1. Repair open, reconnect antenna module connector to glass mounted antenna. 2. Repair open, reconnect coax. 3. Check fuse. if okay, repair open in battery voltage circuit.
NO AM OR FM RECEPTION	<ol style="list-style-type: none"> 1. Coax disconnected at radio. 2. Coax shorted to ground. 	<ol style="list-style-type: none"> 1. Reconnect coax. 2. Repair or Replace coax
WEAK OR NO AM/FM RECEPTION	<ol style="list-style-type: none"> 1. Antenna Module inoperative. 	<ol style="list-style-type: none"> 1. Substitute a known good module to see if reception improves. Replace antenna module as necessary.

REMOVAL

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

1. Disconnect and isolate the battery negative cable.
2. Lower the right side of the headliner.
3. Disconnect the antenna module connector from the integral antenna.
4. Remove the mounting fasteners and the antenna module.
5. Disconnect the battery power lead connector from the antenna module.
6. Disconnect the coax lead from the antenna module.

INSTALLATION

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

1. Connect antenna cable to antenna module.
2. Connect battery power supply lead to antenna module.
3. Position antenna module onto right side upper roof rail. Install and tighten mounting fasteners.
4. Connect antenna module lead to the integral antenna.
5. Install headliner.

MONITOR-MEDIA SYSTEM

DESCRIPTION

The video entertainment system, consist of:

- Battery powered remote control
- DVD player located at the end of the center floor console
- Two headsets
- Video monitor (3) located on the headliner (2)

In addition to video DVDs, the system will play audio DVDs, audio CDs, MP3 audio disc, and video CDs. There are plug-in jacks on the DVD player, to show video directly from a video camera, connect video games for display on the screen, and play music directly from a MP3 player.

OPERATION

A seven inch (diagonal measurement) liquid crystal display (LCD) screen supports both 3 X 4 and 6 X 9 video formats. The hinged screen latches in the closed position and swings down for viewing.

REMOVAL

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

1. Disconnect and isolate the battery negative cable.
2. Remove the two mounting fasteners.
3. Using a trim stick, press the retaining clip at the rear of the monitor (3). Move the monitor from side to side to release from headliner (2).
4. Disconnect electrical harness connector (1) and remove monitor.

INSTALLATION

1. Connect electrical harness connector (1) to monitor (3).
2. Position monitor and press into place.
3. Install and tighten mounting fasteners.
4. Connect battery negative cable.

PLAYER - DVD

DESCRIPTION

The video entertainment system, consist of:

- Battery powered remote control
- DVD player located at the end of the center floor console
- Two headsets
- Video monitor located on the headliner

In addition to video DVDs, the system will play audio DVDs, audio CDs, MP3 audio disc, and video CDs. There are plug-in jacks on the DVD player to show video directly from a video camera, connect video games for display on the screen, and play music directly from a MP3 player.

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Using a trim stick, gently pry on the sides of the DVD player and separate from console.
3. Disconnect electrical harness connector from DVD player.

INSTALLATION

1. Connect electrical harness connector to DVD player.
2. Position player to console and press into place.
3. Connect battery negative cable.

RADIO

DESCRIPTION

Available radios include:

- AM/FM/CD (REF sales code)
- AM/FM/6 disc CD/MP3 (RAQ sales code)
- AM/FM/cassette/CD/RDS/MP3 (RAK sales code)
- AM/FM/6CD/RDS/MP3/Navigation with integrated display (REC sales code)
- AM/FM/CD/RDS/MP3 (RAR sales code) - export only
- AM/FM/CD (REG sales code) - export only
- AM/FM/6CD/RDS/MP3/Navigation with integrated display (REJ sales code) - export only

REMOVAL

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).
3. Remove the radio mounting fasteners.

CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.

4. Disconnect the antenna cable (3) by pulling the locking antenna connector (2) away from the radio (1).

5. Disconnect the electrical harness connector and remove radio.

INSTALLATION

1. Connect antenna cable (3) to radio (1).

2. Connect the electrical harness connector to radio.

3. Position radio to instrument panel. Install and tighten mounting fasteners.
4. Install instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).

RADIO NOISE SUPPRESSION COMPONENTS

DESCRIPTION

Radio noise suppression devices are installed on this vehicle. Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) can be produced by any on-board or external source of electromagnetic energy. These electromagnetic energy sources can radiate electromagnetic signals through the air, or conduct them through the vehicle electrical system.

When the audio system converts RFI or EMI to an audible acoustic wave form, it is referred to as radio noise. This undesirable radio noise is generally manifested in the form of "buzzing," "hissing," "popping," "clicking," "crackling," and/or "whirring" sounds. In most cases, RFI and EMI radio noise can be suppressed using a combination of vehicle and component grounding, filtering and shielding techniques. This vehicle is equipped with radio noise suppression devices that were designed to minimize exposure to typical sources of RFI and EMI; thereby, minimizing radio noise complaints.

Radio noise suppression is accomplished primarily through circuitry or devices that are integral to the radios, audio power amplifiers and other on-board electrical components such as generators, wiper motors, blower motors, and fuel pumps that have been found to be potential sources of RFI or EMI. External radio noise suppression devices that are used on this vehicle to control RFI or EMI, and can be serviced, include the following:

- **Engine-to-bulkhead ground strap** - This length of braided ground strap has an eyelet terminal connector crimped to each end. One end is secured to the engine cylinder heads. The other is secured to the bulkhead.
- **Resistor-type spark plugs** - This type of spark plug has an internal resistor connected in series between the spark plug terminal and the center electrode to help reduce the production of electromagnetic radiation that can result in radio noise.
- **Exhaust-to-frame ground strap** - This length of braided ground strap has an eyelet terminal connector crimped to each end. One end is secured to the exhaust pipe. The other is secured to the frame.

OPERATION

There are two common strategies that can be used to suppress Radio Frequency Interference (RFI) and Electro-Magnetic Interference (EMI) radio noise. The first suppression strategy involves preventing the production of RFI and EMI electromagnetic signals at their sources. The second suppression strategy involves preventing the reception of RFI and EMI electromagnetic signals by the audio system components.

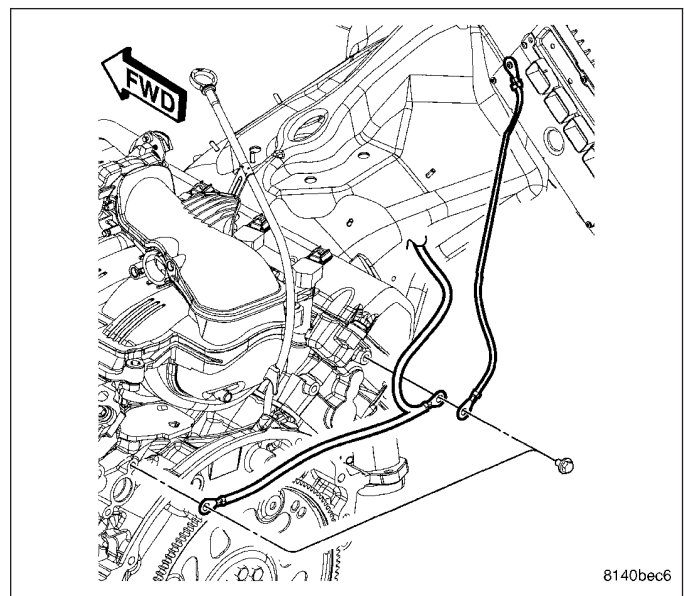

The use of braided ground straps in key locations is part of the RFI and EMI prevention strategy. These ground straps ensure adequate ground paths, particularly for high current components such as many of those found in the starting, charging, ignition, engine control and transmission control systems. An insufficient ground path for any of these high current components may result in radio noise caused by induced voltages created as the high current seeks alternative ground paths through components or circuits intended for use by, or in close proximity to the audio system components or circuits.

Preventing the reception of RFI and EMI is accomplished by ensuring that the audio system components are correctly installed in the vehicle. Loose, corroded or improperly soldered wire harness connections, improperly routed wiring and inadequate audio system component grounding can all contribute to the reception of RFI and EMI. A properly grounded antenna body and radio chassis, as well as a shielded antenna coaxial cable with clean and tight connections will each help reduce the potential for reception of RFI and EMI.

REMOVAL

ENGINE TO BULKHEAD - 4.7L

1. Disconnect and isolate the battery negative cable.
2. Remove mounting fasteners from engine cylinder heads.

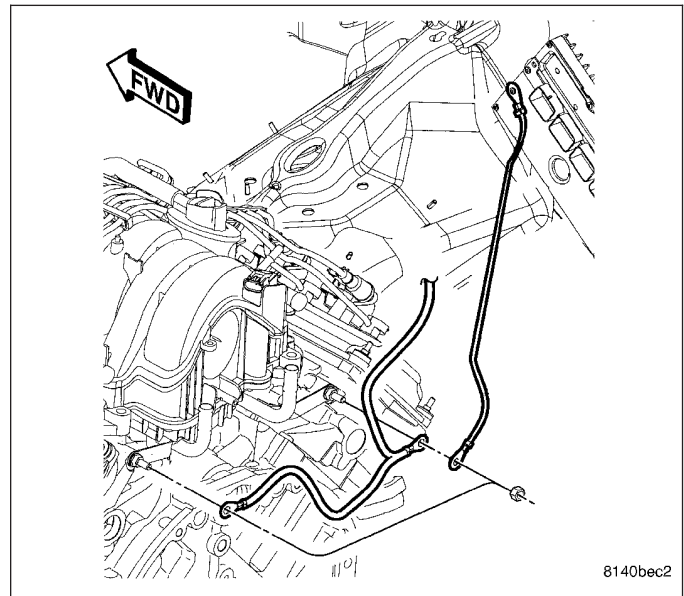

3. Remove mounting fastener from bulkhead and remove cable.

ENGINE TO BULKHEAD - 5.7L

1. Disconnect and isolate the battery negative cable.
2. Remove mounting fasteners from engine cylinder heads.

3. Remove mounting fastener from bulkhead and remove cable.

EXHAUST TO FRAME

1. Disconnect and isolate the battery negative cable.
2. Remove mounting fastener from exhaust pipe.
3. Remove mounting fastener from frame and remove cable.

INSTALLATION

ENGINE TO BULKHEAD - 4.7L

1. Position cable to cylinder heads.
2. Install and tighten mounting fasteners.

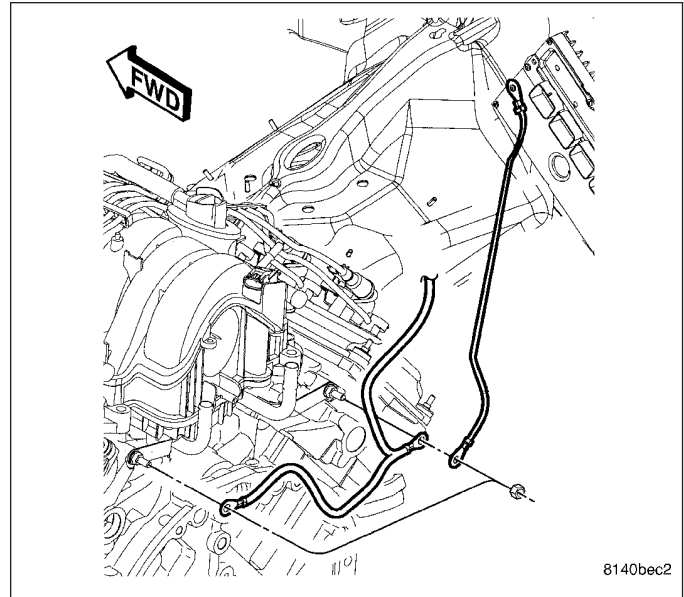

3. Position cable to bulkhead.
4. Install and tighten mounting fastener.
5. Connect battery negative cable.

ENGINE TO BULKHEAD - 5.7L

1. Position cable to cylinder heads.
2. Install and tighten mounting fasteners.

3. Position cable to bulkhead.
4. Install and tighten mounting fastener.
5. Connect battery negative cable.

EXHAUST TO FRAME

1. Position cable to exhaust pipe
2. Install and tighten mounting fastener to exhaust pipe.
3. Position cable to frame.
4. Install and tighten mounting fastener.
5. Connect battery negative cable.

RECEIVER-SATELLITE

DESCRIPTION

The satellite receiver is located in the right rear quarter area behind the trim panel. It is secured with three mounting fasteners.

OPERATION

The satellite receiver module receives signals from the roof mounted antenna and processes this information before it is sent to the radio. The module operates on both battery feed circuits and CAN bus messages. It will operate with the ignition key in the run or accessory position only.

REMOVAL

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

1. Disconnect and isolate the battery negative cable.
2. Remove the right quarter trim.
3. Remove the mounting fasteners.
4. Disconnect the antenna and electrical harness connectors.
5. Remove the module.

INSTALLATION

1. Connect antenna and electrical harness connector to module.

2. Position module to quarter panel.
3. Install and tighten mounting fasteners.
4. Install quarter trim panel.
5. Connect battery negative cable.

SWITCH - REMOTE RADIO

DESCRIPTION

Two rocker-type switches (2) are mounted in the sides of the rear (instrument panel side) steering wheel trim cover. The switch on the left spoke is the seek switch and has seek up, seek down, and preset station advance functions. The switch on the right spoke is the volume control switch and has volume up, and volume down functions. The switch on the right spoke also includes a "mode" control that allows the driver to sequentially select AM radio, FM radio, cassette player or CD player.

OPERATION

The six switches in the two remote radio switch units are normally open, resistor multiplexed momentary switches that are hard wired to the Instrument cluster through the clockspring. The instrument cluster sends a five volt reference signal to both switch units on one circuit, and senses the status of all of the switches by reading the voltage drop on a second circuit.

When the instrument cluster senses an input (voltage drop) from any one of the remote radio switches, it sends the proper switch status messages on the Controller Area Network (CAN) data bus to the radio. The electronic circuitry within the radio is programmed to respond to these remote radio switch status messages by adjusting the radio settings as requested.

DIAGNOSIS AND TESTING

REMOTE SWITCHES

Any diagnosis of the Audio system should begin with the use of a scan tool and the appropriate Diagnostic Service information.

Refer to the appropriate wiring information.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

1. Remove the remote radio switch(es) (1) and (2) from the steering wheel (Refer to 8 - ELECTRICAL/AUDIO/REMOTE SWITCHES - REMOVAL).
2. Use an ohmmeter to check the switch resistances as shown in the Remote Radio Switch test table. If the remote radio switch resistances are not as indicated, replace the inoperative switch.

80b0d6f1

REMOTE RADIO SWITCH TEST

SWITCH	SWITCH POSITION	RESISTANCE
Right or Left	Neutral	24K Ohms ± 5%
Right (White)	Volume Up	6.8K Ohms ± 5%
Right (White)	Volume Down	15.6K Ohms ± 1%
Right (White)	Mode	0 Ohms

Left (Black)	Seek Down	3.3K Ohms ± 5%
Left (Black)	Pre-Set Station Advance	.47K Ohms ± 5%

REMOVAL

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

1. Disconnect and isolate the battery negative cable.
2. Remove the driver side airbag (5) from the steering wheel (1). (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).
3. Remove the speed control switch (3) or (6) located on the same side of the steering wheel as the remote radio switch that is being serviced. (Refer to 8 - ELECTRICAL/SPEED CONTROL/SWITCH - REMOVAL).
4. Disconnect the steering wheel wire harness connector from the connector receptacle of the remote radio switch.
5. Disengage the four remote radio switch latches that secure the switch to the inside of the mounting hole in the steering wheel rear trim cover.
6. From the outside of the steering wheel rear trim cover, remove the remote radio switch (2) from the trim cover.

INSTALLATION

1. Position the remote radio switch (2) to the mounting hole on the outside of the steering wheel rear trim cover. Be certain that the connector receptacle is oriented toward the bottom of the switch and pointed toward the center of the steering wheel.
2. Press firmly and evenly on the remote radio switch until each of the switch latches is fully engaged in the mounting hole of the steering wheel rear trim cover.
3. Reconnect the steering wheel wire harness connector to the connector receptacle of the remote radio switch.
4. Install the speed control switch (3) (6) onto the steering wheel. (Refer to 8 - ELECTRICAL/SPEED CONTROL/SWITCH - INSTALLATION).
5. Install the driver side airbag (5) to the steering wheel (1). (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).
6. Connect the battery negative cable.

SPEAKER

DESCRIPTION

STANDARD

The standard equipment speaker system includes speakers in six locations. One 6.4 centimeter (2.50 inch) diameter tweeter is installed on each end of the instrument panel. One 15.2 by 22.9 centimeter (6 by 9 inch) full-range speaker is located in each front door. There is also one full-range 16.5 centimeter (6.5 inch) diameter full-range speaker located in each rear door.

BOSTON ACOUSTICS

The Boston Acoustics speaker system includes speakers in six locations. Each of the standard speakers is replaced with Boston Acoustics speakers. One 6.4 centimeter (3.50 inch) diameter speaker is installed on each end of the instrument panel. One 15.2 by 22.9 centimeter (6 by 9 inch) speaker is located in each front door. One 16.5 centimeter (6.5 inch) diameter speaker is located in each rear door. The Boston Acoustics speaker system also includes an amplifier. The total available power of the premium speaker system is approximately 288 watts.

DIAGNOSIS AND TESTING

SPEAKER

Any diagnosis of the Audio system should begin with the use of a scan tool and the appropriate Diagnostic Service information.

Refer to the appropriate wiring information.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

CAUTION: The speaker output of the radio is a “floating ground” system. Do not allow any speaker lead to short to ground, as damage to the radio may result.

1. If all speakers are inoperative, check the radio fuses in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
2. Check the amplifier fuse (if equipped) in the junction block. If OK, go to Step 3. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
3. Turn the ignition switch to the ON position. Turn the radio receiver ON. Adjust the balance and fader control controls to check the performance of each individual speaker. Note the speaker locations that are not performing correctly. Go to Step 4.
4. Turn the radio OFF. Turn the ignition OFF. Disconnect and isolate the battery negative cable. If vehicle is **not** equipped with a amplifier, remove the radio receiver. If the vehicle is equipped with an amplifier, disconnect the wire harness connectors. There are two connectors. The one on the body harness has body speakers only. The other on the instrument panel harness has the instrument panel speakers, battery, ground, and CAN. Go to Step 5.
5. Check both the speaker feed (+) circuit and return (-) circuit cavities for the inoperative speaker at the wire harness connector for continuity to ground. There should be no continuity. If OK, go to Step 6. If not OK, repair the shorted speaker feed (+) and/or return (-) circuits(s) to the speaker as required.
6. Disconnect wire harness connector at the inoperative speaker. Check for continuity between the speaker feed (+) circuit cavities of the radio receiver wire harness connector or if equipped, the amplifier wire harness connector and the speaker wire harness connector. Repeat the check between the speaker return (-) circuit cavities of the radio receiver wire harness connector and the speaker wire harness connector. In each case, there should be continuity. If OK, replace the faulty speaker. If not OK, repair the open speaker feed (+) and/or return (-) circuits(s) as required.

REMOVAL

FRONT DOOR

1. Disconnect and isolate the battery negative cable.
2. Remove front door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
3. Remove mounting fasteners.

4. Remove speaker from door.
5. Disconnect wire harness connector from speaker.

INSTRUMENT PANEL

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

1. Disconnect and isolate the battery negative cable.
2. Remove speaker grille from instrument panel.
3. Remove speaker from instrument panel.
4. Disconnect wire harness connector from speaker.

REAR DOOR

1. Disconnect and isolate the battery negative cable.
2. Remove rear door trim panel (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL).
3. Remove mounting fasteners.

4. Remove speaker from door.
5. Disconnect wire harness connector from speaker.

INSTALLATION

FRONT DOOR

1. Connect wire harness connector to speaker.
2. Position speaker to door.

3. Install and tighten mounting fasteners.
4. Install front door trim panel.
5. Connect battery negative cable.

INSTRUMENT PANEL

1. Connect wire harness connector to speaker.
2. Position speaker to instrument panel.

3. Install and tighten mounting fasteners.
4. Install speaker grille.
5. Connect battery negative cable.

REAR DOOR

1. Connect wire harness connector to speaker.
2. Position speaker to door.

3. Install and tighten mounting fasteners.
4. Install rear door trim panel.
5. Connect battery negative cable.

CHIME/BUZZER - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B122C-PTS SENSOR 7 CIRCUIT LOW

MODULE-PARK ASSIST C1 (PARK ASSIST)

SENSOR-PARK ASSIST NO. 7 (REAR PARK ASSIST)

B122C-PTS SENSOR 7 CIRCUIT LOW (CONTINUED)

For the Park Assist circuit diagram (Refer to 8 - ELECTRICAL/CHIME/BUZZER - SCHEMATIC - ELECTRICAL).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
While the vehicle is in reverse for speeds less than 16km/h.
- **Set Condition:**
Sensor ring down time is too short (700 µsecs).

Possible Causes
(D700) PARK ASSIST SENSOR NO. 7 SIGNAL CIRCUIT SHORTED TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(D700) PARK ASSIST SENSOR NO. 7 SIGNAL CIRCUIT SHORTED TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT
(D700) PARK ASSIST SENSOR NO. 7 SIGNAL CIRCUIT SHORTED TO (Z914) PARK ASSIST MODULE GROUND CIRCUIT
(D700) PARK ASSIST SENSOR NO. 7 SIGNAL CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR NO. 7
PARK ASSIST MODULE

Diagnostic Test**1. CHECK FOR ACTIVE DTC: B122C-PTS SENSOR 7 CIRCUIT LOW**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is DTC: B122C-PTS SENSOR 7 CIRCUIT LOW active?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B122C-PTS SENSOR 7 CIRCUIT LOW (CONTINUED)

2. CHECK PARK ASSIST SENSOR NO. 7 FOR A SHORT TO GROUND

Shift the transmission into park.
 With the scan tool, erase DTCs.
 Turn the ignition off.
 Disconnect Park Assist Sensor No. 7.
 Turn the ignition on.
 Shift the transmission into reverse.
 With the scan tool, read Park Assist Module DTCs.

Does the scan tool display: B122C-PTS SENSOR 7 CIRCUIT LOW?

- Yes** >> Go To 3
- No** >> Replace Park Assist Sensor No. 7 in accordance with the service information.
 Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. CHECK THE (D700) PARK ASSIST SENSOR NO. 7 SIGNAL CIRCUIT FOR A SHORT TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT

Turn the ignition off.
 Disconnect the Park Assist Module harness connector.
 Measure the resistance between the (D700) Park Assist Sensor No. 7 Signal circuit and the (X750) Park Assist Sensor Ground circuit.

Is the resistance below 10K ohms?

- Yes** >> Repair the (D700) Park Assist Sensor No. 7 Signal circuit for a short to the (X750) Park Assist Sensor Ground circuit.
 Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)
- No** >> Go To 4

B122C-PTS SENSOR 7 CIRCUIT LOW (CONTINUED)

4. CHECK THE (D700) PARK ASSIST SENSOR NO. 7 SIGNAL CIRCUIT FOR A SHORT TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT

Measure the resistance between the (D700) Park Assist Sensor No. 7 Signal circuit and the (Z171) Park Assist Display Ground circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (D700) Park Assist Sensor No. 7 Signal circuit for a short to the (Z171) Park Assist Display Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 5

5. CHECK THE (D700) PARK ASSIST SENSOR NO. 7 SIGNAL CIRCUIT FOR A SHORT TO (Z914) PARK ASSIST MODULE GROUND CIRCUIT

Measure the resistance between the (D700) Park Assist Sensor No. 7 Signal circuit and the (Z914) Park Assist Module Ground circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (D700) Park Assist Sensor No. 7 Signal circuit for a short to the (Z914) Park Assist Module Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 6

B122C-PTS SENSOR 7 CIRCUIT LOW (CONTINUED)

6. CHECK THE (D700) PARK ASSIST SENSOR NO. 7 SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (D700) Park Assist Sensor No. 7 Signal circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (D700) Park Assist Sensor No. 7 Signal circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Park Assist Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B122E-PTS SENSOR 7 RING TIME TOO SHORT

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
While the vehicle is in reverse for speeds less than 16km/h.
- **Set Condition:**
Sensor ring down time exceeds limit (greater than 1450 µsecs).

Possible Causes
PARK ASSIST SENSOR NO. 7

Diagnostic Test**1. CHECK FOR ACTIVE DTC: B122E-PTS SENSOR 7 RING TIME TOO SHORT**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is DTC: B122E-PTS SENSOR 7 RING TIME TOO SHORT active?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. REPLACE PARK ASSIST SENSOR NO. 7**View Repair****Repair**

Replace Park Assist Sensor No. 7 in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B122F-PTS SENSOR 7 RING TIME TOO LONG

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
While the vehicle is in reverse for speeds less than 16km/h.
- **Set Condition:**
Data line stuck at 0.

Possible Causes
PARK ASSIST SENSOR NO. 7

Diagnostic Test

1. CHECK FOR ACTIVE DTC: B122F-PTS SENSOR 7 RING TIME TOO LONG

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is DTC: B122F-PTS SENSOR 7 RING TIME TOO LONG active?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. REPLACE PARK ASSIST SENSOR NO 7.

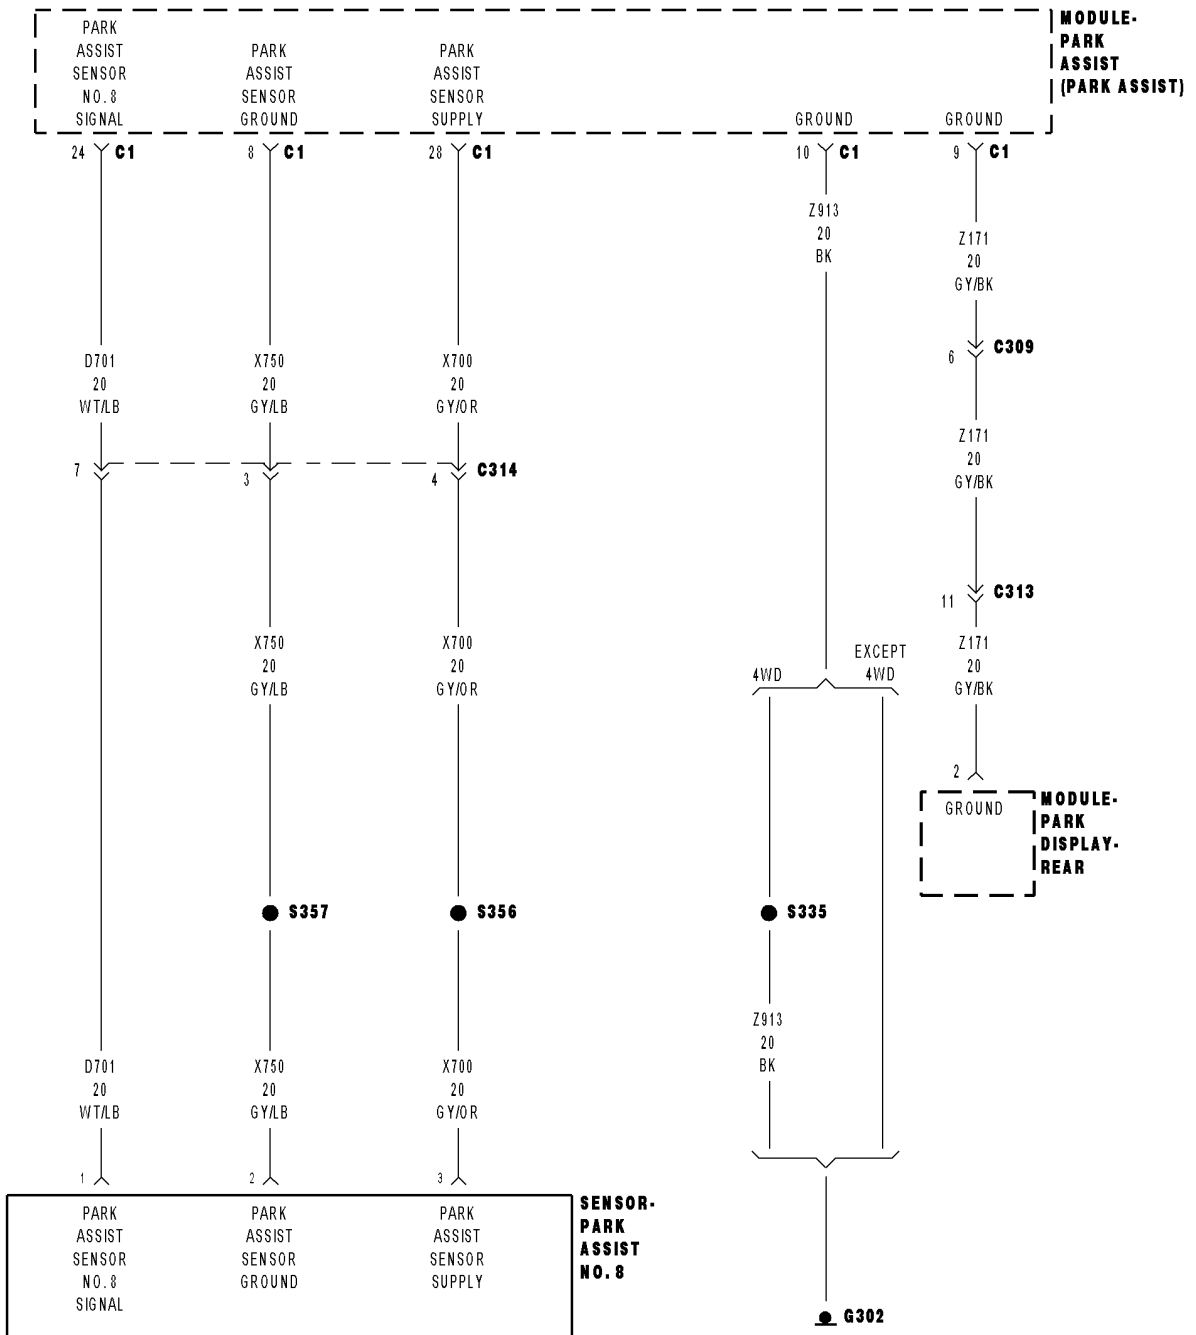

View Repair

Repair

Replace Park Assist Sensor No. 7 in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1231-PTS SENSOR 8 CIRCUIT LOW

MODULE-PARK ASSIST C1 (PARK ASSIST)

SENSOR-PARK ASSIST NO. 8 (REAR PARK ASSIST)

B1231-PTS SENSOR 8 CIRCUIT LOW (CONTINUED)

For the Park Assist circuit diagram (Refer to 8 - ELECTRICAL/CHIME/BUZZER - SCHEMATIC - ELECTRICAL).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
While the vehicle is in reverse for speeds less than 16km/h.
- **Set Condition:**
Sensor ring down time is too short (700 µsecs).

Possible Causes
(D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT SHORTED TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT SHORTED TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT
(D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT SHORTED TO (Z914) PARK ASSIST MODULE GROUND CIRCUIT
(D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR NO. 8
PARK ASSIST MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC: B1231-PTS SENSOR 8 CIRCUIT LOW

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is DTC: B1231-PTS SENSOR 8 CIRCUIT LOW active?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1231-PTS SENSOR 8 CIRCUIT LOW (CONTINUED)**2. CHECK PARK ASSIST SENSOR NO. 8 FOR A SHORT TO GROUND**

Shift the transmission into park.

With the scan tool, erase DTCs.

Turn the ignition off.

Disconnect Park Assist Sensor No. 8.

Turn the ignition on.

Shift the transmission into reverse.

With the scan tool, read Park Assist Module DTCs.

Does the scan tool display: B1231-PTS SENSOR 8 CIRCUIT LOW?

Yes >> Go To 3

No >> Replace Park Assist Sensor No. 8 in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**3. CHECK THE (D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT FOR A SHORT TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT**

Turn the ignition off.

Disconnect the Park Assist Module harness connector.

Measure the resistance between the (D701) Park Assist Sensor No. 8 Signal circuit and the (X750) Park Assist Sensor Ground circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (D701) Park Assist Sensor No. 8 Signal circuit for a short to the (X750) Park Assist Sensor Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 4

B1231-PTS SENSOR 8 CIRCUIT LOW (CONTINUED)

4. CHECK THE (D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT FOR A SHORT TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT

Measure the resistance between the (D701) Park Assist Sensor No. 8 Signal circuit and the (Z171) Park Assist Display Ground circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (D701) Park Assist Sensor No. 8 Signal circuit for a short to the (Z171) Park Assist Display Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 5

5. CHECK THE (D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT FOR A SHORT TO (Z914) PARK ASSIST MODULE GROUND CIRCUIT

Measure the resistance between the (D701) Park Assist Sensor No. 8 Signal circuit and the (Z914) Park Assist Module Ground circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (D701) Park Assist Sensor No. 8 Signal circuit for a short to the (Z914) Park Assist Module Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 6

B1231-PTS SENSOR 8 CIRCUIT LOW (CONTINUED)**6. CHECK THE (D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (D701) Park Assist Sensor No. 8 Signal circuit.

Is the resistance below 10K ohms?

- Yes** >> Repair the (D701) Park Assist Sensor No. 8 Signal circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)
- No** >> Replace the Park Assist Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1233-PTS SENSOR 8 RING TIME TOO SHORT

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
While the vehicle is in reverse for speeds less than 16km/h.
- **Set Condition:**
Sensor ring down time exceeds limit (greater than 1450 µsecs).

Possible Causes
PARK ASSIST SENSOR NO. 8

Diagnostic Test**1. CHECK FOR ACTIVE DTC: B1233-PTS SENSOR 8 RING TIME TOO SHORT**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into Reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is DTC: B1233-PTS SENSOR 8 RING TIME TOO SHORT active?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. (D703) PARK ASSIST SENSOR NO. 9 SIGNAL CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR NO. 9
PARK ASSIST MODULE

Diagnostic Test**1. CHECK FOR ACTIVE DTC: B1236-PTS SENSOR 9 CIRCUIT LOW**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is DTC: B1236-PTS SENSOR 9 CIRCUIT LOW active?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1236-PTS SENSOR 9 CIRCUIT LOW (CONTINUED)

2. CHECK PARK ASSIST SENSOR NO. 9 FOR A SHORT TO GROUND

Shift the transmission into park.
 With the scan tool, erase DTCs.
 Turn the ignition off.
 Disconnect Park Assist Sensor No. 9.
 Turn the ignition on.
 Shift the transmission into reverse.
 With the scan tool, read Park Assist Module DTCs.

Does the scan tool display: B1236-PTS SENSOR 9 CIRCUIT LOW?

- Yes** >> Go To 3
- No** >> Replace Park Assist Sensor No. 9 in accordance with the service information.
 Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. CHECK THE (D703) PARK ASSIST SENSOR NO. 9 SIGNAL CIRCUIT FOR A SHORT TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT

Turn the ignition off.
 Disconnect the Park Assist Module harness connector.
 Measure the resistance between the (D703) Park Assist Sensor No. 9 Signal circuit and the (X750) Park Assist Sensor Ground circuit.

Is the resistance below 10K ohms?

- Yes** >> Repair the (D703) Park Assist Sensor No. 9 Signal circuit for a short to the (X750) Park Assist Sensor Ground circuit.
 Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)
- No** >> Go To 4

B1236-PTS SENSOR 9 CIRCUIT LOW (CONTINUED)

4. CHECK THE (D703) PARK ASSIST SENSOR NO. 9 SIGNAL CIRCUIT FOR A SHORT TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT

Measure the resistance between the (D703) Park Assist Sensor No. 9 Signal circuit and the (Z171) Park Assist Display Ground circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (D703) Park Assist Sensor No. 9 Signal circuit for a short to the (Z171) Park Assist Display Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 5

5. CHECK THE (D703) PARK ASSIST SENSOR NO. 9 SIGNAL CIRCUIT FOR A SHORT TO (Z914) PARK ASSIST MODULE GROUND CIRCUIT

Measure the resistance between the (D703) Park Assist Sensor No. 9 Signal circuit and the (Z914) Park Assist Module Ground circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (D703) Park Assist Sensor No. 9 Signal circuit for a short to the (Z914) Park Assist Module Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 6

B1236-PTS SENSOR 9 CIRCUIT LOW (CONTINUED)

6. CHECK THE (D703) PARK ASSIST SENSOR NO. 9 SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (D703) Park Assist Sensor No. 9 Signal circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (D703) Park Assist Sensor No. 9 Signal circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Park Assist Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1238-PTS SENSOR 9 RING TIME TOO SHORT

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
While the vehicle is in reverse for speeds less than 16km/h.
- **Set Condition:**
Sensor ring down time exceeds limit (greater than 1450 µsecs).

Possible Causes
PARK ASSIST SENSOR NO. 9

Diagnostic Test

1. CHECK FOR ACTIVE DTC: B1238-PTS SENSOR 9 RING TIME TOO SHORT

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into Reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is DTC: B1238-PTS SENSOR 9 RING TIME TOO SHORT active?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. REPLACE PARK ASSIST SENSOR NO. 9

View Repair

Repair

Replace Park Assist Sensor No. 9 in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B1239-PTS SENSOR 9 RING TIME TOO LONG

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
While the vehicle is in reverse for speeds less than 16km/h.
- **Set Condition:**
Data line stuck at 0.

Possible Causes
PARK ASSIST SENSOR NO. 9

Diagnostic Test**1. CHECK FOR ACTIVE DTC: B1239-PTS SENSOR 9 RING TIME TOO LONG**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into Reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is DTC: B1239-PTS SENSOR 9 RING TIME TOO LONG active?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. REPLACE PARK ASSIST SENSOR NO. 9

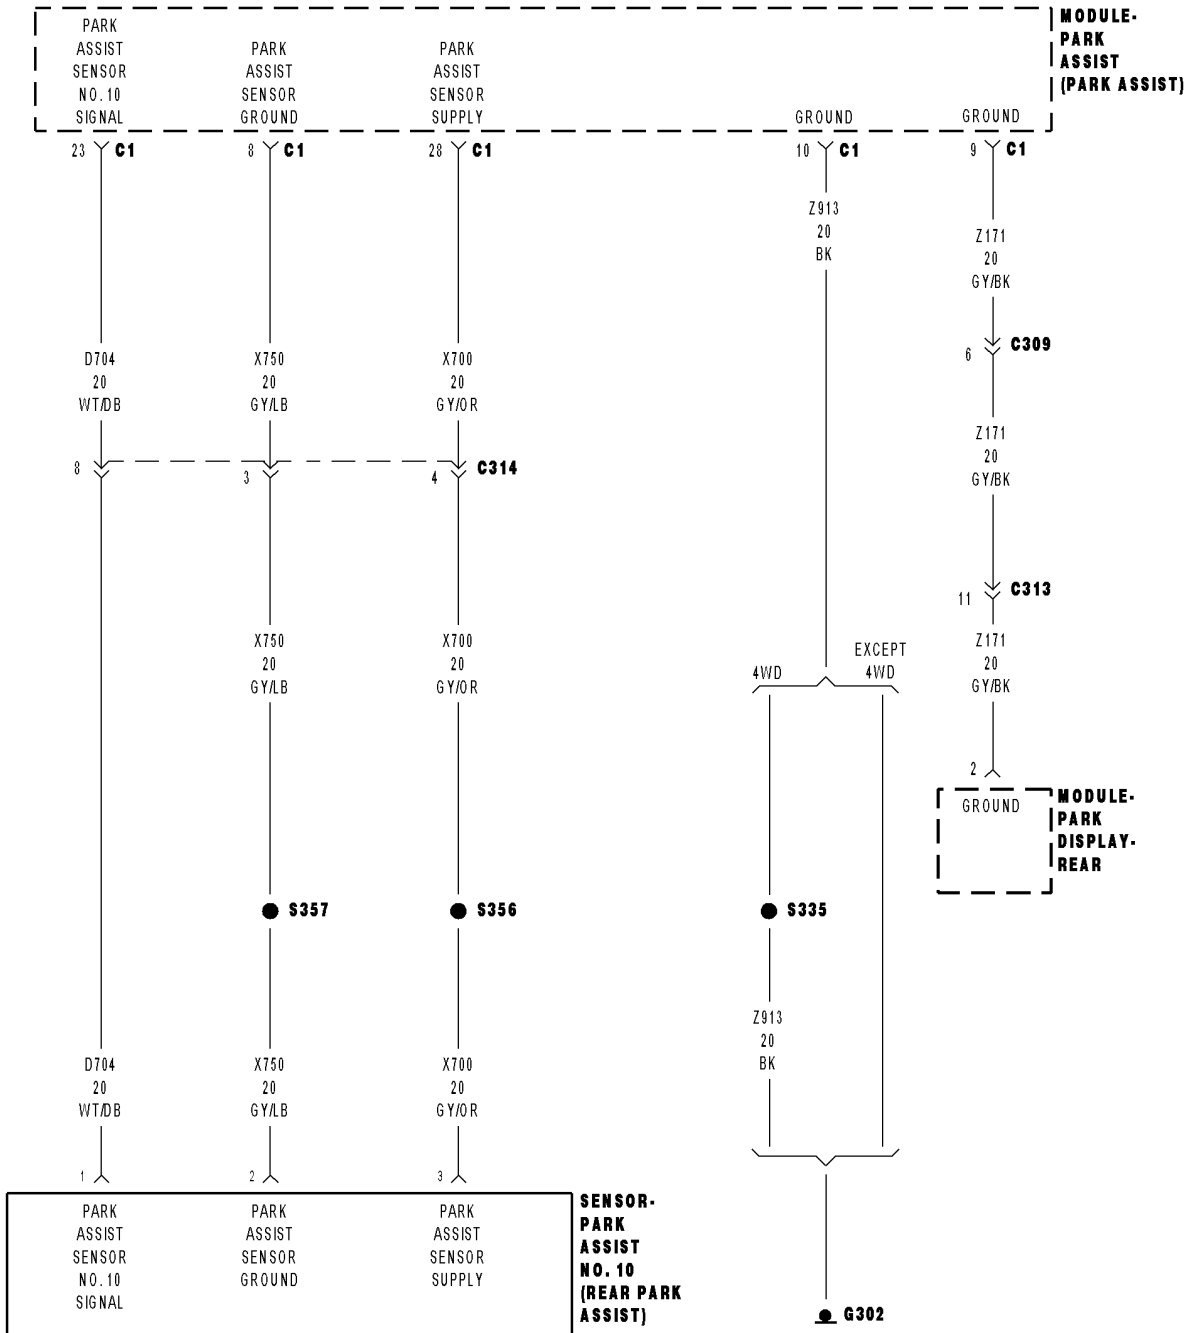

View Repair

Repair

Replace Park Assist Sensor No. 9 in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B123B-PTS SENSOR 10 CIRCUIT LOW

MODULE-PARK ASSIST C1 (PARK ASSIST)

SENSOR-PARK ASSIST NO. 10 (REAR PARK ASSIST)

B123B-PTS SENSOR 10 CIRCUIT LOW (CONTINUED)

For the Park Assist circuit diagram (Refer to 8 - ELECTRICAL/CHIME/BUZZER - SCHEMATIC - ELECTRICAL).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
While the vehicle is in reverse for speeds less than 16km/h.
- **Set Condition:**
Sensor ring down time is too short (700 µsecs).

Possible Causes
(D704) PARK ASSIST SENSOR NO. 10 SIGNAL CIRCUIT SHORTED TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(D704) PARK ASSIST SENSOR NO. 10 SIGNAL CIRCUIT SHORTED TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT
(D704) PARK ASSIST SENSOR NO. 10 SIGNAL CIRCUIT SHORTED TO (Z913) PARK ASSIST MODULE GROUND CIRCUIT
(D704) PARK ASSIST SENSOR NO. 10 SIGNAL CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR NO. 10
PARK ASSIST MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC: B123B-PTS SENSOR 10 CIRCUIT LOW

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is DTC: B123B-PTS SENSOR 10 CIRCUIT LOW active?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B123B-PTS SENSOR 10 CIRCUIT LOW (CONTINUED)**2. CHECK PARK ASSIST SENSOR NO. 10 FOR A SHORT TO GROUND**

Shift the transmission into park.

With the scan tool, erase DTCs.

Turn the ignition off.

Disconnect Park Assist Sensor No. 10.

Turn the ignition on.

Shift the transmission into reverse.

With the scan tool, read Park Assist Module DTCs.

Does the scan tool display: B123B-PTS SENSOR 10 CIRCUIT LOW?

Yes >> Go To 3

No >> Replace Park Assist Sensor No. 10 in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**3. CHECK THE (D704) PARK ASSIST SENSOR NO. 10 SIGNAL CIRCUIT FOR A SHORT TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT**

Turn the ignition off.

Disconnect the Park Assist Module harness connector.

Measure the resistance between the (D704) Park Assist Sensor No. 10 Signal circuit and the (X750) Park Assist Sensor Ground circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (D704) Park Assist Sensor No. 10 Signal circuit for a short to the (X750) Park Assist Sensor Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 4

B123B-PTS SENSOR 10 CIRCUIT LOW (CONTINUED)

4. CHECK THE (D704) PARK ASSIST SENSOR NO. 10 SIGNAL CIRCUIT FOR A SHORT TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT

Measure the resistance between the (D704) Park Assist Sensor No. 10 Signal circuit and the (Z171) Park Assist Display Ground circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (D704) Park Assist Sensor No. 10 Signal circuit for a short to the (Z171) Park Assist Display Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 5

5. CHECK THE (D704) PARK ASSIST SENSOR NO. 10 SIGNAL CIRCUIT FOR A SHORT TO (Z913) PARK ASSIST MODULE GROUND CIRCUIT

Measure the resistance between the (D704) Park Assist Sensor No. 10 Signal circuit and the (Z913) Park Assist Module Ground circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (D704) Park Assist Sensor No. 10 Signal circuit for a short to the (Z913) Park Assist Module Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 6

B123B-PTS SENSOR 10 CIRCUIT LOW (CONTINUED)**6. CHECK THE (D704) PARK ASSIST SENSOR NO. 10 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (D704) Park Assist Sensor No. 10 Signal circuit and ground.

Is the resistance below 10K ohms?

Yes >> Repair the (D704) Park Assist Sensor No. 10 Signal circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Park Assist Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B123D-PTS SENSOR 10 RING TIME TOO SHORT

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
While the vehicle is in reverse for speeds less than 16km/h.
- **Set Condition:**
Sensor ring down time exceeds limit (greater than 1450 µsecs).

Possible Causes
PARK ASSIST SENSOR NO. 10

Diagnostic Test**1. CHECK FOR ACTIVE DTC: B123D-PTS SENSOR 10 RING TIME TOO SHORT**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into Reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is DTC: B123D-PTS SENSOR 10 RING TIME TOO SHORT active?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. REPLACE THE PARK ASSIST SENSOR NO. 10

View Repair

Repair

Replace Park Assist Sensor No. 10 in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B123E-PTS SENSOR 10 RING TIME TOO LONG

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
While the vehicle is in reverse for speeds less than 16km/h.
- **Set Condition:**
Data line stuck at 0.

Possible Causes
PARK ASSIST SENSORNO. 10

Diagnostic Test

1. CHECK FOR ACTIVE DTC: B123E-PTS SENSOR 10 RING TIME TOO LONG

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is DTC B123E-PTS SENSOR 10 RING TIME TOO LONG active?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. REPLACE PARK ASSIST SENSOR NO. 10

View Repair

Repair

Replace Park Assist Sensor No. 10 in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B210D-BATTERY VOLTAGE LOW

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
While the vehicle is in reverse for speeds less than 16km/h.
- **Set Condition:**
Park Assist Module supply voltage less than 9.0 volts.

Possible Causes
VEHICLE CHARGING SYSTEM
PARK ASSIST MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC: B210D-BATTERY VOLTAGE LOW

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is DTC: B210D-BATTERY VOLTAGE LOW active?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM

NOTE: Troubleshoot any PCM charging/cranking DTCs before proceeding.

NOTE: Ensure the battery is fully charged.

Are any charging system DTCs present?

Yes >> (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Park Assist Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B210E-BATTERY VOLTAGE HIGH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
While the vehicle is in reverse for speeds less than 16km/h.
- **Set Condition:**
Park Assist Module supply voltage greater than 16.0 volts.

Possible Causes
VEHICLE CHARGING SYSTEM
PARK ASSIST MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC: B210E-BATTERY VOLTAGE HIGH

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is DTC: B210E-BATTERY VOLTAGE HIGH active?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM

NOTE: Troubleshoot any PCM charging/cranking DTCs before proceeding.

NOTE: Ensure the battery is fully charged.

Are any charging system DTCs present?

Yes >> (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Park Assist Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2126-SENSOR SUPPLY VOLTAGE LOW

B2126-SENSOR SUPPLY VOLTAGE LOW (CONTINUED)

For the Park Assist circuit diagram (Refer to 8 - ELECTRICAL/CHIME/BUZZER - SCHEMATIC - ELECTRICAL).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
While the vehicle is in reverse for speeds less than 16km/h.
- **Set Condition:**
Park Assist Sensor supply voltage less than 7.2 volts.

Possible Causes
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO (Z913) PARK ASSIST MODULE GROUND CIRCUIT
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO GROUND PARK ASSIST SENSOR PARK ASSIST MODULE

Diagnostic Test**1. CHECK FOR AN ACTIVE DTC**

Turn the ignition on.

Apply the park brake.

Shift the transmission into Reverse.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

Is the DTC active?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2126-SENSOR SUPPLY VOLTAGE LOW (CONTINUED)

2. CHECK EACH PARK ASSIST SENSOR FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect one Park Assist Sensor.

Turn the ignition on.

With the scan tool, read Park Assist Module DTCs. If DTC B2126 is still active, repeat this procedure by disconnecting another park assist sensor. However, if DTC B2126 changes from active to stored, or if all four sensors have been disconnected, proceed as follows:

Is B2126-SENSOR SUPPLY VOLTAGE LOW still active?

Yes >> Go To 3

No >> Replace the Park Assist Sensor that caused DTC B2126 to change from active to stored after disconnecting it in accordance with the service information.
 Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

3. CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT

NOTE: Perform this test with all Park Assist Sensors disconnected.

Turn the ignition off.

Disconnect the Park Assist Module harness connector.

Measure the resistance between the (X700) Park Assist Sensor Supply circuit and the (X750) Park Assist Sensor Ground circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X700) Park Assist Sensor Supply circuit for a short to the (X750) Park Assist Sensor Ground circuit.
 Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 4

B2126-SENSOR SUPPLY VOLTAGE LOW (CONTINUED)

4. CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT

NOTE: Perform this test with all Park Assist Sensors disconnected.

Measure the resistance between the (X700) Park Assist Sensor Supply circuit and the (Z171) Park Assist Display Ground circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X700) Park Assist Sensor Supply circuit for a short to the (Z171) Park Assist Display Ground circuit. Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 5

5. CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO (Z913) PARK ASSIST MODULE GROUND CIRCUIT

NOTE: Perform this test with all Park Assist Sensors disconnected.

Measure the resistance between the (X700) Park Assist Sensor Supply circuit and the (Z913) Park Assist Module Ground circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X700) Park Assist Sensor Supply circuit for a short to the (Z913) Park Assist Module Ground circuit. Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 6

B2126-SENSOR SUPPLY VOLTAGE LOW (CONTINUED)

6. CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND

NOTE: Perform this test with all Park Assist Sensors disconnected.

Measure the resistance between ground and the (X700) Park Assist Sensor Supply circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X700) Park Assist Sensor Supply circuit for a short to ground.

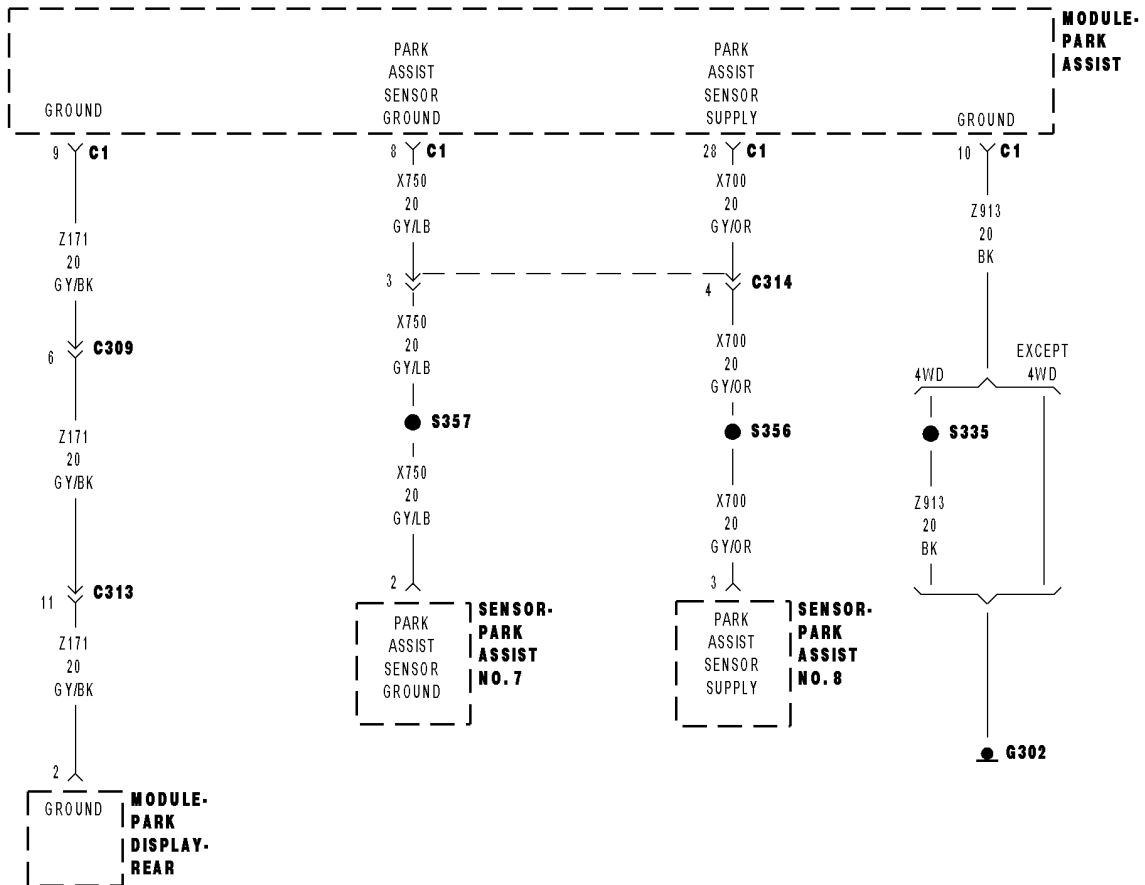

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Park Assist Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2127-SENSOR SUPPLY VOLTAGE HIGH

MODULE-PARK ASSIST C1 (PARK ASSIST)

B2127-SENSOR SUPPLY VOLTAGE HIGH (CONTINUED)

For the Park Assist circuit diagram (Refer to 8 - ELECTRICAL/CHIME/BUZZER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
While the vehicle is in reverse for speeds less than 16km/h.
- **Set Condition:**
Park Assist Sensor supply voltage greater than 9.2 volts.

Possible Causes
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT SHORT TO VOLTAGE
PARK ASSIST MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC: B2127-SENSOR SUPPLY VOLTAGE HIGH

- Turn the ignition on.
- Apply the vehicle park brake.
- Shift the transmission into Reverse.
- With the scan tool, record and erase Park Assist Module DTCs.
- Wait 30 seconds.
- With the scan tool, read Park Assist Module DTCs.

Is DTC: B2127-SENSOR SUPPLY VOLTAGE HIGH active?

- Yes** >> Go To 2
- No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE

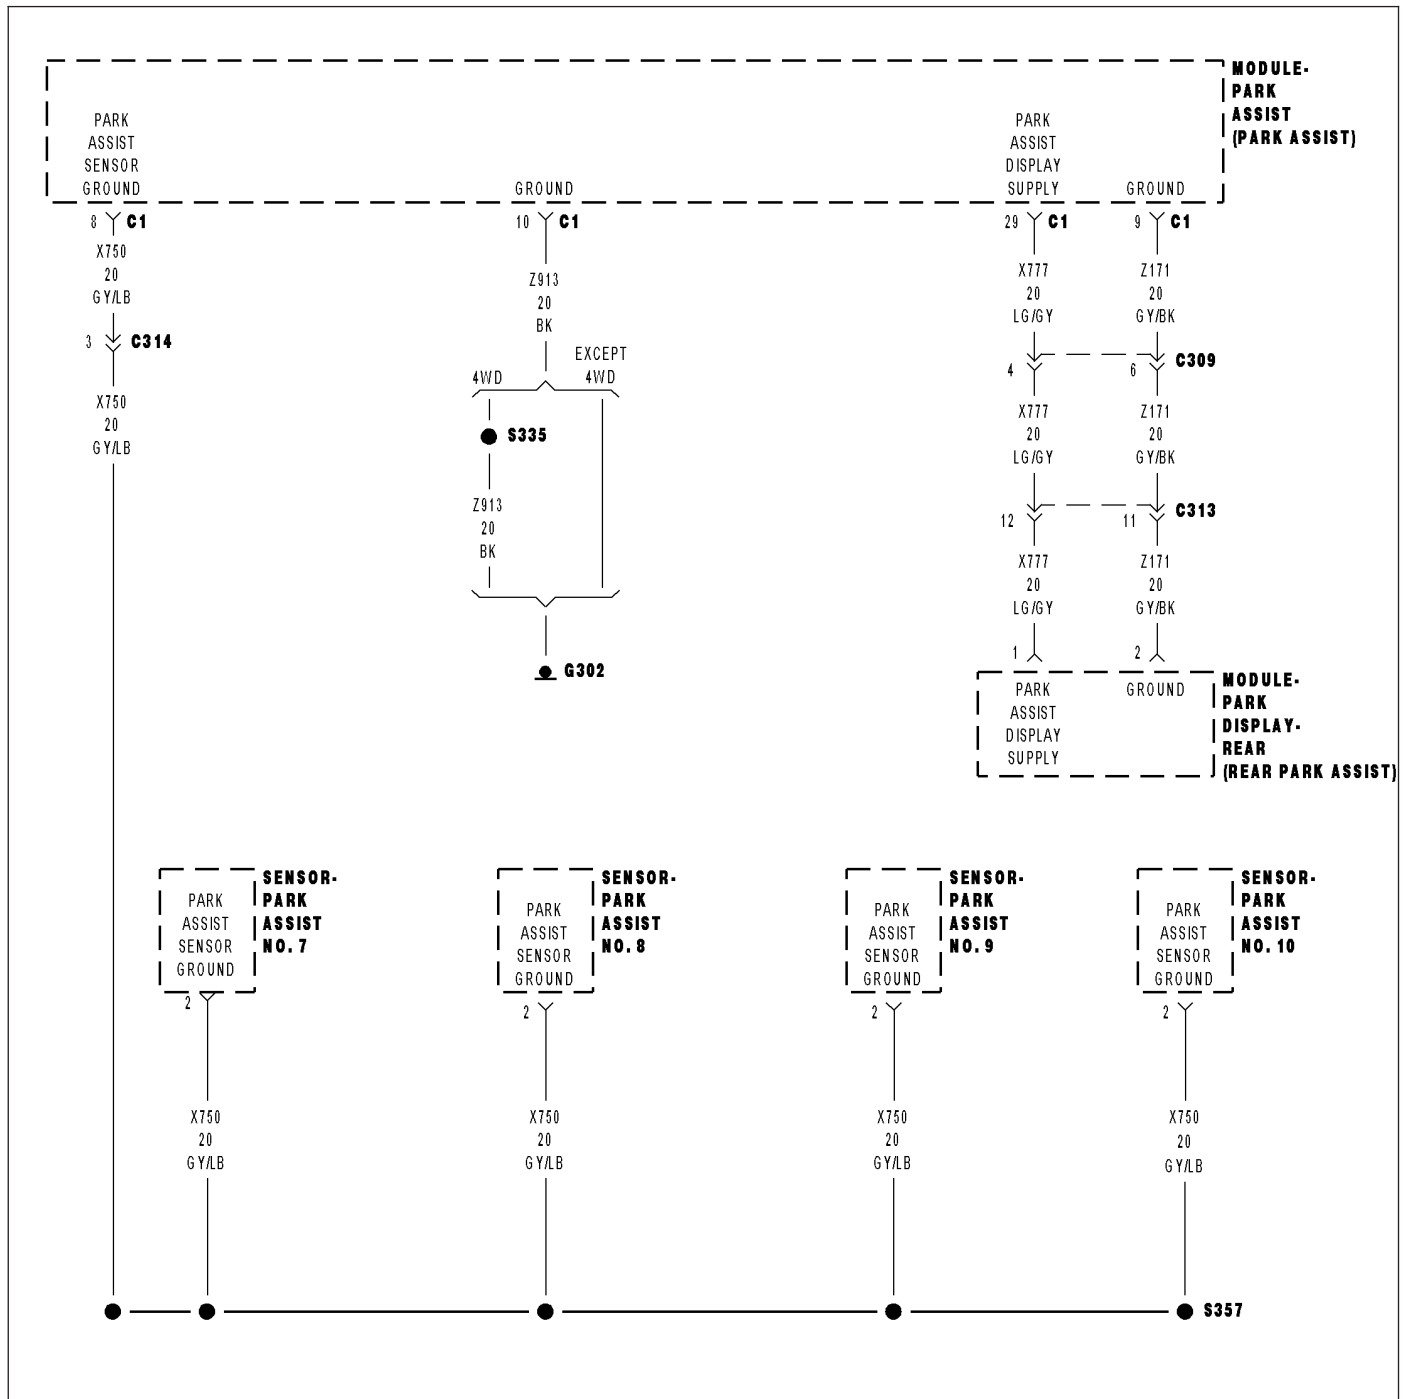

- Turn the ignition off.
- Disconnect the Park Assist Module harness connector.
- Turn the ignition on.
- Measure the voltage on the (X700) Park Assist Sensor Supply circuit.

Is the voltage above 9.2 volts?

- Yes** >> Repair the (X700) Park Assist Sensor Supply circuit for a short to voltage.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)
- No** >> Replace the Park Assist Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B212A-PTS DISPLAY SUPPLY VOLTAGE LOW

B212A-PTS DISPLAY SUPPLY VOLTAGE LOW (CONTINUED)

For the Park Assist circuit diagram (Refer to 8 - ELECTRICAL/CHIME/BUZZER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
While the vehicle is in reverse for speeds less than 16km/h.
- **Set Condition:**
Park Assist Sensor Display voltage less than 8.0 volts.

Possible Causes
(X777) PARK ASSIST DISPLAY SUPPLY CIRCUIT SHORT TO GROUND
(X777) PARK ASSIST DISPLAY SUPPLY CIRCUIT SHORT TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT
(X777) PARK ASSIST DISPLAY SUPPLY CIRCUIT SHORT TO (Z913) PARK ASSIST MODULE GROUND CIRCUIT
(X777) PARK ASSIST DISPLAY SUPPLY CIRCUIT SHORT TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT
PARK ASSIST DISPLAY
PARK ASSIST MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC: B212A-PTS DISPLAY SUPPLY VOLTAGE LOW

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into Reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is DTC: B212A-PTS DISPLAY SUPPLY VOLTAGE LOW active?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B212A-PTS DISPLAY SUPPLY VOLTAGE LOW (CONTINUED)**2. CHECK PARK ASSIST MODULE FOR AN INTERNAL SHORT TO GROUND**

Turn the ignition off.

Disconnect the Park Assist Module harness connector.

Measure the resistance between ground and the (X777) Park Assist Display Supply circuit.

Is the resistance below 10K ohms?

Yes >> Go To 3

No >> Replace the Park Assist Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**3. CHECK THE (X777) PARK ASSIST DISPLAY SUPPLY CIRCUIT FOR A SHORT TO THE (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT**

Disconnect the Park Assist Display harness connector.

Measure the resistance between the (X777) Park Assist Display Supply circuit and the (Z171) Park Assist Display Ground circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (X777) Park Assist Display Supply circuit for a short to the (Z171) Park Assist Display Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 4

B212A-PTS DISPLAY SUPPLY VOLTAGE LOW (CONTINUED)

4. CHECK THE (X777) PARK ASSIST DISPLAY SUPPLY CIRCUIT FOR A SHORT TO THE (Z913) PARK ASSIST MODULE GROUND CIRCUIT

Measure the resistance between the (X777) Park Assist Display Supply circuit and the (Z913) Park Assist Module Ground circuit.

Is the resistance below 10K ohms?

- Yes** >> Repair the (X777) Park Assist Display Supply circuit for a short to the (Z913) Park Assist Module Ground circuit. Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)
- No** >> Go To 5

5. CHECK THE (X777) PARK ASSIST DISPLAY SUPPLY CIRCUIT FOR A SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT

Measure the resistance between the (X777) Park Assist Display Supply circuit and the (X750) Park Assist Sensor Ground circuit.

Is the resistance below 10K ohms?

- Yes** >> Repair the (X777) Park Assist Display Supply circuit for a short to the (X750) Park Assist Sensor Ground circuit. Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)
- No** >> Go To 6

B212A-PTS DISPLAY SUPPLY VOLTAGE LOW (CONTINUED)**6. CHECK THE (X777) PARK ASSIST DISPLAY SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (X777) Park Assist Display Supply circuit.

Is the resistance below 10K ohms?

- Yes** >> Repair the (X777) Park Assist Display Supply circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)
- No** >> Replace the Park Assist Display in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B222A-VEHICLE LINE MISMATCH

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the Vehicle Line data transmitted on the CAN B bus doesn't correspond with the data stored in the Park Assist Module.

Possible Causes
PARK ASSIST MODULE

Diagnostic Test

1. CHECK VEHICLE LINE IN THE PCM

With the scan tool, compare the vehicle line that is programmed in to the PCM to the vehicle line of the vehicle.

Does the vehicle line programmed into the PCM match the vehicle?

- Yes** >> Replace the Park Assist Module in accordance with the service information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)
- No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
Perform (NGC) POWERTRAIN VERIFICATION TEST (Refer to 9 - ENGINE - STANDARD PROCEDURE)
-

B2232-(PTS) PARKTRONICS INTERNAL

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Park Assist Module detects an internal failure.

Possible Causes
PARK ASSIST MODULE

Diagnostic Test**1. REPLACE THE PARK ASSIST MODULE**

View Repair

Repair

Replace the Park Assist Module in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B2234-(PTS) PARKTRONICS REAR DISPLAY INTERNAL

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
While the vehicle is in reverse for speeds less than 16km/h.
- **Set Condition:**
The Park Assist Module detects an internal Park Assist Display failure.

Possible Causes
PARK ASSIST DISPLAY

Diagnostic Test

1. REPLACE THE PARK ASSIST DISPLAY

[View Repair](#)

Repair

Replace the Park Assist Display in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

U0423-IMPLAUSIBLE DATA RECEIVED FROM CLUSTER/CCN

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Park Assist Module supply voltage between 9–16 volts. Ignition in Run/Start.
- **Set Condition:**
Ignition status = 7h

Possible Causes
NO COMMUNICATION WITH INSTRUMENT CLUSTER DTCS STORED OR ACTIVE IN THE INSTRUMENT CLUSTER ACTIVE DTCS IN THE FCM PARK ASSIST MODULE

Diagnostic Test**1. CHECK FOR ACTIVE DTC: U0423-IMPLAUSIBLE DATA RECEIVED FROM CLUSTER/CCN**

Turn the ignition on.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is DTC: U0423-IMPLAUSIBLE DATA RECEIVED FROM CLUSTER/CCN active?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

2. INSTRUMENT CLUSTER IS ACTIVE ON THE CAN B BUS

With the scan tool, select ECU View.

Verify that the Instrument Cluster is active on the bus.

Is the Instrument Cluster active on the bus?

Yes >> Go To 3

No >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

U0423-IMPLAUSIBLE DATA RECEIVED FROM CLUSTER/CCN (CONTINUED)

3. DTCS STORED OR ACTIVE IN THE INSTRUMENT CLUSTER

Check for Ignition Switch DTCs in the Instrument Cluster.

Are any DTCs active or stored in the Instrument Cluster?

- Yes** >> Refer to the appropriate section and perform the diagnostics for the DTCs.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)
- No** >> Go to 4
-

4. ACTIVE DTCS IN THE FCM

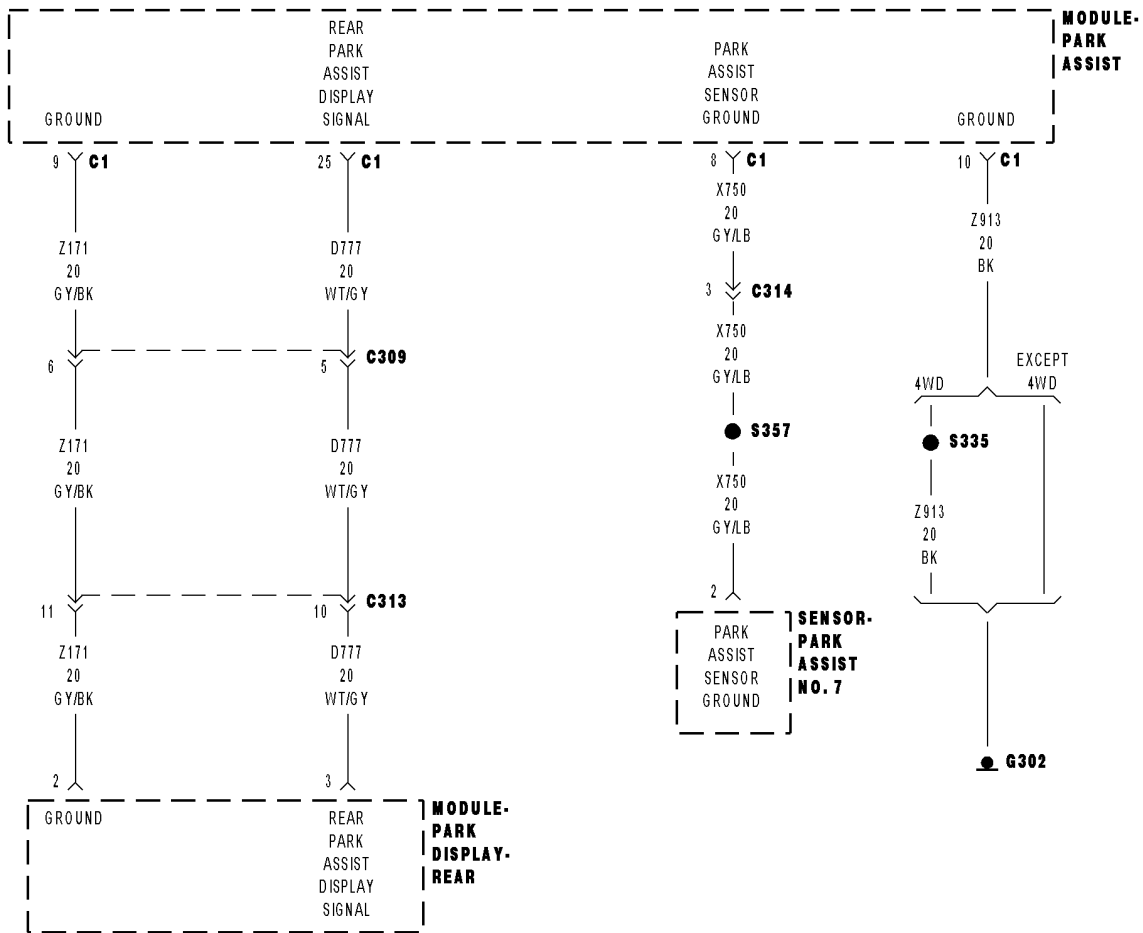

With the scan tool, select ECU View and select FCM.

With the scan tool, read active DTCs.

Are any Communication DTCs active in the FCM Park Assist System?

- Yes** >> Refer to the appropriate section and perform the diagnostics for the DTCs.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace and program the Park Assist Module in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

U1002-PTS DISPLAY COMMUNICATION CIRCUIT LOW

U1002-PTS DISPLAY COMMUNICATION CIRCUIT LOW (CONTINUED)

For the Park Assist circuit diagram (Refer to 8 - ELECTRICAL/CHIME/BUZZER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
While the vehicle is in reverse for speeds less than 16km/h.
- **Set Condition:**
Display data line low.

Possible Causes
(D777) PARK ASSIST DISPLAY SIGNAL CIRCUIT SHORT TO THE (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT
(D777) PARK ASSIST DISPLAY SIGNAL CIRCUIT SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(D777) PARK ASSIST DISPLAY SIGNAL CIRCUIT SHORT TO THE (Z913) PARK ASSIST MODULE GROUND CIRCUIT
(D777) PARK ASSIST DISPLAY SIGNAL CIRCUIT SHORT TO GROUND
PARK ASSIST DISPLAY
PARK ASSIST MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC: U1002-PTS DISPLAY COMMUNICATION CIRCUIT LOW

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

Is DTC: U1002-PTS DISPLAY COMMUNICATION CIRCUIT LOW active?

Yes >> Go To 2

No >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

U1002-PTS DISPLAY COMMUNICATION CIRCUIT LOW (CONTINUED)**2. CHECK PARK ASSIST MODULE FOR AN INTERNAL SHORT TO GROUND**

Turn the ignition off.

Disconnect the Park Assist Module harness connector.

Measure the resistance between ground and the (D777) Park Assist Display Signal circuit.

Is the resistance below 10K ohms?

Yes >> Go To 3

No >> Replace the Park Assist Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

**3. CHECK THE (D777) PARK ASSIST DISPLAY SIGNAL CIRCUIT FOR A SHORT TO THE (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT**

Disconnect the Park Assist Display harness connector.

Measure the resistance between the (D777) Park Assist Display Signal circuit and the (Z171) Park Assist Display Ground circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (D777) Park Assist Display Signal circuit for a short to the (Z171) Park Assist Display Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 4

U1002-PTS DISPLAY COMMUNICATION CIRCUIT LOW (CONTINUED)

4. CHECK THE (D777) PARK ASSIST DISPLAY SIGNAL CIRCUIT FOR A SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT

Measure the resistance between the (D777) Park Assist Display Signal circuit and the (X750) Park Assist Sensor Ground circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (D777) Park Assist Display Signal circuit for a short to the (X750) Park Assist Sensor Ground circuit. Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 5

5. CHECK THE (D777) PARK ASSIST DISPLAY SIGNAL CIRCUIT FOR A SHORT TO THE (Z913) PARK ASSIST MODULE GROUND CIRCUIT

Measure the resistance between the (D777) Park Assist Display Signal circuit and the (Z913) Park Assist Module Ground circuit.

Is the resistance below 10K ohms?

Yes >> Repair the (D777) Park Assist Display Signal circuit for a short to the(Z913) Park Assist Module Ground circuit. Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 6

U1002-PTS DISPLAY COMMUNICATION CIRCUIT LOW (CONTINUED)

6. CHECK THE (D777) PARK ASSIST DISPLAY SIGNAL CIRCUIT FOR A SHORT TO GROUND

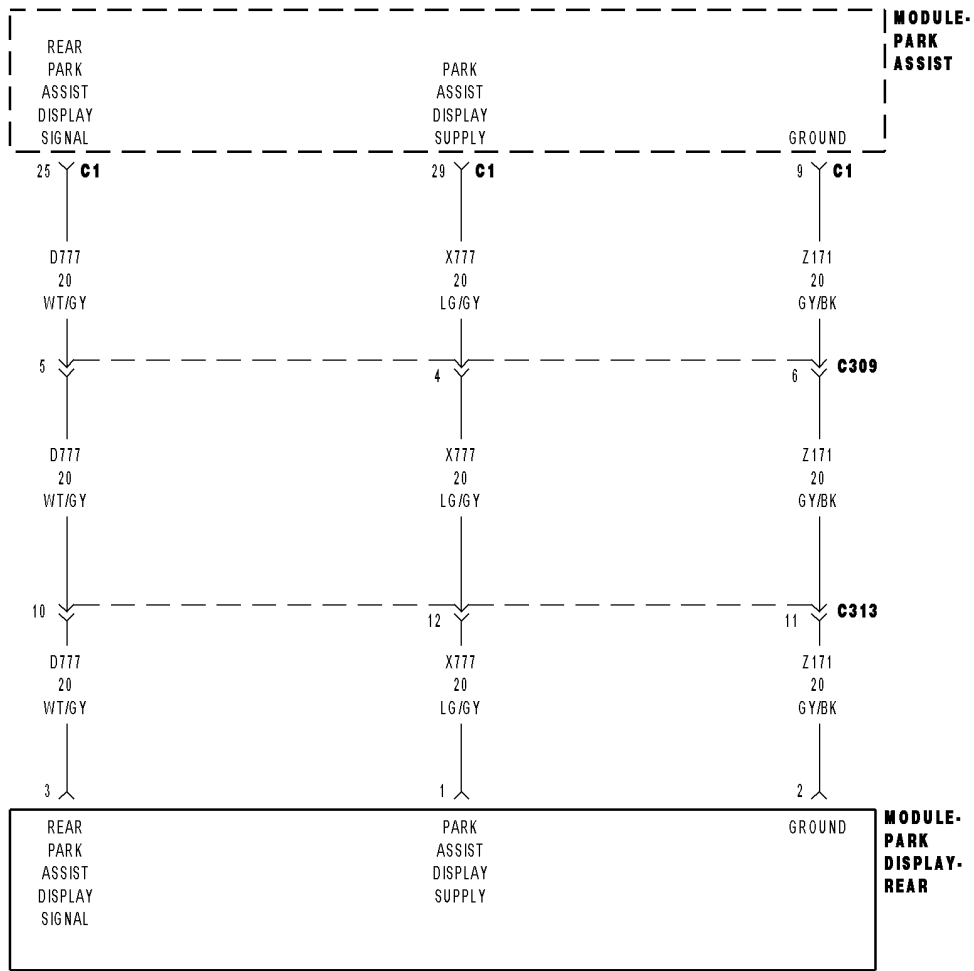

Measure the resistance between ground and the (D777) Park Assist Display Signal circuit.

Is the resistance below 10K ohms?

- Yes** >> Repair the (D777) Park Assist Display Signal circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)
- No** >> Replace the Park Assist Display in accordance with the service information.

CHIME/BUZZER - SERVICE INFORMATION

DESCRIPTION

CHIME WARNING SYSTEM

814cdedc

A chime warning system is standard factory-installed equipment. The chime warning system uses an electromechanical transducer and an electromechanical relay that are soldered onto the electronic circuit board inside of the ElectroMechanical Instrument Cluster (EMIC) (1) to provide audible indications of various vehicle conditions that may require the attention of the vehicle operator or occupants. The EMIC also includes the hardware and software necessary to serve as the electronic body control module and is sometimes referred to as the Cab Compartment Node or CCN.

The Park Assist Display (2) will give out an audible signal when objects are detected starting at 40 cm (16 in.).

The electromechanical transducer generates beep tones and chime tones, while the electromechanical relay generates click tones to emulate the sounds associated with conventional turn signal and hazard warning flasher operation. The microprocessor-based EMIC utilizes electronic chime request messages received from other modules in the vehicle over the Controller Area Network (CAN) data bus along with hard wired inputs to monitor many sensors and switches throughout the vehicle. In response to those inputs, the circuitry and programming of the EMIC allow it to control the audible outputs that are produced through its on-board transducer and relay.

The EMIC is capable of producing the following audible outputs:

- **Slow Rate Repetitive Click** - Repeated "click" tones that are issued at a slow rate of about 50 clicks per minute.

- **Fast Rate Repetitive Click** - Repeated “click” tones that are issued at a fast rate of more than about 100 clicks per minute.
- **Fixed Duration Beep** - A short, sharp, single tactile “beep” tone.
- **Single Chime Tone** - A single “chime” tone.
- **Slow Rate Repetitive Chime** - Repeated “chime” tones that are issued at a slow rate of about 50 chimes per minute.
- **Fast Rate Repetitive Chime** - Repeated “chime” tones that are issued at a fast rate of about 180 chimes per minute.

Hard wired circuitry connects the EMIC and the various chime warning system switch and sensor inputs to their modules and to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the EMIC through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The EMIC chime warning system circuits and components cannot be adjusted or repaired. If the EMIC circuitry, the on-board transducer or the relay are damaged or faulty, the EMIC unit must be replaced.

PARK ASSIST SYSTEM

The Park Assist System is an electronic parking aid that alerts the driver to obstacles which are located immediately behind the vehicle. Objects are sensed using ultrasonic sound waves. When an object is detected, the system will

give the driver visual and audible warnings. The system can be turned OFF and ON with a disable switch located in the upper instrument panel switch pod, in the the instrument panel center stack, just above the radio. The system is enabled from the factory as a default.

The major components of the park assist system are:

- **Park Assist Module (3)** - supplies voltage to the object detection sensors and park assist display. It triggers the sensors, analyzes the echo delay times and calculates obstacle distances. It sends display information to the park assist display, performs system diagnostics, and communicates via the Controller Area Network (CAN) data bus network.
- **Park Assist Sensors (5)** - there are four sensors located in the rear bumper that generate ultrasonic pulses when triggered by the park assist module. The sensors signal the park assist module when reflected ultrasonic pulses are received.
- **Park Assist Display (4)** - there are sixteen Light Emitting Diode (LED) indicators which provide indication of relative distance to obstacles. When the system is engaged and no obstacles are detected, the two outermost yellow LED's are lit at reduced brightness to show the system is working. As the distance to a detected obstacle decreases, more yellow LED's towards the center of the display illuminate.
- **Park Assist OFF Switch (2)** - this is so the park assist system can be disabled/enabled if the system is not desired (I.E. during off road use where large objects are common). When the system is disabled, the EVIC display in the EMIC (1) will display "Park Assist Disabled".

For diagnosis and testing of the park assist system, use a scan tool and the appropriate body diagnostic information.

OPERATION

CHIME WARNING SYSTEM

The chime warning system operates on battery voltage received through a fuse in the Junction Block (JB) on a non-switched fused B(+) circuit so that the system may operate regardless of the ignition switch position. The chime warning system also monitors the ignition switch position so that some chime features are functional only with the ignition switch in the ON position, while others are functional regardless of the ignition switch position.

The chime warning system provides an audible indication to the vehicle operator or occupants under the following conditions:

- **Airbag Indicator Warning** - The ElectroMechanical Instrument Cluster (EMIC) transducer will generate one short chime when the ignition switch is in the On position, and an electronic message is received over the Controller Area Network (CAN) data bus from the Occupant Restraint Controller (ORC) requesting "Airbag" indicator illumination. This warning will only occur following completion of the "Airbag" indicator bulb test, and will only occur once during any ignition cycle.
- **Compass Mini-Trip Computer Global Reset** - The EMIC transducer will generate one short chime when the ignition switch is in the On position, and an electronic message is received over the CAN data bus from the EVIC requesting that the average fuel economy, trip odometer and distance to empty data be reset. The EVIC monitors hard wired inputs from the U.S./Metric and Reset button switches to determine the proper reset messages to send to the EMIC.
- **Door Ajar Indicator Warning** - The EMIC transducer will generate one short chime when the ignition switch is in the On position, a hard wired input is received indicating that the status of any door ajar switch has changed, and an electronic message is received over the CAN data bus indicating that the vehicle is moving.
- **Fasten Seat Belt Indicator Warning** - The EMIC transducer will generate repetitive chimes at a slow rate to announce that a hard wired input from the seat belt switch indicates that the driver side front seat belt is not fastened with the ignition switch in the On position. The chime warning system also supports the enhanced seat belt reminder (beltminder) when this feature is enabled. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/SEAT BELT INDICATOR - OPERATION).
- **Gate Ajar Indicator Warning** - The EMIC transducer will generate one short chime when the ignition switch is in the On position, a hard wired input is received indicating that the status of the liftgate ajar switch has changed, and an electronic message is received over the CAN data bus indicating that the vehicle is moving.
- **Head/Park Lamps-On Warning** - The EMIC transducer will generate repetitive chimes at a fast rate to indicate that hard wired inputs from the driver door ajar switch, the headlamp switch, and the ignition switch indicate that the exterior lamps are turned On with the driver side front door opened and the ignition switch in the Off position. The chimes will continue to sound until the exterior lamps are turned Off, the driver side front door is closed, or the ignition switch is turned to the On position, whichever occurs first.

- **Key-In-Ignition Warning** - The EMIC transducer will generate repetitive chimes at a fast rate to indicate that hard wired inputs from the driver door ajar switch, the ignition switch, and the key-in ignition switch circuitry of the ignition switch indicate that the key is in the ignition lock cylinder with the driver side front door open and the ignition switch in the Off position. The chimes will continue to sound until the key is removed from the ignition lock cylinder, the driver side front door is closed, or the ignition switch is turned to the On position, whichever occurs first.
- **Low Fuel Indicator Warning** - The EMIC transducer will generate one short chime when the low fuel indicator is illuminated by the instrument cluster circuitry. This chime will only occur once during any ignition cycle.
- **Low Wash Indicator Warning** - The EMIC transducer will generate one short chime when the low washer fluid indicator is illuminated by the instrument cluster circuitry. This chime will only occur once during any ignition cycle.
- **Overspeed Warning** - The EMIC transducer will generate repetitive chimes at a slow rate to indicate that the vehicle speed is over a pre-programmed speed value. The EMIC monitors electronic vehicle speed messages received over the CAN data bus. This feature is only enabled on an EMIC that has been programmed with a Middle East Gulf Coast Country (GCC) country code.
- **Park Assist System Warning** - The Park Assist System Display will generate a chime as an object is detected by the sensors. This chime will be intermittent when the object is approximately 40 cm (16 in.) away and then become faster as the object approaches 30 cm (12 in.), when it will be a constant chime. If the radio is on when an object is detected, the radio will mute when the distance is that of which a chime is needed (Refer to 8 - ELECTRICAL/CHIME/BUZZER/PARK ASSIST DISPLAY - OPERATION).
- **Park Brake Reminder** - The EMIC transducer will generate one short chime to announce that the hard wired input from the park brake switch and a vehicle speed message input received over the CAN data bus indicate that the park brake is applied and the vehicle is moving. This chime will repeat each time the input conditions are met.
- **Sentry Key “Customer Learn” Mode Announcement** - The EMIC transducer will generate one short chime to confirm that an electronic “Customer Learn” mode message has been received over the CAN data bus to indicate that the Sentry Key Remote Entry Module (SKREEM) is prepared for programming additional sentry key transponders. This chime feature is only active on vehicles equipped with the optional Sentry Key system, and sold in a market where “Customer Learn” programming is an allowed feature.
- **Trans Overtemp Indicator Warning** - The EMIC transducer will generate repetitive chimes at a slow rate when the transmission overtemp indicator is illuminated by the instrument cluster for a high or critical transmission fluid temperature condition. This chime will repeat each time the trans overtemp indicator is cycled from Off to On.
- **Turn Signal/Hazard Warning Flasher Emulation** - The EMIC relay will generate repetitive clicks at a slow rate to emulate an electromechanical flasher when the turn signal or hazard warning system are operating. The EMIC relay will generate repetitive clicks at a fast rate to indicate that the right or left turn signal are operating with one or more bulbs inoperative. In either case, the clicks will continue until the turn signal and hazard warning systems are turned off.
- **Turn Signal On Warning** - The EMIC transducer will generate repetitive chimes at a slow rate to indicate that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per hour). Vehicles built for markets other than the United States and Canada have a revised distance threshold of 4 kilometers for this feature. The chime will continue until the turn signal input becomes inactive or until the vehicle speed message indicates that the speed is less than 22 kilometers-per-hour (15 miles-per-hour), whichever occurs first. The hazard warning flashers will not activate this chime feature.
- **Warning Indicator Announcement** - The EMIC transducer will generate one short chime each time the check gauges indicator is illuminated by the instrument cluster circuitry. The check gauges indicator may be illuminated when any critical engine or transmission systems are operating outside of their normal parameters. The instrument cluster monitors electronic messages received over the CAN data bus to determine when to illuminate the check gauges indicator.

The EMIC provides chime service for all available features in the chime warning system. The EMIC relies upon its internal programming, numerous hard wired inputs, and electronic message inputs received from other modules over the CAN data bus network to provide the chime warning system features. The internal programming of the EMIC determines the priority of each chime request input that is received, as well as the rate and duration of each chime that is to be generated.

The hard wired chime warning system inputs to the EMIC may be diagnosed and tested using conventional diagnostic tools and procedures. However, conventional diagnostic methods may not prove conclusive in the diagnosis

of the EMIC, the CAN data bus, or the electronic messages received by the EMIC from other modules. The most reliable, efficient and accurate means to diagnose the EMIC, the CAN data bus, or the electronic message inputs used for the chime warning system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

PARK ASSIST SYSTEM

The Park Assist System display activates an audible tone that changes from intermittent to continuous as the final two Light Emitting Diodes (LED's) are illuminated on one side or both sides of the display.

The system detection length from the rear of the vehicle is 0.3 meters to 1.5 meters. This area extends around the rear side of the vehicle. The system detection height from the ground is 0.2 meters to about 1.5 meters. The radio mutes when the system activates its audible tone.

When the driver selects Reverse, the system scans for objects behind the vehicle using four sensors located in the rear bumper. A warning display above the rear window provides both visible and audible warnings indicating the range of the object. If the radio is on, the system will mute the radio when the audible warning comes on.

The system is active only when the transmission gear selector is in reverse for vehicle speeds less than 16 Km/h (10 mph). If the vehicle's Parking/Emergency Brake is applied, the system is deactivated. There is an OFF/ON switch on the instrument panel located in the upper instrument panel switch pod, above the radio. If the driver does not want the system active, then a simple momentary press of the park assist system OFF button will disable the system until pressed again or the ignition key is cycled. The reason for the switch is mainly for use while pulling a trailer and off road use. With a trailer attached to the vehicle, anytime it is put into reverse, the audible and visual message would be present due to the close proximity of the trailer to the rear of the vehicle. When operating the vehicle off road, there are extreme angles that may set off the system alert and this helps eliminate the audible and visual message.

The display contains two sets of yellow and red Light Emitting Diode's (LED's) that the driver can see as they look over their shoulder while backing up. Each side of the vehicle has its own warning LED's. The system provides a visual warning by illuminating one or more yellow LED's as the vehicle gets closer to the object. As the vehicle continues to approach the object, one red LED is illuminated and the system emits a series of short beeps. The tone will remain constant and both red LED's are illuminated once the vehicle is within 12 inches (30.5 cm) of the object.

The system can be turned OFF and back ON through the switch on the upper instrument panel switch pod. If the park assist system is turned OFF, a single chime will sound and the EVIC display in the EMIC will display the following message "PARK ASSIST DISABLED", when the vehicle is in reverse.

- Ensure that the rear bumper is free of dirt and debris to keep the system operating properly.
- Jackhammers, large trucks, and other vibrations could affect the performance of the system.
- Ensure that the parking brake is not applied.

If "Service Park Assist System" appears in the EVIC display after making sure the rear bumper is clean, proceed to diagnose the system using a scan tool and the appropriate diagnostic information.

DIAGNOSIS AND TESTING

CHIME WARNING SYSTEM

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

The hard wired chime warning system inputs to the ElectroMechanical Instrument Cluster (EMIC), as well as other hard wired circuits for this system may be diagnosed and tested using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods may not prove conclusive in the diagnosis of the EMIC, the Controller Area Network (CAN) data bus, or the electronic message inputs used by the EMIC to provide chime warning system service. The most reliable, efficient, and accurate means to diagnose the EMIC, the CAN data bus, and the electronic message inputs for the chime warning system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

PARK ASSIST DISPLAY

DESCRIPTION

The Park Assist Display is a molded plastic unit, housing Light Emitting Diodes (LED's) and a chime module.

814ce5bd

The Park Assist Display (4) is located in the rear of vehicle, over the rear window in the headliner. Located in the rear of the vehicle for easy visual reference when the driver is backing up.

The display is used to alert the driver of any obstacles detected in the rear of the vehicle. The chime or audible signal also comes from the display unit.

OPERATION

When the ignition is put in the RUN position, all the Light Emitting Diodes (LED's) will illuminate for approximately one second. This will be interrupted if the system senses an obstacle.

The ready status will be sensed by the outermost two yellow LED's (1) being illuminated. As the obstacle is sensed, the yellow LED's will start illuminating inward (6) until the object is approximately 40 cm (16 in.) away and then the inner red LED will light (3).

The display is sensitive to which side of the rear of the vehicle that the object is detected. If on the left rear, the left segments will light and the same for the right side of the vehicle.

8134ff80

CORRELATION OF LED SEGMENTS TO DISTANCE

DISPLAY LED	DISTANCE		LED COLOR	AUDIBLE SIGNAL
	REAR CORNERS	REAR CENTER		
1st LED		150 cm (59 in.)	Yellow	None
2nd LED		120 cm (47 in.)	Yellow	None
3rd LED		100 cm (39 in.)	Yellow	None
4th LED	80 cm (31.5 in.)	80 cm (31.5 in.)	Yellow	None
5th LED	65 cm (25.5 in.)	65 cm (25.5 in.)	Yellow	None
6th LED	50 cm (20 in.)	50 cm (20 in.)	Yellow	None
7th LED	40 cm (16 in.)	40 cm (16 in.)	Red	30 cm (12 in.) Intermittant
8th LED	15 cm (6 in.)	30 cm (12 in.)	Red	20 cm (8 in.) Continuous

There will be an audible tone when the object gets within 40 cm (16 in.) from the rear of the vehicle.

To diagnose and test the Park Assist System, use a scan tool and the appropriate diagnostic information.

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Lower the headliner (3) in the rear of the vehicle in the liftgate opening. Follow the headliner removal procedure for the rear of the headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
3. Bend the retaining tabs (2) upwards to allow the park assist display (1) to drop out of the headliner (3) opening.
4. Disconnect the display electrical connector (4) and remove display (1) from vehicle.

INSTALLATION

1. Position the Park Assist Display (1) in headliner (3) opening and connect the display electrical connector (4).
2. Bend the retaining tabs (2) down behind the headliner (3).
3. Raise the headliner in the rear of the vehicle in the liftgate opening (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).
4. Connect the battery negative cable.

PARK ASSIST MODULE

DESCRIPTION

The Park Assist Module has a molded plastic housing which housing internal circuitry and two electrical connectors. There are four mounting tabs that affix the module to the mounting bracket with four clips.

The Park Assist Module (1) is located on the left side of the vehicle, under the rear seat cushion, next to the final drive control module.

The park assist module (1) has a number of functions:

- Supply voltage to the sensors and display.
- Disconnection of the display with bus idle and over voltage V_{max} .
- Triggering the sensors.
- Analyze echo delay times and calculate obstacle distances.
- Bi-directional data communication to the display for diagnosis.
- System diagnostics - diagnosis and error handling (sensors, display, module).
- Data exchange over the Controller Area Network (CAN) data bus.

OPERATION

814ce5bd

The system detection length from the rear of the vehicle is 0.3 meters to 1.5 meters. This area extends around the rear side of the vehicle. The system detection height from the ground is 0.2 meters to about 1.5 meters. The radio mutes when the system activates its audible tone.

When the driver selects Reverse, the system scans for objects behind the vehicle using four sensors (5) located in the rear bumper. Objects can be detected from up to 1.5 meters. A warning display (4) above the rear window provides both visible and audible warnings indicating the range of the object.

The system is active only when the vehicle is in reverse for vehicle speeds less than 16 Km/h (10 mph). If the vehicle's Parking/Emergency Brake is applied, the system is deactivated.

The park assist system has a disable switch (2) located on the instrument panel center stack within the upper instrument panel switch pod. The default for the system is ON, but it may be turned OFF by a press of the switch. This is a momentary switch and the system will stay OFF until pressed again or the ignition key is cycled. If the park assist system is turned OFF, a single chime will sound and the EVIC will display the following message "PARK ASSIST DISABLED", when the vehicle is in reverse.

The display contains two sets of yellow and red Light Emitting Diode's (LED's) that the driver can see as they look over their shoulder while backing up. Each side of the vehicle has its own warning LED's. The system provides a visual warning by illuminating one or more yellow LED's as the vehicle gets closer to the object. As the vehicle continues to approach the object, one red LED is illuminated and the system emits a series of short beeps. The tone will remain constant and both red LED's are illuminated once the vehicle is within 12 inches (30.5 cm) of the object.

- Ensure that the rear bumper is free of dirt and debris to keep the system operating properly.
- Jackhammers, large trucks, and other vibrations could affect the performance of the system.

- Ensure that the parking brake is not applied.

If "Service Park Assist System" appears in the EVIC after making sure the rear bumper is clean, proceed to diagnose the system using a scan tool and the appropriate diagnostic information.

To diagnose the Park Assist Module, use a scan tool and the appropriate body diagnostic information.

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Lift up rear seat to expose the park assist module and final drive control module.

3. Disconnect the module electrical connector (1).
4. Using a trim stick (special tool #C-4755) or equivalent, gently pry back on the retaining tabs on the mounting plate (2) and remove module.

INSTALLATION

1. Place the park assist module (3) in its location on the mounting plate (2) and firmly snap into place.
2. Connect the electrical connector (1).

3. Lower the rear seat back down into position.
4. Connect the battery negative cable.

PARK ASSIST SENSOR

DESCRIPTION

The Park Assist Sensors generate ultrasonic pulses when triggered by the park assist module when an obstacle is detected. The sensors then signal the module when reflected ultrasonic pulses are received.

The Park Assist Sensors are located in the rear bumper fascia mounted equally apart. The sensors detect objects with an ultrasonic pulse that reflects off the object and then is sent to the module to determine the distance of the object.

OPERATION

The Park Assist Sensors:

- Generate ultrasonic pulses when triggered by the Park Assist Module.
- Reception/filtering of ultrasonic energy received.
- Signalling the module of received ultrasonic pulses that meet threshold criteria.

The sensors are supplied power by the module. The sensor supply is enabled when the sensor function is necessary.

The sensors detection length from the rear of the vehicle is 0.3 meters to 1.5 meters. This area extends around the rear side of the vehicle. The sensor detection height from the ground is 0.2 meters to about 1.5 meters.

- Ensure that the rear bumper (sensors) is free of dirt and debris to keep the system operating properly.
- Jackhammers, large trucks, and other vibrations could affect the performance of the system.
- Ensure that the parking brake is not applied.

If "Service Park Assist System" appears in the EVIC after making sure the rear bumper is clean, proceed to diagnose the system using a scan tool and the appropriate diagnostic information.

REMOVAL

812d8c91

1. Disconnect and isolate the battery negative cable.
2. Remove rear fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR FASCIA - REMOVAL).
3. Unsnap Park Assist Sensor (1) from the retaining housing (2) and remove from fascia.

814a8852

4. If the bracket (1) holding the sensor (2) is damaged, unclip it from the rear fascia with the sensor and then separate them.

INSTALLATION

1. If replacing the sensor retaining bracket (1), snap the sensor (2) into the bracket until it seats fully.

2. Position the Park Assist Sensor (1) over the retaining bracket (2) and firmly snap into housing in rear fascia.

3. Install the rear fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR FASCIA - INSTALLATION).
4. Connect the battery negative cable.

ELECTRONIC CONTROL MODULES - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B210D-BATTERY VOLTAGE LOW

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
Battery voltage less than 9 volts for more than 15 seconds.

Possible Causes
RESISTANCE IN THE (A1) BATTERY POSITIVE CIRCUIT
RESISTANCE IN THE GENERATOR CASE GROUND
GENERATOR OPERATION
GENERATOR FIELD CONTROL CIRCUIT OPEN
GENERATOR FIELD CONTROL CIRCUIT SHORTED TO GROUND
GROUND CIRCUIT OPEN
PCM

Diagnostic Test

1. CHECK FOR ANY POWERTRAIN CONTROL MODULES DTCS

NOTE: Make sure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.

NOTE: Inspect the vehicle for after market accessories that may exceed the Generator System output.

NOTE: Make sure the generator drive belt is in good operating condition.

NOTE: Inspect the fuses in the IPM. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.

Turn the ignition on.

With the scan tool, read active PCM DTC's.

Does the scan tool display any active PCM DTC's?

Yes >> (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

No >> Check the above conditions that can cause a low voltage condition. Repair as necessary.

B210E-BATTERY VOLTAGE HIGH

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
Battery voltage greater than 16 volts for more than 15 seconds.

Possible Causes
GENERATOR FIELD CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE GENERATOR PCM

Diagnostic Test

1. CHECK FOR ANY POWERTRAIN CONTROL MODULES DTCS

NOTE: Make sure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.

NOTE: Inspect the vehicle for after market accessories that may exceed the Generator System output.

NOTE: Make sure the generator drive belt is in good operating condition.

NOTE: Inspect the fuses in the IPM. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.

Turn the ignition on.

With the scan tool, read active PCM DTC's.

Does the scan tool display any active PCM DTC's?

Yes >> (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

No >> Check the above conditions that can cause a high voltage condition. Repair as necessary.

B2112-5 VOLT SUPPLY CIRCUIT LOW (FCM)

B2112-5 VOLT SUPPLY CIRCUIT LOW (FCM) (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Front Control Module detects the (F891) 5 volt supply circuit voltage below 0.3 volts.

Possible Causes
(F891) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND A/C PRESSURE TRANSDUCER FRONT CONTROL MODULE

Diagnostic Test**1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. A/C PRESSURE TRANSDUCER

Turn the ignition off.

Disconnect the A/C Pressure Transducer harness connector.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 3

No >> Replace the A/C Pressure Transducer in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B2112-5 VOLT SUPPLY CIRCUIT LOW (FCM) (CONTINUED)

3. (F891) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the FCM C1 harness connector.

Measure the resistance between ground and the (F891) 5 Volt Supply circuit.

Is the resistance below 1000.0 ohms?

Yes >> Repair the (F891) 5 Volt Supply circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B2113-5 VOLT SUPPLY CIRCUIT HIGH (FCM)

B2113-5 VOLT SUPPLY CIRCUIT HIGH (FCM) (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Front Control Module detects the (F891) 5 volt supply circuit voltage above 5.0 volts.

Possible Causes
(F891) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE A/C PRESSURE TRANSDUCER FRONT CONTROL MODULE

Diagnostic Test**1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. A/C PRESSURE TRANSDUCER

Turn the ignition off.

Disconnect the A/C Pressure Transducer harness connector.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 3

No >> Replace the A/C Pressure Transducer in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B2113-5 VOLT SUPPLY CIRCUIT HIGH (FCM) (CONTINUED)**3. (F891) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE**

Turn the ignition off.

Disconnect the FCM C1 harness connector.

Turn the ignition on.

Measure the voltage of the (F891) 5 Volt Supply circuit.

Is the voltage above 5.5 volts?

Yes >> Repair the (F891) 5 Volt Supply circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B2206-CURRENT VIN MISSING/MISMATCH

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Front Control Module will receive and monitor the VIN message from the PCM and record the VIN if different from the last VIN.

Possible Causes
INCORRECT VIN PROGRAMMED IN PCM FRONT CONTROL MODULE

Diagnostic Test**1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. CHECK VIN IN PCM

With the scan tool compare the VIN that is programmed into the PCM to the VIN on the vehicle.

Does the VIN programmed into the PCM match the vehicles VIN?

Yes >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Program the correct VIN in the PCM and retest.

B2215-FRONT CONTROL MODULE INTERNAL

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Continuously.
- **Set Condition:**
The Front Control Module detects an internal fault.

Possible Causes
FRONT CONTROL MODULE

Diagnostic Test

1. REPLACE THE FRONT CONTROL MODULE IF DTC IS ACTIVE

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

- Yes** >> Replace and program the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
-

B222C-VEHICLE CONFIGURATION NOT PROGRAMMED

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Front Control Module is not configured correctly to the vehicle.

Possible Causes
FRONT CONTROL MODULE NOT CONFIGURED CORRECTLY
FRONT CONTROL MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. CONFIGURE THE FCM TO THE VEHICLE

With the scan tool enter program network configuration and program the FCM to the vehicle configuration.

With the scan tool, erase FCM DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair is complete.

***CAN C DIAGNOSTIC (+) AND/OR CAN C DIAGNOSTIC (-) CIRCUITS HIGH**

***CAN C DIAGNOSTIC (+) AND/OR CAN C DIAGNOSTIC (-) CIRCUITS HIGH (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
When the scan tool queries the FCM.
- **Set Condition:**
The scan tool has detected a shorted high condition on either or both CAN C Diagnostic circuits.

Possible Causes
(D72) CAN C DIAGNOSTIC (+) CIRCUIT SHORTED TO VOLTAGE (D71) CAN C DIAGNOSTIC (-) CIRCUIT SHORTED TO VOLTAGE FRONT CONTROL MODULE

Diagnostic Test

1. CHECK THE STATUS OF THE ERROR MESSAGE

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

Does the scan tool display this same error message?

Yes >> Go To 2

No >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. CAN C DIAGNOSTIC CIRCUITS SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Disconnect the scan tool from the DLC.

Turn the ignition on.

Measure the voltage of the CAN C Diagnostic circuits.

Is the voltage above 6.0 volts for either circuit?

Yes >> Repair the CAN C Diagnostic circuits for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***CAN C DIAGNOSTIC (+) CIRCUIT LOW**

***CAN C DIAGNOSTIC (+) CIRCUIT LOW (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
When the scan tool queries the FCM.
- **Set Condition:**
The scan tool has detected a shorted low condition on the (D72) CAN C Diagnostic (+) circuit.

Possible Causes
(D72) CAN C DIAGNOSTIC (+) CIRCUIT SHORTED TO GROUND FRONT CONTROL MODULE

Diagnostic Test

1. CHECK THE STATUS OF THE ERROR MESSAGE

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.
Disconnect the scan tool from the DLC.
Cycle the ignition from on to off 3 times.
Turn the ignition on.

Does the scan tool display this same error message?

- Yes** >> Go To 2
- No** >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. (D72) CAN C DIAGNOSTIC (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.
Disconnect the Front Control Module C1 harness connector.
Disconnect the scan tool from the DLC.
Measure the resistance between ground and the (D72) CAN C Diagnostic (+) circuit.

Is the resistance below 100.0 ohms?

- Yes** >> Repair the (D72) CAN C Diagnostic (+) circuit for a short to ground.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***CAN C DIAGNOSTIC (-) CIRCUIT LOW**

***CAN C DIAGNOSTIC (-) CIRCUIT LOW (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
When the scan tool queries the FCM.
- **Set Condition:**
The scan tool has detected a shorted low condition on the (D71) CAN C Diagnostic (-) circuit.

Possible Causes
(D71) CAN C DIAGNOSTIC (-) CIRCUIT SHORTED TO GROUND FRONT CONTROL MODULE

Diagnostic Test

1. CHECK THE STATUS OF THE ERROR MESSAGE

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

- With the scan tool, record the error message.
- Disconnect the scan tool from the DLC.
- Cycle the ignition from on to off 3 times.
- Turn the ignition on.

Does the scan tool display this same error message?

- Yes** >> Go To 2
- No** >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. (D71) CAN C DIAGNOSTIC (-) CIRCUIT SHORTED TO GROUND

- Turn the ignition off.
- Disconnect the Front Control Module C1 harness connector.
- Disconnect the scan tool from the DLC.
- Measure the resistance between ground and the (D71) CAN C Diagnostic (-) circuit.

Is the resistance below 100.0 ohms?

- Yes** >> Repair the (D71) CAN C Diagnostic (-) circuit for a short to ground.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***CAN C DIAGNOSTIC (+) SHORTED TO CAN C DIAGNOSTIC (-)**

***CAN C DIAGNOSTIC (+) SHORTED TO CAN C DIAGNOSTIC (-) (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
When the scan tool queries the FCM.
- **Set Condition:**
The scan tool has detected a shorted together condition on the CAN C Diagnostic circuits.

Possible Causes
(D72) CAN C DIAGNOSTIC (+) CIRCUIT SHORTED TO (D71) CAN C DIAGNOSTIC (-) CIRCUIT FRONT CONTROL MODULE

Diagnostic Test

1. CHECK THE STATUS OF THE ERROR MESSAGE

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

- With the scan tool, record the error message.
- Disconnect the scan tool from the DLC.
- Cycle the ignition from on to off 3 times.
- Turn the ignition on.

Does the scan tool display this same error message?

- Yes** >> Go To 2
- No** >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. (D72) CAN C DIAGNOSTIC (+) CIRCUIT SHORTED TO (D71) CAN C DIAGNOSTIC (-) CIRCUIT

- Turn the ignition off.
- Disconnect the Front Control Module C1 harness connector.
- Disconnect the scan tool from the DLC.
- Measure the resistance between the (D72) CAN C Diagnostic (+) circuit and the (D71) CAN C Diagnostic (-) circuit.

Is the resistance below 100.0 ohms?

- Yes** >> Repair the (D72) CAN C Diagnostic (+) circuit for a short to the (D71) CAN C Diagnostic (-) circuit.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***CAN C DIAGNOSTIC (-) CIRCUIT OPEN**

***CAN C DIAGNOSTIC (-) CIRCUIT OPEN (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
When the scan tool queries the FCM.
- **Set Condition:**
The scan tool has detected an open condition on the (D71) CAN C Diagnostic (-) circuit.

Possible Causes
(D71) CAN C DIAGNOSTIC (-) CIRCUIT OPEN FRONT CONTROL MODULE

Diagnostic Test**1. CHECK THE STATUS OF THE ERROR MESSAGE**

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

Does the scan tool display this same error message?

Yes >> Go To 2

No >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

***CAN C DIAGNOSTIC (-) CIRCUIT OPEN (CONTINUED)**

2. (D71) CAN C DIAGNOSTIC (-) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Disconnect the scan tool from the DLC.

Measure the resistance of the (D71) CAN C Diagnostic (-) circuit between the FCM connector and the DLC.

Is the resistance below 5.0 ohms?

Yes >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D71) CAN C Diagnostic (-) circuit for an open. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

8131e657

***CAN C DIAGNOSTIC (+) CIRCUIT OPEN**

***CAN C DIAGNOSTIC (+) CIRCUIT OPEN (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
When the scan tool queries the FCM.
- **Set Condition:**
The scan tool has detected an open condition on the (D72) CAN C Diagnostic (+) circuit.

Possible Causes
(D72) CAN C DIAGNOSTIC (+) CIRCUIT OPEN FRONT CONTROL MODULE

Diagnostic Test**1. CHECK THE STATUS OF THE ERROR MESSAGE**

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

Does the scan tool display this same error message?

Yes >> Go To 2

No >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

***CAN C DIAGNOSTIC (+) CIRCUIT OPEN (CONTINUED)**

2. (D72) CAN C DIAGNOSTIC (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Disconnect the scan tool from the DLC.

Measure the resistance of the (D72) CAN C Diagnostic (+) circuit between the FCM connector and the DLC.

Is the resistance below 5.0 ohms?

Yes >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D72) CAN C Diagnostic (+) circuit for an open. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

8131e6ae

***BOTH CAN C DIAGNOSTIC (+) AND CAN C DIAGNOSTIC (-) CIRCUITS OPEN**

***BOTH CAN C DIAGNOSTIC (+) AND CAN C DIAGNOSTIC (-) CIRCUITS OPEN (CONTINUED)**

For a complete wiring diagram Refer to **Section 8W**.

- **When Monitored:**
When the scan tool queries the FCM.
- **Set Condition:**
The scan tool has detected an open condition on both CAN C Diagnostic circuits.

Possible Causes
(D72) CAN C DIAGNOSTIC (+) CIRCUIT OPEN (D71) CAN C DIAGNOSTIC (-) CIRCUIT OPEN FRONT CONTROL MODULE

Diagnostic Test

1. CHECK THE STATUS OF THE ERROR MESSAGE

NOTE: Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

NOTE: Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

Does the scan tool display this same error message?

Yes >> Go To 2

No >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

***BOTH CAN C DIAGNOSTIC (+) AND CAN C DIAGNOSTIC (-) CIRCUITS OPEN (CONTINUED)**

2. (D72) CAN C DIAGNOSTIC (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Disconnect the scan tool from the DLC.

NOTE: Check the connectors at both the DLC and the FCM.

Measure the resistance of the (D72) CAN C Diagnostic (+) circuit between the FCM connector and the DLC.

Is the resistance below 5.0 ohms?

Yes >> Go To 3

No >> Repair the (D72) CAN C Diagnostic (+) circuit for an open. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***BOTH CAN C DIAGNOSTIC (+) AND CAN C DIAGNOSTIC (-) CIRCUITS OPEN (CONTINUED)**

3. (D71) CAN C DIAGNOSTIC (-) CIRCUIT OPEN

Measure the resistance of the (D71) CAN C Diagnostic (-) circuit between the FCM connector and the DLC.

Is the resistance below 5.0 ohms?

Yes >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D71) CAN C Diagnostic (-) circuit for an open. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0001-CAN C BUS CIRCUIT

U0001-CAN C BUS CIRCUIT (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The FCM detects a short in either CAN C Bus circuit.

Possible Causes
(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND
(D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND
(D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE
(D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT
ANTILOCK BRAKE MODULE
POWERTRAIN CONTROL MODULE
SHIFT LEVER ASSEMBLY
STEERING CONTROL MODULE
FINAL DRIVE CONTROL MODULE
ENGINE CONTROL MODULE (DIESEL ONLY)
TRANSMISSION CONTROL MODULE (3.7L/DIESEL ONLY)
FRONT CONTROL MODULE

Diagnostic Test**1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

Does the scan tool display U0001-CAN C BUS CIRCUIT as active?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

U0001-CAN C BUS CIRCUIT (CONTINUED)**2. ANTILOCK BRAKE MODULE — INTERNAL SHORT**

Turn the ignition off.

Disconnect the Antilock Brake Module harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

Does the scan tool display U0001-CAN C BUS CIRCUIT as active?

Yes >> Go To 3

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Antilock Brake Module in accordance with the service information.
Perform ABS VERIFICATION TEST — VER 1.

3. POWERTRAIN CONTROL MODULE — INTERNAL SHORT

Turn the ignition off.

Disconnect the Powertrain Control Module C1 harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

Does the scan tool display U0001-CAN C BUS CIRCUIT as active?

Yes >> Go To 4

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Powertrain Control Module in accordance with the service information.
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

4. SHIFT LEVER ASSEMBLY (IF EQUIPPED) — INTERNAL SHORT

Turn the ignition off.

Disconnect the Shift Lever Assembly harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

Does the scan tool display U0001-CAN C BUS CIRCUIT as active?

Yes >> Go To 5

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Shift Lever Assembly in accordance with the service information.
Perform VERIFICATION TEST VER 1.

U0001-CAN C BUS CIRCUIT (CONTINUED)**5. STEERING CONTROL MODULE — INTERNAL SHORT**

Turn the ignition off.

Disconnect the Steering Control Module C1 harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes >> Go To 6

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Steering Control Module in accordance with the service information.
Perform VERIFICATION TEST VER - 1.

6. FINAL DRIVE CONTROL MODULE (IF EQUIPPED)— INTERNAL SHORT

Turn the ignition off.

Disconnect the Final Drive Control Module C2 harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes >> Go To 7

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Final Drive Control Module in accordance with the service information.
Perform FDCM VERIFICATION TEST VER - 1.

7. ENGINE CONTROL MODULE (3.7L/DIESEL ONLY) — INTERNAL SHORT

Turn the ignition off.

Disconnect the Engine Control Module harness connectors.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes >> Go To 8

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Engine Control Module in accordance with the service information.
Perform POWERTRAIN VERIFICATION TEST VER - 1.

U0001-CAN C BUS CIRCUIT (CONTINUED)**8. TRANSMISSION CONTROL MODULE (DIESEL ONLY) — INTERNAL SHORT**

Turn the ignition off.

Disconnect the Transmission Control Module C2 harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

Does the scan tool display U0001–CAN C BUS CIRCUIT as active?

Yes >> Go To 9

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Transmission Control Module in accordance with the service information.
Perform TRANSMISSION VERIFICATION TEST VER.

9. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Turn the ignition on.

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

Is there any voltage present?

Yes >> Repair the (D65) CAN C Bus (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 10

U0001-CAN C BUS CIRCUIT (CONTINUED)

10. (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D64) CAN C Bus (-) circuit and ground.

Is there any voltage present?

Yes >> Repair the (D64) CAN C Bus (-) circuit for a short to voltage.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 11

11. (D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D65) CAN C Bus (+) circuit.

Is any resistance present?

Yes >> Repair the (D65) CAN C Bus (+) circuit for a short to ground.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 12

U0001-CAN C BUS CIRCUIT (CONTINUED)

12. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

Is any resistance present?

- Yes** >> Repair the (D64) CAN C Bus (-) circuit for a short to ground.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 13

13. (D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT

Measure the resistance between the (D65) CAN C Bus (+) circuit and the (D64) CAN C Bus (-) circuit.

Is any resistance present?

- Yes** >> Repair the (D65) CAN C Bus (+) circuit for a short to the (D64) CAN C Bus (-) circuit.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0021-CAN B BUS (+) CIRCUIT OPEN

U0021-CAN B BUS (+) CIRCUIT OPEN (CONTINUED)

For a complete wiring diagram Refer to **Section 8W**.

- **When Monitored:**
With the ignition on and battery voltage between 10 and 16 volts.
- **Set Condition:**
The FCM detects the (D55) CAN B Bus (+) circuit is open.

Possible Causes
CAN B BUS TERMINAL PUSH OUT SPREAD CAN B BUS TERMINAL (D55) CAN B BUS (+) CIRCUIT OPEN INTERNAL OPEN IN A CAN B BUS MODULE

Diagnostic Test**1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase FCM DTC's

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

U0021-CAN B BUS (+) CIRCUIT OPEN (CONTINUED)

2. ATTEMPT TO ISOLATE THE OPEN CONDITION

Turn the ignition on.

Verify that all CAN B Bus modules are communicating with the scan tool.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: If any module is not communicating, perform the appropriate no response test procedure before proceeding.

Turn the ignition off.

Gain access to the Front Control Module C1 harness connector, but do not disconnect.

Using a fused jumper wire, connect one end to ground and with the other end backprobe the CAN B Bus (-) circuit at the FCM C1 harness connector.

Turn the ignition on.

With the scan tool monitor the network status screen and document all modules that display a red X.

Are there any red X's displayed next to the modules?

Yes >> Go To 3

No >> Check backprobe connection to ground, make sure it is proper. The CAN B Bus open DTC may no longer be active, it may be stored. Check all module connections
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. ATTEMPT TO ISOLATE THE OPEN CONDITION — MULTIPLE RED X'S

With the scan tool continue monitoring the network status screen.

Are there multiple red X's displayed next to the modules?

Yes >> The most likely cause of this condition is an open CAN B Bus (+) circuit between a common CAN B Bus splice and the modules that display the red X next to them. Use the wiring diagrams will help you determine where open condition exists.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

U0021-CAN B BUS (+) CIRCUIT OPEN (CONTINUED)

4. (D55) CAN B BUS (+) CIRCUIT OPEN — SINGLE RED X

Turn the ignition off.

Disconnect the module that has the red X displayed next to it.

Turn the ignition on.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present?

Yes >> Inspect the connector and terminal for damage, inspect for spread terminals, or push out terminals. If ok, replace the module that displayed the red X next to it in accordance with the service information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) CAN B Bus (+) circuit for an open between the next common splice and the module that has the red X displayed next to it. Use the wiring diagrams will help you determine where open condition exists. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0022-CAN B BUS (+) CIRCUIT LOW

U0022-CAN B BUS (+) CIRCUIT LOW (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Continuously.
- **Set Condition:**
The FCM detects the (D55) CAN B Bus (+) circuit is shorted to ground.

Possible Causes
(D55) CAN B BUS (+) CIRCUIT SHORTED TO GROUND ANY CAN B BUS MODULE FRONT CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
 With the scan tool, record and erase FCM DTC's.
 Cycle the ignition from on to off 3 times.
 Turn the ignition on.
 With the scan tool, read active FCM DTC's.

Does the scan tool display this DTC as active?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. CHECK THE (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.
 Disconnect the Front Control Module C1 harness connector.
 Measure the resistance between ground and the (D55) CAN B Bus (+) circuit.

Is resistance below 1000.0 ohms?

- Yes** >> Go To 3
- No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0022-CAN B BUS (+) CIRCUIT LOW (CONTINUED)

3. (D55) CAN B BUS (+) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (D55) CAN B Bus (+) circuit.

While monitoring the ohmmeter, disconnect each CAN B Bus module one at a time.

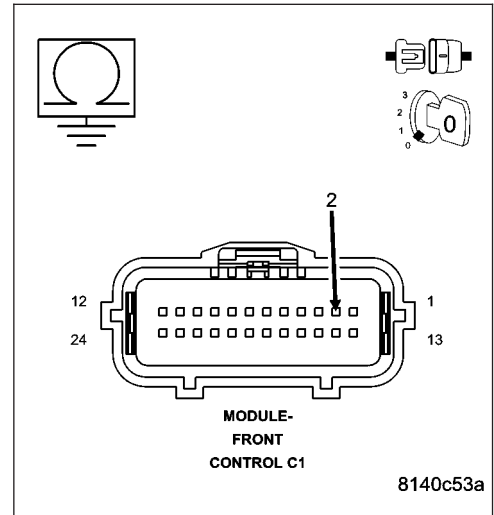

NOTE: This is to determine if the short to ground is internal within a module or if the circuit is shorted.

NOTE: Disconnecting an in-line connector can eliminate a module or group of modules from the list of possible causes for this fault. Refer to the wiring diagrams to assist in diagnosis.

Is resistance below 1000.0 ohms with all the CAN B Bus modules disconnected?

Yes >> Repair the (D55) CAN B Bus (+) circuit for a short to ground.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the module that when disconnected the short to ground was eliminated, in accordance with the service information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0023-CAN B BUS (+) CIRCUIT HIGH

U0023-CAN B BUS (+) CIRCUIT HIGH (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Continuously
- **Set Condition:**
The FCM detects the (D55) CAN B Bus (+) circuit is shorted to voltage.

Possible Causes
(D55) CAN B BUS (+) CIRCUIT SHORTED TO VOLTAGE ANY CAN B BUS MODULE FRONT CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, record and erase FCM DTC's.
Cycle the ignition from on to off 3 times.
Turn the ignition on.
With the scan tool, read active FCM DTC's.

Does the scan tool display this DTC as active?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. CHECK THE (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.
Disconnect the Front Control Module C1 harness connector.
Turn the ignition on.
Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is voltage above 10.0 volts?

- Yes** >> Go To 3
- No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0023-CAN B BUS (+) CIRCUIT HIGH (CONTINUED)

3. (D55) CAN B BUS (+) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

While monitoring the voltmeter, disconnect each CAN B Bus module one at a time.

NOTE: When performing the above step, turn the ignition off (wait one minute) before disconnecting any module. When the module is disconnected turn the ignition on to check for a short to voltage.

NOTE: This is to determine if the short to voltage is internal within a module or if the circuit is shorted.

NOTE: Disconnecting an in-line connector can eliminate a module or group of modules from the list of possible causes for this fault. Refer to the wiring diagrams to assist in diagnosis.

Is the voltage above 10.0 volts with all the CAN B Bus modules disconnected?

- Yes** >> Repair the (D55) CAN B Bus (+) circuit for a short to voltage.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the module that when disconnected the short to voltage was eliminated, in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0024-CAN B BUS (-) CIRCUIT OPEN

U0024-CAN B BUS (-) CIRCUIT OPEN (CONTINUED)

For a complete wiring diagram Refer to **Section 8W**.

- **When Monitored:**
With the ignition on and battery voltage between 10 and 16 volts.
- **Set Condition:**
The FCM detects the (D54) CAN B Bus (-) circuit is open.

Possible Causes
CAN B BUS TERMINAL PUSH OUT SPREAD CAN B BUS TERMINAL (D54) CAN B BUS (-) CIRCUIT OPEN INTERNAL OPEN IN A CAN B BUS MODULE

Diagnostic Test**1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase FCM DTC's

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

U0024-CAN B BUS (-) CIRCUIT OPEN (CONTINUED)

2. ATTEMPT TO ISOLATE THE OPEN CONDITION

Turn the ignition on.

Verify that all CAN B Bus modules are communicating with the scan tool.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: If any module is not communicating, perform the appropriate no response test procedure before proceeding.

Turn the ignition off.

Gain access to the Front Control Module C1 harness connector, but do not disconnect.

Using a fused jumper wire, connect one end to ground and with the other end backprobe the CAN B Bus (+) circuit at the FCM C1 harness connector.

Turn the ignition on.

With the scan tool monitor the network status screen and document all modules that display a red X.

Are there any red X's displayed next to the modules?

Yes >> Go To 3

No >> Check backprobe connection to ground, make sure it is proper. The CAN B Bus open DTC may no longer be active, it may be stored. Check all module connections
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. ATTEMPT TO ISOLATE THE OPEN CONDITION — MULTIPLE RED X'S

With the scan tool continue monitoring the network status screen.

Are there multiple red X's displayed next to the modules?

Yes >> The most likely cause of this condition is an open CAN B Bus (-) circuit between a common CAN B Bus splice and the modules that display the red X next to them. Use the wiring diagrams will help you determine where open condition exists.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

U0024-CAN B BUS (-) CIRCUIT OPEN (CONTINUED)

4. (D54) CAN B BUS (-) CIRCUIT OPEN — SINGLE RED X

Turn the ignition off.

Disconnect the module that has the red X displayed next to it.

Turn the ignition on.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Is there any voltage present?

Yes >> Inspect the connector and terminal for damage, inspect for spread terminals, or push out terminals. If ok, replace the module that displayed the red X next to it in accordance with the service information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D54) CAN B Bus (-) circuit for an open between the next common splice and the module that has the red X displayed next to it. Use the wiring diagrams will help you determine where open condition exists. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0025-CAN B BUS (-) CIRCUIT LOW

U0025-CAN B BUS (-) CIRCUIT LOW (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Continuously
- **Set Condition:**
The FCM detects the (D54) CAN B Bus (-) circuit is shorted to ground.

Possible Causes
(D54) CAN B BUS (-) CIRCUIT SHORTED TO GROUND OR TO (D54) CAN B BUS (-) CIRCUIT ANY CAN B BUS MODULE FRONT CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, record and erase FCM DTC's.
Cycle the ignition from on to off 3 times.
Turn the ignition on.
With the scan tool, read active FCM DTC's.

Does the scan tool display this DTC as active?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. CHECK THE (D54) CAN B BUS (-) CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.
Disconnect the Front Control Module C1 harness connector.
Measure the resistance between ground and the (D54) CAN B Bus (-) circuit.

Is resistance below 1000.0 ohms?

- Yes** >> Go To 3
- No** >> Go To 4

U0025-CAN B BUS (-) CIRCUIT LOW (CONTINUED)

3. (D54) CAN B BUS (-) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (D54) CAN B Bus (-) circuit.

While monitoring the ohmmeter, disconnect each CAN B Bus module one at a time.

NOTE: This is to determine if the short to ground is internal within a module or if the circuit is shorted.

NOTE: Disconnecting an in-line connector can eliminate a module or group of modules from the list of possible causes for this fault. Refer to the wiring diagrams to assist in diagnosis.

Is resistance below 1000.0 ohms with all the CAN B Bus modules disconnected?

Yes >> Repair the (D54) CAN B Bus (-) circuit for a short to ground.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the module that when disconnected the short to ground was eliminated, in accordance with the service information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK THE (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO THE (D54) CAN B BUS (-) CIRCUIT

Measure the resistance between the (D55) CAN B Bus (+) circuit and (D54) CAN B Bus (-) circuit.

Is resistance below 1000.0 ohms?

Yes >> Go To 5

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0025-CAN B BUS (-) CIRCUIT LOW (CONTINUED)**5. (D55) CAN B BUS (+) CIRCUIT SHORTED TO THE (D54) CAN B BUS (-) CIRCUIT**

Measure the resistance between the (D55) CAN B Bus (+) circuit and (D54) CAN B Bus (-) circuit.

While monitoring the ohmmeter, disconnect each CAN B Bus module one at a time.

NOTE: This is to determine if the short together is internal within a module or if the circuits are shorted together.

NOTE: Disconnecting an in-line connector can eliminate a module or group of modules from the list of possible causes for this fault. Refer to the wiring diagrams to assist in diagnosis.

Is resistance below 1000.0 ohms with all the CAN B Bus modules disconnected?

Yes >> Repair the (D55) CAN B Bus (+) circuit for a short to the (D54) CAN B Bus (-) circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the module that when disconnected the short to ground was eliminated, in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0026-CAN B BUS (-) CIRCUIT HIGH

U0026-CAN B BUS (-) CIRCUIT HIGH (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Continuously
- **Set Condition:**
The FCM detects the (D54) CAN B Bus (-) circuit is shorted to voltage.

Possible Causes
(D54) CAN B BUS (-) CIRCUIT SHORTED TO VOLTAGE ANY CAN B BUS MODULE FRONT CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, record and erase FCM DTC's.
Cycle the ignition from on to off 3 times.
Turn the ignition on.
With the scan tool, read active FCM DTC's.

Does the scan tool display this DTC as active?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. CHECK THE (D54) CAN B BUS (-) CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.
Disconnect the Front Control Module C1 harness connector.
Turn the ignition on.
Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Is voltage above 10.0 volts?

- Yes** >> Go To 3
- No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0026-CAN B BUS (-) CIRCUIT HIGH (CONTINUED)

3. (D54) CAN B BUS (-) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

While monitoring the voltmeter, disconnect each CAN B Bus module one at a time.

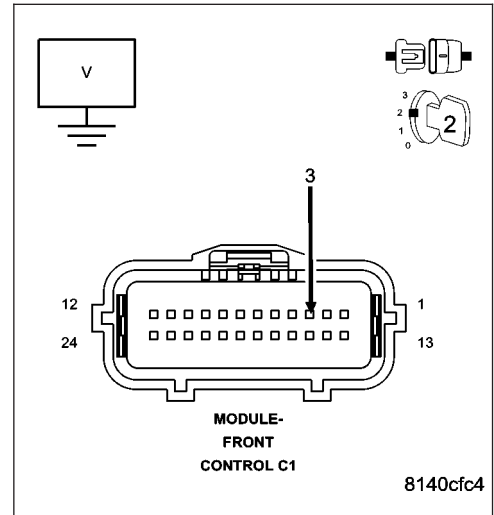

NOTE: When performing the above step, turn the ignition off (wait one minute) before disconnecting any module. When the module is disconnected turn the ignition on to check for a short to voltage.

NOTE: This is to determine if the short to voltage is internal within a module or if the circuit is shorted.

NOTE: Disconnecting an in-line connector can eliminate a module or group of modules from the list of possible causes for this fault. Refer to the wiring diagrams to assist in diagnosis.

Is the voltage above 10.0 volts with all the CAN B Bus modules disconnected?

- Yes** >> Repair the (D54) CAN B Bus (-) circuit for a short to voltage.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the module that when disconnected the short to voltage was eliminated, in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0027-CAN B BUS (-) SHORTED TO BUS (+)

U0027-CAN B BUS (-) SHORTED TO BUS (+) (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Continuously
- **Set Condition:**
The FCM detects the (D55) CAN B Bus (+) circuit is shorted to the (D54) CAN B Bus (-) circuit.

Possible Causes
(D55) CAN B BUS (+) CIRCUIT SHORTED TO THE (D54) CAN B BUS (-) CIRCUIT ANY CAN B BUS MODULE FRONT CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
With the scan tool, record and erase FCM DTC's.
Cycle the ignition from on to off 3 times.
Turn the ignition on.
With the scan tool, read active FCM DTC's.

Does the scan tool display this DTC as active?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. CHECK THE (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO THE (D54) CAN B BUS (-) CIRCUIT

Turn the ignition off.
Disconnect the Front Control Module C1 harness connector.
Measure the resistance between the (D55) CAN B Bus (+) circuit and (D54) CAN B Bus (-) circuit.

Is resistance below 1000.0 ohms?

- Yes** >> Go To 3
- No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0027-CAN B BUS (-) SHORTED TO BUS (+) (CONTINUED)**3. (D55) CAN B BUS (+) CIRCUIT SHORTED TO THE (D54) CAN B BUS (-) CIRCUIT**

Measure the resistance between the (D55) CAN B Bus (+) circuit and (D54) CAN B Bus (-) circuit.

While monitoring the ohmmeter, disconnect each CAN B Bus module one at a time.

NOTE: This is to determine if the short together is internal within a module or if the circuits are shorted together.

NOTE: Disconnecting an in-line connector can eliminate a module or group of modules from the list of possible causes for this fault. Refer to the wiring diagrams to assist in diagnosis.

Is resistance below 1000.0 ohms with all the CAN B Bus modules disconnected?

Yes >> Repair the (D55) CAN B Bus (+) circuit for a short to the (D54) CAN B Bus (-) circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the module that when disconnected the short together was eliminated, in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0100-LOST COMMUNICATION WITH ECM/PCM

U0100-LOST COMMUNICATION WITH ECM/PCM (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the ECM/PCM for approximately 2 to 5 seconds.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
ECM/PCM POWER AND GROUND
ECM/PCM
MODULE THAT SET THIS DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE ECM/PCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ECM/PCM is active on the bus.

Is the ECM/PCM active on the bus?

Yes >> Go To 4

No >> Refer to the No Response test procedure. Refer to the table of contents in this section.

U0100-LOST COMMUNICATION WITH ECM/PCM (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the ECM/PCM?

Yes >> Replace/update the ECM/PCM in accordance with the service information.
Perform the appropriate VERIFICATION TEST.

No >> Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.

U0101-LOST COMMUNICATION WITH TCM

U0101-LOST COMMUNICATION WITH TCM (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
 Bus messages not received from the TCM for approximately 2 to 5 seconds.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
TCM POWER AND GROUND
TCM (PCM - GAS ONLY)
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE TCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the TCM is active on the bus.

Is the TCM active on the bus?

Yes >> Go To 4

No >> Refer to the No Response test procedure. Refer to the table of contents in this section.

U0101-LOST COMMUNICATION WITH TCM (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the TCM?

- Yes** >> Replace/update the TCM (PCM — Gas only) in accordance with the service information.
Perform the appropriate VERIFICATION TEST.
- No** >> Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.
-

U0103-LOST COMMUNICATION WITH ELECTRIC GEAR SHIFT MODULE

U0103-LOST COMMUNICATION WITH ELECTRIC GEAR SHIFT MODULE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the Electric Gear Shift Module (shift lever assembly) for approximately 500ms.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
SHIFT LEVER ASSEMBLY
SHIFT LEVER ASSEMBLY POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE SHIFT LEVER ASSEMBLY IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the Shift Lever Assembly is active on the bus.

Is the Shift Lever Assembly active on the bus?

Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.

U0103-LOST COMMUNICATION WITH ELECTRIC GEAR SHIFT MODULE (CONTINUED)

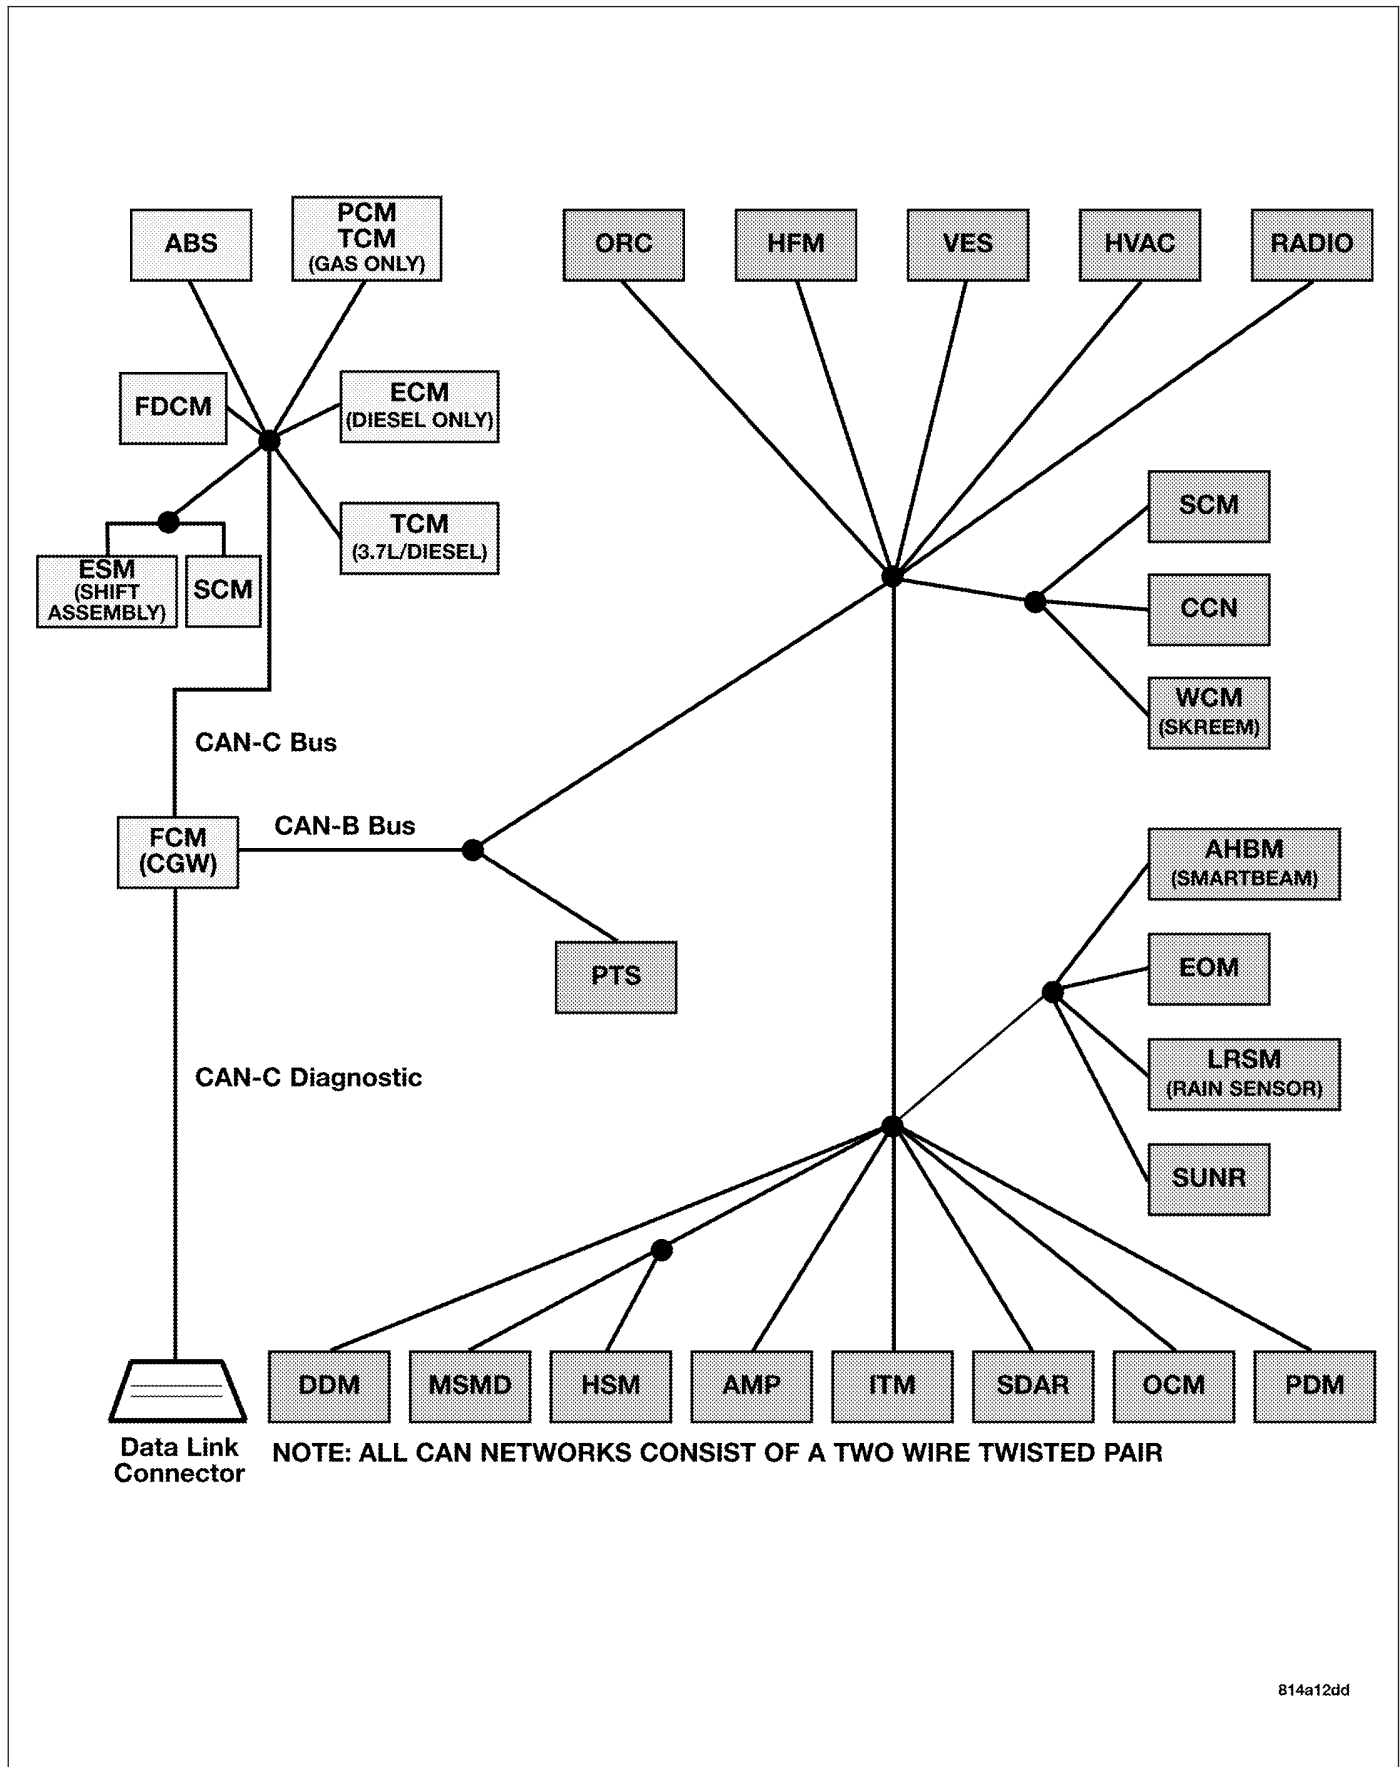

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS “Logged Against” the Shift Lever Assembly?

- Yes** >> Replace/update the Shifter Lever Assembly in accordance with the service information.
Perform the appropriate VERIFICATION TEST.
- No** >> Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.
-

U0114-LOST COMMUNICATION WITH FINAL DRIVE CONTROL MODULE

U0114-LOST COMMUNICATION WITH FINAL DRIVE CONTROL MODULE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
 Bus messages not received from the Final Drive Control Module (FDCM) for approximately 2 to 5 seconds.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY FINAL DRIVE CONTROL MODULE POWER AND GROUND FINAL DRIVE CONTROL MODULE MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE FDCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the FDCM is active on the bus.

Is the FDCM active on the bus?

Yes >> Go To 4

No >> Refer to the No Response test procedure. Refer to the table of contents in this section.

U0114-LOST COMMUNICATION WITH FINAL DRIVE CONTROL MODULE (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS “Logged Against” the FDCM?

- Yes** >> Replace/update the Final Drive Control Module in accordance with the service information.
Perform the appropriate VERIFICATION TEST.
- No** >> Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.
-

U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE

U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received from the Antilock Brake Module for approximately 2 to 5 seconds.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
ANTILOCK BRAKE MODULE POWER AND GROUND
ANTILOCK BRAKE MODULE
MODULE THAT SET THIS DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE ABS IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ABS is active on the bus.

Is the ABS active on the bus?

Yes >> Go To 4

No >> Refer to the No Response test procedure. Refer to the table of contents in this section.

U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the ABS?

Yes >> Replace/update the Antilock Brake Module in accordance with the service information.
Perform ABS VERIFICATION TEST - VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information
Perform the appropriate VERIFICATION TEST.

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
 Bus messages not received from the Front Control Module for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY FRONT CONTROL MODULE POWER AND GROUND FRONT CONTROL MODULE MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE FCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the FCM is active on the bus.

Is the FCM active on the bus?

Yes >> Go To 4

No >> Refer to the No Response test procedure. Refer to the table of contents in this section.

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS “Logged Against” the FCM?

- Yes** >> Replace/update the Front Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set this DTC in accordance with the service information
Perform the appropriate VERIFICATION TEST.
-

U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)

U0151—LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC) (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received from the Occupant Restraint Controller for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
OCCUPANT RESTRAINT CONTROLLER POWER AND GROUND
OCCUPANT RESTRAINT CONTROLLER
MODULE THAT SET THIS DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE ORC IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ORC is active on the bus.

Is the ORC active on the bus?

Yes >> Go To 4

No >> Refer to the No Response test procedure. Refer to the table of contents in this section.

U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC) (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the ORC?

Yes >> Replace/update the Occupant Restraint Controller in accordance with the service information.
Perform AIRBAG VERIFICATION TEST – VER 1.

No >> Replace/update the module that set this DTC in accordance with the service information
Perform the appropriate VERIFICATION TEST.

U0154-LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE

U0154—LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
 Bus messages not received from the Occupant Classification Module for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY OCCUPANT CLASSIFICATION MODULE POWER AND GROUND OCCUPANT CLASSIFICATION MODULE MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE OCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the OCM is active on the bus.

Is the OCM active on the bus?

Yes >> Go To 4

No >> Refer to the No Response test procedure. Refer to the table of contents in this section.

U0154-LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the OCM?

- Yes** >> Replace/update the Occupant Classification Module in accordance with the service information.
Perform AIRBAG VERIFICATION TEST – VER 1.
- No** >> Replace/update the module that set this DTC in accordance with the service information
Perform the appropriate VERIFICATION TEST.
-

U0155-LOST COMMUNICATION WITH CLUSTER/CCN

U0155-LOST COMMUNICATION WITH CLUSTER/CCN (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received from the Cluster/CCN for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
CLUSTER/CCN POWER AND GROUND
CLUSTER/CCN
MODULE THAT SET THE DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE CCN IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the CCN is active on the bus.

Is the CCN active on the bus?

Yes >> Go To 4

No >> Refer to the No Response test procedure. Refer to the table of contents in this section.

U0155-LOST COMMUNICATION WITH CLUSTER/CCN (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the CCN?

- Yes** >> Replace/update the Cluster (CCN) in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.
-

U0156-LOST COMMUNICATION WITH EOM

U0156–LOST COMMUNICATION WITH EOM (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
 Bus messages not received from the Electronic Overhead Module (EOM) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY ELECTRONIC OVERHEAD MODULE POWER OR GROUND ELECTRONIC OVERHEAD MODULE MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE EOM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the EOM is active on the bus.

Is the EOM active on the bus?

Yes >> Go To 4

No >> Refer to the No Response test procedure. Refer to the table of contents in this section.

U0156-LOST COMMUNICATION WITH EOM (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the EOM?

- Yes** >> Replace/update the Electronic Overhead Module (EOM) in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set this DTC in accordance with the service information
Perform the appropriate VERIFICATION TEST.
-

U0159-LOST COMMUNICATION WITH PARK ASSIST CONTROL MODULE

U0159-LOST COMMUNICATION WITH PARK ASSIST CONTROL MODULE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received from the Park Assist Module (PTS) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
PARK ASSIST MODULE
PARK ASSIST MODULE POWER OR GROUND
MODULE THAT SET THIS DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read all active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE PTS IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the PTS is active on the bus.

Is the PTS active on the bus?

Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.

U0159-LOST COMMUNICATION WITH PARK ASSIST CONTROL MODULE (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS “Logged Against” the PTS?

- Yes** >> Replace/update the Park Assist Module (PTS) in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set this DTC in accordance with the service information
Perform the appropriate VERIFICATION TEST.
-

U0164-LOST COMMUNICATION WITH HVAC CONTROL MODULE

U0164-LOST COMMUNICATION WITH HVAC CONTROL MODULE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
 Bus messages not received from the A/C Heater Control (HVAC) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY A/C HEATER CONTROL POWER AND GROUND A/C HEATER CONTROL MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE HVAC IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the HVAC is active on the bus.

Is the HVAC active on the bus?

Yes >> Go To 4

No >> Refer to the No Response test procedure. Refer to the table of contents in this section.

U0164-LOST COMMUNICATION WITH HVAC CONTROL MODULE (CONTINUED)

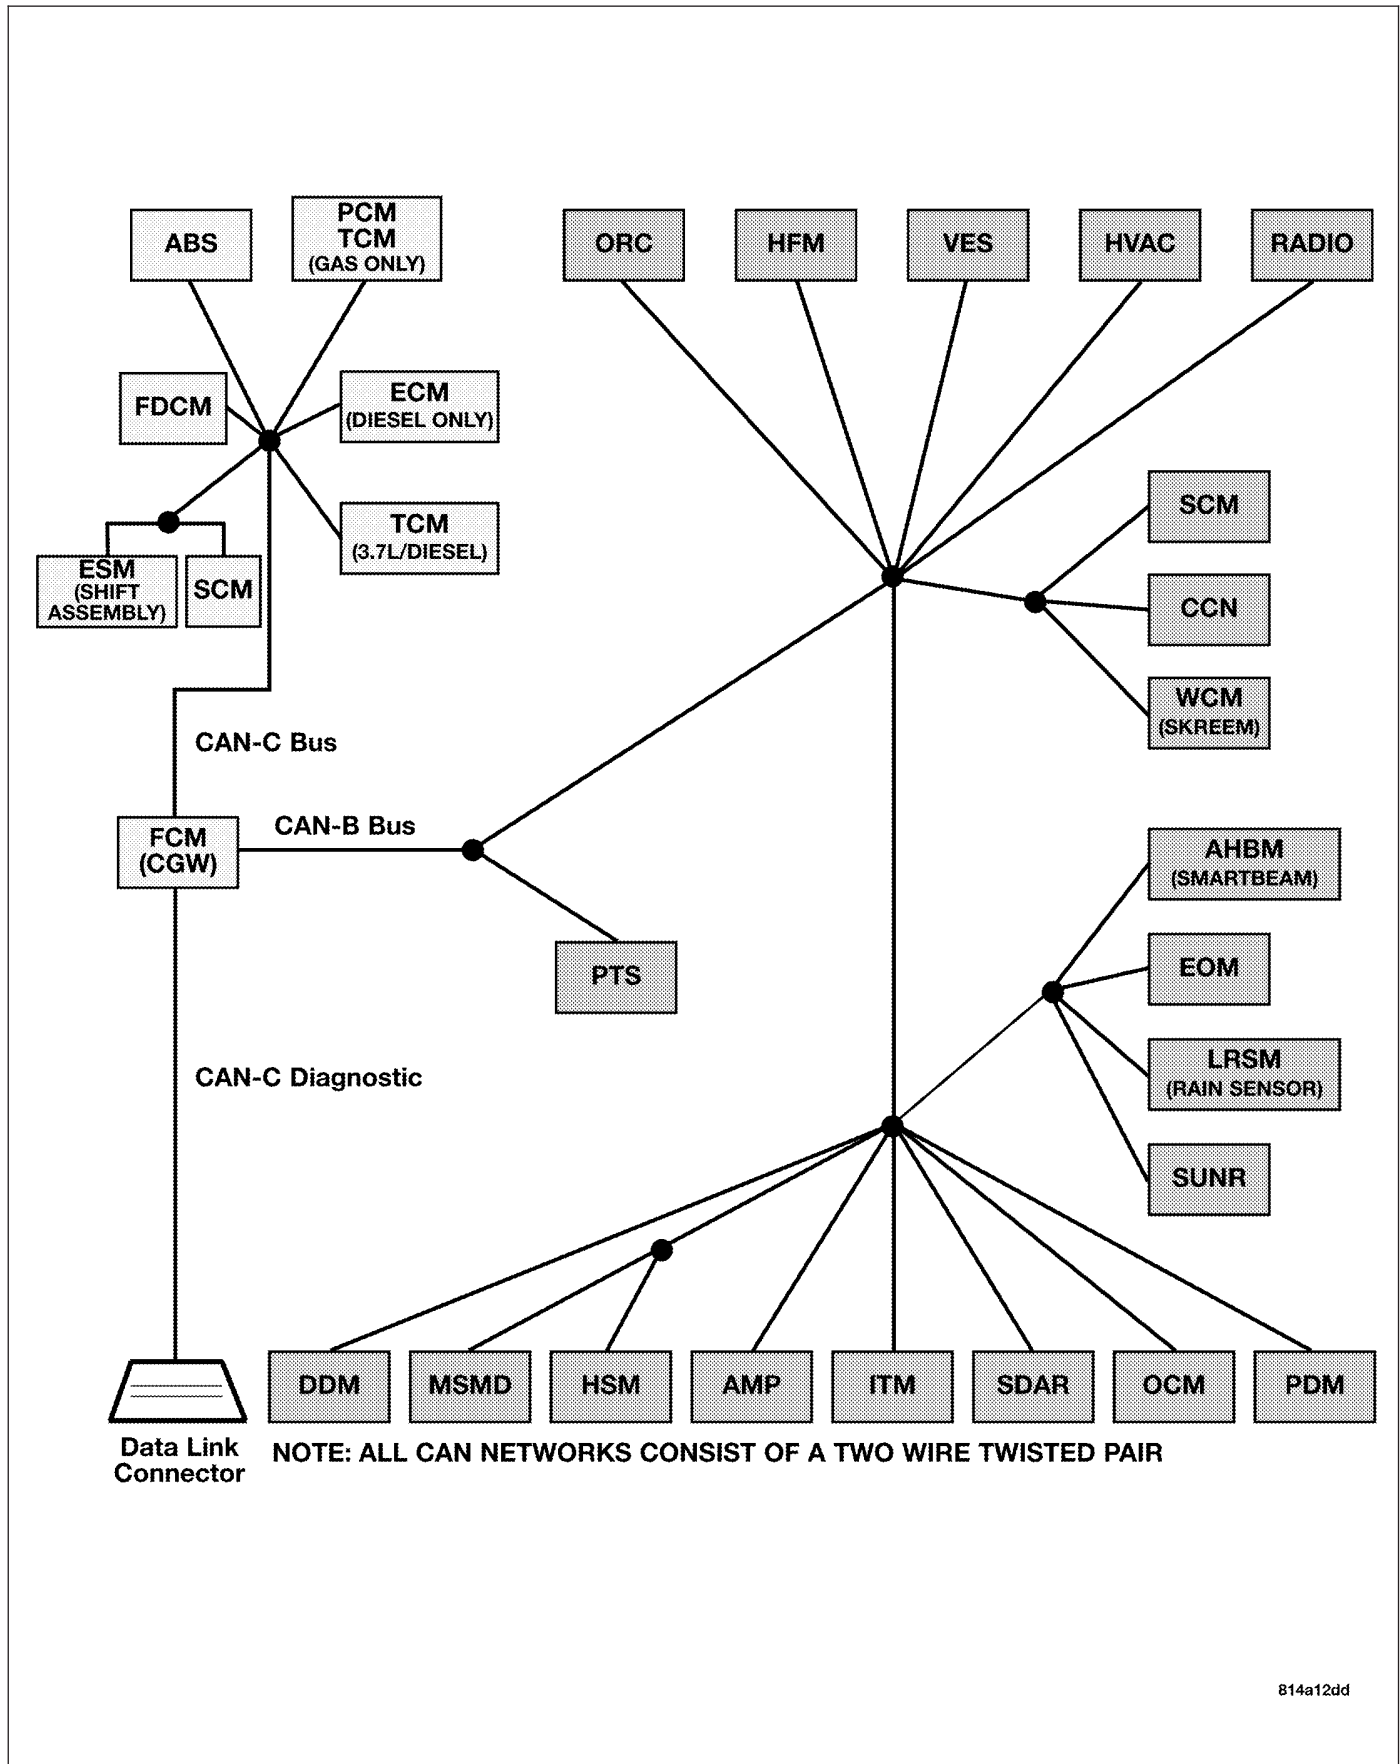

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the HVAC?

- Yes** >> Replace/update the A/C Heater Control in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set the DTC in accordance with the service information
Perform the appropriate VERIFICATION TEST.
-

U0167-LOST COMMUNICATION WITH INTRUSION TRANSCIEVER CONTROL MODULE

U0167-LOST COMMUNICATION WITH INTRUSION TRANSCEIVER CONTROL MODULE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the Intrusion Transceiver Control Module (ITM) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
INTRUSION TRANSCEIVER CONTROL MODULE POWER AND GROUND
INTRUSION TRANSCEIVER CONTROL MODULE
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE ITM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ITM is active on the bus.

Is the ITM active on the bus?

Yes >> Go To 4

No >> Refer to the No Response test procedure. Refer to the table of contents in this section.

U0167-LOST COMMUNICATION WITH INTRUSION TRANSCEIVER CONTROL MODULE (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS “Logged Against” the ITM?

- Yes** >> Replace/update the Intrusion Transceiver Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set the DTC in accordance with the service information
Perform the appropriate VERIFICATION TEST.
-

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM)

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM) (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the Sentry Key Remote Entry Module (WCM) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
SENTRY KEY REMOTE ENTRY MODULE POWER AND GROUND
SENTRY KEY REMOTE ENTRY MODULE
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE WCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the WCM is active on the bus.

Is the WCM active on the bus?

Yes >> Go To 4

No >> Refer to the No Response test procedure. Refer to the table of contents in this section.

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM) (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the WCM?

Yes >> Replace/update the Sentry Key Remote Entry Module in accordance with the service information.
Perform SKREEM VERIFICATION TEST

No >> Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.

U0169-LOST COMMUNICATION WITH SUNROOF CONTROL MODULE

U0169-LOST COMMUNICATION WITH SUNROOF CONTROL MODULE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received from the Sunroof Motor/Module (SUNR) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY SUNROOF MOTOR/MODULE POWER AND GROUND SUNROOF MOTOR/MODULE MODULE THAT SET THIS DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE SUNR IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the SUNR is active on the bus.

Is the SUNR active on the bus?

Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.

U0169-LOST COMMUNICATION WITH SUNROOF CONTROL MODULE (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the SUNR?

- Yes** >> Replace/update the Sunroof Motor/Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.
-

U0184-LOST COMMUNICATION WITH RADIO

U0184-LOST COMMUNICATION WITH RADIO (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received from the Radio for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
RADIO POWER AND GROUND
RADIO
MODULE THAT SET THIS DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE RADIO IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the Radio is active on the bus.

Is the Radio active on the bus?

Yes >> Go To 4

No >> Refer to the No Response test procedure. Refer to the table of contents in this section.

U0184-LOST COMMUNICATION WITH RADIO (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS “Logged Against” the Radio?

- Yes** >> Replace/update the Radio in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.
-

U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER

U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received from the Amplifier for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
AMPLIFIER POWER AND GROUND
AMPLIFIER
MODULE THAT SET THIS DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE AMPLIFIER IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the Amplifier is active on the bus.

Is the Amplifier active on the bus?

Yes >> Go To 4

No >> Refer to the No Response test procedure. Refer to the table of contents in this section.

U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS “Logged Against” the Amplifier?

- Yes** >> Replace/update the Amplifier in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.
-

U0195-LOST COMMUNICATION WITH SDARS

U0195-LOST COMMUNICATION WITH SDARS (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
 Bus messages not received from the Satellite Receiver (SDAR) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
SATELLITE RECEIVER POWER AND GROUND
SATELLITE RECEIVER
MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE SATELLITE RECEIVER IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the SDARS is active on the bus.

Is the SDARS active on the bus?

Yes >> Go To 4

No >> Refer to the No Response test procedure. Refer to the table of contents in this section.

U0195-LOST COMMUNICATION WITH SDARS (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the SDARS?

- Yes** >> Replace/update the Satellite Receiver in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set the DTC in accordance with the service information
Perform the appropriate VERIFICATION TEST.
-

U0196-LOST COMMUNICATION WITH VEHICLE ENTERTAINMENT CONTROL MODULE

U0196-LOST COMMUNICATION WITH VEHICLE ENTERTAINMENT CONTROL MODULE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received from the vehicle entertainment system (DVD player) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
MONITOR/DVD MEDIA SYSTEM (DVD PLAYER)
MONITOR/DVD MEDIA SYSTEM (DVD PLAYER) POWER AND GROUND
MODULE THAT SET THIS DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE VES IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the VES is active on the bus.

Is the VES active on the bus?

Yes >> Go To 4

No >> Refer to the No Response test procedure. Refer to the table of contents in this section.

U0196-LOST COMMUNICATION WITH VEHICLE ENTERTAINMENT CONTROL MODULE (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS “Logged Against” the VES?

- Yes** >> Replace/update the Monitor/DVD Media System (DVD Player) in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.
-

U0197-LOST COMMUNICATION WITH HANDS FREE PHONE MODULE

U0197-LOST COMMUNICATION WITH HANDS FREE PHONE MODULE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received from the HFM for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
HANDS FREE MODULE POWER AND GROUND
HANDS FREE MODULE
MODULE THAT SET THIS DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE HFM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the HFM is active on the bus.

Is the HFM active on the bus?

Yes >> Go To 4

No >> Refer to the No Response test procedure. Refer to the table of contents in this section.

U0197-LOST COMMUNICATION WITH HANDS FREE PHONE MODULE (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS “Logged Against” the HFM?

- Yes** >> Replace/update the Hands Free Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.
-

U0199-LOST COMMUNICATION WITH DRIVER DOOR MODULE

U0199-LOST COMMUNICATION WITH DRIVER DOOR MODULE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received from the DDM for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
DRIVER MEMORY MIRROR MODULE POWER AND GROUND
DRIVER MEMORY MIRROR MODULE
MODULE THAT SET THE DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE DDM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the DDM is active on the bus.

Is the DDM active on the bus?

Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.

U0199-LOST COMMUNICATION WITH DRIVER DOOR MODULE (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS “Logged Against” the DDM?

- Yes** >> Replace/update the Driver Memory Mirror Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.
-

U0200-LOST COMMUNICATION WITH PASSENGER DOOR MODULE

U0200-LOST COMMUNICATION WITH PASSENGER DOOR MODULE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
 Bus messages not received from the PDM for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY PASSENGER MEMORY MIRROR MODULE POWER AND GROUND PASSENGER MEMORY MIRROR MODULE MODULE THAT SET THIS DTC

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE PDM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the PDM is active on the bus.

Is the PDM active on the bus?

Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.

U0200-LOST COMMUNICATION WITH PASSENGER DOOR MODULE (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS “Logged Against” the PDM?

- Yes** >> Replace/update the Passenger Memory Mirror Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set this DTC in accordance with the service information
Perform the appropriate VERIFICATION TEST.
-

U0208-LOST COMMUNICATION WITH HEATED SEAT CONTROL MODULE

U0208-LOST COMMUNICATION WITH HEATED SEAT CONTROL MODULE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received from the HSM for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
HEATED SEAT MODULE POWER AND GROUND
HEATED SEAT MODULE
MODULE THAT SET THIS DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE HSM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the HSM is active on the bus.

Is the HSM active on the bus?

Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.

U0208-LOST COMMUNICATION WITH HEATED SEAT CONTROL MODULE (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS “Logged Against” the HSM?

- Yes** >> Replace/update the Heated Seat Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.
-

U0209-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE

U0209-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received from the MSMD for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
MEMORY SEAT MODULE POWER AND GROUND
MEMORY SEAT MODULE
MODULE THAT SET THIS DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE MSMD IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the MSMD is active on the bus.

Is the MSMD active on the bus?

Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.

U0209-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the MSMD?

- Yes** >> Replace/update the Memory Seat Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.
-

U0212-LOST COMMUNICATION WITH SCCM - CAN B

U0212-LOST COMMUNICATION WITH SCCM - CAN B (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received from the SCM (CAN B) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY STEERING CONTROL MODULE POWER AND GROUND STEERING CONTROL MODULE MODULE THAT SET THIS DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE SCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the SCM is active on the bus.

Is the SCM active on the bus?

Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.

U0212-LOST COMMUNICATION WITH SCCM - CAN B (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS “Logged Against” the SCM?

- Yes** >> Replace/update the Steering Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.
-

U0231-LOST COMMUNICATION WITH RAIN SENSING MODULE

U0231-LOST COMMUNICATION WITH RAIN SENSING MODULE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received from the rain sensor (LRSM) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
RAIN SENSOR POWER AND GROUND
RAIN SENSOR
MODULE THAT SET THIS DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE LRSM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the LRSM is active on the bus.

Is the LRSM active on the bus?

Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.

U0231-LOST COMMUNICATION WITH RAIN SENSING MODULE (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS “Logged Against” the LRSM?

- Yes** >> Replace/update the Rain Sensor in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.
-

U0241-LOST COMMUNICATION WITH AUTO HIGHBEAM HEADLAMP CONTROL MODULE

U0241-LOST COMMUNICATION WITH AUTO HIGHBEAM HEADLAMP CONTROL MODULE (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received from the inside rearview mirror (smartbeam) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
INSIDE REARVIEW MIRROR (SMARTBEAM) POWER AND GROUND
INSIDE REARVIEW MIRROR (SMARTBEAM)
MODULE THAT SET THIS DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Index for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE AHBM (SMARTBEAM) IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the AHBM (SMARTBEAM) is active on the bus.

Is the AHBM (SMARTBEAM) active on the bus?

Yes >> Go To 4

No >> Refer to the No Response test procedure. Refer to the table of contents in this section.

U0241-LOST COMMUNICATION WITH AUTO HIGHBEAM HEADLAMP CONTROL MODULE (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCS “Logged Against” the AHBM (SMARTBEAM)?

- Yes** >> Replace/update the Inside Rearview Mirror (SMARTBEAM) in accordance with the service information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set this DTC in accordance with the service information. Perform the appropriate VERIFICATION TEST.
-

U1108-ADDITIONAL CAN B ECU DETECTED

U1108-ADDITIONAL CAN B ECU DETECTED (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Continuously.
- **Set Condition:**
The Front Control Module detects an additional CAN B module and requires a reconfiguration.

Possible Causes
ADDITIONAL MODULE ADDED/REMOVED FROM THE CAN B BUS NETWORK

Diagnostic Test**1. RECONFIGURE THE FRONT CONTROL MODULE**

Turn the ignition on.

With the scan tool, select network view and press the gateway button. This will list the CAN modules on the vehicle. Read and record the listed modules.

With the scan tool, select FCM, miscellaneous functions then add/remove ECUs.

With the scan tool, add or remove the module that was not configured in the FCM.

With the scan tool, erase DTC's.

Cycle the ignition from on to off 3 times and read the active FCM DTC's.

Does the scan tool display this DTC as active?

- Yes** >> Retest system and attempt to reconfigure the FCM.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Repair is complete.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

U110A-LOST COMMUNICATION WITH SCCM - CAN C

U110A-LOST COMMUNICATION WITH SCCM - CAN C (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received from the SCM (CAN C) for approximately 200ms.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCs RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
STEERING CONTROL MODULE POWER AND GROUND
STEERING CONTROL MODULE
MODULE THAT SET THIS DTC

Diagnostic Test**1. VERIFY DTC IS ACTIVE**

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

Is this DTC active?

Yes >> Go To 2

No >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.

2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs

With the scan tool, read active DTCs from all modules.

NOTE: Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.

No >> Go To 3

3. VERIFY THAT THE SCM IS ACTIVE ON THE BUS

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the SCM is active on the bus.

Is the SCM active on the bus?

Yes >> Go To 4

No >> Refer to the Table of Contents located in this section for a no response test procedure.

U110A-LOST COMMUNICATION WITH SCCM - CAN C (CONTINUED)

4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS

With the scan tool, select Network Diagnostics.

Is there more than one module with active DTCs “Logged Against” the SCM?

- Yes** >> Replace/update the Steering Control Module in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace/update the module that set this DTC in accordance with the service information.
Perform the appropriate VERIFICATION TEST.
-

***STORED LOST COMMUNICATION DTCS**

***STORED LOST COMMUNICATION DTCS (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
 - With the ignition on
 - Battery voltage between 10 and 16 volts
 - IOD fuse installed
 - FCM is configured correctly
- **Set Condition:**
Bus messages not received for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
POWER OR GROUND FROM THE REPORTING MODULE
MODULE THAT SET THIS DTC
PREVIOUS SERVICE PERFORMED WITHIN THE LAST 100 KEY CYCLES (FUSE/RELAYS REMOVED, WIRING SERVICE, BATTERY DISCONNECT)
LOW BATTERY/JUMP START CONDITION
IOD FUSE WAS REMOVED DURING SHIPPING
CHECK FOR RELATED TSBS

Diagnostic Test**1. VERIFY DTC IS STORED**

NOTE: Stored faults may indicate a customer perceived intermittent condition.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read stored DTCs.

Is this DTC stored?

Yes >> Go To 2

No >> Diagnose the active DTC. Refer to the Index for a list of the symptoms.

2. CHECK THE ENVIRONMENTAL DATA

With the scan tool, read the loss of communication environmental data.

Does the loss of communication environmental odometer data match up to any of the previous service procedures listed in the possible causes or are there any stored CAN B or C hardware electrical, battery, ignition voltage, VIN missing/mismatch, FCM configuration DTCs present with matching environmental data?

Yes >> These DTCs may have been the result of other service procedures performed. Clear DTCs.

No >> Go To 3

STORED LOST COMMUNICATION DTCS (CONTINUED)*3. VERIFY INTERMITTENT LOST COMMUNICATION DTC – WIRING CONCERNS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Is there more than one ECU with stored DTCs “Logged Against” the module and one or more lost communication DTCs stored in the offending module?

Yes >> Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

No >> Go To 4

4. VERIFY INTERMITTENT LOST COMMUNICATION DTC – OFFENDING MODULE

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Is there more than one ECU with stored DTCs “Logged Against” the module and NO lost communication DTCs stored in the offending module?

Yes >> Check for TSB related to this offending module.

No >> Go To 5

5. VERIFY INTERMITTENT LOST COMMUNICATION DTC – REPORTING MODULE

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Is there ONLY ONE ECU with stored DTCs “Logged Against” the module?

Yes >> Check for TSB related to the module that set this DTC.

No >> Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

***NO RESPONSE FROM ABS (ANTILOCK BRAKE MODULE)**

MODULE-ANTILOCK BRAKES

***NO RESPONSE FROM ABS (ANTILOCK BRAKE MODULE) (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(A107) (A200) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z107) (Z127) GROUND CIRCUIT OPEN
(F943) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
ANTILOCK BRAKE MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the FCM for any active CAN C hardware DTCs, perform DTC before proceeding.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A107) (A200) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Antilock Brake Module harness connector.

Using a 12-volt test light connected to ground, check each (A107) and (A200) Fused B(+) circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 3

No >> Repair the Fused B(+) circuit for an open or short. Perform ABS VERIFICATION TEST - VER 1.

***NO RESPONSE FROM ABS (ANTILOCK BRAKE MODULE) (CONTINUED)**

3. (Z107) (Z127) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check each (Z107) and (Z127) ground circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 4

No >> Repair the ground circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

4. (F943) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F943) Fused Ignition Switch Output circuit.

Does the test light illuminate brightly?

Yes >> Go To 5

No >> Repair the (F943) Fused Ignition Switch Output circuit for an open or short.
Perform ABS VERIFICATION TEST - VER 1.

***NO RESPONSE FROM ABS (ANTILOCK BRAKE MODULE) (CONTINUED)**

5. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the FCM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the FCM connector and the Antilock Brake Module connector.

Is resistance below 5.0 ohms?

Yes >> Go To 6

No >> Repair the (D65) CAN C Bus (+) circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

***NO RESPONSE FROM ABS (ANTILOCK BRAKE MODULE) (CONTINUED)**

6. (D64) CAN C BUS (-) CIRCUIT OPEN

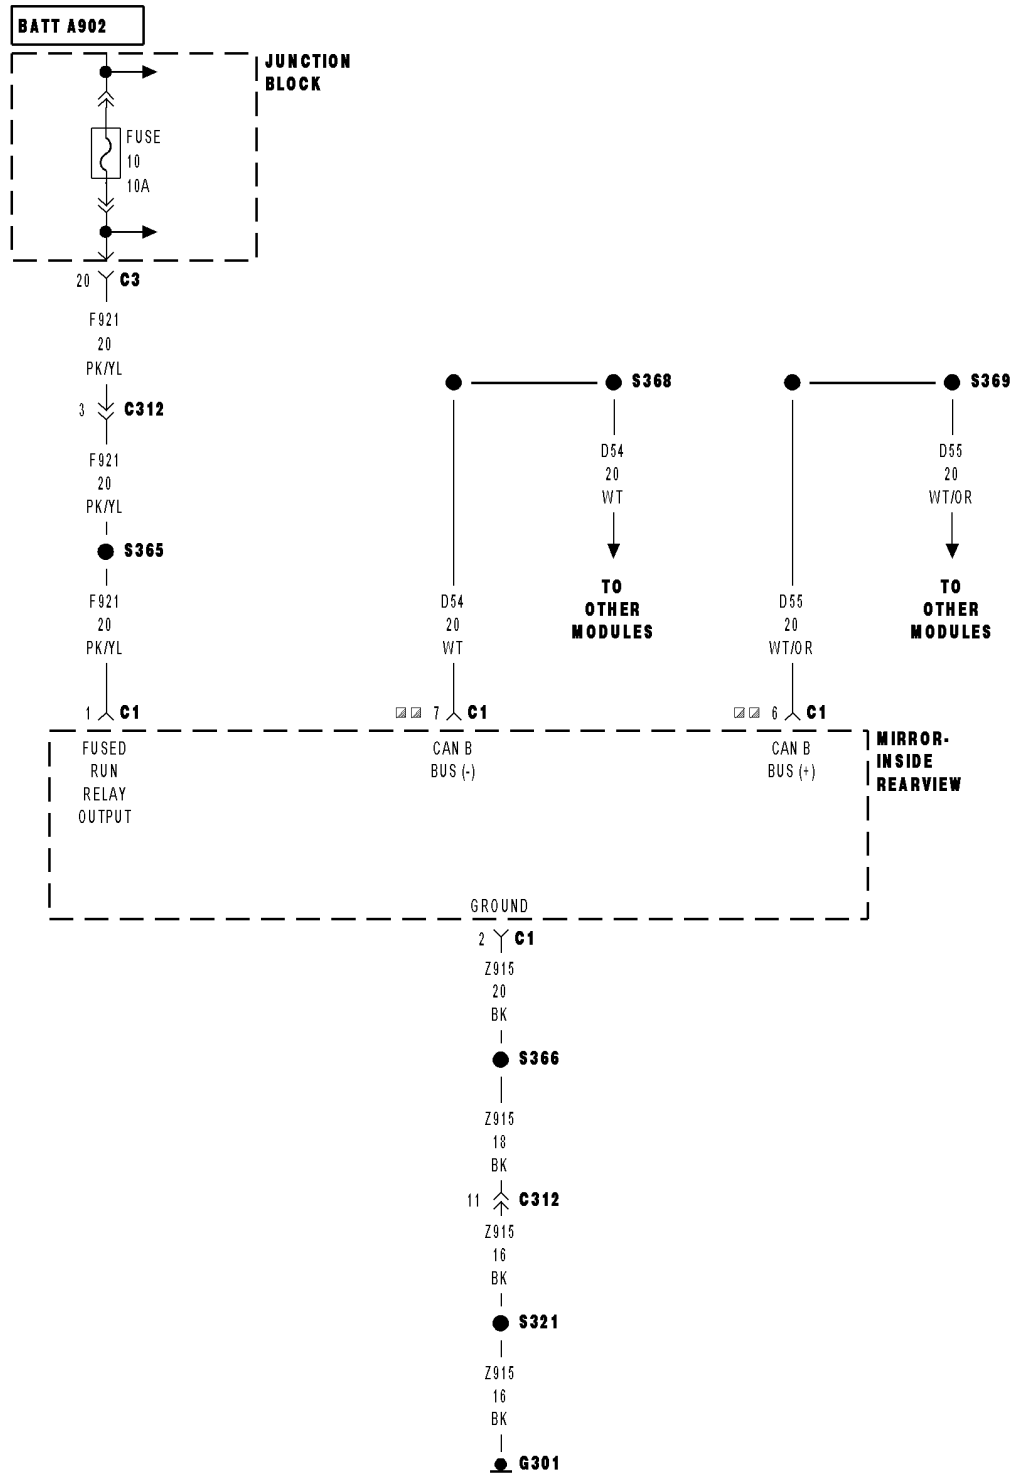

Measure the resistance of the (D64) CAN C Bus (-) circuit between the FCM connector and the Antilock Brake Module connector.

Is resistance below 5.0 ohms?

- Yes** >> Replace the Antilock Brake Module in accordance with the service information.
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (D64) CAN C Bus (-) circuit for an open.
Perform ABS VERIFICATION TEST - VER 1.

***NO RESPONSE FROM AHBM (SMARTBEAM)**

SMART BEAM

***NO RESPONSE FROM AHBM (SMARTBEAM) (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(F921) FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED
(Z915) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
INSIDE REARVIEW MIRROR (CONTROLS SMARTBEAM FUNCTIONS)

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (F921) FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition off.

NOTE: Check the FCM and the Cluster for any ignition related DTCs. If set, perform the appropriate DTC before proceeding.

Disconnect the Inside Rearview Mirror C1 harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F921) Fused Run Relay Output circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (F921) Fused Run Relay Output circuit for an open or short.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

814ab913

***NO RESPONSE FROM AHBM (SMARTBEAM) (CONTINUED)**

3. (Z915) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z915) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z915) ground circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?

Yes >> Replace and program/calibrate the Inside Rearview Mirror (for smartbeam functions) in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM AMP (AMPLIFIER)**

***NO RESPONSE FROM AMP (AMPLIFIER) (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(A116) FUSED B (+) CIRCUIT OPEN OR SHORTED
(Z514) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
AMPLIFIER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A116) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Radio Amplifier C2 harness connector.

Using a 12-volt test light connected to ground, check each (A116) Fused B(+) circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 3

No >> Repair the (A116) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM AMP (AMPLIFIER) (CONTINUED)**

3. (Z514) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check each (Z514) ground circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 4

No >> Repair the (Z514) ground circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

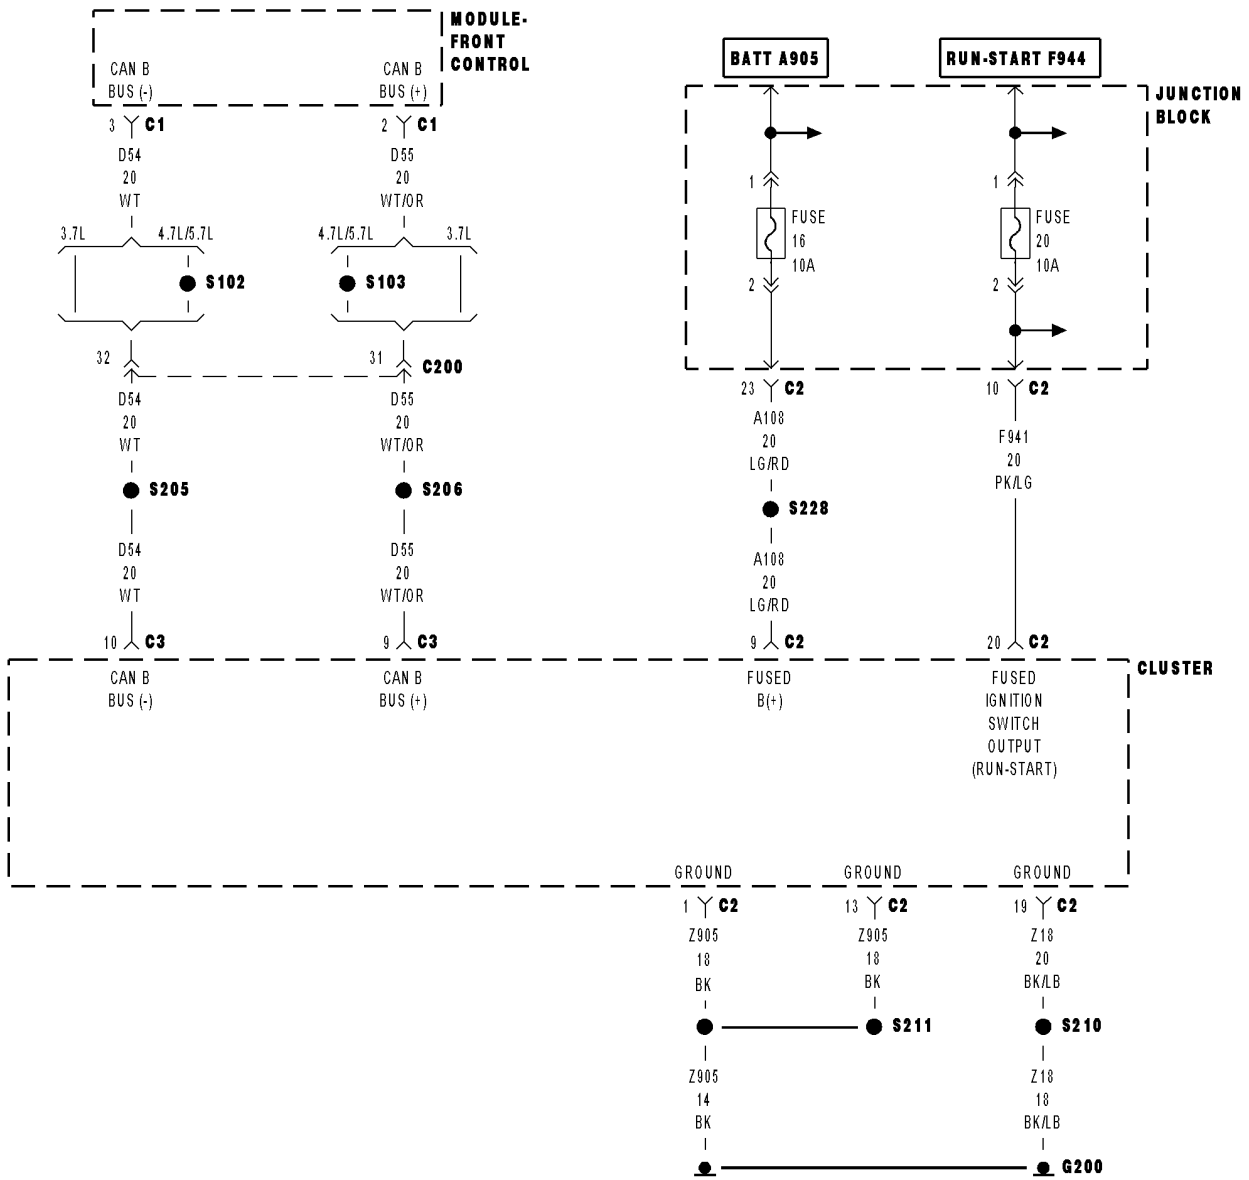

Is there any voltage present on either circuit?

Yes >> Replace the Radio Amplifier in accordance with the service information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM CCN (CLUSTER)**

***NO RESPONSE FROM CCN (CLUSTER) (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(A108) FUSED B(+) CIRCUITS OPEN OR SHORTED
(Z905) (Z18) GROUND CIRCUITS OPEN
(F941) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
CLUSTER (CCN)

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A108) FUSED B(+) CIRCUITS OPEN OR SHORTED

Turn the ignition off.

Disconnect the Cluster C2 harness connector.

Using a 12-volt test light connected to ground, check the (A108) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (A108) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM CCN (CLUSTER) (CONTINUED)**

3. (Z905) (Z18) GROUND CIRCUITS OPEN

Using a 12-volt test light connected to 12-volts, check each (Z905) (Z18) ground circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 4

No >> Repair the (Z905) (Z18) ground circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (F941) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F941) Fused Ignition Switch Output circuit.

Does the test light illuminate brightly?

Yes >> Go To 5

No >> Repair the (F941) Fused Ignition Switch Output circuit for an open or short.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

NO RESPONSE FROM CCN (CLUSTER) (CONTINUED)*5. (D55) AND (D54) CAN B BUS CIRCUITS OPEN****NOTE: One open circuit will not cause this condition.**

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

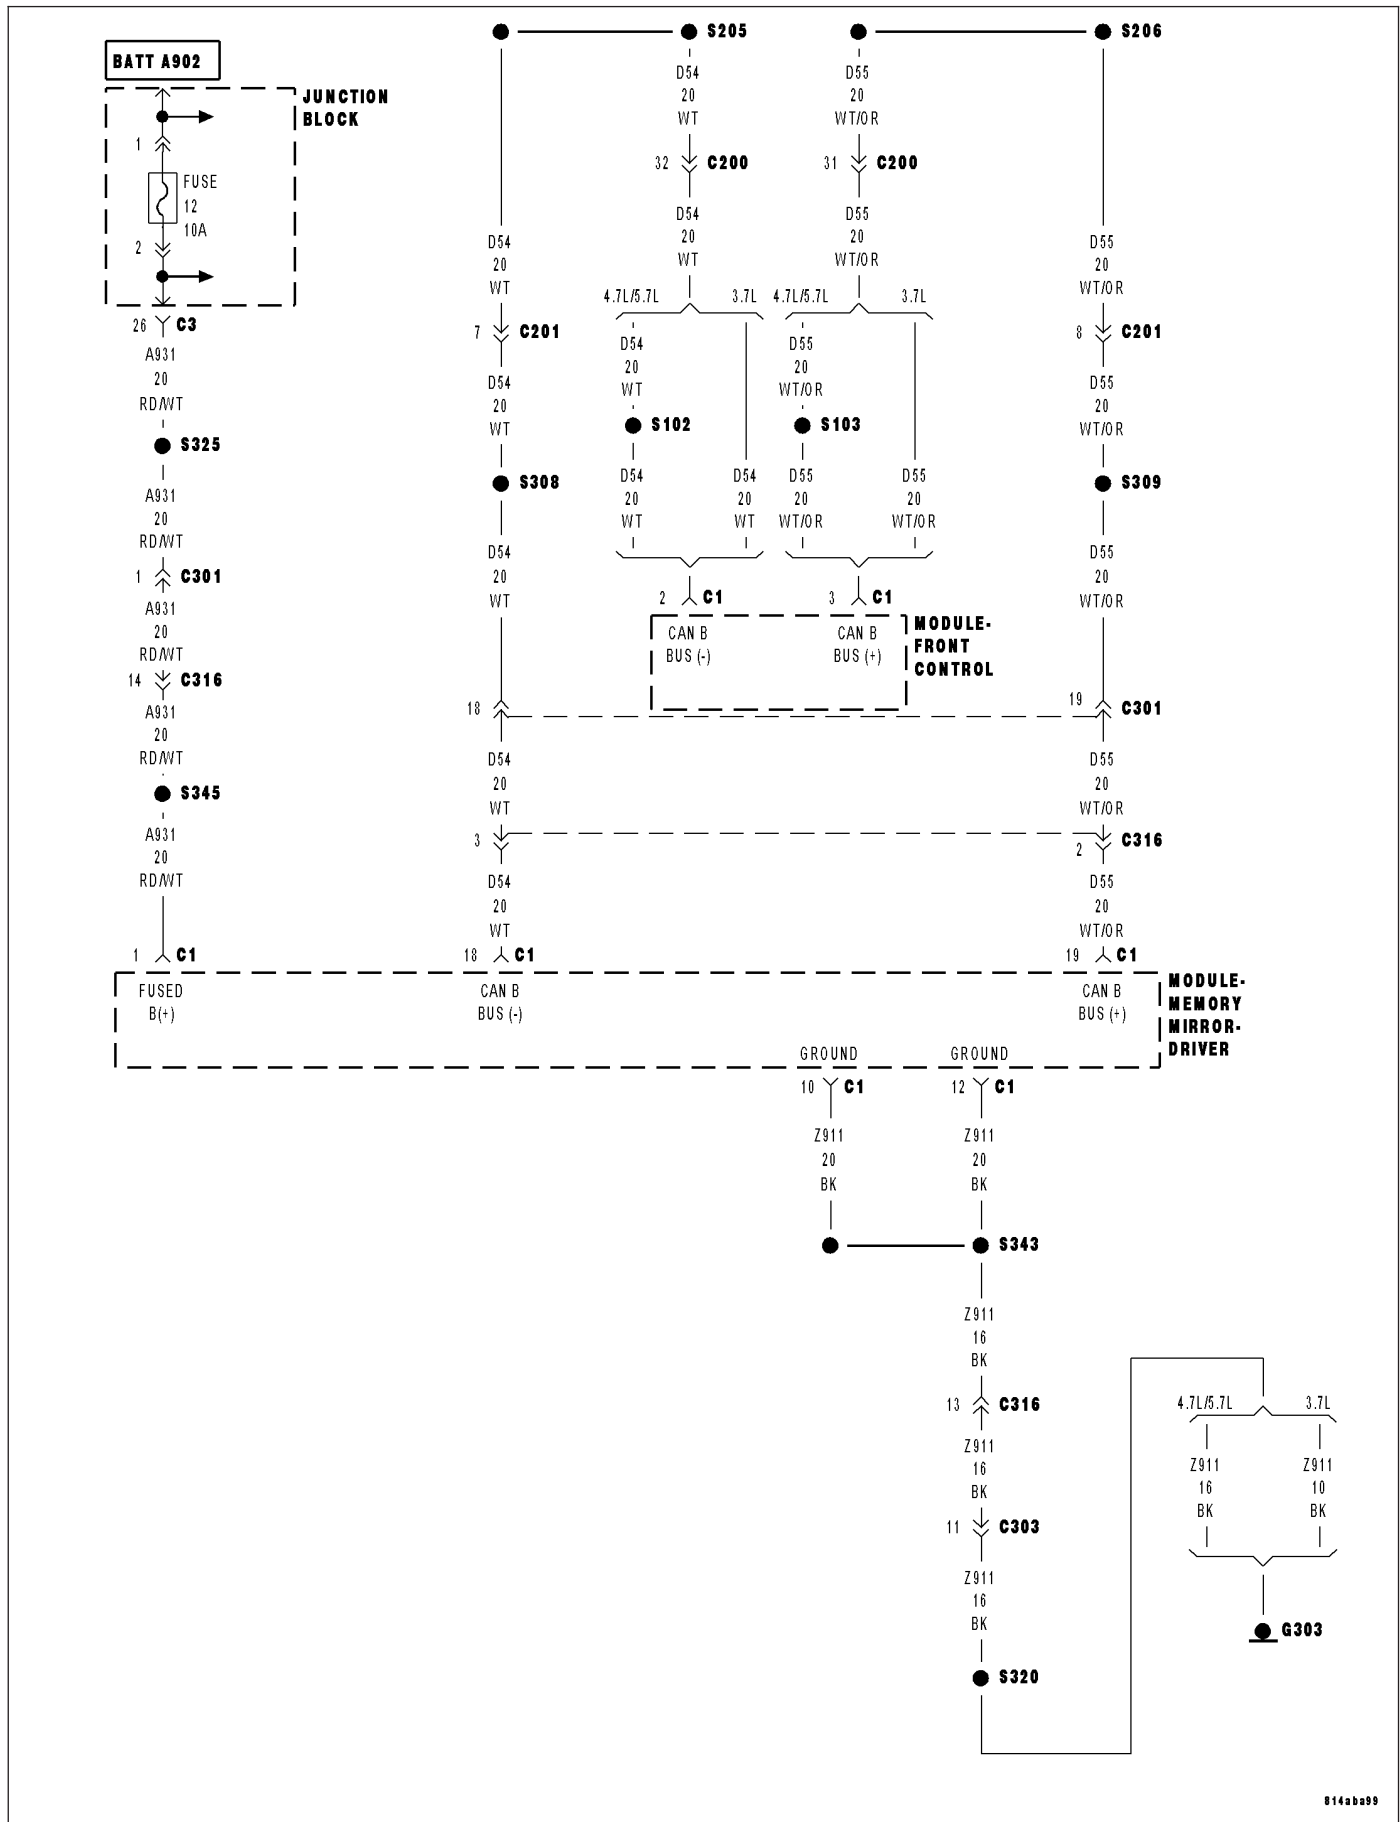

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?

- Yes** >> Replace the Cluster in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM DDM (DRIVER MEMORY MIRROR MODULE)**

***NO RESPONSE FROM DDM (DRIVER MEMORY MIRROR MODULE) (CONTINUED)**

For a complete wiring diagram Refer to **Section 8W**.

Possible Causes
(A931) FUSED B (+) CIRCUIT OPEN OR SHORTED
(Z911) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
DRIVER MEMORY MIRROR MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A931) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Driver Memory Mirror Module C1 harness connector.

Using a 12-volt test light connected to ground, check the (A931) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (A931) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM DDM (DRIVER MEMORY MIRROR MODULE) (CONTINUED)**

3. (Z911) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check each (Z911) ground circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 4

No >> Repair the (Z911) ground circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

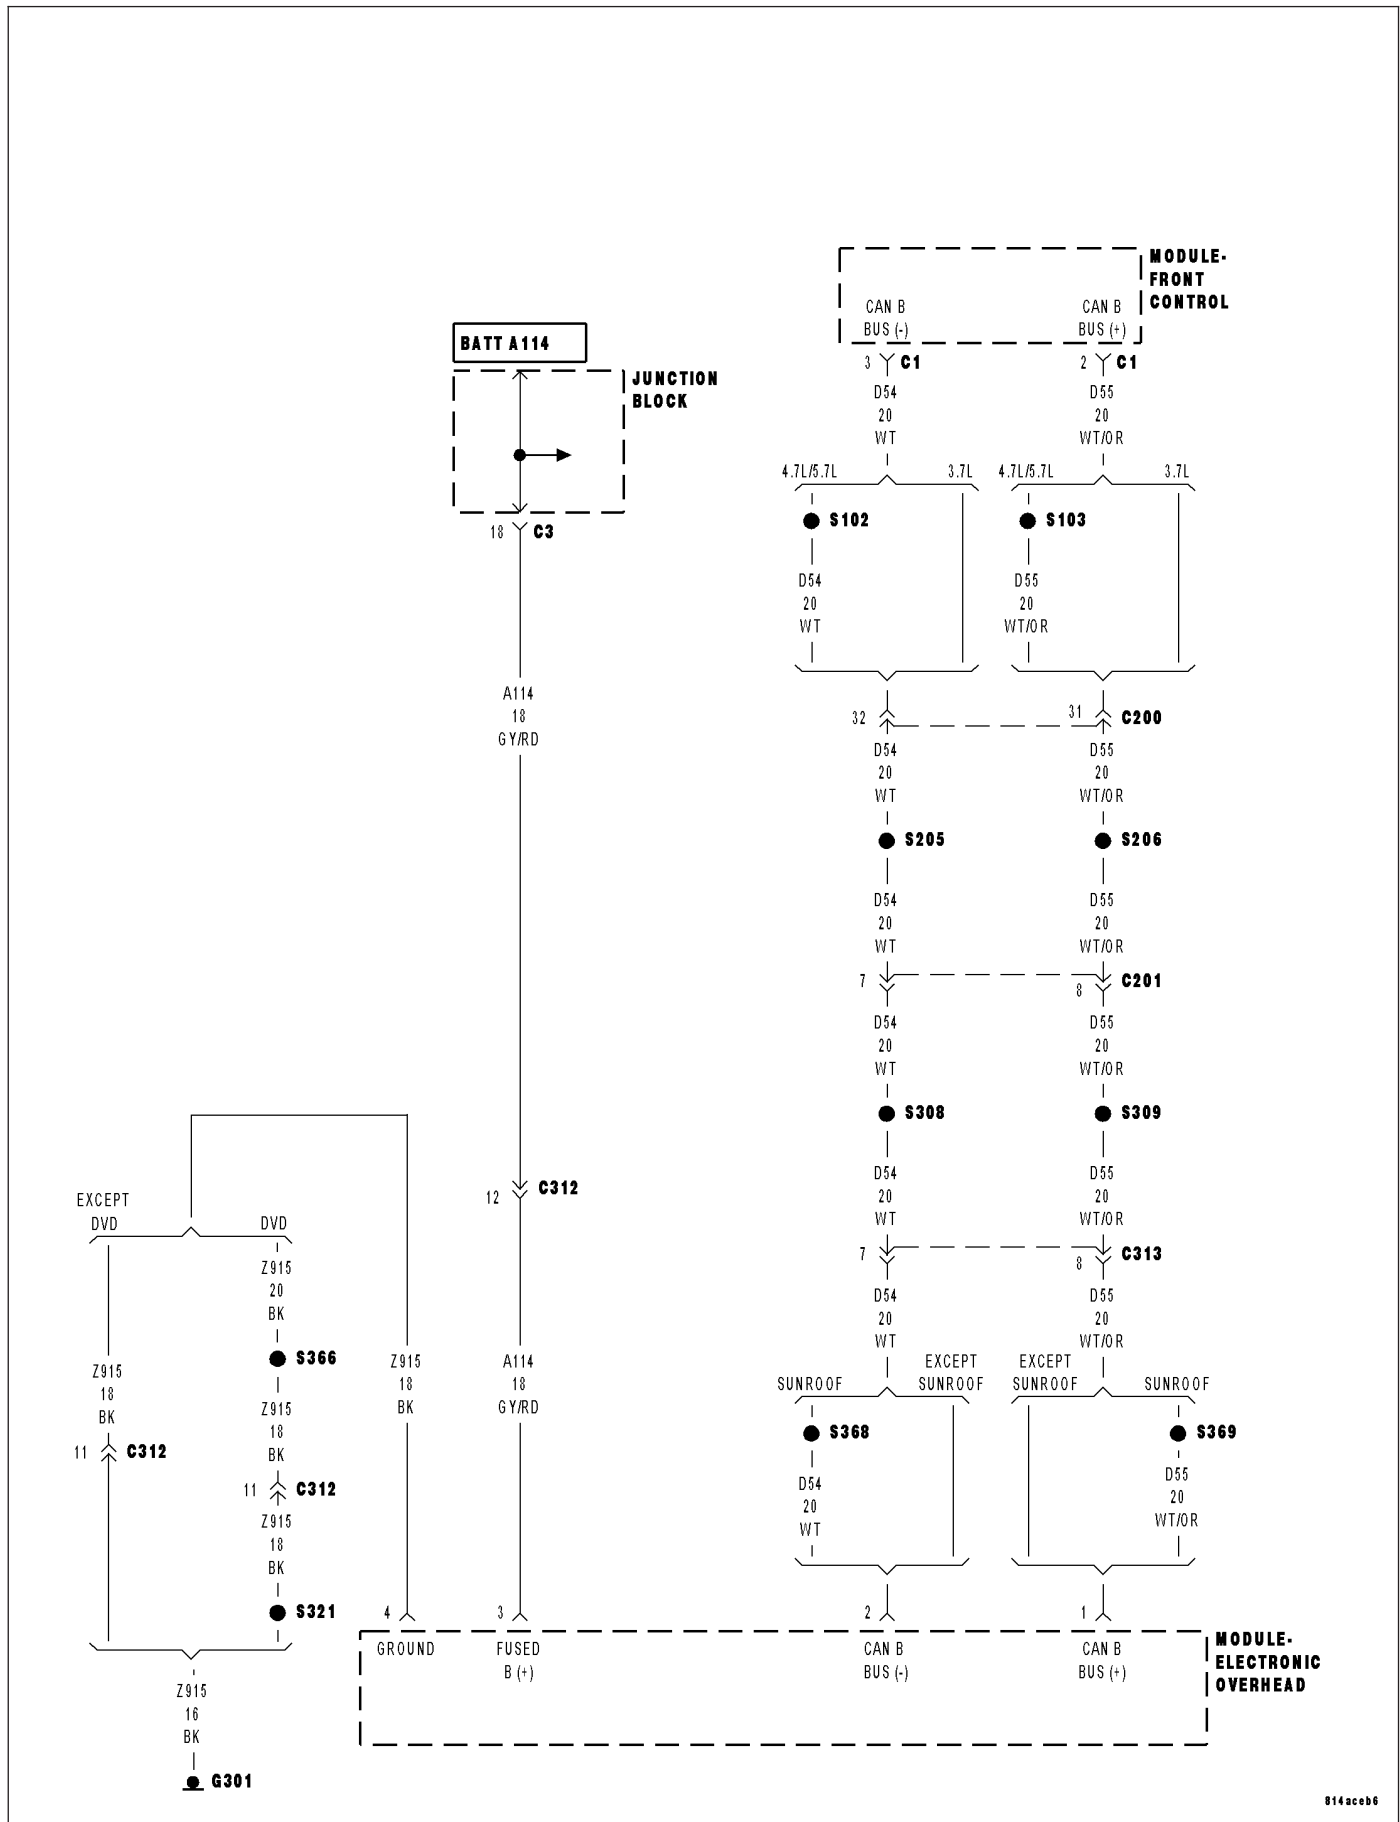

Is there any voltage present on either circuit?

Yes >> Replace the Driver Memory Mirror Module in accordance with the service information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM EOM (ELECTRONIC OVERHEAD MODULE)**

***NO RESPONSE FROM EOM (ELECTRONIC OVERHEAD MODULE) (CONTINUED)**

For a complete wiring diagram Refer to **Section 8W**.

Possible Causes
(A114) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z915) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
ELECTRONIC OVERHEAD MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A114) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Electronic Overhead Module harness connector.

Using a 12-volt test light connected to ground, check the (A114) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (A114) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

NO RESPONSE FROM EOM (ELECTRONIC OVERHEAD MODULE) (CONTINUED)*3. (Z915) GROUND CIRCUIT OPEN**

Using a 12-volt test light connected to 12-volts, check the (Z915) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z915) ground circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?

Yes >> Replace the Electronic Overhead Module (EOM) in accordance with the service information.

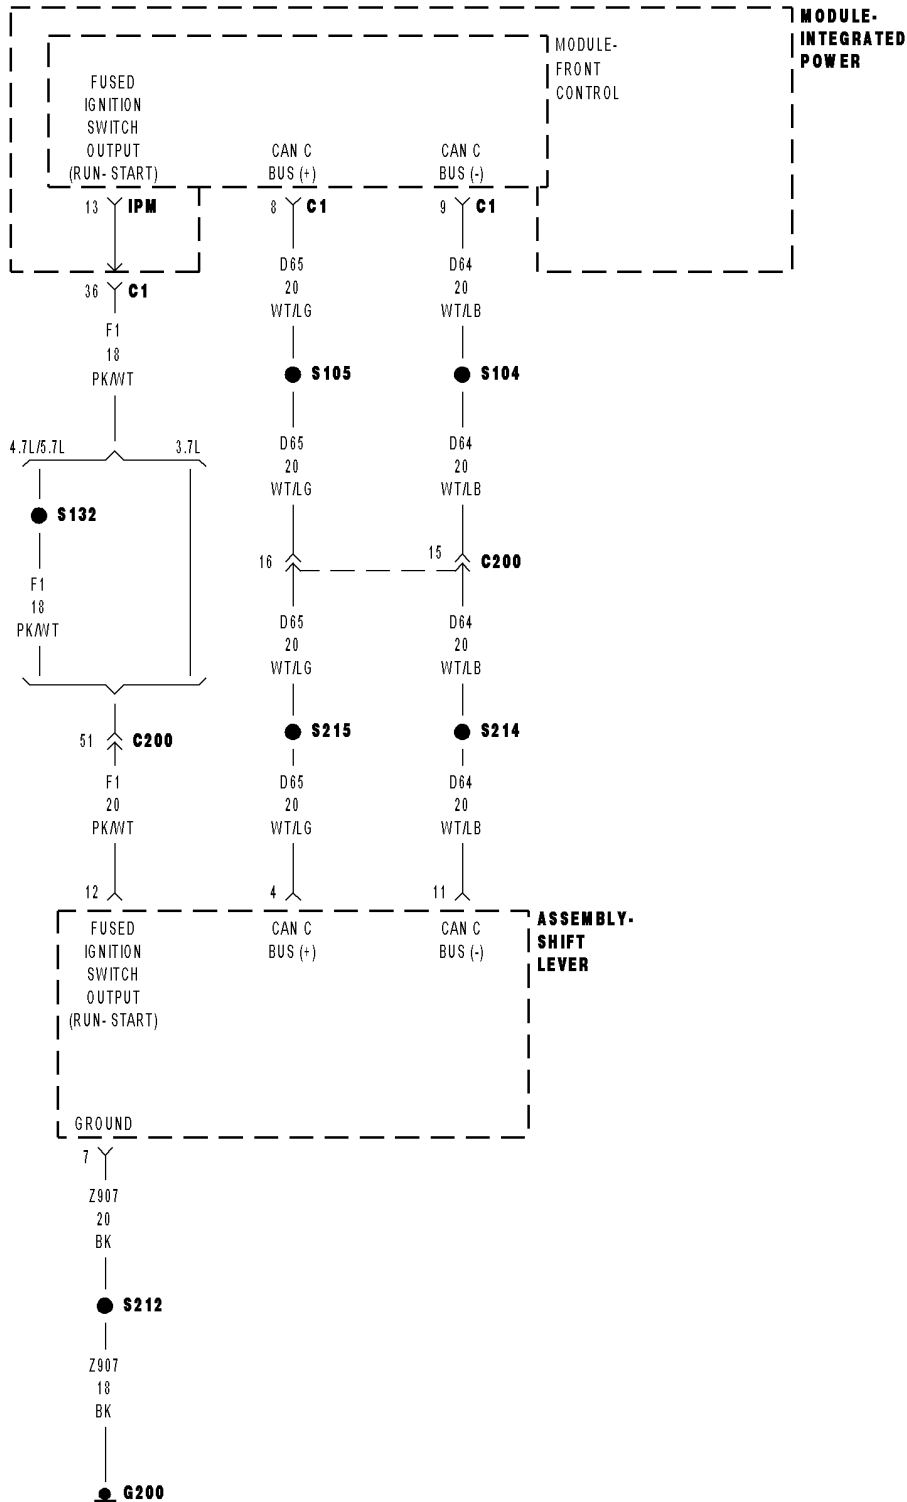

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM ESM (SHIFT LEVER ASSEMBLY) - NAG1/DIESEL**

***NO RESPONSE FROM ESM (SHIFT LEVER ASSEMBLY) - NAG1/DIESEL (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(Z907) GROUND CIRCUIT OPEN
(F1) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
SHIFT LEVER ASSEMBLY

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the FCM for any active CAN C hardware and any ignition related DTCs, perform DTCs before proceeding.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (Z907) GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the Shift Lever Assembly harness connector.

Using a 12-volt test light connected to 12-volts, check the (Z907) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (Z907) ground circuit for an open.
Perform NAG1/Diesel TRANSMISSION VERIFICATION TEST - VER 1.

814b1815

***NO RESPONSE FROM ESM (SHIFT LEVER ASSEMBLY) - NAG1/DIESEL (CONTINUED)**

3. (F1) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F1) Fused Ignition Switch Output circuit.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (F1) Fused Ignition Switch Output circuit for an open or short.
 Perform NAG1/Diesel TRANSMISSION VERIFICATION TEST - VER 1.

4. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the FCM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the FCM connector and the Shift Lever Assembly connector.

Is resistance below 5.0 ohms?

Yes >> Go To 5

No >> Repair the (D65) CAN C Bus (+) circuit for an open.
 Perform NAG1/Diesel TRANSMISSION VERIFICATION TEST - VER 1.

***NO RESPONSE FROM ESM (SHIFT LEVER ASSEMBLY) - NAG1/DIESEL (CONTINUED)**

5. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the FCM connector and the Shift Lever Assembly connector.

Is resistance below 5.0 ohms?

Yes >> Replace the Shift Lever Assembly in accordance with the service information.

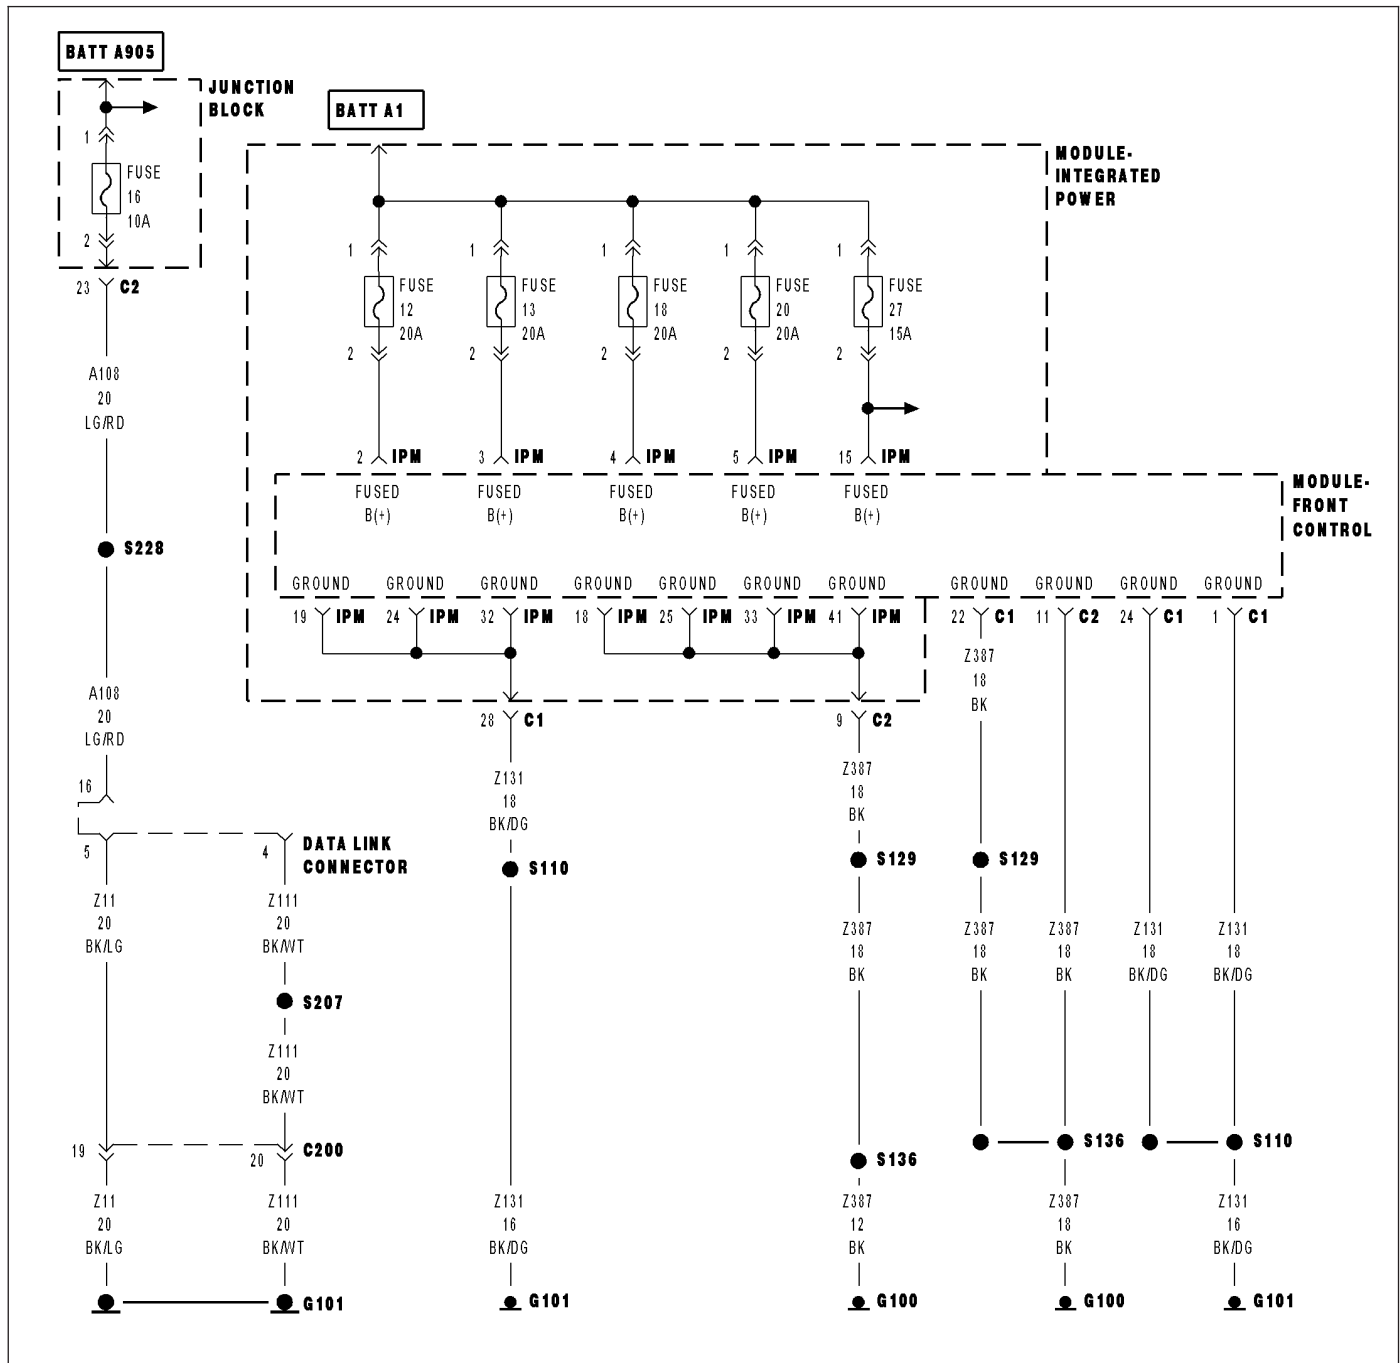

Perform NAG1/Diesel TRANSMISSION VERIFICATION TEST - VER 1.

No >> Repair the (D64) CAN C Bus (-) circuit for an open.

Perform NAG1/Diesel TRANSMISSION VERIFICATION TEST - VER 1.

***NO RESPONSE FROM FCM (FRONT CONTROL MODULE)**

***NO RESPONSE FROM FCM (FRONT CONTROL MODULE) (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(A108) FUSED B (+) CIRCUIT OPEN AT DLC (Z11) (Z111) GROUND CIRCUIT OPEN AT DLC GROUND CIRCUITS OPEN AT FCM FUSED B+ CIRCUITS OPEN AT FCM FRONT CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

NOTE: Ensure the scan tool is updated to the latest software.

NOTE: If the scan tool displays any error messages involving the CAN C Diagnostic circuits, diagnose and repair the error message before proceeding. Refer to the Table of Contents.

NOTE: A loss of communication with the FCM can cause the ECU View button on the scan tool to be inoperative (not highlighted).

With the scan tool, attempt to select ECU view.

Can the scan tool communicate with the FCM?

Yes >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

No >> Go To 2

2. (A108) FUSED B(+) CIRCUIT OPEN AT DLC

Disconnect the scan tool from the DLC.

Using a 12-volt test light connected to ground, check the (A108) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (A108) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM FCM (FRONT CONTROL MODULE) (CONTINUED)**

3. (Z11) (Z111) GROUND CIRCUIT OPEN AT DLC

Using a 12-volt test light connected to 12-volts, check the (Z11) and (Z111) ground circuits.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 4

No >> Repair the ground circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. GROUND CIRCUITS OPEN AT FCM C1 CONNECTOR

Disconnect the FCM C1 harness connector.

Using a 12-volt test light connected to 12-volts, check each ground circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 5

No >> Repair the ground circuit for an open. Inspect the connector for damage.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM FCM (FRONT CONTROL MODULE) (CONTINUED)**

5. GROUND CIRCUITS OPEN AT FCM IPM CONNECTOR

Remove the FCM from the IPM.

Using a 12-volt test light connected to 12-volts, check each ground circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 6

No >> Repair the ground circuit for an open. Inspect the connector for damage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

6. FUSED B(+) CIRCUITS OPEN AT FCM IPM CONNECTOR

Using a 12-volt test light connected to ground, check each Fused B(+) circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the Fused B(+) circuit for an open. Inspect the connector for damage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM FDCM (FINAL DRIVE CONTROL MODULE)**

***NO RESPONSE FROM FDCM (FINAL DRIVE CONTROL MODULE) (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(A926) (A909) (A927) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z901) (Z902) (Z913) GROUND CIRCUIT OPEN
(F921) FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
FINAL DRIVE CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the FCM for any active CAN C hardware DTCs, perform DTC before proceeding.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

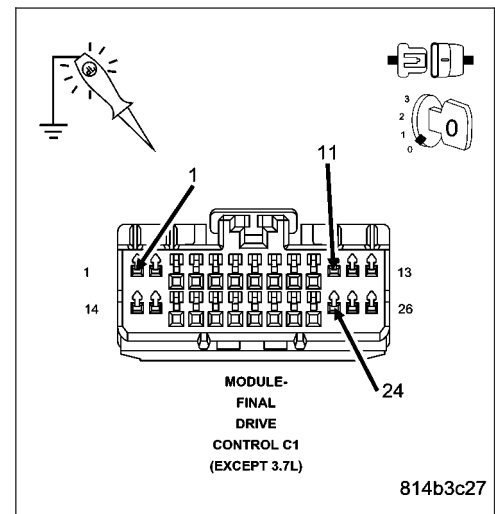

Disconnect the Final Drive Control Module harness connectors.

Using a 12-volt test light connected to ground, check each Fused B(+) circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 3

No >> Repair the Fused B(+) circuit for an open or short. Perform the FDCM VERIFICATION TEST.

***NO RESPONSE FROM FDCM (FINAL DRIVE CONTROL MODULE) (CONTINUED)**

3. GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check each Ground circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 4

No >> Repair the ground circuit for an open.
Perform the FDCM VERIFICATION TEST.

4. (F921) FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F921) Fused Run Relay Output circuit.

Does the test light illuminate brightly?

Yes >> Go To 5

No >> Repair the (F921) Fused Run Relay Output circuit for an open or short.
Perform the FDCM VERIFICATION TEST.

***NO RESPONSE FROM FDCM (FINAL DRIVE CONTROL MODULE) (CONTINUED)**

5. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the FCM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the FCM connector and the FDCM connector.

Is resistance below 5.0 ohms?

Yes >> Go To 6

No >> Repair the (D65) CAN C Bus (+) circuit for an open.
Perform the FDCM VERIFICATION TEST.

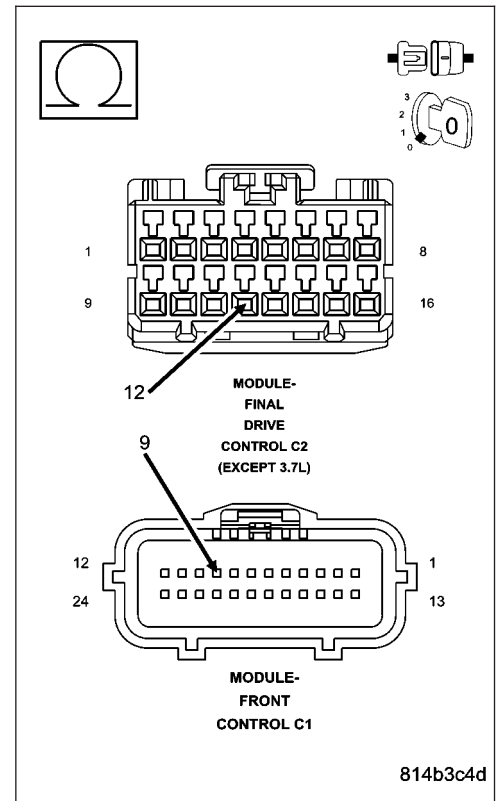

***NO RESPONSE FROM FDCM (FINAL DRIVE CONTROL MODULE) (CONTINUED)**

6. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the FCM connector and the FDCM connector.

Is resistance below 5.0 ohms?

- Yes** >> Replace the Final Drive Control Module in accordance with the service information.
Perform the FDCM VERIFICATION TEST.
- No** >> Repair the (D64) CAN C Bus (-) circuit for an open.
Perform the FDCM VERIFICATION TEST.

***NO RESPONSE FROM HFM (HANDS FREE MODULE)**

***NO RESPONSE FROM HFM (HANDS FREE MODULE) (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(A114) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z907) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
HANDS FREE MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A114) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Using a 12-volt test light connected to ground, check the (A114) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (A114) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM HFM (HANDS FREE MODULE) (CONTINUED)**

3. (Z907) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z907) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z907) ground circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?

Yes >> Replace the Hands Free Module in accordance with the service information.

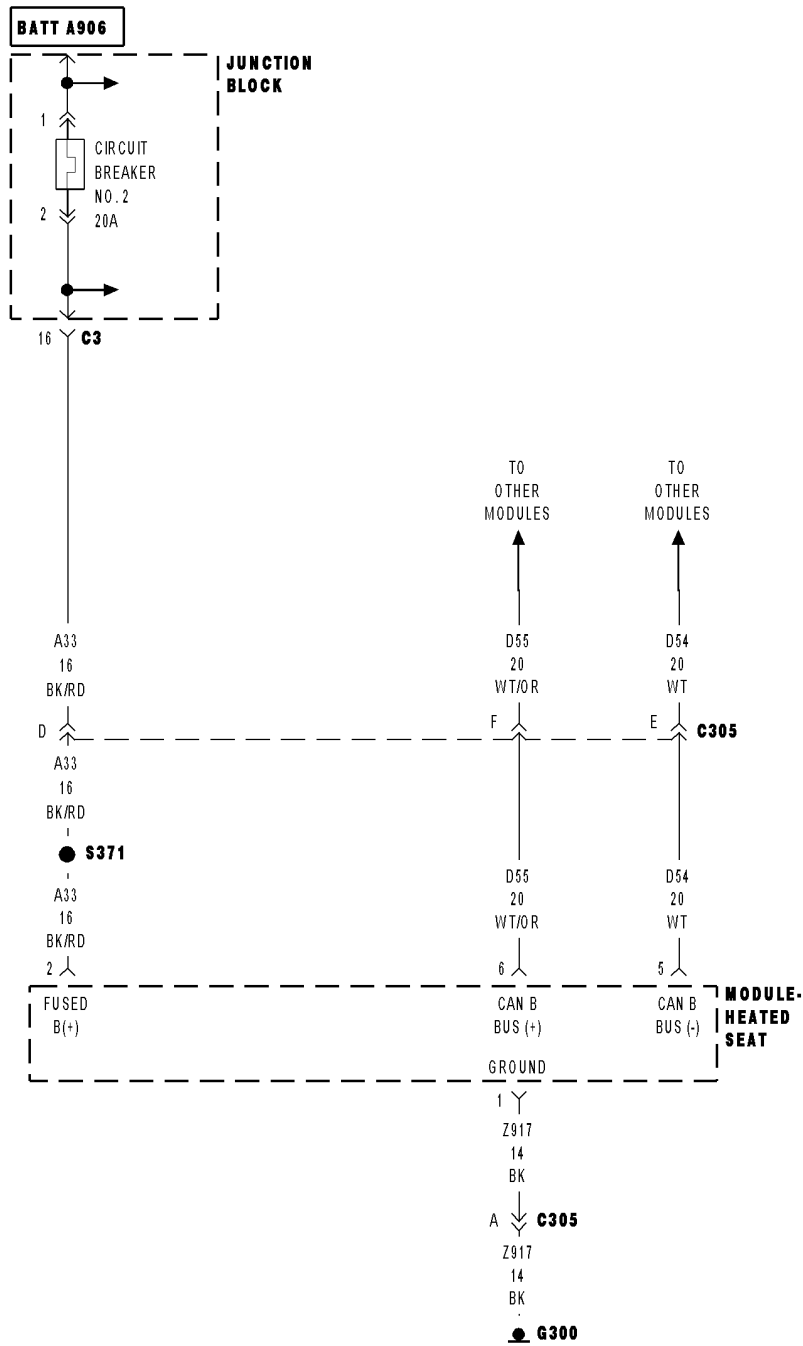

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM HSM (HEATED SEAT MODULE)**

MODULE-HEATED SEAT

***NO RESPONSE FROM HSM (HEATED SEAT MODULE) (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes

(A33) FUSED B (+) CIRCUIT OPEN OR SHORTED
 (Z917) GROUND CIRCUIT OPEN
 (D55) AND (D54) CAN B BUS CIRCUITS OPEN
 HEATED SEAT MODULE

Diagnostic Test**1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**Does the scan tool display a red X next to the module?****Yes** >> Go To 2**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.**2. (A33) FUSED B(+) CIRCUIT OPEN OR SHORTED**

Turn the ignition off.

Disconnect the Heated Seat Module harness connector.

Using a 12-volt test light connected to ground, check the (A33) Fused B(+) circuit.

Does the test light illuminate brightly?**Yes** >> Go To 3**No** >> Repair the (A33) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM HSM (HEATED SEAT MODULE) (CONTINUED)**

3. (Z917) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z917) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z917) ground circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

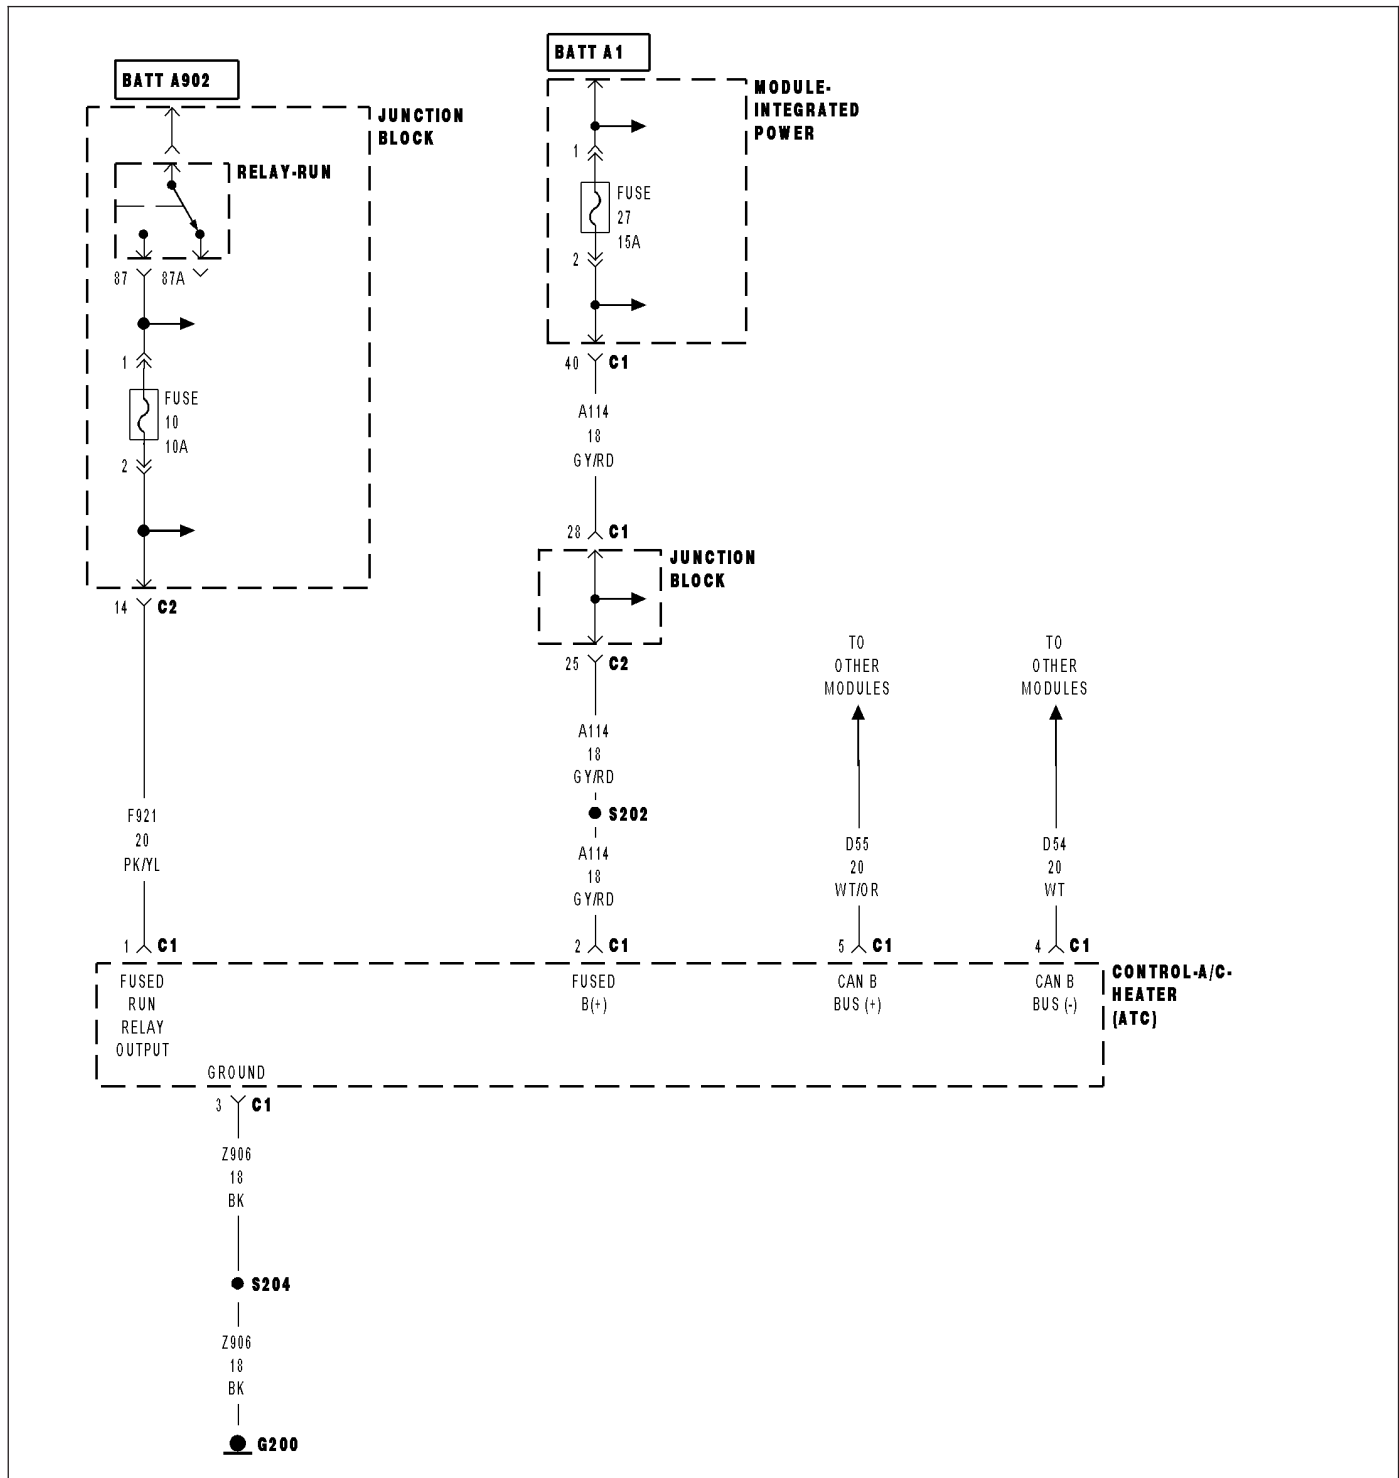

Is there any voltage present on either circuit?

Yes >> Replace the Heated Seat Module in accordance with the service information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

OCCUPANT CLASSIFICATION MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A27) FUSED B(+) CIRCUIT OPEN OR SHORTED

WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Occupant Classification Module C1 harness connector.

WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Using a 12-volt test light connected to ground, check the (A27) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (A27) Fused B(+) circuit for an open or short. Perform the OCS VERIFICATION TEST-VER 1.

NO RESPONSE FROM OCM (OCCUPANT CLASSIFICATION MODULE) (CONTINUED)*3. (Z105) GROUND CIRCUIT OPEN**

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z105) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z105) ground circuit for an open.
Perform the OCS VERIFICATION TEST-VER 1.

**4. (F200) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED**

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F200) Fused Ignition Switch Output circuit.

Does the test light illuminate brightly?

Yes >> Go To 5

No >> Repair the (F200) Fused Ignition Switch Output circuit for an open or short.
Perform the OCS VERIFICATION TEST-VER 1.

***NO RESPONSE FROM OCM (OCCUPANT CLASSIFICATION MODULE) (CONTINUED)**

5. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

WARNING: If the Occupant Classification Module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.

NOTE: One open circuit will not cause this condition.

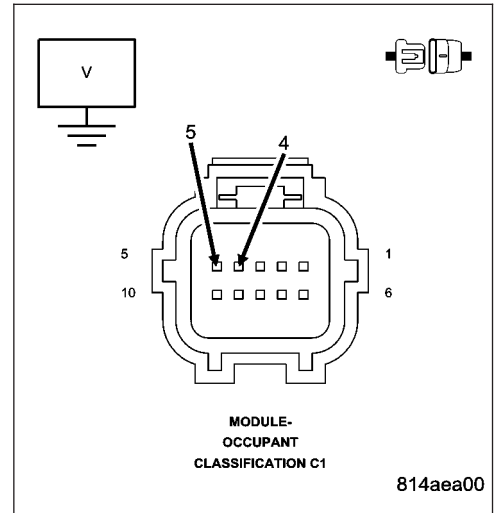

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?

Yes >> Go To 6

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform the OCS VERIFICATION TEST-VER 1.

6. CHECK (R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (R263) Driver Seat Position Sensor Voltage-Driver circuit.

Is the resistance below 10k ohms?

Yes >>

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the OCM and Driver Seat Position Sensor Harness in accordance with the service information.
Perform the OCS VERIFICATION TEST-VER 1.

No >> Go To 7

7. CHECK (R726) STRAIN GAUGE 5 VOLT IN CIRCUIT FOR A SHORT TO GROUND

Disconnect the Occupant Classification Module C2 harness connector.

Measure the resistance between ground and the (R726) Seat Weight Sensor 5 volt circuit.

Is the resistance below 10k ohms?

Yes >>

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the OCM and Driver Seat Position Sensor Harness in accordance with the service information.
Perform the OCS VERIFICATION TEST-VER 1.

No >> Replace the Occupant Classification Module in accordance with the service information.
Perform the OCS VERIFICATION TEST-VER 1.

***NO RESPONSE FROM ORC (OCCUPANT RESTRAINT CONTROLLER)**

MODULE-OCCUPANT RESTRAINT CONTROLLER C2

***NO RESPONSE FROM ORC (OCCUPANT RESTRAINT CONTROLLER) (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(Z104) GROUND CIRCUIT OPEN
(F100) FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED
(F20) FUSED IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT OPEN OR SHORTED
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
OCCUPANT RESTRAINT CONTROLLER MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

2. (Z104) GROUND CIRCUIT OPEN

WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Occupant Restraint Controller Module harness connectors.

Connect the appropriate Load Tool ACM Adaptor to the ORC connector.

Using a 12-volt test light connected to 12-volts, check the (Z104) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (Z104) ground circuit for an open.
Perform AIRBAG VERIFICATION TEST - VER 1.

***NO RESPONSE FROM ORC (OCCUPANT RESTRAINT CONTROLLER) (CONTINUED)**

3. (F100) FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED

NOTE: Check the FCM for any ignition related DTCs before proceeding. If set (Refer to 8 - ELECTRICAL/IGNITION CONTROL - DIAGNOSIS AND TESTING).

WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Using a 12-volt test light connected to ground, check the (F100) Fused Run Relay Output circuit.

Does the test light illuminate brightly?

- Yes** >> Go To 4
- No** >> Repair the (F100) Fused Run Relay Output circuit for an open or short.
Perform AIRBAG VERIFICATION TEST - VER 1.

4. (F20) FUSED IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT OPEN OR SHORTED

Using a 12-volt test light connected to ground, check the (F20) Fused Ignition Switch Output (RUN/START) circuit.

Does the test light illuminate brightly?

- Yes** >> Go To 5
- No** >> Repair the (F20) Fused Ignition Switch Output (RUN/START) circuit for an open or short.
Perform AIRBAG VERIFICATION TEST - VER 1.

***NO RESPONSE FROM ORC (OCCUPANT RESTRAINT CONTROLLER) (CONTINUED)**

5. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

WARNING: If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

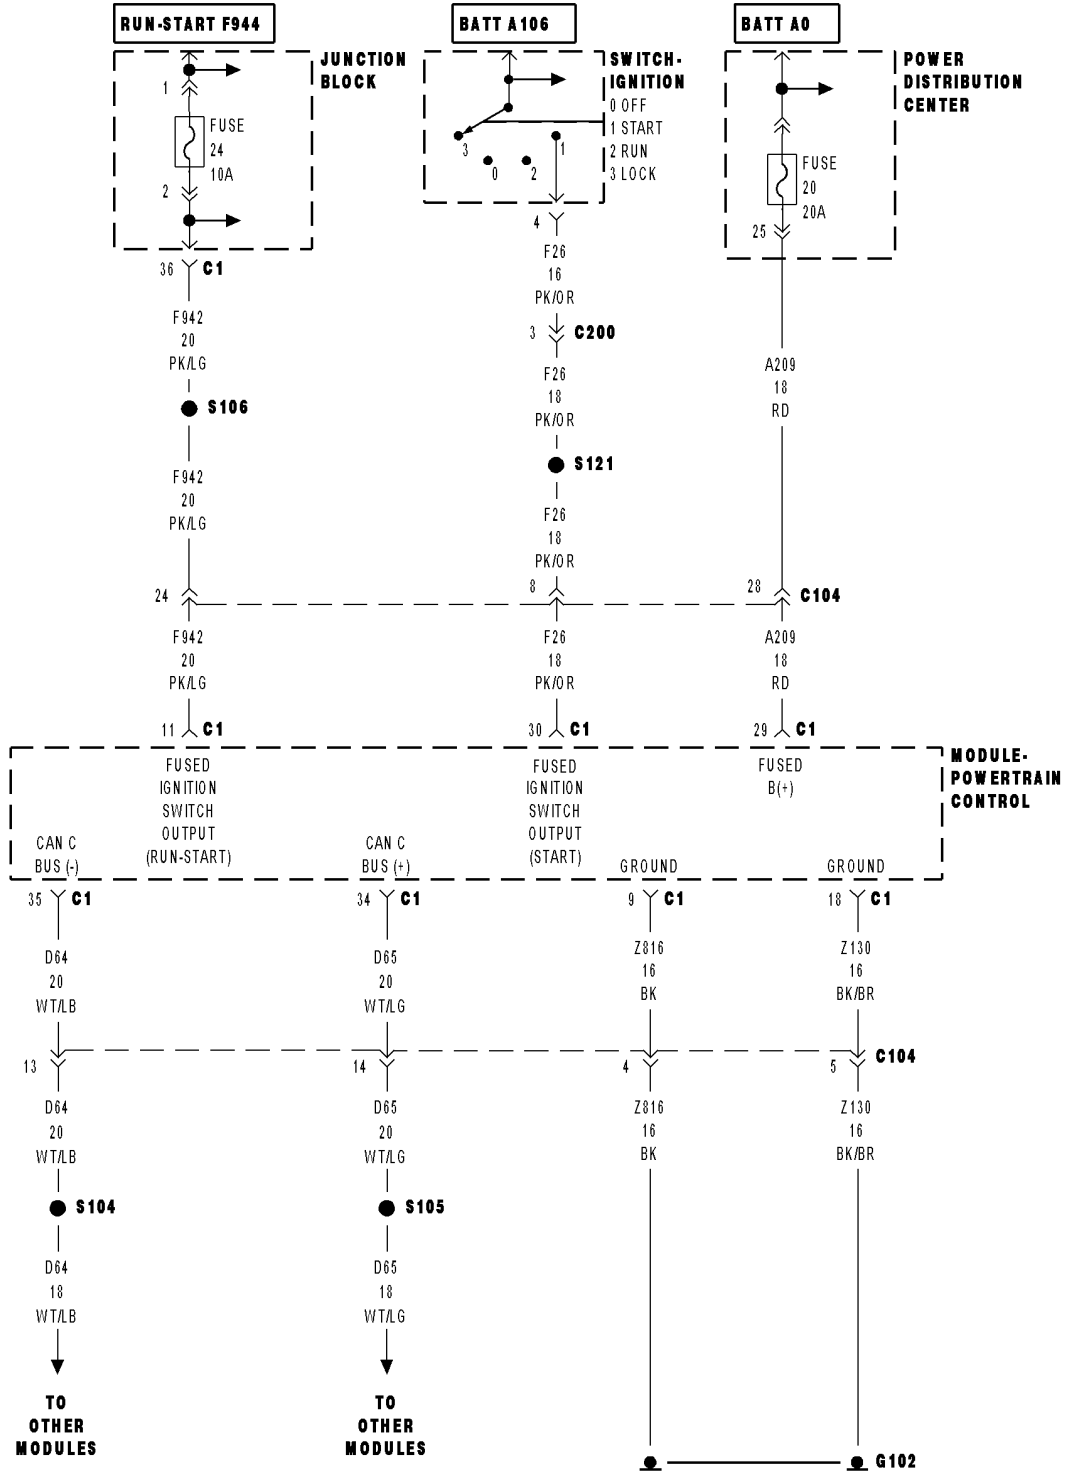

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?

- Yes** >> Replace the Occupant Restraint Controller Module in accordance with the service information.
Perform AIRBAG VERIFICATION TEST - VER 1.
- No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform AIRBAG VERIFICATION TEST - VER 1.

***NO RESPONSE FROM PCM (POWERTRAIN CONTROL MODULE)**

***NO RESPONSE FROM PCM (POWERTRAIN CONTROL MODULE) (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(A209) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z130) (Z816) GROUND CIRCUIT OPEN
(F26) (F942) FUSED IGNITION SW OUTPUT CIRCUIT OPEN OR SHORTED
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the FCM for any active CAN C hardware DTCs, perform DTC before proceeding.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A209) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the PCM C1 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12-volt test light connected to ground, check the (A209) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (A209) Fused B(+) circuit for an open or short. Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

***NO RESPONSE FROM PCM (POWERTRAIN CONTROL MODULE) (CONTINUED)**

3. (Z816) (Z130) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check each (Z816) and (Z130) ground circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 4

No >> Repair the ground circuit for an open.
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

4. (F26) (F942) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition on.

Using a 12-volt test light connected to ground, check each (F26) and (F942) Fused Ignition Switch Output circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 5

No >> Repair the Fused Ignition Switch Output circuit for an open or short.
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

***NO RESPONSE FROM PCM (POWERTRAIN CONTROL MODULE) (CONTINUED)**

5. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the FCM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the FCM connector and the appropriate terminal of the special tool #8815.

Is the resistance below 5.0 ohms?

Yes >> Go To 6

No >> Repair the (D65) CAN C Bus (+) circuit for an open.
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

***NO RESPONSE FROM PCM (POWERTRAIN CONTROL MODULE) (CONTINUED)**

6. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the FCM connector and the appropriate terminal of the special tool #8815.

Is the resistance below 5.0 ohms?

- Yes** >> Replace and program the Powertrain Control Module in accordance with the service information.
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.
- No** >> Repair the (D64) CAN C Bus (-) circuit for an open.
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

***NO RESPONSE FROM PDM (PASSENGER MEMORY MIRROR MODULE)**

MODULE-MEMORY MIRROR-PASSENGER

***NO RESPONSE FROM PDM (PASSENGER MEMORY MIRROR MODULE) (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(A931) FUSED B (+) CIRCUIT OPEN OR SHORTED
(Z908) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
PASSENGER MEMORY MIRROR MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A931) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Passenger Memory Mirror Module harness connector.

Using a 12-volt test light connected to ground, check the (A931) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (A931) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM PDM (PASSENGER MEMORY MIRROR MODULE) (CONTINUED)**

3. (Z908) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z908) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z908) ground circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?

Yes >> Replace the Passenger Memory Mirror Module in accordance with the service information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM PTS (PARK ASSIST MODULE)**

***NO RESPONSE FROM PTS (PARK ASSIST MODULE) (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(F921) FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED
(Z913) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
PARK ASSIST MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (F921) FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED

NOTE: Check the FCM for any ignition related DTCs before proceeding. If set (Refer to 8 - ELECTRICAL/IGNITION CONTROL - DIAGNOSIS AND TESTING).

Turn the ignition off.

Disconnect the Park Assist Module C1 harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F921) Fused Run Relay Output circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (F921) Fused Run Relay Output circuit for an open or short.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM PTS (PARK ASSIST MODULE) (CONTINUED)**

3. (Z913) GROUND CIRCUIT OPEN

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z913) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z913) ground circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?

Yes >> Replace the Park Assist Module in accordance with the service information.

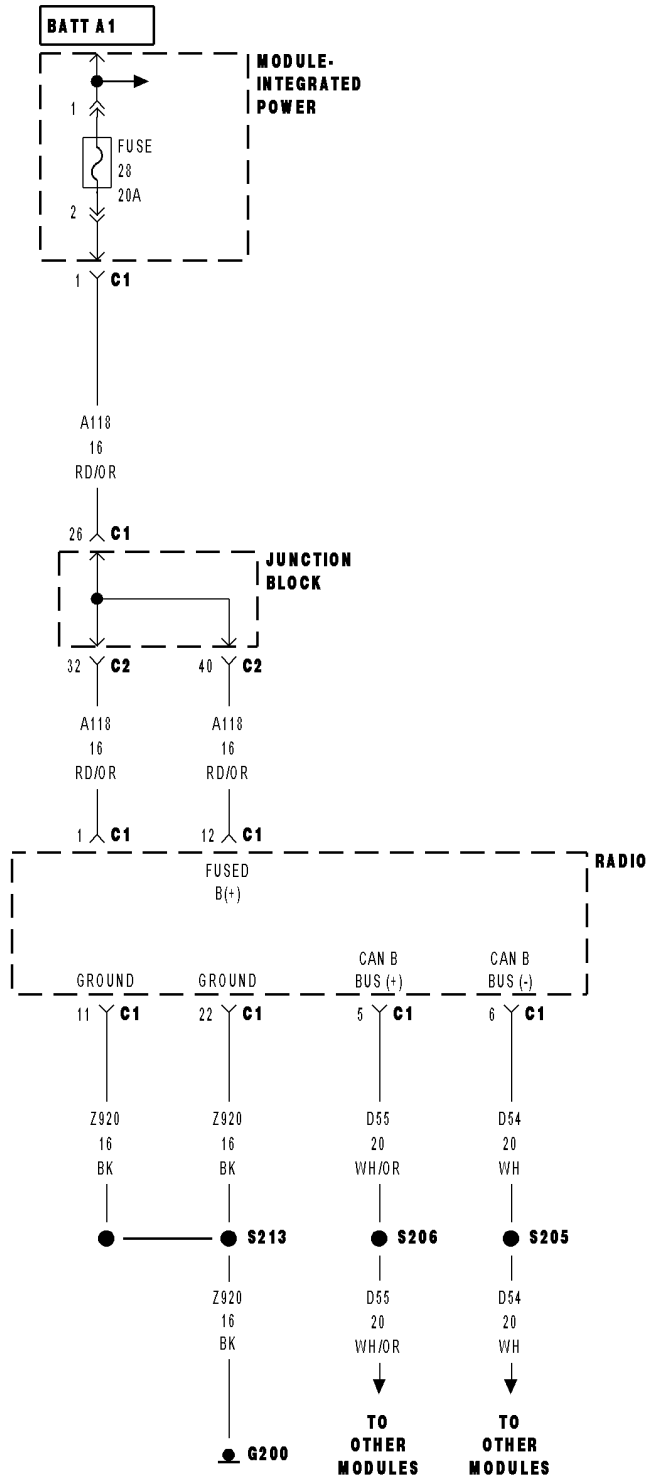

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM RADIO**

***NO RESPONSE FROM RADIO (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(A118) FUSED B (+) CIRCUIT OPEN OR SHORTED (Z920) GROUND CIRCUIT OPEN (D55) AND (D54) CAN B BUS CIRCUITS OPEN RADIO

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A118) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Using a 12-volt test light connected to ground, check each (A118) Fused B(+) circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 3

No >> Repair the (A118) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM RADIO (CONTINUED)**

3. (Z920) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check each (Z920) ground circuit.

Does the test light illuminate brightly for each circuit?

Yes >> Go To 4

No >> Repair the (Z920) ground circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

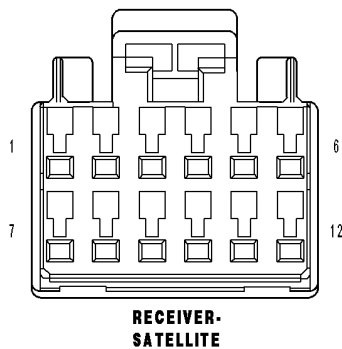

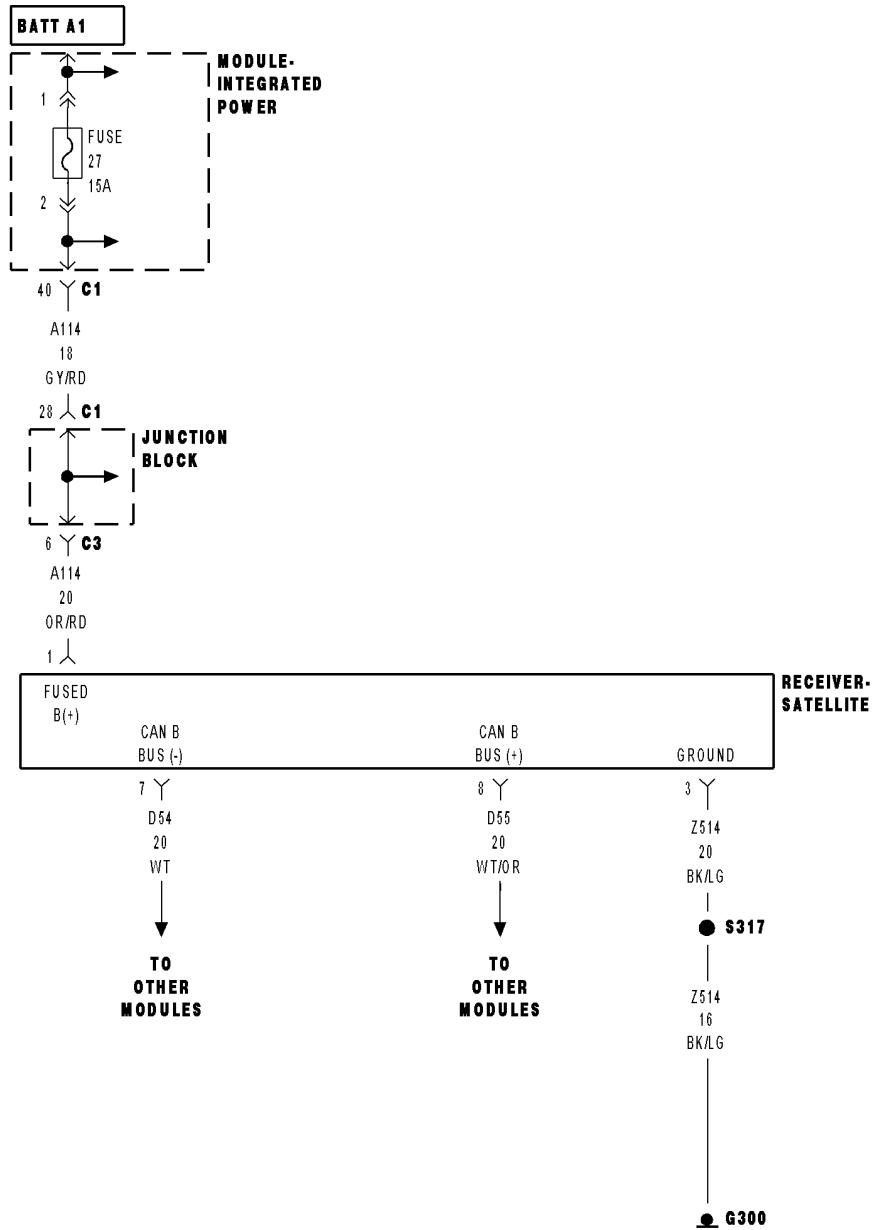

Is there any voltage present on either circuit?

Yes >> Replace the Radio in accordance with the service information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM SDAR (SATELLITE RECEIVER)**

***NO RESPONSE FROM SDAR (SATELLITE RECEIVER) (CONTINUED)**

For a complete wiring diagram Refer to **Section 8W**.

Possible Causes
(A114) FUSED B (+) CIRCUIT OPEN OR SHORTED (Z514) GROUND CIRCUIT OPEN (D55) AND (D54) CAN B BUS CIRCUITS OPEN SATELLITE RECEIVER

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A114) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Satellite Receiver harness connector.

Using a 12-volt test light connected to ground, check the (A114) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (A114) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM SDAR (SATELLITE RECEIVER) (CONTINUED)**

3. (Z514) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z514) ground circuit.

Does the test light illuminate brightly?

- Yes** >> Go To 4
- No** >> Repair the (Z514) ground circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?

- Yes** >> Replace the Satellite Receiver in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

 STEERING CONTROL MODULE

Diagnostic Test**1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.**Does the scan tool display a red X next to the module?****Yes** >> Go To 2**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.**2. (A108) FUSED B(+) CIRCUIT OPEN OR SHORTED**

Turn the ignition off.

Disconnect the Steering Control Module C1 harness connector.

Using a 12-volt test light connected to ground, check the (A108) Fused B(+) circuit.

Does the test light illuminate brightly?**Yes** >> Go To 3**No** >> Repair the (A108) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM SCM (STEERING COLUMN MODULE) (CONTINUED)**

3. (Z907) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z907) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z907) ground circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

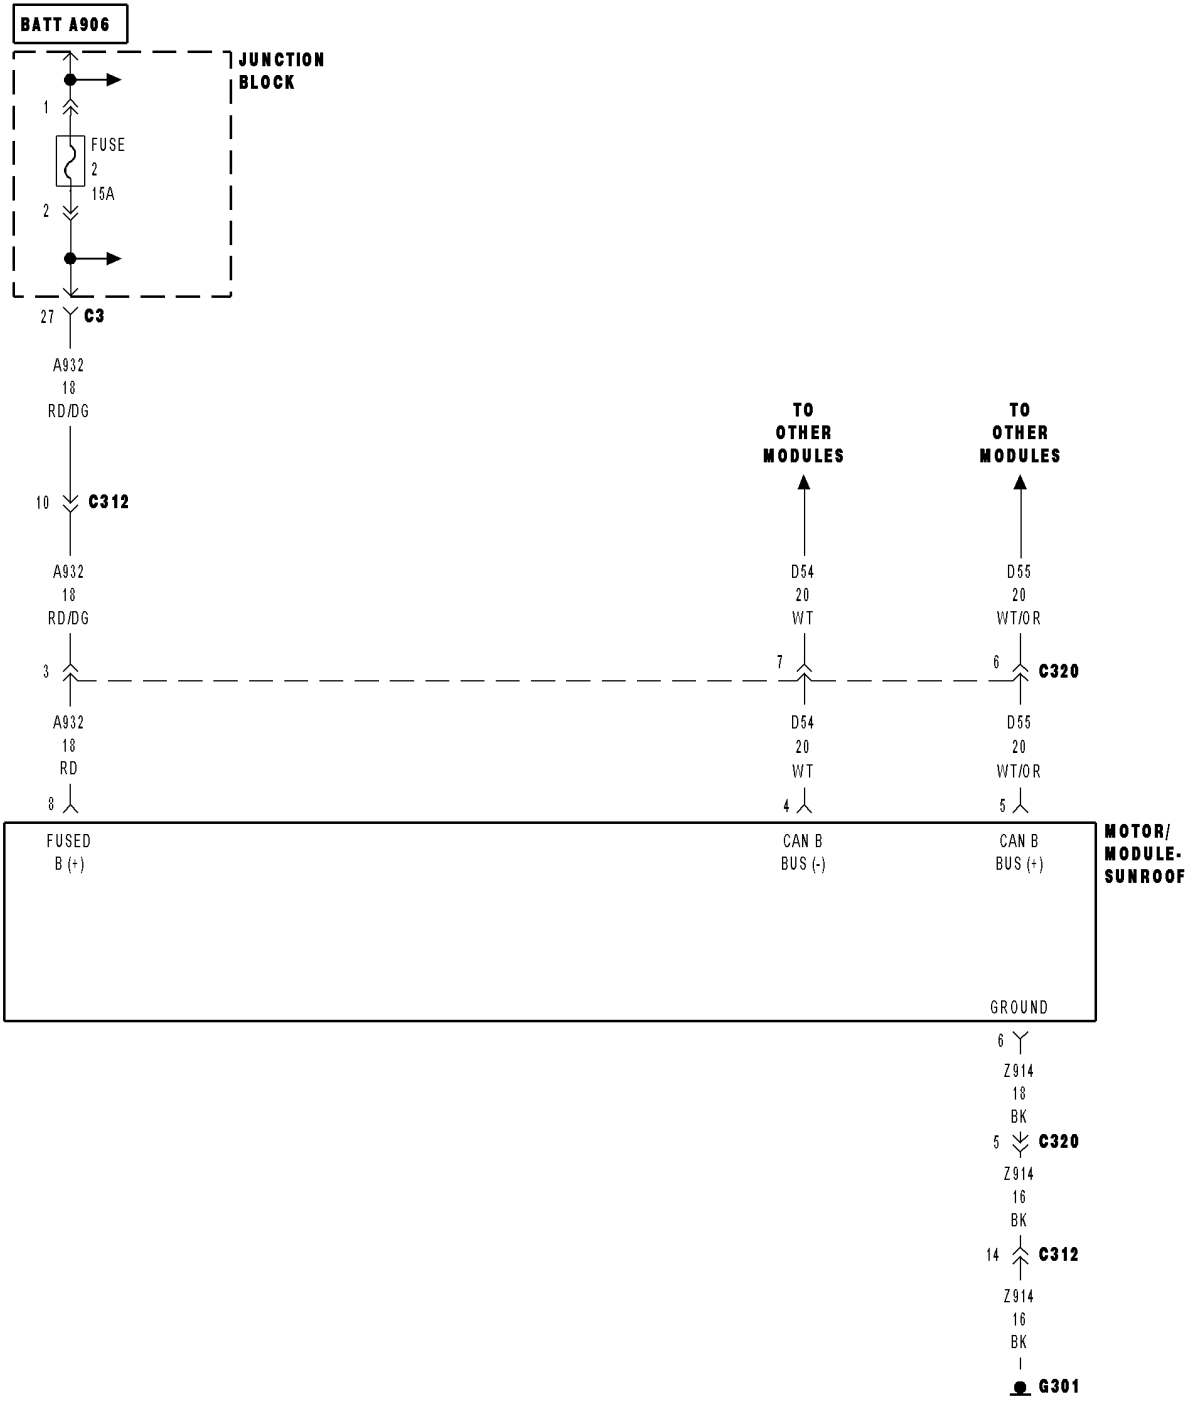

Is there any voltage present on either circuit?

Yes >> Replace the Steering Control Module in accordance with the service information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM SUNR (SUNROOF MOTOR/MODULE)**

**MOTOR/
MODULE-
SUNROOF**

***NO RESPONSE FROM SUNR (SUNROOF MOTOR/MODULE) (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(A932) FUSED B (+) CIRCUIT OPEN OR SHORTED
(Z914) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
SUNROOF MOTOR/MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A932) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Sunroof Motor/Module harness connector.

Using a 12-volt test light connected to ground, check the (A932) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (A932) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM SUNR (SUNROOF MOTOR/MODULE) (CONTINUED)**

3. (Z914) GROUND CIRCUIT OPEN

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z914) ground circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?

Yes >> Replace the Sunroof Motor/Module in accordance with the service information.

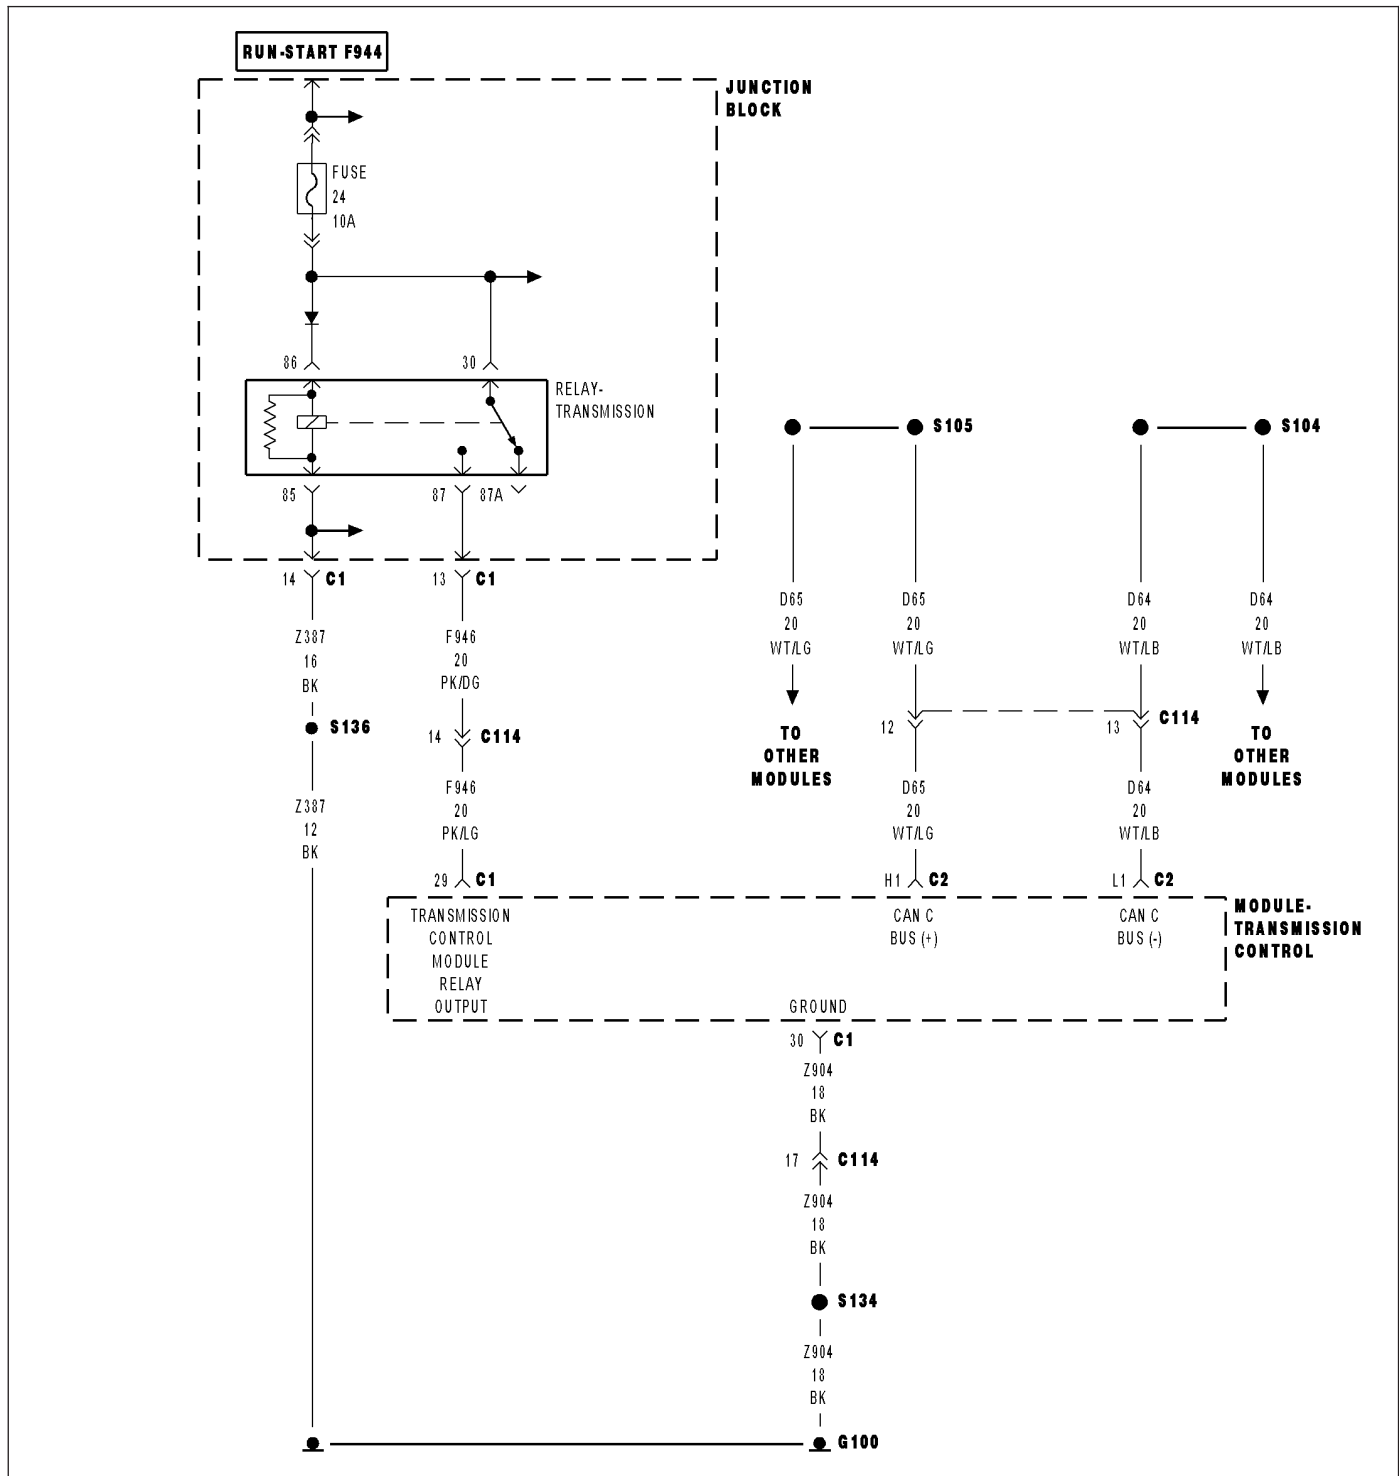

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM TCM - NAG1/DIESEL**

***NO RESPONSE FROM TCM - NAG1/DIESEL (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(Z904) GROUND CIRCUIT OPEN
(F946) TRANSMISSION RELAY OUTPUT CIRCUIT OPEN OR SHORT
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
TRANSMISSION CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the FCM for any active CAN C hardware and any ignition related DTCs, perform DTCs before proceeding.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (Z904) GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the Transmission Control Module C1 harness connector.

Using a 12-volt test light connected to 12-volts, check the (Z904) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (Z904) ground circuit for an open.
Perform NAG1/Diesel TRANSMISSION VERIFICATION TEST - VER 1.

***NO RESPONSE FROM TCM - NAG1/DIESEL (CONTINUED)**

3. (F946) TRANSMISSION RELAY OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F946) Transmission Relay Output circuit.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (F946) Transmission Relay Output circuit for an open or short.
 Perform NAG1/Diesel TRANSMISSION VERIFICATION TEST - VER 1.

4. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the FCM C1 harness connector.

Disconnect the TCM C2 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the FCM connector and the TCM connector.

Is resistance below 5.0 ohms?

Yes >> Go To 5

No >> Repair the (D65) CAN C Bus (+) circuit for an open.
 Perform NAG1/Diesel TRANSMISSION VERIFICATION TEST - VER 1.

***NO RESPONSE FROM TCM - NAG1/DIESEL (CONTINUED)**

5. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the FCM connector and the TCM connector.

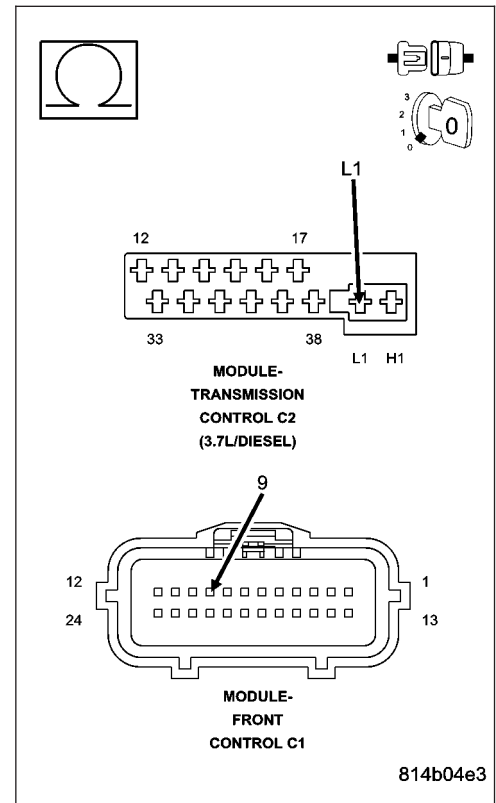

Is resistance below 5.0 ohms?

Yes >> Replace the Transmission Control Module in accordance with the service information.

Perform NAG1/Diesel TRANSMISSION VERIFICATION TEST - VER 1.

No >> Repair the (D64) CAN C Bus (-) circuit for an open.

Perform NAG1/Diesel TRANSMISSION VERIFICATION TEST - VER 1.

***NO RESPONSE FROM TCM (POWERTRAIN CONTROL MODULE) - NGC**

***NO RESPONSE FROM TCM (POWERTRAIN CONTROL MODULE) - NGC (CONTINUED)**

(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

Diagnostic Test**1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

NOTE: Check the FCM for any active CAN C hardware DTCs, perform DTC before proceeding.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. ATTEMPT TO COMMUNICATE WITH THE PCM

With the scan tool in ECU view, observe the status of the PCM.

Does the scan tool display a red X next to the PCM?

Yes >> Refer to the No Response From PCM test procedure. Refer to the table of contents in this section.

No >> Go To 3

***NO RESPONSE FROM TCM (POWERTRAIN CONTROL MODULE) - NGC (CONTINUED)**

3. (Z903) GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the PCM C4 harness connector.

CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

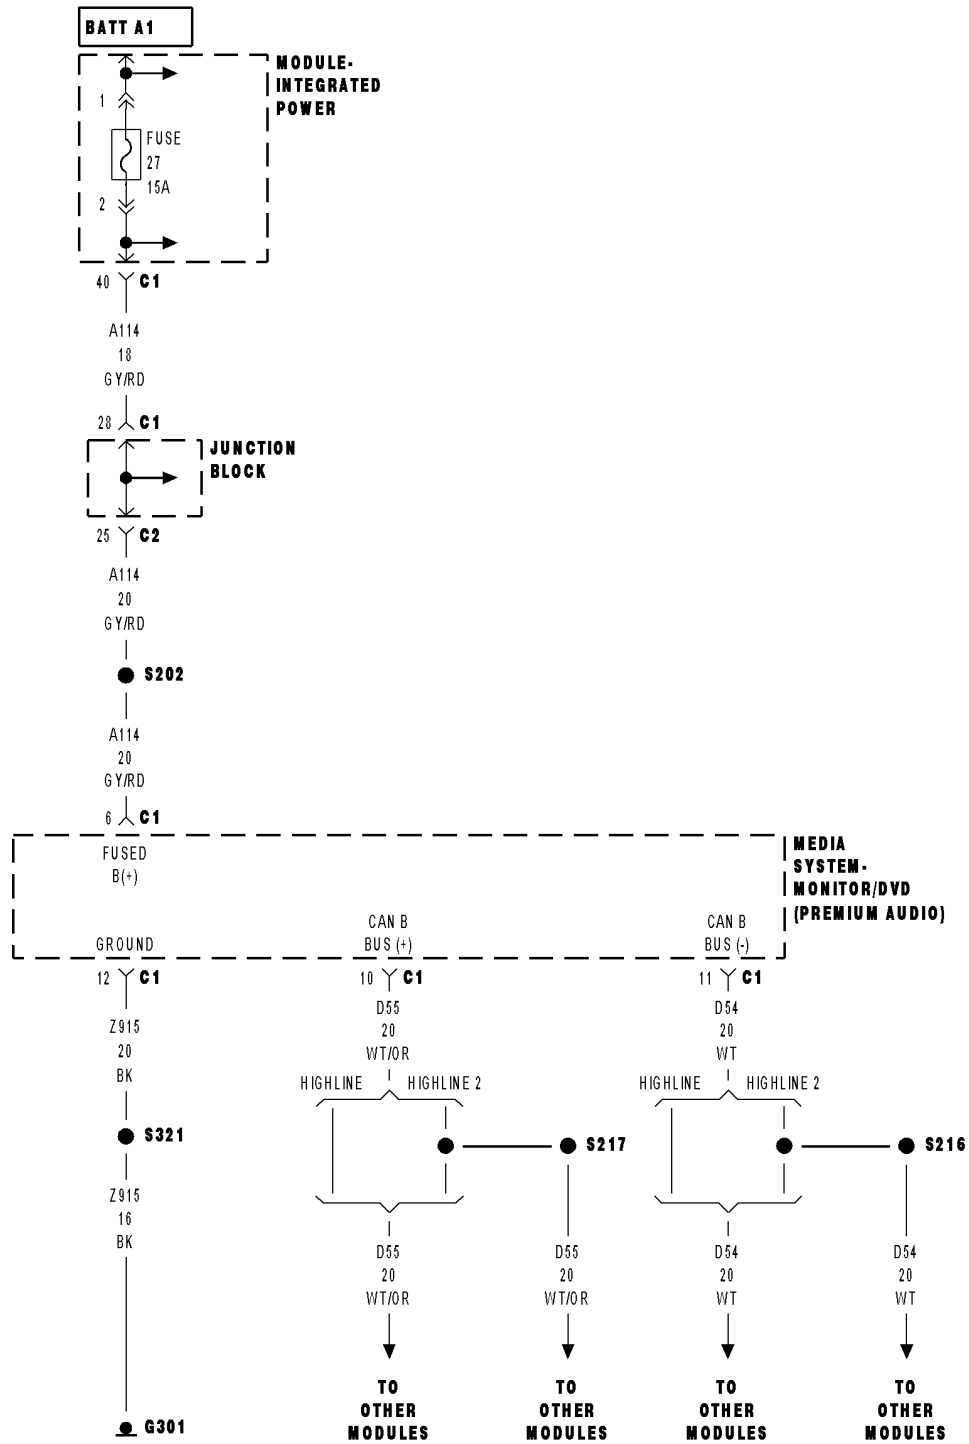

Using a 12-volt test light connected to 12-volts, check each (Z903) ground circuit.

Does the test light illuminate brightly for each circuit?

- Yes** >> Replace and program the Powertrain Control Module in accordance with the service information.
Perform the appropriate VERIFICATION TEST.
- No** >> Repair the (Z903) ground circuit for an open.
Perform the appropriate VERIFICATION TEST.

***NO RESPONSE FROM VES (MONITOR/DVD MEDIA SYSTEM)**

MEDIA SYSTEM-MONITOR/DVD C1 (PREMIUM AUDIO)

***NO RESPONSE FROM VES (MONITOR/DVD MEDIA SYSTEM) (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(A114) FUSED B (+) CIRCUIT OPEN OR SHORTED (Z915) GROUND CIRCUIT OPEN (D55) AND (D54) CAN B BUS CIRCUITS OPEN MONITOR/DVD MEDIA SYSTEM (DVD PLAYER)

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

2. (A114) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Monitor/DVD Media System C1 (DVD Player) harness connector.

Using a 12-volt test light connected to ground, check the (A114) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (A114) Fused B(+) circuit for an open or short. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

NO RESPONSE FROM VES (MONITOR/DVD MEDIA SYSTEM) (CONTINUED)*3. (Z915) GROUND CIRCUIT OPEN**

Using a 12-volt test light connected to 12-volts, check the (Z915) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z915) ground circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

NOTE: One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

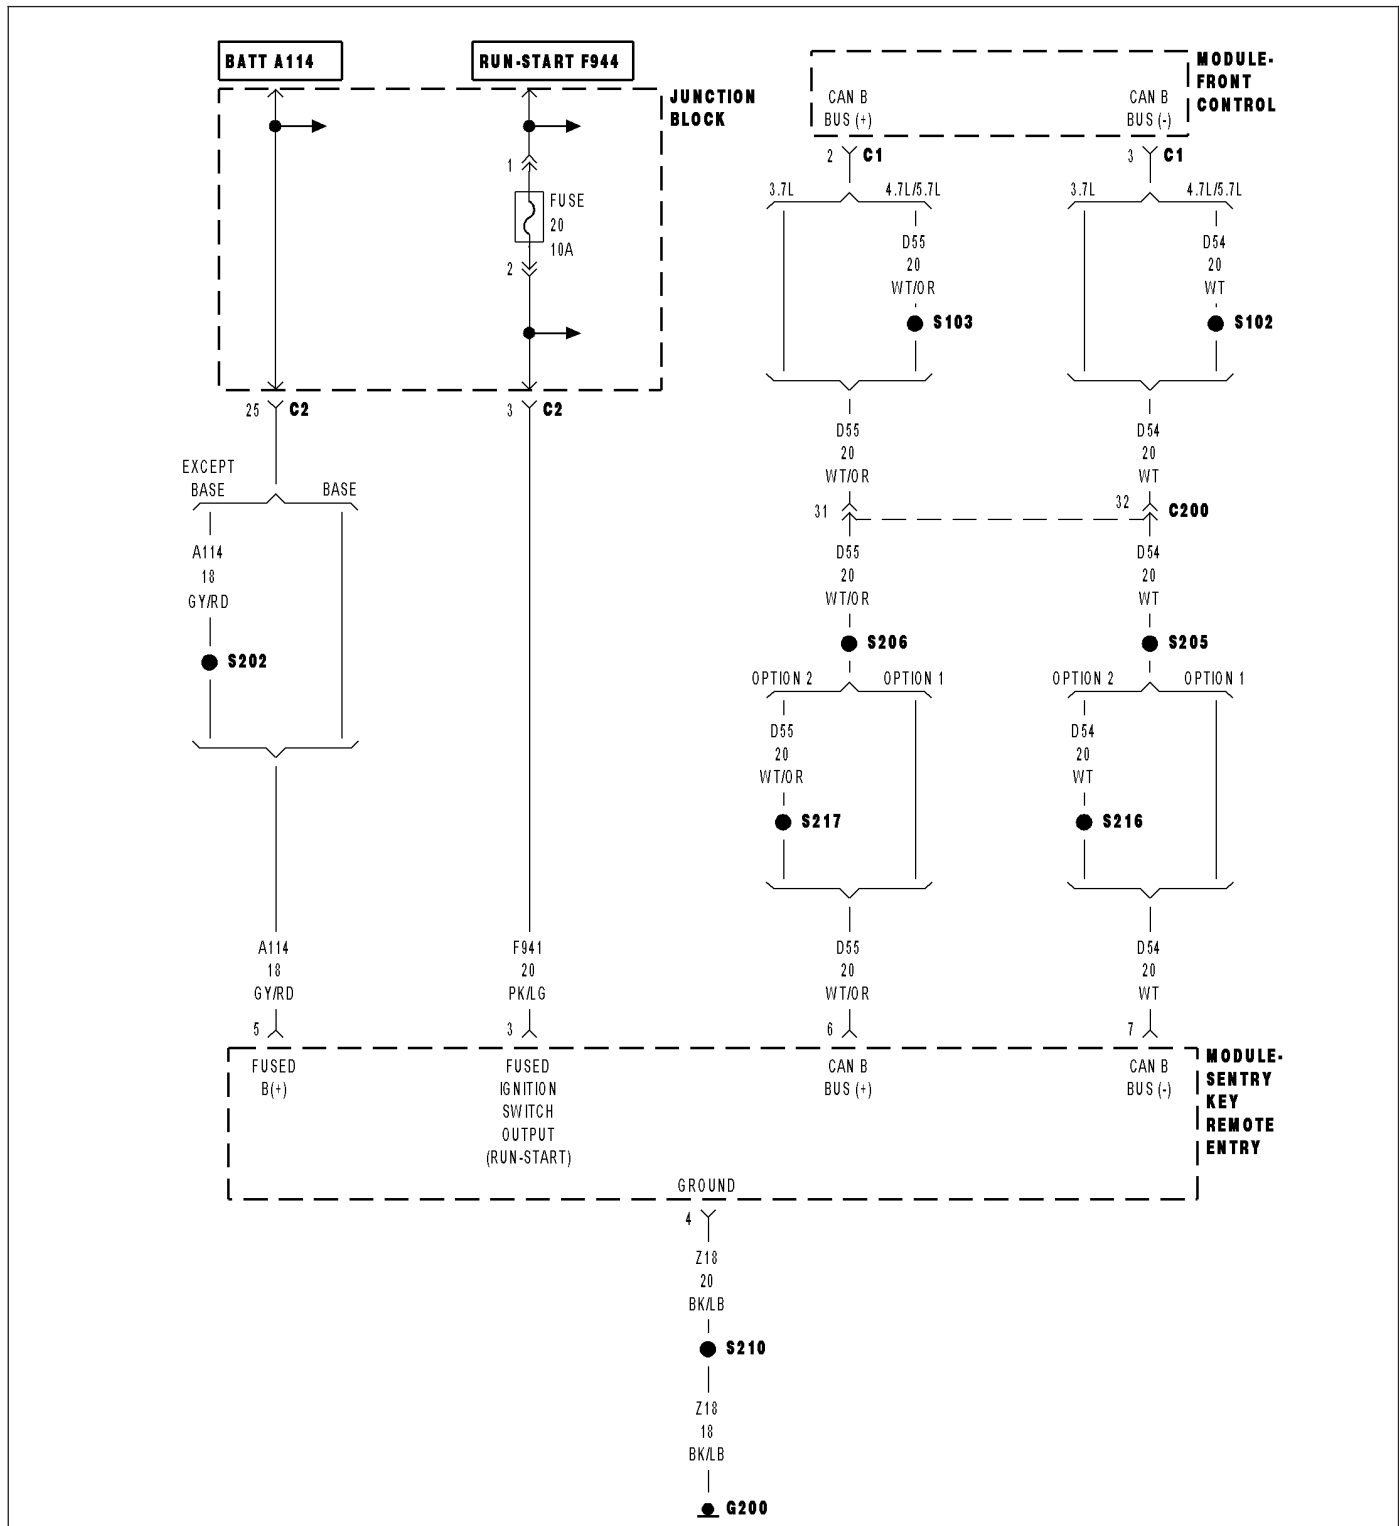

Is there any voltage present on either circuit?

Yes >> Replace the Monitor/DVD Media System (DVD Player) in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***NO RESPONSE FROM WCM (SENTRY KEY REMOTE ENTRY MODULE)**

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

NOTE: A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

Yes >> Go To 2

No >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

2. (A114) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.

Disconnect the Sentry Key Remote Entry Module harness connector. Using a 12-volt test light connected to ground, check the (A114) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (A114) Fused B(+) circuit for an open or short. Perform SKREEM VERIFICATION TEST.

***NO RESPONSE FROM WCM (SENTRY KEY REMOTE ENTRY MODULE) (CONTINUED)**

3. (Z18) GROUND CIRCUIT OPEN

Using a 12-volt test light connected to 12-volts, check the (Z18) ground circuit.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (Z18) ground circuit for an open.
Perform SKREEM VERIFICATION TEST.

4. (F941) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F941) Fused Ignition Switch Output circuit.

Does the test light illuminate brightly?

Yes >> Go To 5

No >> Repair the (F941) Fused Ignition Switch Output circuit for an open or short.
Perform SKREEM VERIFICATION TEST.

NO RESPONSE FROM WCM (SENTRY KEY REMOTE ENTRY MODULE) (CONTINUED)*5. (D55) AND (D54) CAN B BUS CIRCUITS OPEN****NOTE: One open circuit will not cause this condition.**

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

Is there any voltage present on either circuit?

- Yes** >> Replace the Sentry Key Remote Entry Module in accordance with the service information.
Perform SKREEM VERIFICATION TEST.
- No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.
Perform SKREEM VERIFICATION TEST.

STANDARD PROCEDURE

BODY VERIFICATION TEST – VER 1

Diagnostic Test

1. Perform Body Verification Test

1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
2. Ensure that all accessories are turned off.
3. Ensure that the battery is fully charged.
4. Turn the ignition on.
5. With the scan tool, record and erase DTCs from all modules.
6. If an electronic control module was replaced, select the applicable module from the scan tool menu and press "Misc. Functions". If the module has programable features, program as necessary.
7. Perform this step only if diagnosing faults related to the HVAC system.
 - The Manual Temperature Control (MTC) is not on the Bus and not addressable with a scan tool. Perform the following to clear DTCs from the MTC: 1. Turn the blower control on. 2. Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch. 3. When the A/C status indicator begins flashing DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches.
 - For vehicles equipped with Automatic Temperature Control (ATC), if repairs were made to any of the HVAC doors, linkage, door actuators, or door actuator circuits, run the actuator calibration function by selecting the following from the scan tool menu: select HVAC, More Options, System Tests, Actuator Calibration Test, and Start. Follow the directions displayed by the scan tool. Allow the test to run to completion before proceeding.
 - For vehicles equipped with MTC, if repairs were made to any of the HVAC doors, linkage, door actuators, or door actuator circuits, run the door calibration function by performing the following: 1. Turn the ignition on. 2. Turn the blower control to off. 3. Press the EBL mode switch down, turn the blower control on, wait 5 seconds and then release the mode switch. Wait approximately 90 seconds for the calibration process to run to completion before proceeding.
8. Turn the ignition off, wait 10 seconds, and then turn the ignition on.
9. Operate all functions of the system that caused the original concern.
10. With the scan tool, select ECU View.
11. With the scan tool, select ECU View and check for DTCs in the modules.
12. Perform this step only if diagnosing faults related to the MTC HVAC system.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

- Perform the following to read DTCs from the MTC: 1. Turn the blower control on. 2. Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch. 3. Read the DTCs from the flashing A/C status indicator.

Are DTCs present in any of the modules or is the original condition still present?

- Yes** >> The repair is not complete. Refer to the related category for the DTC or symptom that is still present.
- No** >> The repair is complete.
-

ELECTRONIC CONTROL MODULES - SERVICE INFORMATION

STANDARD PROCEDURE

PCM/SKREEM PROGRAMMING

NOTE: Before replacing the PCM, be sure to check the related component/circuit integrity for failures not detected due to a double fault in the circuit. Most PCM failures are caused by internal component failures (i.e. relays and solenoids) and shorted circuits (i.e. pull-ups, drivers, and switched circuits). These failures are difficult to detect when a double fault has occurred and only one Diagnostic Trouble Code (DTC) has been set.

When a PCM and the SKREEM are replaced at the same time, perform the following steps in order:

1. Program the new PCM.
2. Program the new SKREEM.
3. Replace all ignition keys and program them to the new SKREEM.

PROGRAMMING THE PCM

The SKIS Secret Key is an ID code that is unique to each SKREEM. This code is programmed and stored in the SKREEM, the PCM, and the ignition key transponder chip(s). When replacing the PCM, it is necessary to program the secret key into the new PCM using the scan tool. Perform the following steps to program the secret key into the PCM.

1. Turn the ignition switch to the On position (transmission in Park/Neutral).
2. Use the scan tool and select THEFT ALARM, SKREEM, then MISCELLANEOUS.
3. Select PCM REPLACED (GAS ENGINE).
4. Enter secured access mode by entering the vehicle four-digit PIN.
5. Select ENTER to update PCM VIN.

NOTE: If three attempts are made to enter secure access mode using an incorrect PIN, secured access mode will be locked out for one hour. To exit this lockout mode, turn the ignition switch to the ON position for one hour, then enter the correct PIN. (Ensure all accessories are turned off. Also monitor the battery state and connect a battery charger if necessary).

6. Press ENTER to transfer the secret key (the SKREEM will send the secret key to the PCM).
7. Press Page Back to get to the Select System menu and select ENGINE, MISCELLANEOUS, and SRI MEMORY CHECK.
8. The scan tool will ask, "Is odometer reading between XX and XX?" Select the YES or NO button on the scan tool. If NO is selected, the scan tool will read, "Enter Odometer Reading (From I.P. odometer)". Enter the odometer reading from the instrument cluster and press ENTER.

PROGRAMMING THE SKREEM

1. Turn the ignition switch to the On position (transmission in Park/Neutral).
2. Use the scan tool and select THEFT ALARM, SKREEM, then MISCELLANEOUS.
3. Select PCM REPLACED (GAS ENGINE).
4. Program the vehicle four-digit PIN into SKREEM.
5. Select COUNTRY CODE and enter the correct country.

NOTE: Be sure to enter the correct country code. If the incorrect country code is programmed into SKREEM, it cannot be changed and the SKREEM must be replaced.

6. Select YES to update VIN (the SKREEM will learn the VIN from the PCM).
7. Press ENTER to transfer the secret key (the PCM will send the secret key to the SKREEM).
8. Program ignition keys to the SKREEM.

NOTE: If the PCM and the SKREEM are replaced at the same time, all vehicle ignition keys will need to be replaced and programmed to the new SKREEM.

PROGRAMMING IGNITION KEYS TO THE SKREEM

1. Turn the ignition switch to the On position (transmission in Park/Neutral).
2. Use the scan tool and select THEFT ALARM, SKREEM, then MISCELLANEOUS.
3. Select PROGRAM IGNITION KEY'S.
4. Enter secured access mode by entering the vehicle four-digit PIN.

NOTE: A maximum of eight keys can be learned to each SKREEM. Once a key is learned to a SKREEM it (the key) cannot be transferred to another vehicle.

5. Obtain ignition keys to be programmed from the customer (8 keys maximum).
6. Using the scan tool, erase all ignition keys by selecting MISCELLANEOUS, and ERASE ALL CURRENT IGN. KEYS.
7. Program all of the ignition keys.

If ignition key programming is unsuccessful, the scan tool will display one of the following messages:

- **Programming Not Attempted** - The scan tool attempts to read the programmed key status and there are no keys programmed into SKREEM memory.
- **Programming Key Failed (Possible Used Key From Wrong Vehicle)** - SKREEM is unable to program an ignition key transponder due to one of the following:
 - The ignition key transponder is faulty.
 - The ignition key transponder is or has been already programmed to another vehicle.
- **8 Keys Already Learned, Programming Not Done** - The SKREEM transponder ID memory is full.
- **Learned Key In Ignition** - The ID for the ignition key transponder currently in the ignition lock cylinder is already programmed in SKREEM memory.

MODULE-ADJUSTABLE PEDALS

DESCRIPTION

The Adjustable pedals module (APM) is located underneath the driver seat, towards the front and on the outboard side. It is used in conjunction with the other modules in the memory system.

DIAGNOSIS AND TESTING

ADJUSTABLE PEDALS MODULE (APM)

In order to obtain conclusive testing of the adjustable pedals system, the Controller Area Network (CAN) data bus, and all of the electronic modules that provide inputs to, or receive outputs from the adjustable pedals system components must be checked. **Any diagnosis of the adjustable pedals module should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

Before any testing of the adjustable pedals system is attempted, the battery should be fully-charged.

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the driver seat cushion/cover (2) (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - REMOVAL).
3. Pivot the module upward and disconnect the electrical connectors (1).
4. Unsnap the adjustable pedals module (4) from the side brackets.
5. Pull the module rearward to remove it from the front of the seat frame (3).

INSTALLATION

CAUTION: The Adjustable Pedals Module mounting tabs can be damaged during module installation. Use care to properly align tabs to prevent binding that could result in tab breakage.

1. Place the module (4) into position making sure the mounting tabs are properly aligned with the front bracket.
2. Push down on the rear of the module (4) snapping the retaining clips into place in the side brackets.
3. Connect the adjustable pedals module rear harness connectors (1).
4. Connect the adjustable pedals module front harness connectors.
5. Install the driver seat cushion/cover (2) (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - INSTALLATION).
6. Connect the battery negative cable.
7. Verify system and vehicle operation.

MODULE-ANTILOCK BRAKES

DESCRIPTION

NOTE: If the ABM module is replaced it must be initialized using the scan tool.

The Antilock Brake Module (ABM) (1) is mounted to the Hydraulic Control Unit (HCU) (2) and operates the ABS system.

OPERATION

NOTE: If the ABM module is replaced it must be initialized using the scan tool.

The ABM voltage is supplied by the ignition switch in the RUN position. The ABM contains dual microprocessors. A logic block in each microprocessor receives identical sensor signals. These signals are processed and compared simultaneously. The ABM contains a self check program that illuminates the ABS warning light when a system fault is detected. Faults are stored in a diagnostic program memory and are accessible with the scan tool. ABS faults remain in memory until cleared, or until after the vehicle is started approximately 50 times. Stored faults are **not** erased if the battery is disconnected.

REMOVAL

1. Remove the negative battery cable from the battery.
2. Install a brake pedal prop rod.
3. Siphon the master cylinder.

4. Disconnect the HCU electrical connectors (5).
5. Remove the primary brake line at the master cylinder.
6. Remove the primary brake line from the HCU (4).
7. Remove the secondary brake line at the master cylinder.
8. Remove the secondary brake line at the HCU (4).
9. Remove the 4 chassis lines (3) at the HCU (4).

10. Remove the 3 mounting nuts at the HCU bracket (2).
11. Remove the HCU (1) with the bracket (2) from the vehicle.

12. Remove the 3 ABM bolts securing the ABM (1) to the HCU (2).

13. Separate the ABM (1) from the HCU (2).

INSTALLATION

NOTE: If the ABM is being replaced with a new ABM it must be reprogrammed with the use of a scan tool.

1. Install the ABM (1) to the HCU (2).

2. Install the 3 ABM (1) mounting bolts to the HCU (2) if removed tighten mounting bolts to 12 N·m (9 ft. lbs.).

3. Install the HCU (1) with bracket (2) to the vehicle and tighten the 2 mounting nuts.

4. Reconnect the HCU electrical connector (5).
5. Install the 4 chassis lines (3) at the HCU (4).
6. Install the secondary brake tube at the HCU (4).
7. Install the secondary brake tube at the master cylinder.
8. Install the primary brake tube at the HCU (4).
9. Install the primary brake tube at the master cylinder.

10. Install negative battery cable to the battery.
11. Remove the brake pedal prop rod.
12. Bleed base and ABS brake systems, (Refer to 5 - BRAKES - STANDARD PROCEDURE).
13. Initialize the ABS module using the scan tool.

COMMUNICATION

DESCRIPTION

The Controller Area Network (CAN) is a serial data bus communication network used for interconnecting numerous electronic control modules throughout the vehicle in a two-wire multiplexed system. Within this context the term serial refers to electronic data that is transferred bit by bit, while bus refers to the shared wires through which that data is transferred. Multiplexing is any system that enables the transmission of multiple messages over a single channel or circuit. The communication protocol being used is a non-proprietary, open standard adopted from the Bosch CAN Specification 2.0b and uses an 11-bit message identifier.

There are actually three separate CAN bus systems used in the vehicle. They are designated: the CAN-B, the CAN-C and the Diagnostic CAN-C. The CAN-B and CAN-C systems provide on-board communication between all nodes in the vehicle. The CAN-C is the faster of the two systems providing near real-time communication (500 Kbps), but is less fault tolerant than the CAN-B system. The CAN-C is used exclusively for communications between critical powertrain and chassis nodes. The slower (83.3 Kbps), but more fault tolerant CAN-B system is used for communications between body and interior nodes. The CAN-B fault tolerance comes from its ability to revert to a single wire communication mode if there is a fault in the bus wiring.

The Diagnostic CAN-C bus is also capable of 500 Kbps communication, and is sometimes informally referred to as the CAN-D system to differentiate it from the other high speed CAN-C bus. A central gateway or hub integral to the Front Control Module (FCM) physically and electrically isolates the three CAN buses from each other and coordinates the bi-directional transfer of messages between the three buses. The FCM is located on the Integrated Power Module (IPM), which is located in the engine compartment near the battery. The Diagnostic CAN-C is used exclusively for the transmission of diagnostic information between the FCM/gateway and a diagnostic scan tool connected to the industry-standard 16-way Data Link Connector (DLC) located beneath the instrument panel on the driver side of the vehicle.

Each node is connected in parallel to its CAN-B or CAN-C bus using a two-wire twisted pair. These wires are wrapped around each other to provide shielding from unwanted electromagnetic induction interfering with the relatively low voltage signals being carried through them. The twisted pairs have between 33 and 50 twists per meter. While the CAN bus is operating, one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire. Each twisted pair terminates at the FCM/gateway.

The added speed of the CAN data bus is many times faster than previous data bus systems. This added speed facilitates the addition of more electronic control modules or nodes and the incorporation of many new electrical and electronic features in the vehicle. Like prior data bus systems, the CAN data bus minimizes redundant wiring connections; and, at the same time, reduces wire harness complexity, sensor current loads and controller hardware by allowing each sensing device to be connected to only one node. Each node reads, then broadcasts its sensor data over the bus for use by all other nodes requiring that data.

OPERATION

The Controller Area Network (CAN) data bus allows all electronic modules or nodes connected to the bus to share information with each other. Each node can both send and receive serial data simultaneously. The CAN bus signal lines have termination through a termination resistor within each node, either dominant or recessive. The serial data is made up of high and low voltage pulses strung together. Each string of voltage pulses forms a message.

Regardless of whether a message originates from a node on the medium speed CAN-B bus or on the high speed CAN-C bus, the message structure and layout is the same, which allows the Front Control Module (FCM)/Central GateWay (sometimes referred to as the FCMCGW) to process and transfer messages between the buses. The priority of each message is based upon the 11-bit message identifier. Each node uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time.

The FCM used in the CAN system has more control than a non-CAN FCM. Available options are configured into the FCM at the assembly plant, but additional options can be added in the field using the diagnostic scan tool. The configuration settings are stored in non-volatile memory. The FCM also has two 64-bit registers, which register each of the "as-built" and "currently responding" nodes on the CAN-B and CAN-C buses. The FCM stores a Diagnostic Trouble Code (DTC) in one of two caches for any detected active or stored faults in the order in which they occur. One cache stores powertrain (P-Code), chassis (C-Code) and body (B-Code) DTCs, while the second cache is dedicated to storing network (U-Code) DTCs.

If there are intermittent or active faults in the CAN network, a diagnostic scan tool connected to the Diagnostic CAN-C bus through the 16-way Data Link Connector (DLC) may only be able to communicate with the FCM. To aid in CAN network diagnosis, the FCM will provide CAN-B and CAN-C network status information to the scan tool using certain diagnostic signals. In addition, the transceiver in each node on the CAN-C bus will identify a "bus off hardware failure," while the transceiver in each node on the CAN-B bus will identify a "general bus hardware failure." The transceivers for some CAN-B nodes will also identify "bus shorted high," "bus shorted low," "bus open" or "bus shorted together" failures for both CAN-B bus signal wires.

In order to minimize the potential effects of Ignition-Off Draw (IOD), the CAN-B network employs a sleep strategy. However, a network sleep strategy should not be confused with the sleep strategy of the individual nodes on that network, as they may differ. For example: The CAN-C bus network is awake only when the ignition switch is in the On or Start positions; however, the FCM or the Transmission Control Module (TCM), which are on the CAN-C bus,

may still be awake with the ignition switch in the Accessory or Unlock positions. The integrated circuitry of an individual node may be capable of processing certain sensor inputs and outputs without the need to utilize network resources.

The CAN-B bus network remains active until all nodes on that network are ready for sleep. This is determined by the network using tokens in a manner similar to polling. When the last node that is active on the network is ready for sleep, and it has already received a token indicating that all other nodes on the bus are ready for sleep, it broadcasts a "bus sleep acknowledgment" message that causes the network to sleep. Once the CAN-B bus network is asleep, any node on the bus can awaken it by transmitting a message on the network. The FCM will keep either the CAN-B or the CAN-C bus awake for a timed interval after it receives a diagnostic message for that bus over the Diagnostic CAN-C bus.

CONNECTOR-DATA LINK

DESCRIPTION

The Data Link Connector (DLC) is a 16-way molded plastic connector insulator on a dedicated take out of the instrument panel wire harness. This connector is located at the lower edge of the instrument panel, outboard of the steering column. The connector insulator is retained by integral snap features within a rectangular cutout in the lower instrument panel reinforcement.

OPERATION

The Data Link Connector (DLC) is an industry-standard 16-way connector that permits the connection of a diagnostic scan tool to the Controller Area Network (CAN) for interfacing with, configuring, and retrieving Diagnostic Trouble Code (DTC) data from the electronic modules that reside on the data bus network of the vehicle.

MODULE-FINAL DRIVE CONTROL

DESCRIPTION

The Final Drive Control Module (FDCM) (2) is a micro-processor-based assembly, controlling a 4X4 Transfer Case and Front and Rear Electronic Limited Slip Differentials (ELSD's). Communication is via the CAN serial bus. Inputs include user selectable 4X4 modes that include 4WD Full Time (4HI), 4LO, Neutral. The logic and driver circuitry is contained in aluminum housing base and a stamped steel housing cover with an embedded heat sink

The FDCM is installed inside the passenger compartment underneath the driver side of the rear seat.

OPERATION

POWER UP/DOWN

The Final Drive Control Module (FDCM) will power up with an OFF/ON transition of the hardwired ignition switch input, or with the presence of active CAN C communications.

The FDCM will power down when the vehicle ignition switch transitions from ON to OFF, or there are no CAN C messages, or there are no system requirements that dictate the controller to remain active

START-UP DIAGNOSTICS

When the FDCM is activated, the internal circuitry will undergo a diagnostic procedure. The controller will examine all inputs and outputs for short circuits to ground, short circuits to battery and open circuits and will also verify proper CPU and memory operation. If a fault is detected, a message will be sent out over the CAN C bus to the Cluster based Electronic Vehicle Information Center EVIC indicating that service is recommended.

After passing all diagnostic tests, the controller will receive and process inputs and produce the appropriate outputs. Proper monitoring of the controller inputs and outputs performance will continue.

INPUTS/OUTPUTS

The following are inputs to the FDCM:

- Lateral Accelerometer
- Transfer Case Range Select Switch
- Transfer Case Mode Sensor Signal
- Front Differential Temperature Sensor
- Rear Differential Temperature Sensor
- 3 Direct Battery Feeds
- Ignition RUN Sense
- Sensor Grounds
- Module Grounds
- CAN C Bus

The following are outputs of the FDCM:

- 5V Sensor Supply
- Transfer Case NEUTRAL Lamp
- Front Electronic Limited Slip Differential Pressure Solenoid
- Rear Electronic Limited Slip Differential Pressure Solenoid
- Transfer Case Bi-directional Motor Control (A & B)
- Switched B+ Solenoid Supply
- Transfer Case Motor Brake Control

TRANSFER CASE RANGE SELECT SWITCH INPUT (NEUTRAL & 4HI/4LO SELECT SWITCH)

The FDCM will support circuitry which interfaces to the system's Transfer Case Range Select Switch, including a Transfer Case Range Select Switch voltage supply and a Transfer Case Range Select Switch input. The purpose of this circuitry is to determine the mode currently being requested by the operator via the resistance ladder network in the shifter assembly, where the Transfer Case Range Select Switch is packaged.

The NEUTRAL Select Switch Input will provide the operator with the ability to place the Transfer Case in Neutral. The 4HI/ 4LO Select Switch Input will provide the operator with the ability to place the transfer case in 4HI or 4LO. The NEUTRAL Select Switch is a momentary contact switch and the 4HI/4LO Select Switch is a 2-position toggle or a momentary contact switch and both these switches are provided through a resistor network for diagnostic purposes. The input will have an internal 1.0K +/- 1% pull-down resistor to ground.

As the selected position in the 4HI/4LO Switch varies and/or the NEUTRAL Switch is depressed or not, the resistance between the module's Transfer Case Range Select Switches voltage supply and Transfer Case Range Select Switches input will vary. Hardware, software, and calibrations within the FDCM will be provided that interpret the external resistance between the module's Transfer Case Range Select Switches voltage supply and Transfer Case Range Select Switches inputs as given in the table below:

STEP	RESISTANCE RANGE	REQUIRED INTERPRETATION
A	63<111<140.4	Fault Condition (short)
B	309.7<337<364.39	NEUTRAL from 4LO(1)
C	380.93< 414<448.20	NEUTRAL from 4HI(1)
D	910.87< 990< 1071.72	4LO
E	2024.17< 2200< 2381.61	4HI
F	Greater Than 8661.5<9000<9343	Fault condition (open)

NOTE: There is no requirement for the FDCM to distinguish between a neutral request from the 4LO or the 4HI position. Resistances in these ranges will be represented as a Neutral Switch Activation.

TRANSFER CASE MODE SENSOR SIGNAL

The Transfer Case Mode Sensor Signal Input will provide the FDCM feedback about the position of the transfer case. The mode sensor will be a linear analog position sensor with a 1.4K +/- 20% potentiometer and a 1 K +/- 20% wiper resistor that converts the motor shaft position into a multiplexed voltage.

FRONT AND REAR DIFFERENTIAL TEMPERATURE SENSORS

The Front and Rear Differential Temperature Sensors will provide a Temperature signal to the FDCM. The temperature sensor will be of a resistive nature and supplied by the Drivetrain Sensor Supply.

TEMPERATURE		RESISTANCE kΩ	
Degrees C	Degrees F	Minimum	Maximum
-60	-76	1353.41	1838.59
-40	-40	291.49	381.71
-30	-22	155.2	199.6
-20	-4	85.85	108.39
-10	14	49.25	61.43
0	32	29.33	35.99
10	50	17.99	21.81
20	68	11.37	13.61
25	77	9.12	10.88
30	86	7.37	8.75
40	104	4.9	5.75
50	122	3.33	3.88
60	140	2.31	2.67
70	158	1.63	1.87
80	176	1.17	1.34
90	194	0.86	0.97
100	212	0.64	0.72
110	230	0.48	0.54
120	248	0.37	0.41
130	266	0.28	0.32
140	284	0.21	0.25
150	302	0.17	0.20

NEUTRAL LAMP

There will be a LED indicator in the Shifter bezel to indicate to the driver that the Transfer Case is in the Neutral gear. FDCM will be capable of driving the LED continuously at 25 mA.

FRONT AND REAR ELECTRONIC LIMITED SLIP DIFFERENTIAL PRESSURE SOLENOID

These outputs will control a Solenoid that regulates the oil pressure inside the Front and Rear Electrical Differential. The oil pressure controls a clutch pack in the front differential that varies the torque transfer across the front or rear axle.. The solenoid will be PWM controlled at a 1Khz frequency and with a 0 to 100% duty cycle capability.

TRANSFER CASE BI-DIRECTIONAL MOTOR CONTROL (A & B)

This output will control a Bi-directional DC motor that controls a clutch pack in the Transfer Case that varies the torque transfer between the front and rear axles.

MODES OF OPERATION

Normal Operation

This mode is achieved by the ignition being switched in the RUN position, which powers up the 5V regulator and generates the appropriate RESET for the microprocessor. This mode also includes any required power-up system checks.

Shut Down Mode

This mode is activated when the ignition switch turned to the off position. The FDCM will perform any required Shut Down tasks prior to turning off the 5V regulator.

Limp-In Mode

This mode is entered when the FDCM has detected an error condition that prevents the system from performing its' required task. The FDCM operation will vary depending from modified operation to total system shut down based on the failure that has occurred.

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Lift up rear seat to expose the park assist module and final drive control module.

3. Disconnect the module electrical connector (1).
4. Using a trim stick (special tool #C-4755) or equivalent, gently pry back on the retaining tabs on the mounting plate (2) and remove module.

INSTALLATION

1. Place the park assist module (3) in its location on the mounting plate (2) and firmly snap into place.
2. Connect the electrical connector (1).

3. Lower the rear seat back down into position.
4. Connect the battery negative cable.

MODULE-FRONT CONTROL

DESCRIPTION

CAUTION: Do not exchange the Front Control Module with the module from another vehicle. Multiple vehicle module configurations may be altered. Use only approved service parts when replacing the module or exchanging the module for diagnostic purposes.

The Front Control Module (FCM) (3) is a micro controller based module located in the left front corner of the engine compartment. The FCM mates directly to the Integrated Power Module (IPM)(2). The IPM connects directly to the battery and provides the primary means of circuit protection and power distribution for many of the vehicle electrical systems. The FCM controls power to some of these vehicle systems electrical and electromechanical loads based on inputs received from hard wired switch inputs and data received on the Controller Area Network (CAN) data bus circuit.

OPERATION

As messages are sent over the Controller Area Network (CAN) bus circuit, the Front Control Module (FCM) reads these messages and controls power to some of the vehicles electrical systems by completing the circuit to ground (low side driver) or completing the circuit to 12 volt power (high side driver). The following functions are controlled by the FCM:

- Front turn signals
- Turn signal and tail lamps
- Front and rear hazard warning lamps
- Headlamps
- Fog Lamps
- Daytime running lamps - if equipped
- Horn

- Windshield wiper and washer systems
- Trailer tow wiring output
- Power Accessory Delay
- Smart Power Accessory Delay
- Manual adjustable pedals
- Hydraulic cooling fan
- Sensor monitoring (ambient, battery voltage, brake pedal position, and hood ajar - if equipped)

The FCM provides the following features for the above function:

- It flashes lamps in response to turn signal, Remote Keyless Entry and Vehicle Theft Security Alarm inputs, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/ELECTRONIC VEHICLE INFO CENTER - OPERATION) for additional information on customer programmable features.
- It sounds the horn in response to Remote Keyless Entry and Vehicle Theft Security Alarm inputs, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/ELECTRONIC VEHICLE INFO CENTER - OPERATION) for additional information on customer programmable features.
- It turns off the horn in the event of excessively long operation that could otherwise damage the horn.
- It minimized voltage variations to the headlamps to extend bulb life.
- If the headlamps are left on, it automatically turns them off after eight minutes to protect the battery from discharge.
- It operates the high-beam headlamps at reduced intensity by pulse-width modulation of the power supply to provide the daytime running lamps.
- It provides the variable delay intermittent windshield wiper feature and the vehicle speed sensitive windshield wiper delay variation.
- It acts as a gateway between the CAN-C network for critical powertrain and anti-lock brake systems and the CAN-B network for body and interior modules as well as the CAN-D network. For example it collects ambient temperature data and relays it to the PCM.

REMOVAL

CAUTION: Front Control Module (FCM) damage may occur if the module case comes in contact with the battery while still connected. Always disconnect the battery negative cable prior to removal of the FCM.

1. Disconnect and isolate the battery negative cable.
2. Remove the Integrated Power Module (IPM) from the engine compartment, (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/INTEGRATED POWER MODULE - REMOVAL).
3. Remove the four fasteners (2) securing the Front Control Module (FCM) (1) to the IPM (3).
4. Separate the FCM from the IPM by pulling the two straight away from each other to disengage the electrical connector.

INSTALLATION

NOTE: If installing a new service part, remove the plastic cover from the original module and install it on the one.

1. Connect the Integrated Power Module (IPM) (3) to the Front Control Module (FCM) (1) by lining up the electrical connector and pushing the two together.
2. Install the four fasteners (2) securing the FCM (1) to the IPM (3).
3. Install the IPM, (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/INTEGRATED POWER MODULE - INSTALLATION).
4. Connect the battery negative cable.

MODULE-MEMORY MIRROR

DESCRIPTION

There are two Memory Mirror Modules (these are sometimes referred to as Driver Door Modules (DDM) and Passenger Door Modules (PDM) within the memory system. One located in the driver door and one in the passenger door, just behind the door trim panel. The modules send a bus message to the power mirrors to adjust them to a preset position when a memory recall request has been made.

The memory mirror modules also act as an interface in each door for electrical functions (door lock switches and door ajar switches).

The **Memory System** makes available for immediate recall personalized preferences of the following:

- Automatic temperature control settings.
- Outside mirror positions.
- Power adjustable brake and accelerator pedal position.
- Power seat horizontal, vertical, recliner, and easy entry positions.
- Radio push button station selections.

The major components of the **Memory System** are:

- **Memory Selector Switch** - located in the driver door trim panel.
- **Driver Memory Mirror Module (DMMM)** - located in the driver door, behind the trim panel.
- **Passenger Memory Mirror Module (PMMM)** - located in the passenger door, behind the trim panel.
- **Sentry Key Remote Entry Module (SKREEM)** - located at ignition key cylinder.

- **Remote Keyless Entry (RKE) Transmitter** - located with ignition key.
- **Memory Seat Module (MSM)** - located underneath the driver seat and also controls the Adjustable Pedals.
- **Radio** - located in the instrument panel center stack.
- **Automatic Temperature Control (ATC)** - located in the instrument panel center stack.

The memory recall is available at the press of a button on the drivers door trim panel or, by using the Remote Keyless Entry (RKE) transmitter if it is programmed to trigger the recall.

Radio settings include up to 20 push button presets (10 AM and 10 FM), and the last station selection, even if it is not one of the 20 preset selections.

OPERATION

The memory mirror module receives input from the door lock switches and sends that message to the cluster for door lock operation (vehicles equipped with memory system only). It also controls the mirror adjustment by receiving input from the mirror switch on the door trim panel. Sensors in the mirrors act as inputs to the memory mirror module in order to position the mirrors to presets by the driver(s). The power supply to the mirrors is supplied by the mirror memory modules. On vehicles equipped with a memory system, the front door ajar switches are inputs to the memory mirror module. The modules use this information for door lock inhibit etc.

A memory setting is saved by pressing the "set" button, then pressing either the memory "1" or "2" button within 5 seconds of pressing the "set" button.

A memory setting is recalled by pressing either the memory "1" or "2" button, or by pressing the unlock button on a "linked" Remote Keyless Entry (RKE) transmitter.

For driver safety, memorized settings can not be recalled if the transmission is in a position other than Park or the seat belt is latched.

Both driver and passenger modules provide active and stored Diagnostic Trouble Codes (DTC's) to aid in diagnosis. Both modules are identical in appearance with the exception of an extra ground wire on the driver side memory mirror module.

DIAGNOSIS AND TESTING

MEMORY MIRROR MODULE

Any diagnosis of the memory mirror module should begin with the use of a scan tool and the appropriate Diagnostic information.

Refer to the appropriate wiring information.

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the door trim panel (Refer to 23 - BODY/ DOOR - FRONT/TRIM PANEL - REMOVAL).
3. Disconnect the electrical connector from module.
4. Remove fasteners and module from vehicle.

INSTALLATION

1. Position module on door trim panel and install fasteners (2).
2. Connect the electrical connector to module.
3. Install the door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).
4. Connect the battery negative cable.

MODULE-POWERTRAIN CONTROL

DESCRIPTION

POWERTRAIN CONTROL MODULE (PCM)

The PCM (1) is attached to the right-front inner fender located in the engine compartment.

MODES OF OPERATION

As input signals to the Powertrain Control Module (PCM) change, the PCM adjusts its response to the output devices.

The PCM will operate in two different modes: **Open Loop and Closed Loop.**

During Open Loop modes, the PCM receives input signals and responds only according to preset PCM programming. Input from the oxygen (O₂S) sensors is not monitored during Open Loop modes.

During Closed Loop modes, the PCM will monitor the oxygen (O₂S) sensors input. This input indicates to the PCM whether or not the calculated injector pulse width results in the ideal air-fuel ratio. This ratio is 14.7 parts air-to-1 part fuel. By monitoring the exhaust oxygen content through the O₂S sensor, the PCM can fine tune the injector pulse width. This is done to achieve optimum fuel economy combined with low emission engine performance.

The fuel injection system has the following modes of operation:

- Ignition switch ON
- Engine start-up (crank)
- Engine warm-up
- Idle
- Cruise
- Acceleration
- Deceleration
- Wide open throttle (WOT)
- Ignition switch OFF

The ignition switch On, engine start-up (crank), engine warm-up, acceleration, deceleration and wide open throttle modes are Open Loop modes. The idle and cruise modes, (with the engine at operating temperature) are Closed Loop modes.

IGNITION SWITCH (KEY-ON) MODE

This is an Open Loop mode. When the fuel system is activated by the ignition switch, the following actions occur:

- The PCM pre-positions the idle air control (IAC) motor.
- The PCM determines atmospheric air pressure from the MAP sensor input to determine basic fuel strategy.
- The PCM monitors the engine coolant temperature sensor input. The PCM modifies fuel strategy based on this input.
- Intake manifold air temperature sensor input is monitored.
- Throttle position sensor (TPS) is monitored.
- The auto shutdown (ASD) relay is energized by the PCM for approximately three seconds.
- The fuel pump is energized through the fuel pump relay by the PCM. The fuel pump will operate for approximately three seconds unless the engine is operating or the starter motor is engaged.
- The O₂S sensor heater element is energized via the ASD relay. The O₂S sensor input is not used by the PCM to calibrate air-fuel ratio during this mode of operation.

ENGINE START-UP MODE

This is an Open Loop mode. The following actions occur when the starter motor is engaged.

The PCM receives inputs from:

- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Starter motor relay
- Camshaft position sensor signal

The PCM monitors the crankshaft position sensor. If the PCM does not receive a crankshaft position sensor signal within 3 seconds of cranking the engine, it will shut down the fuel injection system.

The fuel pump is activated by the PCM through the fuel pump relay.

Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.

The PCM determines the proper ignition timing according to input received from the crankshaft position sensor.

ENGINE WARM-UP MODE

This is an Open Loop mode. During engine warm-up, the PCM receives inputs from:

- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)

Based on these inputs the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM adjusts engine idle speed through the idle air control (IAC) motor and adjusts ignition timing.
- The PCM operates the A/C compressor clutch through the clutch relay. This is done if A/C has been selected by the vehicle operator and requested by the A/C thermostat.
- When engine has reached operating temperature, the PCM will begin monitoring O₂S sensor input. The system will then leave the warm-up mode and go into closed loop operation.

IDLE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At idle speed, the PCM receives inputs from:

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal
- Battery voltage
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Oxygen sensors

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM monitors the O₂S sensor input and adjusts air-fuel ratio by varying injector pulse width. It also adjusts engine idle speed through the idle air control (IAC) motor.
- The PCM adjusts ignition timing by increasing and decreasing spark advance.
- The PCM operates the A/C compressor clutch through the clutch relay. This happens if A/C has been selected by the vehicle operator and requested by the A/C thermostat.

CRUISE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At cruising speed, the PCM receives inputs from:

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Oxygen (O2S) sensors

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then adjust the injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM monitors the O2S sensor input and adjusts air-fuel ratio. It also adjusts engine idle speed through the idle air control (IAC) motor.
- The PCM adjusts ignition timing by turning the ground path to the coil on and off.
- The PCM operates the A/C compressor clutch through the clutch relay. This happens if A/C has been selected by the vehicle operator and requested by the A/C thermostat.

ACCELERATION MODE

This is an Open Loop mode. The PCM recognizes an abrupt increase in throttle position or MAP pressure as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased throttle opening.

DECELERATION MODE

When the engine is at operating temperature, this is an Open Loop mode. During hard deceleration, the PCM receives the following inputs.

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Vehicle speed sensor

If the vehicle is under hard deceleration with the proper rpm and closed throttle conditions, the PCM will ignore the oxygen sensor input signal. The PCM will enter a fuel cut-off strategy in which it will not supply a ground to the injectors. If a hard deceleration does not exist, the PCM will determine the proper injector pulse width and continue injection.

Based on the above inputs, the PCM will adjust engine idle speed through the idle air control (IAC) motor.

The PCM adjusts ignition timing by turning the ground path to the coil on and off.

WIDE OPEN THROTTLE MODE

This is an Open Loop mode. During wide open throttle operation, the PCM receives the following inputs.

- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal

During wide open throttle conditions, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off. The PCM ignores the oxygen sensor input signal and provides a predetermined amount of additional fuel. This is done by adjusting injector pulse width.
- The PCM adjusts ignition timing by turning the ground path to the coil on and off.

IGNITION SWITCH OFF MODE

When ignition switch is turned to OFF position, the PCM stops operating the injectors, ignition coil, ASD relay and fuel pump relay.

5 VOLT SUPPLIES

Two different Powertrain Control Module (PCM) five volt supply circuits are used; primary and secondary.

IGNITION CIRCUIT SENSE

This circuit ties the ignition switch to the Powertrain Control Module (PCM). Battery voltage is supplied to the PCM through the ignition switch when the ignition is in the Run or Start position. This is referred to as the "ignition sense" circuit and is used to "wake up" the PCM.

POWER GROUNDS

The Powertrain Control Module (PCM) has 2 main grounds. Both of these grounds are referred to as power grounds. All of the high-current, noisy, electrical devices are connected to these grounds as well as all of the sensor returns. The sensor return comes into the sensor return circuit, passes through noise suppression, and is then connected to the power ground.

The power ground is used to control ground circuits for the following PCM loads:

- Generator field winding
- Fuel injectors
- Ignition coil(s)
- Certain relays/solenoids
- Certain sensors

SENSOR RETURN

The Sensor Return circuits are internal to the Powertrain Control Module (PCM).

Sensor Return provides a low-noise ground reference for all engine control system sensors. Refer to Power Grounds for more information.

SIGNAL GROUND

Signal ground provides a low noise ground to the data link connector.

OPERATION

POWERTRAIN CONTROL MODULE (PCM)

The PCM is a pre-programmed, microprocessor digital computer. It regulates ignition timing, air-fuel ratio, emission control devices, charging system, certain transmission features, speed control, air conditioning compressor clutch engagement and idle speed. The PCM can adapt its programming to meet changing operating conditions.

The PCM receives input signals from various switches and sensors. Based on these inputs, the PCM regulates various engine and vehicle operations through different system components. These components are referred to as Powertrain Control Module (PCM) Outputs. The sensors and switches that provide inputs to the PCM are considered Powertrain Control Module (PCM) Inputs.

The PCM adjusts ignition timing based upon inputs it receives from sensors that react to: engine rpm, manifold absolute pressure, engine coolant temperature, throttle position, transmission gear selection (automatic transmission), vehicle speed and the brake switch.

The PCM adjusts idle speed based on inputs it receives from sensors that react to: throttle position, vehicle speed, transmission gear selection, engine coolant temperature and from inputs it receives from the air conditioning clutch switch and brake switch.

Based on inputs that it receives, the PCM adjusts ignition coil dwell. The PCM also adjusts the generator charge rate through control of the generator field and provides speed control operation.

NOTE: PCM Inputs:

- Accelerator pedal position sensor (if equipped)
- A/C request (if equipped with factory A/C)
- A/C select (if equipped with factory A/C)
- Auto shutdown (ASD) sense
- Battery temperature
- Battery voltage
- Brake switch
- CAN bus (+) circuits
- CAN bus (-) circuits
- Camshaft position sensor signal
- Clutch Interlock Switch (if equipped)
- Crankshaft position sensor
- Data link connection for diagnostic scan tool
- EGR position sensor (if equipped)
- Engine coolant temperature sensor
- Fuel level
- Generator (battery voltage) output
- Ignition circuit sense (ignition switch in on/off/crank/run position)
- Intake manifold air temperature sensor
- Knock sensor(s) (if equipped)
- Leak detection pump (switch) sense (if equipped)
- Manifold absolute pressure (MAP) sensor
- Oil pressure sensor
- Output shaft speed sensor
- Overdrive/override switch
- Oxygen sensors
- Park/neutral switch (auto. trans. only)
- Power ground
- Power steering pressure switch (if equipped)
- Sensor return
- Signal ground

- Speed control multiplexed single wire input
- Throttle position sensor
- Transmission governor pressure sensor
- Transmission output speed sensor
- Transmission temperature sensor
- Vehicle speed inputs from ABS or RWAL system

NOTE: PCM Outputs:

- A/C clutch relay
- Auto shutdown (ASD) relay
- CAN bus (+/-) circuits for: speedometer, voltmeter, fuel gauge, oil pressure gauge/lamp, engine temp. gauge and speed control warn. lamp
- Data link connection for diagnostic scan tool
- Double start override (if equipped)
- EGR valve control solenoid (if equipped)
- Electronic throttle control
- EVAP canister purge solenoid
- Five volt sensor supply (primary)
- Five volt sensor supply (secondary)
- Fuel injectors
- Fuel pump relay
- Generator field driver (-)
- Generator field driver (+)
- Generator lamp (if equipped)
- Idle air control (IAC) motor
- Ignition coil(s)
- CAN bus circuits
- Leak detection pump (if equipped)
- Malfunction indicator lamp (Check engine lamp). Driven through CAN bus circuits.
- Overdrive indicator lamp (if equipped)
- Radiator cooling fan (if equipped)
- Speed control vacuum solenoid
- Speed control vent solenoid
- Starter relay
- Tachometer (if equipped). Driven through CAN bus circuits.
- Transmission convertor clutch circuit
- Transmission 3-4 shift solenoid
- Transmission relay
- Transmission temperature lamp (if equipped)
- Transmission variable force solenoid

5 VOLT SUPPLIES

Primary 5-volt supply:

- supplies the required 5 volt power source to the Crankshaft Position (CKP) sensor.
- supplies the required 5 volt power source to the Camshaft Position (CMP) sensor.
- supplies a reference voltage for the Manifold Absolute Pressure (MAP) sensor.
- supplies a reference voltage for the Throttle Position Sensor (TPS) sensor.

Secondary 5-volt supply:

- supplies the required 5 volt power source to the oil pressure sensor.
- supplies the required 5 volt power source for the Vehicle Speed Sensor (VSS) (if equipped).

- supplies the 5 volt power source to the transmission pressure sensor (if equipped with an RE automatic transmission).

IGNITION CIRCUIT SENSE

The ignition circuit sense input tells the PCM the ignition switch has energized the ignition circuit.

Battery voltage is also supplied to the PCM through the ignition switch when the ignition is in the RUN or START position. This is referred to as the "ignition sense" circuit and is used to "wake up" the PCM. Voltage on the ignition input can be as low as 6 volts and the PCM will still function. Voltage is supplied to this circuit to power the PCM's 8-volt regulator and to allow the PCM to perform fuel, ignition and emissions control functions.

REMOVAL

CAUTION: Certain ABS systems rely on having the Powertrain Control Module (PCM) broadcast the Vehicle Identification Number (VIN) over the bus network. To prevent problems of DTCs and other items related to the VIN broadcast, it is recommended that you disconnect the ABS CAB (controller) temporarily when replacing the PCM. Once the PCM is replaced, write the VIN to the PCM using a diagnostic scan tool. This is done from the engine main menu. Arrow over to the second page to "1. Miscellaneous". Select "Check VIN" from the choices. Make sure it has the correct VIN entered before continuing. When the VIN is complete, turn off the ignition key and reconnect the ABS module connector. This will prevent the setting of DTCs and other items associated with the lack of a VIN detected when you turn the key ON after replacing the PCM.

CAUTION: Use a diagnostic scan tool to reprogram the new PCM with the vehicles original identification number (VIN) and the vehicles original mileage. If this step is not done, a Diagnostic Trouble Code (DTC) may be set.

The PCM (1) is attached to the right-front inner fender located in the engine compartment.

To avoid possible voltage spike damage to the PCM, ignition key must be off, and negative battery cable must be disconnected before unplugging PCM connectors.

1. Disconnect and isolate negative battery cable.

- Carefully unplug the 38-way connectors (2) from PCM.

- A locating pin (5) is used in place of one of the PCM mounting bolts. Pry clip (4) from pin (5).
- Remove two PCM mounting bolts (2), and remove PCM from vehicle.
- Position ground strap (3) to the side.

INSTALLATION

CAUTION: Certain ABS systems rely on having the Powertrain Control Module (PCM) broadcast the Vehicle Identification Number (VIN) over the bus network. To prevent problems of DTCs and other items related to the VIN broadcast, it is recommended that you disconnect the ABS CAB (controller) temporarily when replacing the PCM. Once the PCM is replaced, write the VIN to the PCM using a diagnostic scan tool. This is done from the engine main menu. Arrow over to the second page to "1. Miscellaneous". Select "Check VIN" from the choices. Make sure it has the correct VIN entered before continuing. When the VIN is complete, turn off the ignition key and reconnect the ABS module connector. This will prevent the setting of DTCs and other items associated with the lack of a VIN detected when you turn the key ON after replacing the PCM.

CAUTION: Use a diagnostic scan tool to reprogram the new PCM with the vehicles original identification number (VIN) and the vehicles original mileage. If this step is not done, a Diagnostic Trouble Code (DTC) may be set.

1. Install clip (4) to pin (5).
2. Position PCM (1) to body and install two bolts (2). Be sure to position ground strap (3) before installing bolt.
3. Tighten two bolts (2) to 3–5 N·m (30–40 in. lbs.).

4. Check pin connectors in PCM. Also check the 38-way connectors (2) for corrosion or damage. Repair as necessary.
5. Carefully plug the 38-way connectors (2) into PCM (1).

6. Connect negative battery cable.
7. **Use a diagnostic scan tool to reprogram new PCM with vehicles original Identification Number (VIN) and original vehicle mileage. If this step is not done, a Diagnostic Trouble Code (DTC) may be set.**

MODULE-MEMORY SEAT

DESCRIPTION

The Memory Seat Module (MSM) is located underneath the driver seat, towards the front and on the outboard side. It is used in conjunction with the other modules in the memory system to recall the driver seat to one of two preset seat positions (horizontal, vertical, and recliner). The switch for the memory seat programming and selection mounts on the driver door trim panel. The memory system is able to store and recall all driver side power seat positions, outside mirror positions and power adjustable pedal position. The system can be set for two different drivers. On vehicles with a factory installed radio connected to the Controller Area Network (CAN) data bus network, the memory system is also able to store and recall up to twelve radio station presets (six AM and six FM), also for two drivers. The memory system will also store and recall the last station listened to for each driver, even if it is not one of the twelve preset stations.

The memory system will automatically recall all of these settings when a button of the memory switch is depressed, or when the doors are unlocked using the Remote Keyless Entry (RKE) transmitter (if the “RKE Linked to Memory” feature is enabled). If the vehicle has more than two drivers the RKE transmitter recall of memory features can be disabled. This is a customer programmable feature of the Electronic Vehicle Information Center (EVIC).

OPERATION

The Memory Seat Module (MSM) receives battery current through a 25 amp circuit breaker in the Power Distribution Center (PDC) so that the memory system remains operational, regardless of the ignition switch position. When the driver memory switch button is pushed, a resistance signal is sent to the MSM via the Controller Area Network (CAN) bus circuit. The MSM is responsible for the 12v battery feed and ground path to the power seat adjuster motor and other memory system components.

The MSM receives memory set/position switch input through the CAN bus circuit. The MSM also receives hard wired input from the hall effect sensors, mounted on each of the driver power seat adjuster motors and the driver side view mirror motor. The programmed software in the module allows it to know where the seat and adjustable pedals are located in its designed travel by a pulse count generated from the hall effect sensors. This way, when the memory switch is depressed the module will power these components until the correct preset location is achieved. The module will prevent the seat memory recall function from being initiated, if the transmission gear selector lever is not in the Park position, or if the vehicle is moving. These inputs are monitored over the Controller Area Network (CAN) bus circuit by the MSM.

A memory setting is saved by pressing the “set” button, then pressing either the memory “1” or “2” button within 5 seconds of pressing the “set” button.

A memory setting is recalled by pressing either the memory “1” or “2” button, or by pressing the unlock button on a “linked” Remote Keyless Entry (RKE) transmitter.

For driver safety, memorized settings can not be recalled if the transmission is in a position other than Park or the seat belt is latched.

The MSM performs the following functions:

- Positions the driver power seat (vertical, horizontal, and recliner positions).

- Positions the power adjustable pedals.
- Sends the memory save or recall (#1 or #2) command over the CAN data bus circuit to the other memory system components, radio station pre-sets and power mirror positions.
- Provides for “linking” the key FOBs to memory.
- Provides for the easy entry/exit feature.

When a memory button is pressed (#1 or #2) on the memory switch, the Driver Door Module (DDM) sends a recall message to the MSM. The MSM will then position the memory system components to the preprogrammed location/setting. When the Remote Keyless Entry (RKE) Transmitter button is pressed, depending on which transmitter (#1 or #2), the SKREEM (RKE Receiver) sends the recall request and FOB number (#1 or #2) data message. This RKE transmitter function depends on if the MSM is programmed to trigger the recall (linked FOBs).

A key FOB is “linked” to a memory setting by pressing the “set” button and then pressing either the memory “1” or “2” button within 5 seconds of pressing the set button, then by pressing the “lock” button on the selected key FOB.

The memory system “Easy Entry and /Exit” feature provides the driver with more room to enter or exit the vehicle. When the seat is in a memorized position, it will move rearward 55 millimeters or to the end of its travel, whichever occurs first, when the key is removed from the ignition switch lock cylinder. This is a customer programmable feature of the overhead console. The seat will return to the memory position when the driver turns the vehicle’s ignition switch out of the LOCK position.

The memory system “learns” the seat and adjustable pedal motor maximum end positions when the motor reaches the limit of travel in any direction and stalls. Subsequently, movement will stop just short of that position to avoid extra stress on the motors and mechanisms. If the system learned a maximum position as a result of an obstruction, as for instance if a large object was placed on the floor behind the seat, the system can relearn the “true” maximum position through manually operating the power seat after the obstruction is removed.

NOTE: It is normal for the power accessories contained in the memory system to stop at the maximum “learned” position and then continue to the “true” maximum position when the control switch is released and then applied in the same direction a second time.

Certain functions and features of the memory system rely upon resources shared with other electronic modules in the vehicle over the Controller Area Network (CAN) bus. The CAN bus allows the sharing of sensor information. This helps to reduce wire harness complexity, internal controller hardware, and component sensor current loads. At the same time, this system provides increased reliability, enhanced diagnostics, and allows the addition of many new feature capabilities. For diagnosis of these electronic modules or of the CAN bus, the use of a scan tool and the proper diagnostic information are needed.

DIAGNOSIS AND TESTING

MEMORY SEAT MODULE

In order to obtain conclusive testing of the memory system, the Controller Area Network (CAN) data bus, and all of the electronic modules that provide inputs to, or receive outputs from the memory system components must be checked. **Any diagnosis of the memory system/module should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the memory/heated seat option utilize a low voltage cut-off feature. This feature turns off the 12v power to the power seat system anytime vehicle voltage is below 11.7v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the power seat system is attempted, the battery should be fully-charged.

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the driver seat cushion/cover (2) (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - REMOVAL).
3. Pivot the module upward and disconnect the electrical connectors (1).
4. Unsnap the memory seat module (4) from the side brackets.
5. Pull the module rearward to remove it from the front of the seat frame (3).

INSTALLATION

CAUTION: The Memory Seat Module (MSM) mounting tabs can be damaged during module installation. Use care to properly align tabs to prevent binding that could result in tab breakage.

1. Place the module (4) into position making sure the mounting tabs are properly aligned with the front bracket.
2. Push down on the rear of the module (4) snapping the retaining clips into place in the side brackets.
3. Connect the MSM rear harness connectors (1).
4. Connect the MSM front harness connectors.
5. Install the driver seat cushion/cover (2) (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - INSTALLATION).
6. Connect the battery negative cable.
7. Verify system and vehicle operation.

MODULE-TRANSMISSION CONTROL

DESCRIPTION

3.7L VEHICLES

The transmission control module (TCM) (1) is mounted to the dash panel (2), under the dash panel silencer pad, just to the right of the steering column.

The electronic control system consists of various components providing inputs to the TCM. The TCM monitors transmission sensors, shifter assembly, and bus messages to determine transmission shift strategy. After shift strategies are determined, the TCM controls the actuation of transmission solenoids, which controls the routing of hydraulic fluid within the transmission, by moving a sequence of four valves to make a shift occur.

The system performs its functions based on continuous real-time sensor feedback information. In addition the TCM receives information from the rest of the vehicle over the CAN C bus. The CAN C bus is a high-speed communication bus that allows real time control capability between various controllers. Most messages are sent every 20 milliseconds. This means critical information can be shared between the transmission, engine, and ABS controllers. The CAN C bus is a two wire bus with a CAN C Bus (+) circuit and a CAN C Bus (-) circuit. These circuits are twisted pairs in the harness to reduce the potential of radio and noise interference.

The transmission control system automatically adapts to changes in engine performance, vehicle speed, and transmission temperature variations to provide consistent shift quality. The control system ensures that clutch operation during up-shifting and downshifting is more responsive without increased harshness. The TCM activates the solenoid valves and moves valves in the valve body to achieve the necessary gear changes. The required pressure level is calculated from the load condition, engine speed. Vehicle speed (from ABS module) and transmission oil temperature, matched to the torque to be transmitted. Power for the transmission system is supplied through the shifter mechanism (no transmission control relay).

4.7L/5.7L VEHICLES

The Transmission Control Module (TCM) is a sub-module within the Powertrain Control Module (PCM) (1). The PCM is located on the right inner fender.

OPERATION

3.7L VEHICLES

The transmission control module (TCM) determines the current operating conditions of the vehicle and controls the shifting process for shift comfort and driving situations. It receives this operating data from sensors and broadcast messages from other modules.

The TCM uses inputs from several sensors that are directly hardwired to the controller and it uses several indirect inputs that are used to control shifts. This information is used to actuate the proper solenoids in the valve body to achieve the desired gear.

The shift lever sensor assembly (SLSA) has sensors that are monitored by the TCM to calculate shift lever position. The reverse light switch, an integral part of the SLSA, controls the reverse light relay control circuit. The Brake/Transmission Shift Interlock (BTSI) solenoid and the park lockout solenoid (also part of the SLSA) are controlled by the TCM.

The ECM and ABS broadcast messages over the controller area network (CAN C) bus for use by the TCM. The TCM uses this information, with other inputs, to determine the transmission operating conditions.

The TCM:

- determines the momentary operating conditions of the vehicle.
- controls all shift processes.
- considers shift comfort and the driving situation.

The TCM controls the solenoid valves for modulating shift pressures and gear changes. Relative to the torque being transmitted, the required pressures are calculated from load conditions, engine rpm, vehicle speed, and ATF temperature.

The following functions are contained in the TCM:

- Shift Program
- Downshift Safety
- Torque Converter Lock-Up Clutch.
- Adaptation.

This transmission does not have a TCM relay. Power is supplied to the SLSA and the TCM directly from the ignition.

The TCM continuously checks for electrical problems, mechanical problems, and some hydraulic problems. When a problem is sensed, the TCM stores a diagnostic trouble code (DTC). Some of these codes cause the transmission to go into "Limp-In" or "default" mode. Some DTCs cause permanent Limp-In and others cause temporary Limp-In. The W5J400 defaults in the current gear position if a DTC is detected, then after a key cycle the transmission will go into Limp-in, which is mechanical 2nd gear. Some DTCs may allow the transmission to resume normal operation (recover) if the detected problem goes away. A permanent Limp-In DTC will recover when the key is cycled, but if the same DTC is detected for three key cycles the system will not recover and the DTC must be cleared from the TCM with the DRBIII® scan tool.

TCM SIGNALS

The TCM registers one part of the input signals by direct inputs, the other part by CAN C bus. In addition to the direct control of the actuators, the TCM sends various output signals by CAN C bus to other control modules.

Selector Lever Position

A series of 12 Hall-effect switches in the SLSA inform the TCM of the position of the selector lever.

The TCM monitors the SLSA for all shift lever positions through five position circuits. The SLSA provides a low-current 12-volt signal to the TCM. The TCM compares the on/off signals to programmed combinations to determine the exact position of the shift lever.

ATF Temperature Sensor

The ATF temperature sensor is a positive temperature co-efficient (PTC) thermistor. It measures the temperature of the transmission fluid and is a direct input signal for the TCM. The temperature of the ATF has an influence on the shifttime and resulting shift quality. As the temperature rises, resistance rises, and therefore, the probing voltage is decreasing. Because of its registration, the shifting process can be optimized in all temperature ranges.

The ATF temperature sensor is wired in series with the park/neutral contact. The temperature signal is transmitted to the TCM only when the reed contact of the park/neutral contact is closed because the TCM only reads ATF temperature while in any forward gear, or REVERSE. When the transmission is in PARK or NEUTRAL, the TCM will substitute the engine temperature for the ATF temperature.

Starter Interlock

The TCM monitors a contact switch wired in series with the transmission temperature sensor to determine PARK and NEUTRAL positions. The contact switch is open in PARK and NEUTRAL. The TCM senses transmission temperature as high (switch supply voltage), confirming switch status as open. The TCM then broadcasts a message over CAN bus to confirm switch status. The PCM receives this information and allows operation of the starter circuit.

N2 and N3 Speed Sensors

The N2 and N3 Input Speed Sensors are two Hall-effect speed sensors that are mounted internally in the transmission and are used by the TCM to calculate the transmission's input speed. Since the input speed cannot be measured directly, two of the drive elements are measured. Two input speed sensors were required because both drive elements are not active in all gears.

CAN C Bus Indirect Input Signals

A 2.5-volt bias (operating voltage) is present on the CAN C bus any time the ignition switch is in the RUN position. Both the TCM and the ABS apply this bias. On this vehicle, the CAN C bus is used for module data exchange only. The indirect inputs used on the W5J400 electronic control system are:

- Wheel Speed Sensors.
- Transfer Case Switch Status.
- Brake Switch.
- Engine RPM.
- Engine Temperature.
- Cruise Control Status.
- Gear Limit Request.
- Throttle Position - 0% at idle, 100% at WOT. If open, TCM assumes idle (0% throttle opening).
- Odometer Mileage

- Maximum Effective Torque.
- Engine in Limp-In Mode/Mileage Where DTC Was Set.

SHIFT SCHEDULES

The basic shift schedule includes up and downshifts for all five gears. The TCM adapts the shift program according to driving style, accelerator pedal position and deviation of vehicle speed. Influencing factors are:

- Road Conditions.
- Incline, Decline and Altitude.
- Trailer Operation, Loading.
- Engine Coolant Temperature.
- Cruise Control Operation.
- Sporty Driving Style.
- Low and High ATF Temperature.

Upshift To:	1-2	2-3	3-4	4-5
Activated By Solenoid:	1-2/4-5	2-3	3-4	1-2/4-5
Shift Point (at 35.2% of throttle)	17.8 km/h (11.6 mph)	32.1 km/h (19.95 mph)	67.5 km/h (41.94 mph)	73.8 km/h (45.86 mph)

Downshift From:	5-4	4-3	3-2	2-1
Activated By Solenoid:	1-2/4-5	3-4	2-3	1-2/4-5
Shift Point	55.7 km/h (34.61 mph)	40.5 km/h (25.17 mph)	24.4 km/h (15.16 mph)	15.1 km/h (9.38 mph)

DOWNSHIFT SAFETY

Selector lever downshifts are not performed if inadmissible high engine rpm is sensed.

ADAPTATION

To equalize tolerances and wear, an automatic adaptation takes place for:

- Shift Time.
- Clutch Filling Time.
- Clutch Filling Pressure.
- Torque Converter Lock-Up Control.

Adaptation data may be stored permanently and to some extent, can be diagnosed.

Driving Style Adaptation

The shift point is modified in steps based on the information from the inputs. The control module looks at inputs such as:

- vehicle acceleration and deceleration (calculated by the TCM).
- rate of change as well as the position of the throttle pedal (fuel injection information from the ECM).
- lateral acceleration (calculated by the TCM).
- gear change frequency (how often the shift occurs).

Based on how aggressive the driver is, the TCM moves up the shift so that the present gear is held a little longer before the next upshift. If the driving style is still aggressive, the shift point is modified up to ten steps. If the driving returns to normal, then the shift point modification also returns to the base position.

This adaptation has no memory. The adaptation to driving style is nothing more than a shift point modification meant to assist an aggressive driver. The shift points are adjusted for the moment and return to base position as soon as the inputs are controlled in a more rational manner.

Shift Time Adaptation (Shift Overlap Adaptation, Working Pressure)

Shift time adaptation is the ability of the TCM to electronically alter the time it takes to go from one gear to another. Shift time is defined as the time it takes to disengage one shift member while another is being applied. Shift time adaptation is divided into four categories:

1. Accelerating upshift, which is an upshift under a load. For shift time adaptation for the 1-2 upshift to take place, the transmission must shift from 1st to 2nd in six different engine load ranges vs. transmission output speed ranges.
2. Decelerating upshift, which is an upshift under no load. This shift is a rolling upshift and is accomplished by letting the vehicle roll into the next gear.
3. Accelerating downshift, which is a downshift under load. This shift can be initiated by the throttle, with or without kickdown. The shift selector can also be used.
4. Decelerating downshift, which is accomplished by coasting down. As the speed of the vehicle decreases, the transmission downshifts.

Fill Pressure Adaptation (Apply Pressure Adaptation, Modulating Pressure)

Fill pressure adaptation is the ability of the TCM to modify the pressure used to engage a shift member. The value of this pressure determines how firm the shift will be.

- If too much pressure is used, the shift will be hard.
- If too little pressure is used, the transmission may slip.

The pressure adjustment is needed to compensate for the tolerances of the shift pressure solenoid valve. The amount the solenoid valve opens as well as how quickly the valve can move, has an effect on the pressure. The return spring for the shift member provides a resistance that must be overcome by the pressure in order for shift member to apply. These return springs have slightly different values. This also affects the application pressure and is compensated for by fill pressure adaptation.

Fill Time Adaptation (Engagement Time Adaptation)

Fill time is the time it takes to fill the piston cavity and take up any clearances for a friction element (clutch or brake). Fill time adaptation is the ability of the TCM to modify the time it takes to fill the shift member by applying a preload pressure.

CONTROLLER MODES OF OPERATION

Permanent Limp-In Mode

When the TCM determines there is a non-recoverable condition present that does not allow proper transmission operation, it places the transmission in permanent Limp-In Mode. When the condition occurs the TCM turns off all solenoids as well as the solenoid supply output circuit. If this occurs while the vehicle is moving, the transmission remains in the current gear position until the ignition is turned off or the shifter is placed in the "P" position. When the shifter has been placed in "P," the transmission only allows 2nd gear operation. If this occurs while the vehicle is not moving, the transmission only allows operation in 2nd gear.

Temporary Limp-In Mode

This mode is the same as the permanent Limp-In Mode except if the condition is no longer present, the system resumes normal operation.

Under Voltage Limp-In Mode

When the TCM detects that system voltage has dropped below 8.5 volts, it disables voltage-dependant diagnostics and places the transmission in the temporary Limp-In Mode. When the TCM senses that the voltage has risen above 9.0 volts, normal transmission operation is resumed.

Hardware Error Mode

When the TCM detects a major internal error, the transmission is placed in the permanent Limp-In Mode and ceases all communication over the CAN bus. When the TCM has entered this mode normal transmission operation does not resume until all DTCs are cleared from the TCM.

Loss of Drive

If the TCM detects a situation that has resulted or may result in a catastrophic engine or transmission problem, the transmission is placed in the neutral position. Improper Ratio, Input Sensor Overspeed or Engine Overspeed DTCs cause the loss of drive.

Controlled Limp-in Mode

When a failure does not require the TCM to shut down the solenoid supply, but the failure is severe enough that the TCM places the transmission into a predefined gear, there are several shift performance concerns. For instance, if the transmission is slipping, the controller tries to place the transmission into 3rd gear and maintain 3rd gear for all forward drive conditions.

4.7L/5.7L VEHICLES

The Transmission Control Module (TCM) controls all electronic operations of the transmission. The TCM receives information regarding vehicle operation from both direct and indirect inputs, and selects the operational mode of the transmission. Direct inputs are hardwired to, and used specifically by the TCM. Indirect inputs originate from other components/modules, and are shared with the TCM via the vehicle communication bus.

Some examples of **direct inputs** to the TCM are:

- Battery (B+) voltage
- Ignition "ON" voltage
- Transmission Control Relay (Switched B+)
- Throttle Position Sensor
- Crankshaft Position Sensor
- Transmission Range Sensor
- Pressure Switches
- Transmission Temperature Sensor
- Input Shaft Speed Sensor
- Output Shaft Speed Sensor
- Line Pressure Sensor

Some examples of **indirect inputs** to the TCM are:

- Engine/Body Identification
- Manifold Pressure
- Target Idle
- Torque Reduction Confirmation
- Engine Coolant Temperature
- Ambient/Battery Temperature
- Scan Tool Communication

Based on the information received from these various inputs, the TCM determines the appropriate shift schedule and shift points, depending on the present operating conditions and driver demand. This is possible through the control of various direct and indirect outputs.

Some examples of TCM **direct outputs** are:

- Transmission Control Relay
- Solenoids
- Torque Reduction Request

Some examples of TCM **indirect outputs** are:

- Transmission Temperature (to PCM)
- PRNDL Position (to BCM)

In addition to monitoring inputs and controlling outputs, the TCM has other important responsibilities and functions:

- Storing and maintaining Clutch Volume Indexes (CVI)
- Storing and selecting appropriate Shift Schedules
- System self-diagnostics
- Diagnostic capabilities (with scan tool)

NOTE: If the TCM has been replaced, the “Quick Learn Procedure” must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

BATTERY FEED

A fused, direct battery feed to the TCM is used for continuous power. This battery voltage is necessary to retain adaptive learn values in the TCM’s RAM (Random Access Memory). When the battery (B+) is disconnected, this memory is lost. When the battery (B+) is restored, this memory loss is detected by the TCM and a Diagnostic Trouble Code (DTC) is set.

CLUTCH VOLUME INDEXES (CVI)

An important function of the TCM is to monitor Clutch Volume Indexes (CVI). CVIs represent the volume of fluid needed to compress a clutch pack.

The TCM monitors gear ratio changes by monitoring the Input and Output Speed Sensors. The Input, or Turbine Speed Sensor sends an electrical signal to the TCM that represents input shaft rpm. The Output Speed Sensor provides the TCM with output shaft speed information.

By comparing the two inputs, the TCM can determine transmission gear position. This is important to the CVI calculation because the TCM determines CVIs by monitoring how long it takes for a gear change to occur.

Gear ratios can be determined by using the DRBIII® Scan Tool and reading the Input/Output Speed Sensor values in the “Monitors” display. Gear ratio can be obtained by dividing the Input Speed Sensor value by the Output Speed Sensor value.

The gear ratio changes as clutches are applied and released. By monitoring the length of time it takes for the gear ratio to change following a shift request, the TCM can determine the volume of fluid used to apply or release a friction element.

The volume of transmission fluid needed to apply the friction elements are continuously updated for adaptive controls. As friction material wears, the volume of fluid need to apply the element increases.

Certain mechanical failures within the input clutch assembly can cause inadequate or out-of-range element volumes. Also, defective Input/Output Speed Sensors and wiring can cause these conditions. The following chart identifies the appropriate clutch volumes and when they are monitored/updated:

CLUTCH VOLUMES		
Clutch	When Updated	Proper Clutch Volume
L/R	2-1 or 3-1 downshift	45 to 134
2C	3-2 kickdown shift	25 to 85
OD	2-3 upshift	30 to 100
4C	3-4 upshift	30 to 85
UD	4-3 kickdown shift	25 to 100

SHIFT SCHEDULES

As mentioned earlier, the TCM has programming that allows it to select a variety of shift schedules. Shift schedule selection is dependent on the following:

- Shift lever position
- Throttle position

- Engine load
- Fluid temperature
- Software level

As driving conditions change, the TCM appropriately adjusts the shift schedule. Refer to the following chart to determine the appropriate operation expected, depending on driving conditions.

Schedule	Condition	Expected Operation
Extreme Cold	Oil temperature below -16° F	-Park, Reverse, Neutral and 1st and 3rd gear only in D position, 2nd gear only in Manual 2 or L -No EMCC
Super Cold	Oil temperature between -12° F and 10° F	- Delayed 2-3 upshift - Delayed 3-4 upshift - Early 4-3 coastdown shift - High speed 4-2, 3-2, 2-1 kickdown shifts are prevented -Shifts at high throttle openings will be early. - No EMCC
Cold	Oil temperature between 10° F and 36° F	-Shift schedule is the same as Super Cold except that the 2-3 upshifts are not delayed.
Warm	Oil temperature between 40° F and 80° F	- Normal operation (upshift, kickdowns, and coastdowns) - No EMCC
	Oil temperature between 80° F and 240° F	- Normal operation (upshift, kickdowns, and coastdowns)
Hot		- Normal EMCC operation
Overheat	Oil temperature above 240° F or engine coolant temperature above 244° F	- Delayed 2-3 upshift - Delayed 3-4 upshift - 3rd gear FEMCC from 30-48 mph - 3rd gear PEMCC above 35 mph - Above 25 mph the torque converter will not unlock unless the throttle is closed or if a wide open throttle 2nd PEMCC to 1 kickdown is made

STANDARD PROCEDURE

ADAPTATION - 3.7L VEHICLES

The adaptation procedure requires the use of the appropriate scan tool. This program allows the electronic transmission system to re-calibrate itself. This will provide the proper baseline transmission operation. The adaptation procedure should be performed if any of the following procedures are performed:

- Transmission Assembly Replacement
- Transmission Control Module Replacement
- Clutch Plate and/or Seal Replacement
- Electrohydraulic Unit Replacement or Recondition

1. With the scan tool, reset the Transmission adaptives. Resetting the adaptives will set the adaptives to factory settings.

NOTE: Perform the Coast Down Adaptations first. The Transmission Temperature must be greater than 60°C (140°F) and less than 70°C (158°F). Failure to stay within these temperature ranges will void the procedure.

2. Drive the vehicle until the transmission temperature is in the specified range.
3. Perform 4 to 5 coast downs from 5th to 4th gear and then 4th to 3rd gear.

NOTE: For Upshift adaptation, the Transmission temperature must be greater than 60°C (140°F) and less than 100°C (212°F). Failure to stay within these temperature ranges will void this procedure.

4. From a stop, moderately accelerate the vehicle and obtain all forward gear ranges while keeping the Engine RPM below 1800 RPM. Repeat this procedure 4 to 5 times.
5. Obtaining 5th gear may be difficult at 1800 RPM. Allow the transmission to shift into 5th gear at a higher RPM then lower the RPM to 1800 and perform manual shifts between 4th and 5th gears using the shift lever.
6. The TCM will store the adaptives every 10 minutes. After completion of the adaptation procedure make sure the vehicle stays running for at least 10 minutes.
7. It is possible to manually store the adaptives under the 10 minute time frame using the scan tool Store Adaptives procedure.

QUICK LEARN - 4.7L/5.7L VEHICLES

The quick learn procedure requires the use of the scan tool.

This program allows the electronic transmission system to recalibrate itself. This will provide the proper transmission operation. The quick learn procedure should be performed if any of the following procedures are performed:

- Transmission Assembly Replacement
- Transmission Control Module Replacement
- Solenoid Pack Replacement
- Clutch Plate and/or Seal Replacement
- Valve Body Replacement or Recondition

To perform the Quick Learn Procedure, the following conditions must be met:

- The brakes must be applied
- The engine speed must be above 500 rpm
- The throttle angle (TPS) must be less than 3 degrees
- The shift lever position must stay in PARK until prompted to shift to overdrive
- The shift lever position must stay in overdrive after the Shift to Overdrive prompt until the scan tool indicates the procedure is complete
- The calculated oil temperature must be above 60° and below 200°

DRIVE LEARN - 4.7L/5.7L VEHICLES

When a transmission is repaired and a Quick Learn procedure has been performed on the Transmission Control Module (TCM), the following Drive Learn procedure can be performed to fine tune any shifts which are particularly objectionable.

NOTE: It is not necessary to perform the complete Drive Learn procedure every time the TCM is Quick Learned. Perform only the portions which target the objectionable shift.

LEARN A SMOOTH 1ST NEUTRAL TO DRIVE SHIFT

Perform this procedure only if the complaint is for a delayed or harsh shift the first time the transmission is put into gear after the vehicle is allowed to set with the engine not running for at least 10 minutes. Use the following steps to have the TCM learn the 1st N-D UD CVI.

NOTE: The transmission oil temperature must be between 80 - 110°F (27 - 43°C).

1. Start the engine only when the engine and ignition have been off for at least ten (10) minutes.

2. With the vehicle at a stop and the service brake applied, record the 1st N-D UD CVI while performing a Neutral to Drive shift. The 1st N-D UD CVI accounts for air entrapment in the UD clutch that may occur after the engine has been off for a period of time.
3. Repeat Step 1 and Step 2 until the recorded 1st N-D UD CVI value stabilizes.

NOTE: It is important that this procedure be performed when the transmission temperature is between 80 - 110°F (27 - 43°C). If this procedure takes too long to complete fully for the allowed transmission oil temperature, the vehicle may be returned to the customer with an explanation that the shift will improve daily during normal vehicle usage. The TCM also learns at higher oil temperatures, but these values (line pressure correction values) are not available for viewing on the scan tool.

LEARN A SMOOTH NEUTRAL TO DRIVE GARAGE SHIFT

Perform this procedure if the complaint is for a delayed or harsh shift when the transmission is put into gear after the vehicle has had its first shift. Use the following steps to have the TCM learn the Norm N-D UD CVI.

NOTE: The transmission oil temperature must be between 80 - 110°F (27 - 43°C) to learn the UD CVI. Additional learning occurs at temperatures as low as 0°F and as high as 200°F. This procedure may be performed at any temperature that experiences poor shift quality. Although the UD CVI may not change, shift quality should improve.

1. Start the vehicle engine and shift to drive.
2. Move the vehicle forward to a speed of at least 16 km/h (10 MPH) and come to a stop. This ensures no air is present in the UD hydraulic circuit.
3. Perform repeated N-D shifts at a stop while pausing in Neutral for at least 2-3 seconds and monitor Norm N-D UD CVI volume until the value stabilizes. The value will change during the N-D shift. This is normal since the UD value is different for the N-D shift then the normal value shown which is used for 4-3 coastdown and kickdowns. Perform repeated shifts in this temperature range until the Norm N-D UD CVI value stabilizes and the N-D shifts become smooth.

LEARN THE 1ST 2-3 SHIFT AFTER A RESTART OR SHIFT TO REVERSE

Use the following steps to have the TCM learn the 1st 2-3 shift OD CVI.

NOTE: The transmission oil temperature must be above 80°F (27°C).

1. With the vehicle engine running, select reverse gear for over 2 seconds.
2. Shift the transmission to Drive and accelerate the vehicle from a stop at a steady 15 degree throttle opening and perform a 2-3 shift while noting the 1st 2-3 OD CVI.
3. Repeat Step 1 and Step 2 until the 1st 2-3 upshift becomes smooth and the 1st 2-3 OD CVI stabilizes.

LEARN A SMOOTH 2-3 AND 3-4 UPSHIFT

NOTE: The transmission oil temperature must be above 110°F (43°C).

Use the following steps to have the TCM learn the OD and 4C CVI's.

1. Accelerate the vehicle from a stop at a steady 15 degree throttle opening and perform multiple 1-2, 2-3, and 3-4 upshifts. The 2nd 2-3 shift following a restart or shift to reverse will be shown during the shift as a value between the 1st 2-3 OD CVI and the normal OD CVI. Updates to the normal OD CVI will occur after the 2nd shift into 3rd gear, following a restart or shift to reverse.
2. Repeat Step 1 until the 2-3 and 3-4 shifts become smooth and the OD and 4C CVI become stable.

LEARN A SMOOTH 4-3 COASTDOWN AND PART THROTTLE 4-3 KICKDOWN

NOTE: The transmission oil temperature must be above 110°F (43°C).

Use the following steps to have the TCM learn the UD shift volume.

1. At a vehicle speed between 64-97 km/h (40-60 MPH), perform repeated 4-3 kickdown shifts.

2. Repeat Step 1 until the UD volume becomes somewhat stable and the shift becomes smooth.

LEARN A SMOOTH 1-2 UPSHIFT AND 3-2 KICKDOWN

Use the following steps to have the TCM learn the 2C shift volume.

NOTE: The transmission oil temperature must be above 110°F (43°C).

1. With a vehicle speed below 48 km/h (30 MPH) and the transmission in 3rd gear, perform multiple 3-2 kickdowns.
2. Repeat Step 1 until the 3-2 kickdowns become smooth and the 2C CVI becomes stable.

LEARN A SMOOTH MANUAL 2-1 PULLDOWN SHIFT AS WELL AS A NEUTRAL TO REVERSE SHIFT

NOTE: The transmission oil temperature must be above 110°F (43°C).

Use the following steps to have the TCM learn the LR volume.

1. With the vehicle speed around 40-48 km/h (25-30 MPH) in Manual 2nd, perform manual pulldowns to Low or 1st gear at closed throttle.
2. Repeat Step 1 until the LR CVI becomes stable and the manual 2-1 becomes smooth.

LEARN A SMOOTH NEUTRAL TO REVERSE SHIFT

NOTE: The transmission oil temperature must be above 110°F (43°C).

1. With the vehicle at a stop, perform Neutral to Reverse shifts until the shift is smooth. An unlearned Neutral to Reverse shift may be harsh or exhibit a double bump.
2. If any of the shifts are still not smooth after the clutch volume stabilizes, an internal transmission problem may be present.

LEARN A SMOOTH 4-5 UPSHIFT

NOTE: The transmission oil temperature must be above 110°F (43°C).

Use the following steps to have the TCM learn the Alt 2C CVI.

1. Accelerate the vehicle through 88 km/h (55mph) at a steady 10-15 degree throttle opening and perform multiple 4-5 upshifts.
2. Repeat Step 1 until the 4-5 shift become smooth and the Alt 2C CVI become stable. There is a separate 2C volume used and learned for 4-5 shifts, 2CA. It is independent of the 2C CVI learned on 3-2 kickdowns.

REMOVAL

3.7L VEHICLES

1. Locate the transmission control module on the dash panel, under the dash panel silencer pad (2), just to the right of the steering column.
2. Locate the cut lines (1) marked on the silencer pad. Cut the pad along these lines.

3. Remove the transmission control module from the dash panel or bracket.
4. Disconnect the wiring harness connectors (3) from the module.
5. Remove the module from the vehicle.

4.7L/5.7L VEHICLES

The transmission control module is part of the powertrain control module. For the removal procedure, Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - REMOVAL.

INSTALLATION

3.7L VEHICLES

1. Connect the wiring connectors (3) to the transmission control module (1).
2. Install the module to the dash panel (2) or the mounting bracket.
3. Fold the dash panel silencer pad back over the module and retain the pad in place with suitable adhesive tape.

4.7L/5.7L VEHICLES

The transmission control module is part of the powertrain control module. For the installation procedure, Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - INSTALLATION.

BATTERY SYSTEM - SERVICE INFORMATION

DESCRIPTION

This vehicle is equipped with a single 12-volt battery. All of the components of the battery system are located within the engine compartment. The battery system for this vehicle covers the following related components:

- **Battery (5)** - The storage battery provides a reliable means of storing a renewable source of electrical energy within the vehicle.
- **Positive Battery cable (8)** - The positive battery cable connects the battery positive terminal post to the vehicle electrical system, starter and alternator.
- **Negative Battery Cable (4)** - The negative battery cable connects the battery negative terminal post to the vehicle electrical system through body, chassis and engine grounding points.
- **Battery Holddown (6)** - The battery holddown hardware secures the battery in the battery tray in the engine compartment.
- **Battery Tray (7)** - The battery tray provides a secure mounting location in the vehicle for the battery and an anchor point for the battery holddown hardware.

For battery system maintenance schedules (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION). (Refer to LUBRICATION & MAINTENANCE/JUMP STARTING - STANDARD PROCEDURE) for the proper jump starting procedure. The battery must be fully-charged before any battery system diagnosis or testing procedures can be performed.

OPERATION

The battery system is designed to provide a safe, efficient, reliable and mobile means of delivering and storing electrical energy. This electrical energy is required to operate the engine starting system, as well as many of the other vehicle accessory systems for limited durations while the engine and/or the charging system are not operating. The battery system is also designed to provide a reserve of electrical energy to supplement the charging system for short durations while the engine is running and the electrical current demands of the vehicle exceed the output of the charging system. In addition to delivering, and storing electrical energy for the vehicle, the battery system serves as a capacitor and voltage stabilizer for the vehicle electrical system. It absorbs most abnormal or transient voltages caused by the switching of any of the electrical components or circuits in the vehicle.

DIAGNOSIS AND TESTING - BATTERY SYSTEM

The battery, starting, and charging systems in the vehicle operate with one another and must be tested as a complete system. In order for the engine to start and the battery to maintain its charge properly, all of the components that are used in these systems must perform within specifications. It is important that the battery, starting, and charging systems be thoroughly tested and inspected any time a battery needs to be charged or replaced. The cause of abnormal battery discharge, overcharging or early battery failure must be diagnosed and corrected before a battery is replaced and before a vehicle is returned to service. The service information for these systems has been separated within this service manual to make it easier to locate the specific information you are seeking. However, when attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used for the battery, starting, and charging systems include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, a volt/ohmmeter, a battery charger, a carbon pile rheostat (load tester) and a 12-volt test lamp may be required. All OBD-sensed systems are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for

any failure it detects. (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING) for the proper charging system on-board diagnostic test procedures.

MICRO 420 ELECTRICAL SYSTEM TESTER

The Micro 420 automotive battery system tester is designed to help diagnose the cause of a defective battery. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - USING MICRO 420 BATTERY TESTER) for directions on using the Micro 420 battery tester.

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
THE BATTERY SEEMS WEAK OR DEAD WHEN ATTEMPTING TO START THE ENGINE.	<ol style="list-style-type: none"> 1. The electrical system ignition-off draw is excessive. 2. The charging system is inoperative. 3. The battery is discharged. 4. The battery terminal connections are loose or corroded. 5. The battery has an incorrect size or rating for this vehicle. 6. The battery is inoperative. 7. The starting system is inoperative. 8. The battery is physically damaged. 	<ol style="list-style-type: none"> 1. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - IGNITION-OFF DRAW TEST) for the proper test procedures. Repair the excessive ignition-off draw, as required. 2. Determine if the charging system is performing to specifications, (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING). Repair the inoperative charging system, as required. 3. Determine the battery state-of-charge using the Micro 420 battery tester, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - USING MICRO 420 BATTERY TESTER). Charge the battery as required. 4. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - DIAGNOSIS AND TESTING). Clean and tighten the battery terminal connections, as required. 5. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - SPECIFICATIONS) for the proper size and rating. Replace an incorrect battery, as required. 6. Determine the battery cranking capacity using the Micro 420 battery tester, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - USING MICRO 420 BATTERY TESTER). Replace the inoperative battery, as required. 7. Determine if the starting system is performing to specifications, (Refer to 8 - ELECTRICAL/STARTING - DIAGNOSIS AND TESTING). Repair the inoperative starting system, as required. 8. Inspect the battery for loose terminal posts or a cracked and leaking case. Replace the damaged battery, as required.

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
THE BATTERY STATE OF CHARGE CANNOT BE MAINTAINED.	<ol style="list-style-type: none"> 1. The battery has an incorrect size or rating for this vehicle. 2. The battery terminal connections are loose or corroded. 3. The electrical system ignition-off draw is excessive. 4. The battery is inoperative. 5. The starting system is inoperative. 6. The charging system is inoperative. 7. Electrical loads exceed the output of the charging system. 8. Slow driving or prolonged idling with high-amperage draw systems in use. 	<ol style="list-style-type: none"> 1. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - SPECIFICATIONS) for the proper size and rating. Replace an incorrect battery, as required. 2. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - DIAGNOSIS AND TESTING). Clean and tighten the battery terminal connections, as required. 3. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - IGNITION-OFF DRAW TEST) for the proper test procedures. Repair the inoperative electrical system, as required. 4. Test the battery using the Micro 420 battery tester, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - USING MICRO 420 BATTERY TESTER). Replace the inoperative battery, as required. 5. Determine if the starting system is performing to specifications, (Refer to 8 - ELECTRICAL/STARTING - DIAGNOSIS AND TESTING). Repair the inoperative starting system, as required. 6. Determine if the charging system is performing to specifications, (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING). Repair the inoperative charging system, as required. 7. Inspect the vehicle for aftermarket electrical equipment which might cause excessive electrical loads. 8. Advise the vehicle operator, as required.
THE BATTERY WILL NOT ACCEPT A CHARGE.	<ol style="list-style-type: none"> 1. The battery is inoperative. 	<ol style="list-style-type: none"> 1. Test the battery using the Micro 420 battery tester, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - USING MICRO 420 BATTERY TESTER). Replace the inoperative battery, as required.

CLEANING

The following information details the recommended cleaning procedures for the battery and related components. In addition to the maintenance schedules found in this service manual, (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION) it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

1. Clean the battery cable terminal clamps (2) of all corrosion. Remove any corrosion using a wire brush or a post and terminal cleaning tool (1), and a sodium bicarbonate (baking soda) and warm water cleaning solution.

2. Clean the battery tray and battery hold down hardware of all corrosion. Remove any corrosion using a wire brush and a sodium bicarbonate (baking soda) and warm water cleaning solution (2). Paint any exposed bare metal.
3. If the removed battery is to be reinstalled, clean the outside of the battery case (3) and the top cover with a sodium bicarbonate (baking soda) and warm water cleaning solution (2) using a stiff bristle parts cleaning brush (1) to remove any acid film. Rinse the battery with clean water. Ensure that the cleaning solution does not enter the battery cells through the vent holes. If the battery is being replaced, confirm that the replacement battery is the correct size and has the correct ratings for the vehicle.
4. Clean the battery thermal guard with a sodium bicarbonate (baking soda) and warm water cleaning solution (2) using a stiff bristle parts cleaning brush (1) to remove any acid film.

5. Clean any corrosion from the battery terminal posts with a wire brush or a post and terminal cleaner (1) and a sodium bicarbonate (baking soda) and warm water cleaning solution.

INSPECTION

The following information details the recommended inspection procedures for the battery and related components. In addition to the maintenance schedules, (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION), it is recommended that these procedures be performed any time the battery or related components are removed for vehicle service.

1. Inspect the battery cable terminal clamps for damage. Replace any battery cable that has a damaged or deformed terminal clamp.
2. Inspect the battery tray and battery hold down hardware for damage. Replace any damaged parts.
3. Slide the thermal guard off of the battery case, if equipped. Inspect the battery case for cracks or other damage that could result in electrolyte leaks. Also, check the battery terminal posts for looseness. Batteries with damaged cases or loose terminal posts must be replaced.
4. Inspect the battery thermal guard for tears, cracks, deformation or other damage. Replace any battery thermal guard that has been damaged.
5. Inspect the battery built-in test indicator sight glass (if equipped) for an indication of the battery condition. If the battery is discharged, charge as required, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - BATTERY CHARGING).

SPECIFICATIONS

The battery Group Size number, the Cold Cranking Amperage (CCA) rating, and the Reserve Capacity (RC) rating or Ampere-Hours (AH) rating can be found on the original equipment battery label. Be certain that a replacement battery has the correct Group Size number, as well as CCA, and RC or AH ratings that equal or exceed the original equipment specification for the vehicle being serviced. Battery sizes and ratings are discussed in more detail below.

- **Group Size** - The outside dimensions and terminal placement of the battery conform to standards established by the Battery Council International (BCI). Each battery is assigned a BCI Group Size number to help identify a correctly-sized replacement.
- **Cold Cranking Amperage** - The Cold Cranking Amperage (CCA) rating specifies how much current (in amperes) the battery can deliver for thirty seconds at -18°C (0°F). Terminal voltage must not fall below 7.2 volts during or after the thirty second discharge period. The CCA required is generally higher as engine displacement increases, depending also upon the starter current draw requirements.
- **Reserve Capacity** - The Reserve Capacity (RC) rating specifies the time (in minutes) it takes for battery terminal voltage to fall below 10.5 volts, at a discharge rate of 25 amperes. RC is determined with the battery fully-charged at 26.7°C (80°F). This rating estimates how long the battery might last after a charging system failure, under minimum electrical load.

- **Ampere-Hours** - The Ampere-Hours (AH) rating specifies the current (in amperes) that a battery can deliver steadily for twenty hours, with the voltage in the battery not falling below 10.5 volts. This rating is also sometimes identified as the twenty-hour discharge rating.

BATTERY

DESCRIPTION

This vehicle is equipped with a single, 12-volt, maintenance-free battery located in the engine compartment. The battery is comprised of the following components:

- Positive Post (1)
- Vent (2)
- Cell Cap (3)
- Vent (4)
- Cell Cap (5)
- Vent (6)
- Negative Post (7)
- Indicator Eye (8) if equipped
- Electrolyte Level (9)
- Plate Groups (10)
- Maintenance Free Battery assembly (11)

This battery is designed to provide a safe, efficient and reliable means of storing electrical energy in a chemical form. This means of energy storage allows the battery to produce the electrical energy required to operate the engine starting system, as well as to operate many of the other vehicle accessory systems for limited durations while the engine and/or the charging system are not operating. The battery is made up of six individual cells that are connected in series. Each cell contains positively charged plate groups that are connected with lead straps to the positive terminal post, and negatively charged plate groups that are connected with lead straps to the negative terminal post. Each plate consists of a stiff mesh framework or grid coated with lead dioxide (positive plate) or sponge lead (negative plate). Insulators or plate separators made of a non-conductive material are inserted between the positive and negative plates to prevent them from contacting or shorting against one another. These dissimilar metal plates are submerged in a sulfuric acid and water solution called an electrolyte.

The battery Group Size number, the Cold Cranking Amperage (CCA) rating, and the Reserve Capacity (RC) rating or Ampere-Hours (AH) rating can be found on the original equipment battery label. Be certain that a replacement battery has the correct Group Size number, as well as CCA, and RC or AH ratings that equal or exceed the original equipment specification for the vehicle being serviced. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - SPECIFICATIONS) for the proper factory-installed battery specifications.

OPERATION

The battery is designed to store electrical energy in a chemical form. When an electrical load is applied to the terminals of the battery, an electrochemical reaction occurs. This reaction causes the battery to discharge electrical current from its terminals. As the battery discharges, a gradual chemical change takes place within each cell. The sulfuric acid in the electrolyte combines with the plate materials, causing both plates to slowly change to lead sulfate. At the same time, oxygen from the positive plate material combines with hydrogen from the sulfuric acid, causing the electrolyte to become mainly water. The chemical changes within the battery are caused by the movement of excess or free electrons between the positive and negative plate groups. This movement of electrons produces a flow of electrical current through the load device attached to the battery terminals.

As the plate materials become more similar chemically, and the electrolyte becomes less acid, the voltage potential of each cell is reduced. However, by charging the battery with a voltage higher than that of the battery itself, the battery discharging process is reversed. Charging the battery gradually changes the sulfated lead plates back into sponge lead and lead dioxide, and the water back into sulfuric acid. This action restores the difference in the electron charges deposited on the plates, and the voltage potential of the battery cells. For a battery to remain useful, it must be able to produce high-amperage current over an extended period. A battery must also be able to accept a charge, so that its voltage potential may be restored.

The battery is vented to release excess hydrogen gas that is created when the battery is being charged or discharged. However, even with these vents, hydrogen gas can collect in or around the battery. If hydrogen gas is exposed to flame or sparks, it may ignite. If the electrolyte level is low, the battery may arc internally and explode. If the battery cell caps cannot be removed, the battery must be replaced if the electrolyte level becomes low.

DIAGNOSIS AND TESTING

BATTERY

The battery must be completely charged and the terminals should be properly cleaned and inspected before diagnostic procedures are performed. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING) and (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - INSPECTION) for the proper battery cleaning and inspection procedures. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - BATTERY CHARGING) for the proper battery charging procedures.

MICRO 420 BATTERY TESTER

The Micro 420 automotive battery tester is designed to help diagnose the cause of an inoperative battery. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - USING MICRO 420 BATTERY TESTER) for instructions on the use of the Micro 420 battery tester.

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING OR LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

A battery that will not accept a charge is inoperative, and must be replaced. Further testing is not required. A fully-charged battery must be load tested to determine its cranking capacity. A battery that is fully-charged, but does not pass the load test, is inoperative and must be replaced.

NOTE: Completely discharged batteries may take several hours to accept a charge. Refer to Standard Procedures for the proper battery charging procedures.

STANDARD PROCEDURE

BATTERY CHARGING

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

- Micro 420 electrical system tester indicates battery is OK.
- All of the battery cells are gassing freely during battery charging.
- Open-circuit voltage of the battery is 12.65 volts or above.

WARNING: NEVER EXCEED TWENTY AMPERES WHEN CHARGING A COLD (-1° C [30° F] OR LOWER) BATTERY. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING, LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

WARNING: IF THE BATTERY IS EQUIPPED WITH REMOVABLE CELL CAPS, BE CERTAIN THAT EACH OF THE CELL CAPS IS IN PLACE AND TIGHT BEFORE THE BATTERY IS RETURNED TO SERVICE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT FROM LOOSE OR MISSING CELL CAPS.

CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Do not exceed sixteen volts while charging a battery. Damage to the vehicle electrical system components may result.

CAUTION: Battery electrolyte will bubble inside the battery case during normal battery charging. Electrolyte boiling or being discharged from the battery vents indicates a battery overcharging condition. Immediately reduce the charging rate or turn off the charger to evaluate the battery condition. Damage to the battery may result from overcharging.

CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.

After the battery has been charged to 12.65 volts or greater, perform a load test to determine the battery cranking capacity, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - USING MICRO 420 BATTERY TESTER) for the proper battery load test procedures. If the battery will endure a load test, return the battery to service. If the battery will not endure a load test, it is inoperative and must be replaced.

Clean and inspect the battery hold downs, tray, terminals, posts, and top before completing battery service. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING) and (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - INSPECTION) for the proper battery system cleaning and inspection procedures.

CHARGING A COMPLETELY DISCHARGED BATTERY

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

1. Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt. If the reading is below ten volts, the battery charging current will be low. It could take some time before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.
2. Disconnect and isolate the battery negative cable. Connect the battery charger leads. Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.
3. Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the Charge Rate Table. If the charging current is still not measurable at the end of the charging time, the battery is inoperative and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

CHARGE RATE TABLE	
Voltage	Hours
16.0 volts maximum	up to 4 hours
14.0 to 15.9 volts	up to 8 hours
13.9 volts or less	up to 16 hours

CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.
- **Temperature** - A longer time will be needed to charge a battery at -18° C (0° F) than at 27° C (80° F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).
- **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies twenty amperes or more will require a shorter charging time.
- **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The Battery Charging Time Table gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

BATTERY CHARGING TIME TABLE			
Charging Amperage	5 Amps	10 Amps	20 Amps
Open Circuit Voltage	Hours Charging @ 21° C (70° F)		
12.25 to 12.49	6 hours	3 hours	1.5 hours
12.00 to 12.24	10 hours	5 hours	2.5 hours
10.00 to 11.99	14 hours	7 hours	3.5 hours
Below 10.00	18 hours	9 hours	4.5 hours

IGNITION-OFF DRAW TEST

The term Ignition-Off Draw (IOD) identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. A normal vehicle electrical system will draw from five to thirty-five milliamperes (0.005 to 0.035 ampere) with the ignition switch in the Off position, and all non-ignition controlled circuits in proper working order. Up to thirty-five milliamperes are needed to enable the memory functions for the Powertrain Control Module (PCM), digital clock, electronically tuned radio, and other modules which may vary with the vehicle equipment.

A vehicle that has not been operated for approximately twenty days, may discharge the battery to an inadequate level. When a vehicle will not be used for twenty days or more (stored), remove the IOD fuse from the Junction Block (JB). This will reduce battery discharging.

Excessive IOD can be caused by:

- Electrical items left on.
- Inoperative or improperly adjusted switches.
- Inoperative or shorted electronic modules and components.
- An internally shorted generator.
- Intermittent shorts in the wiring.

If the IOD is over thirty-five milliamperes, the problem must be found and corrected before replacing a battery. In most cases, the battery can be charged and returned to service after the excessive IOD condition has been corrected.

1. Verify that all electrical accessories are off. Turn off all lamps, remove the ignition key, and close all doors. If the vehicle is equipped with an illuminated entry system or an electronically tuned radio, allow the electronic timer function of these systems to automatically shut off (time out). This may take up to three minutes. See the Electronic Module Ignition-Off Draw Table for more information.

ELECTRONIC MODULE IGNITION-OFF DRAW (IOD) TABLE			
Module	Time Out? (If Yes, Interval And Wake-Up Input)	IOD	IOD After Time Out
Radio	No	1 to 3 milliamperes	N/A
Audio Power Amplifier	No	up to 1 milliampere	N/A
Central Timer Module (CTM)	No	4.75 milliamperes (max.)	N/A
Powertrain Control Module (PCM)	No	0.95 milliampere	N/A
ElectroMechanical Instrument Cluster (EMIC)	No	0.44 milliampere	N/A
Combination Flasher	No	0.08 milliampere	N/A

2. Determine that the underhood lamp is operating properly, then disconnect the lamp wire harness connector or remove the lamp bulb.
3. Disconnect the battery negative cable.
4. Set an electronic digital multi-meter to its highest amperage scale. Connect the multi-meter between the disconnected battery negative cable terminal clamp and the battery negative terminal post. Make sure that the doors remain closed so that the illuminated entry system is not activated. The multi-meter amperage reading may remain high for up to three minutes, or may not give any reading at all while set in the highest amperage scale, depending upon the electrical equipment in the vehicle. The multi-meter leads must be securely clamped to the battery negative cable terminal clamp and the battery negative terminal post. If continuity between the battery negative terminal post and the negative cable terminal clamp is lost during any part of the IOD test, the electronic timer function will be activated and all of the tests will have to be repeated.
5. After about three minutes, the high-amperage IOD reading on the multi-meter should become very low or non-existent, depending upon the electrical equipment in the vehicle. If the amperage reading remains high, remove and replace each fuse or circuit breaker in the Power Distribution Center (PDC) and then in the Junction Block (JB), one at a time until the amperage reading becomes very low, or nonexistent. Refer to the appropriate wiring information for complete PDC and JB fuse, circuit breaker, and circuit identification. This will isolate each circuit and identify the circuit that is the source of the high-amperage IOD. If the amperage reading remains high after removing and replacing each fuse and circuit breaker, disconnect the wire harness from the generator. If the amperage reading now becomes very low or nonexistent, diagnose and repair the Charging System as necessary. After the high-amperage IOD has been corrected, switch the multi-meter to progressively lower amperage scales and, if necessary, repeat the fuse and circuit breaker remove-and-replace process to identify and correct all sources of excessive IOD. It is now safe to select the lowest milliampere scale of the multi-meter to check the low-amperage IOD.

CAUTION: Do not open any doors, or turn on any electrical accessories with the lowest milliampere scale selected, or the multi-meter may be damaged.

6. Observe the multi-meter reading. The low-amperage IOD should not exceed thirty-five milliamperes (0.035 ampere). If the current draw exceeds thirty-five milliamperes, isolate each circuit using the fuse and circuit breaker remove-and-replace process in Step 5. The multi-meter reading will drop to within the acceptable limit when the source of the excessive current draw is disconnected. Repair this circuit as required; whether a wiring short, incorrect switch adjustment, or an inoperative component is the cause.

OPEN-CIRCUIT VOLTAGE TEST

A battery open-circuit voltage (no load) test will show the approximate state-of-charge of a battery. This test can be used in place of the hydrometer test when a hydrometer is not available, or for maintenance-free batteries with non-removable cell caps.

Before proceeding with this test, completely charge the battery (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - BATTERY CHARGING).

1. Before measuring the open-circuit voltage, the surface charge must be removed from the battery. Turn on the headlamps for fifteen seconds, then allow up to five minutes for the battery voltage to stabilize.
2. Disconnect and isolate both battery cables, negative cable first.
3. Using a voltmeter connected to the battery posts (see the instructions provided by the manufacturer of the voltmeter), measure the open-circuit voltage.

See the Open-Circuit Voltage Table. This voltage reading will indicate the battery state-of-charge, but will not reveal its cranking capacity. If a battery has an open-circuit voltage reading of 12.4 volts or greater, it may be load tested to reveal its cranking capacity (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - USING MICRO 420 BATTERY TESTER).

OPEN CIRCUIT VOLTAGE TABLE	
Open Circuit Voltage	Charge Percentage
11.7 volts or less	0%
12.0 volts	25%
12.3 volts	50%
12.6 volts	75%
12.8 volts or more	100%

MICRO 420 BATTERY TESTER

Always use the Micro 420 Instruction Manual that was supplied with the tester as a reference. If the Instruction Manual is not available the following procedure can be used:

WARNING: ALWAYS WEAR APPROPRIATE EYE PROTECTION AND USE EXTREME CAUTION WHEN WORKING WITH BATTERIES.

BATTERY TESTING

1. If testing the battery OUT-OF-VEHICLE, clean the battery terminals with a wire brush before testing, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING). If the battery is equipped with side post terminals, install and tighten the supplied lead terminal stud adapters. Do not use steel bolts. Failure to properly install the stud adapters, or using stud adapters that are dirty or worn-out may result in false test readings.
2. If testing the battery IN-THE-VEHICLE, make certain all of the vehicle accessory loads are OFF, including the ignition. **The preferred test position is at the battery terminal.** If the battery is not accessible, you may test using both the positive and negative jumper posts. Select TESTING AT JUMPER POST when connecting to that location.
3. Connect the tester to the battery or jumper posts, the red clamp to positive (+) and the black clamp to negative (-).

NOTE: Multiple batteries connected in parallel must have the ground cable disconnected to perform a battery test. Failure to disconnect may result in false battery test readings.

4. Using the ARROW key select **in** or **out** of vehicle testing and press ENTER to make a selection.
5. If not selected, choose the Cold Cranking Amp (CCA) battery rating. Or select the appropriate battery rating for your area (see menu). The tester will then run its self programmed test of the battery and display the results. Refer to the test result table noted below.

CAUTION: If REPLACE BATTERY is the result of the test, this may mean a poor connection between the vehicle's cables and battery exists. After disconnecting the vehicle's battery cables from the battery, retest the battery using the OUT-OF-VEHICLE test before replacing.

6. While viewing the battery test result, press the CODE button and the tester will prompt you for the last 4 digits of the VIN. Use the UP/DOWN arrow buttons to scroll to the correct character; then press ENTER to select and move to the next digit. Then press the ENTER button to view the SERVICE CODE. Pressing the CODE button a second time will return you to the test results.

BATTERY TEST RESULTS	
GOOD BATTERY	Return to service
GOOD - RECHARGE	Fully charge battery and return to service
CHARGE & RETEST	Fully charge battery and retest battery
REPLACE BATTERY	Replace the battery and retest complete system
BAD-CELL REPLACE	Replace the battery and retest complete system

NOTE: The SERVICE CODE is required on every warranty claim submitted for battery replacement.

REMOVAL

NOTE: It may be necessary to use a battery terminal puller (2) if the battery cable terminal clamps are seized on to the battery posts.

1. Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.
2. Loosen the battery negative cable terminal clamp pinch-bolt hex nut (4).
3. Disconnect the battery negative cable terminal clamp from the battery negative terminal post. If necessary, use a battery terminal puller to remove the terminal clamp from the battery post.
4. Loosen the battery positive cable terminal clamp pinch-bolt hex nut (8).
5. Disconnect the battery positive cable terminal clamp from the battery positive terminal post. If necessary, use a battery terminal puller to remove the terminal clamp from the battery post.

- Remove the battery hold down bolt (2) and slide the hold down (4) up and forward in the battery tray slots (3).

WARNING: WEAR A SUITABLE PAIR OF RUBBER GLOVES WHEN REMOVING A BATTERY BY HAND. SAFETY GLASSES SHOULD ALSO BE WORN. IF THE BATTERY IS CRACKED OR LEAKING, THE ELECTROLYTE CAN BURN THE SKIN AND EYES.

- Remove the battery (1) from the vehicle.

INSTALLATION

- Clean and inspect the battery case, terminal posts and battery cable clamps, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING).
- Position the battery (1) into the vehicle. Ensure that the battery positive and negative terminal posts are correctly positioned. The battery cable terminal clamps must reach the correct battery terminal post without stretching the cables.
- Install the battery hold down (4) by sliding it back and downward in the battery tray slots (3). Install the battery hold down bolt (2).

CAUTION: Be certain that the battery cable terminal clamps are connected to the correct battery terminal posts. Reverse battery polarity may damage electrical components of the vehicle.

4. Connect the battery positive cable terminal clamp (8) to the battery positive terminal post. Tighten the terminal clamp pinch-bolt hex nut to 5.6 N·m (50 in. lbs.).
5. Connect the battery negative cable terminal clamp (4) to the battery negative terminal post. Tighten the terminal clamp pinch-bolt hex nut to 5.6 N·m (50 in. lbs.).
6. Apply a thin coating of petroleum jelly or chassis grease to the exposed surfaces of the battery cable terminal clamps and the battery terminal posts.

BATTERY CABLES

DESCRIPTION

The battery cables (4) and (8) are large gauge, stranded copper wires sheathed within a heavy plastic or synthetic rubber insulating jacket. The wire used in the battery cables combines excellent flexibility and reliability with high electrical current carrying capacity. The battery cables feature a stamped brass clamping type female battery terminal crimped onto one end of the battery cable wire and then solder-dipped. A square headed pinch-bolt and hex nut are installed at the open end of the female battery terminal clamp. Large eyelet type terminals are crimped onto the opposite end of the battery cable wire and then solder-dipped. The battery positive cable wires (8) have a red insulating jacket to provide visual identification and feature a larger female battery terminal clamp to allow connection to the larger battery positive terminal post. The battery negative cable wires (4) have a black insulating jacket and a smaller female battery terminal clamp.

The battery cables cannot be repaired and, if damaged or faulty they must be replaced. Both the battery positive and negative cables are available for service replacement only as a unit with the battery wire harness, which may include portions of the wiring circuits for the generator and other components on some models. Refer to the appropriate wiring information for the location of the proper battery cable wire harness diagrams. The wiring information also includes proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

The battery cables connect the battery terminal posts to the vehicle electrical system. These cables also provide a return path for electrical current generated by the charging system for restoring the voltage potential of the battery. The female battery terminal clamps on the ends of the battery cable wires provide a strong and reliable connection of the battery cable to the battery terminal posts. The terminal pinch bolts allow the female terminal clamps to be tightened around the male terminal posts on the top of the battery. The eyelet terminals secured to the ends of the

battery cable wires opposite the female battery terminal clamps provide secure and reliable connection of the battery to the vehicle electrical system.

DIAGNOSIS AND TESTING

BATTERY CABLES

A voltage drop test will determine if there is excessive resistance in the battery cable terminal connections or the battery cables. If excessive resistance is found in the battery cable connections, the connection point should be disassembled, cleaned of all corrosion or foreign material, then reassembled. Following reassembly, check the voltage drop for the battery cable connection and the battery cable again to confirm repair.

When performing the voltage drop test, it is important to remember that the voltage drop is giving an indication of the resistance between the two points at which the voltmeter probes are attached. **EXAMPLE:** When testing the resistance of the battery positive cable, touch the voltmeter leads to the battery positive cable terminal clamp and to the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud. If you probe the battery positive terminal post and the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud, you are reading the combined voltage drop in the battery positive cable terminal clamp-to-terminal post connection and the battery positive cable.

TESTING

VOLTAGE DROP TEST

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING, LOOSE POSTS, OR LOW ELECTROLYTE LEVEL, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

WARNING: IF THE BATTERY IS EQUIPPED WITH REMOVABLE CELL CAPS, BE CERTAIN THAT EACH OF THE CELL CAPS IS IN PLACE AND TIGHT BEFORE THE BATTERY IS RETURNED TO SERVICE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT FROM LOOSE OR MISSING CELL CAPS.

The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing this test, be certain that the following procedures are accomplished:

- The battery is fully-charged and tested, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - USING MICRO 420 BATTERY TESTER).
- Fully engage the parking brake.
- If the vehicle is equipped with an automatic transmission, place the gearshift selector lever in the Park position. If the vehicle is equipped with a manual transmission, place the gearshift selector lever in the Neutral position and block the clutch pedal in the fully depressed position.
- Verify that all lamps and accessories are turned off.

- To prevent a gasoline engine from starting, remove the Automatic ShutDown (ASD) relay. The ASD relay is located in the Integrated Power Module (IPM), in the engine compartment. See the fuse and relay layout label on the underside of the IPM cover for ASD relay identification and location.

1. Connect the positive lead of the voltmeter (1) to the battery negative terminal post. Connect the negative lead of the voltmeter (1) to the battery negative cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery negative cable terminal clamp and the battery negative terminal post.

2. Connect the positive lead of the voltmeter (1) to the battery positive terminal post. Connect the negative lead of the voltmeter to the battery positive cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery positive cable terminal clamp and the battery positive terminal post.

3. Connect the voltmeter (2) to measure between the battery positive cable terminal clamp (1) and the starter solenoid (3) B(+) terminal stud. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery positive cable eyelet terminal connection at the starter solenoid B(+) terminal stud. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery positive cable.

4. Connect the voltmeter (1) to measure between the battery (2) negative cable terminal clamp and a good clean ground (3) on the engine block. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery negative cable eyelet terminal connection to the engine block. Repeat the test. If the reading is still above 0.2 volt, replace the faulty battery negative cable.

REMOVAL

NOTE: It may be necessary to use a battery terminal puller (2) if the battery cable terminal clamps are seized on to the battery posts.

Both the battery negative cable (2) and the battery positive cable (4) are serviced in the battery wire harness (10). If either battery cable is damaged or faulty, the battery wire harness assembly must be replaced.

1. Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.
2. Disconnect the battery negative cable terminal clamp (2) from the battery negative terminal post. If necessary, use a battery terminal puller to remove the terminal clamp from the battery post.
3. Lift the battery positive cable terminal clamp cover (3) to gain access to the pinch-bolt hex nut.

4. Disconnect the battery positive cable terminal clamp (4) from the battery positive terminal post. If necessary, use a battery terminal puller to remove the terminal clamp from the battery post.
5. Remove the screw (1) that secures the battery negative cable eyelet terminal (2) to the inner fender (3).

6. Unlatch and open the cover on the Power Distribution Center (PDC)(1) and Integrated Power Module (IPM)(2).

7. Remove the two nuts that secure the battery positive cable eyelet terminal to the B(+) terminal studs in the PDC.
8. Remove the nut that secures the battery positive cable eyelet terminal to the B(+) terminal stud in the IPM.
9. Remove both battery positive cable eyelet terminals from the B(+) terminal studs in the PDC and IPM.

10. Disconnect the battery wire harness three pin connector (11).
11. Remove the battery wire harness three pin connector (11) from the battery tray (12).
12. On 3.7L and 4.7L engines remove the nut (6) that secures the generator output cable eyelet terminal (7) to the generator output terminal stud.
13. Remove the generator output cable eyelet terminal from the generator output terminal stud.
14. Disconnect the battery wire harness connector (8) from the generator field terminal connector receptacle on the back of the generator.
15. Remove the battery wire harness retaining clip (9) from the valve cover stud.

16. On 5.7L engines remove the nut (5) that secures the generator output cable eyelet terminal (4) to the generator output terminal stud.
17. Remove the generator output cable eyelet terminal from the generator output terminal stud.
18. Disconnect the battery wire harness connector (6) from the generator field terminal connector receptacle on the back of the generator (3).
19. Remove the battery wire harness retaining clips (2) from the valve cover studs.

20. Raise the vehicle on a hoist, (Refer to LUBRICATION & MAINTENANCE/LIFT POINTS - STANDARD PROCEDURE).
21. Remove the bolt (5) that secures the battery negative cable ground eyelet terminal (6) to the engine block (10).
22. Remove the nut (4) that secures the battery positive cable eyelet terminal (3) to the B(+) terminal stud on the starter solenoid.
23. Remove the battery positive cable eyelet terminal from the B(+) terminal stud on the starter solenoid.
24. Disconnect the battery wire harness connector (2) from the connector receptacle on the starter solenoid.
25. Remove the battery wire harness retaining clips (7) & (9) from the engine.
26. Remove the battery wire harness from the engine compartment.

INSTALLATION

NOTE: Both the battery negative cable and the battery positive cable are serviced in the battery wire harness. If either battery cable is damaged or inoperative, the battery wire harness assembly must be replaced.

1. Clean and inspect the battery cable terminal clamps and the battery terminal posts, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING).
2. Position the battery wire harness assembly (10) into the vehicle.

3. Raise the vehicle on a hoist, (Refer to LUBRICATION & MAINTENANCE/LIFT POINTS - STANDARD PROCEDURE).
4. Install the battery wire harness retaining clips (7) & (9) to the engine.
5. Reconnect the battery wire harness connector (2) to the connector receptacle on the starter solenoid.
6. Install the battery positive cable eyelet terminal (3) onto the B(+) terminal stud on the starter solenoid.
7. Install and tighten the nut (4) that secures the battery positive cable eyelet terminal (3) to the B(+) terminal stud on the starter solenoid. Tighten the nut to 10.75 N·m (95 in. lbs.).
8. Install and tighten the bolt (5) that secures the battery negative cable ground eyelet terminal (6) to the engine block (10). Tighten the bolt to 10.75 N·m (95 in. lbs.).
9. Lower the vehicle.

10. Install the battery wire harness retaining clips (2) to the valve cover studs.
11. On 5.7L engines, reconnect the battery wire harness connector (6) to the generator field terminal connector receptacle on the back of the generator.
12. Install the generator output cable eyelet terminal (4) onto the generator output terminal stud.
13. Install and tighten the nut (5) that secures the generator output cable eyelet terminal (4) to the generator output terminal stud. Tighten the nut to 14 N·m (125 in. lbs.).

14. On 3.7L and 4.7L engines, reconnect the battery wire harness connector (8) to the generator field terminal connector receptacle on the back of the generator.
15. Install the generator output cable eyelet terminal (7) onto the generator output terminal stud.
16. Install and tighten the nut (6) that secures the generator output cable eyelet terminal (7) to the generator output terminal stud. Tighten the nut to 14 N·m (125 in. lbs.).
17. Install the battery wire harness retaining clip (9) onto the valve cover stud.
18. Install the battery wire harness three pin connector (11) onto the battery tray (12).
19. Connect the battery wire harness three pin connector (11).

20. Install both battery positive cable eyelet terminals onto the B(+) terminal studs in the Power Distribution Center (PDC) and Integrated Power Module (IPM).
21. Install and tighten the nuts that secure the battery positive cable eyelet terminals onto the B(+) terminal studs in the PDC and IPM. Tighten the nut to 11.5 N·m (105 in. lbs.).

22. Close and latch the covers on the PDC (1) and IPM (2).

23. Install and tighten the screw (1) that secures the battery negative cable eyelet terminal (2) to the inner fender (3). Tighten the screw to 28.2 N·m (250 in. lbs.).

24. Reconnect the battery positive cable terminal clamp (4) to the battery positive terminal post. Tighten the terminal clamp pinch-bolt hex nut to 5.6 N·m (50 in. lbs.).
25. Secure the battery positive cable terminal clamp cover (3) over the battery positive cable terminal clamp (4).
26. Reconnect the battery negative cable terminal clamp (2) to the battery negative terminal post. Tighten the terminal clamp pinch-bolt hex nut to 5.6 N·m (50 in. lbs.).
27. Apply a thin coating of petroleum jelly or chassis grease to the exposed surfaces of the battery cable terminal clamps and the battery terminal posts.

BATTERY TRAY

DESCRIPTION

The battery (5) is mounted in a molded plastic battery tray and support unit (7) located in the left front corner of the engine compartment. The battery tray and support unit is secured at the rear with a nut to a stud on the front frame rail, at the outboard side with two screws fastened to the left side inner fender panel, and at the front with a screw on a bracket off the radiator support.

The battery tray for this vehicle is unique in that it has a built-in hold down bracket molded into the tray assembly. This bracket retains the hold down after the bolt is removed. With the bolt removed the hold down can slide up and forward in the bracket slots freeing the battery from the tray.

REMOVAL - GAS ENGINE

1. Remove the battery from the battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL).
2. Remove the battery wire harness three pin connector (11) from the battery tray (12).

3. Remove the two screws (3) that secures the battery tray (4) to the inner fender and the bracket on the radiator support.
4. Remove the one screw (2) that secures the outboard side of the battery tray (4) to the left inner fender.
5. Remove the one nut (1) that secures the rear of the battery tray to the stud (5) on the front frame rail.
6. Remove the battery tray from the left front corner of the engine compartment.

INSTALLATION - GAS ENGINE

1. Clean and inspect the battery tray, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING) and (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - INSPECTION).
2. Position the battery tray and support unit into the right front corner of the engine compartment. Be certain that no hoses or wire harnesses are trapped or pinched by the installation of the tray.
3. Install and tighten the one nut (1) that secures the rear of the battery tray to the stud (5) on the front frame rail. Tighten the nut to 7.3 N·m (65 in. lbs.).
4. Install and tighten the one screw (2) that secures the outboard side of the battery tray (4) to the left inner fender. Tighten the screw to 7.3 N·m (65 in. lbs.).
5. Install and tighten the two screws (3) that secures the battery tray (4) to the inner fender and the bracket on the radiator support. Tighten the screw to 7.3 N·m (65 in. lbs.).
6. Install the battery wire harness three pin connector (11) onto the battery tray (12).
7. Install the battery onto the battery tray (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).

CHARGING - SERVICE INFORMATION

DESCRIPTION

The charging system consists of:

- Generator
- Generator decoupler pulley (if equipped)
- Electronic Voltage Regulator (EVR) circuitry within the Powertrain Control Module (PCM)
- Ignition switch
- Battery (refer to Battery for information)
- Generator lamp (if equipped)
- Check gauges lamp (if equipped)
- Voltmeter (refer to Instrument Cluster for information)
- Wiring harness and connections (refer to Wiring for information)

OPERATION

The charging system is turned on and off with the ignition switch. The system is on when the engine is running and the ASD relay is energized. When the ASD relay is on, voltage is supplied to the ASD relay sense circuit at the PCM. This voltage is connected through the PCM and supplied to one of the generator field terminals (Gen. Source +) at the back of the generator.

The amount of DC current produced by the generator is controlled by the EVR (field control) circuitry contained within the PCM. This circuitry is connected in series with the second rotor field terminal and ground.

A battery temperature sensor, located in the battery tray housing, is used to sense battery temperature. This temperature data, along with data from monitored line voltage, is used by the PCM to vary the battery charging rate. This is done by cycling the ground path to control the strength of the rotor magnetic field. The PCM then compensates and regulates generator current output accordingly.

All vehicles are equipped with On-Board Diagnostics (OBD). All OBD-sensed systems, including EVR (field control) circuitry, are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for certain failures it detects.

The Check Gauges Lamp (if equipped) monitors: **charging system voltage**, engine coolant temperature and engine oil pressure. If an extreme condition is indicated, the lamp will be illuminated. This is done as a reminder to check the three gauges. The signal to activate the lamp is sent via the CAN bus circuits. The lamp is located on the instrument panel. Refer to Instrument Cluster for additional information.

DIAGNOSIS AND TESTING - CHARGING SYSTEM

The following procedures may be used to diagnose the charging system if:

- the check gauges lamp (if equipped) is illuminated with the engine running
- the voltmeter (if equipped) does not register properly

- an undercharged or overcharged battery condition occurs.

Remember that an undercharged battery is often caused by:

- accessories being left on with the engine not running
- a faulty or improperly adjusted switch that allows a lamp to stay on. Refer to Ignition-Off Draw Test in the Battery section for more information.

INSPECTION

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the On-Board Diagnostic (OBD) system. Some charging system circuits are checked continuously, and some are checked only under certain conditions.

Refer to Diagnostic Trouble Codes in; Powertrain Control Module; Electronic Control Modules for more DTC information. This will include a complete list of DTC's including DTC's for the charging system.

To perform a complete test of the charging system, refer to the appropriate Diagnostic Test Procedures and use a diagnostic scan tool. Perform the following inspections before attaching the scan tool.

1. Inspect the battery condition. Refer to Battery for procedures.
2. Inspect condition of battery cable terminals, battery posts, connections at engine block, starter solenoid and relay. They should be clean and tight. Repair as required.
3. Inspect all fuses in both the fuseblock and Power Distribution Center (PDC) for tightness in receptacles. They should be properly installed and tight. Repair or replace as required.
4. Inspect generator mounting bolts for tightness. Replace or tighten bolts if required. Refer to the Generator Removal/Installation section of this group for torque specifications.
5. Inspect generator drive belt condition and tension. Tighten or replace belt as required. Refer to Belt Tension Specifications in Cooling System.
6. Inspect automatic belt tensioner (if equipped). Refer to Cooling System for information.
7. Inspect generator electrical connections at generator field, battery output, and ground terminal (if equipped). Also check generator ground wire connection at engine (if equipped). They should all be clean and tight. Repair as required.

GENERATOR

DESCRIPTION

The generator is belt-driven by the engine using a serpentine type drive belt. It is serviced only as a complete assembly. If the generator fails for any reason, the entire assembly must be replaced.

OPERATION

As the energized rotor begins to rotate within the generator, the spinning magnetic field induces a current into the windings of the stator coil. Once the generator begins producing sufficient current, it also provides the current needed to energize the rotor.

The stator winding connections deliver the induced alternating current to 6 positive and 6 negative diodes for rectification. From the diodes, rectified direct current is delivered to the vehicle electrical system through the generator battery terminal.

Noise emitting from the generator may be caused by: worn, loose or defective bearings; a loose or defective drive pulley; incorrect, worn, damaged or misadjusted fan drive belt; loose mounting bolts; a misaligned drive pulley or a defective stator or diode.

REMOVAL

3.7L / 4.7L

WARNING: DISCONNECT NEGATIVE CABLE FROM BATTERY BEFORE REMOVING BATTERY OUTPUT WIRE (B+ WIRE) FROM GENERATOR. FAILURE TO DO SO CAN RESULT IN INJURY OR DAMAGE TO ELECTRICAL SYSTEM.

1. Disconnect negative battery cable at battery.
2. Remove generator drive belt. Refer to 7, Cooling System for procedure.
3. Unsnap plastic insulator cap (3) from B+ output terminal.
4. Remove B+ terminal mounting nut (2) at rear of generator. Disconnect terminal from generator.
5. Disconnect field wire connector (4) at rear of generator by pushing on connector tab.

6. Remove 1 rear vertical generator mounting bolt (2).
7. Remove 2 front horizontal generator mounting bolts (1).
8. Remove generator from vehicle.

5.7L

WARNING: DISCONNECT NEGATIVE CABLE FROM BATTERY BEFORE REMOVING BATTERY OUTPUT WIRE (B+ WIRE) FROM GENERATOR. FAILURE TO DO SO CAN RESULT IN INJURY OR DAMAGE TO ELECTRICAL SYSTEM.

1. Disconnect negative battery cable at battery.
2. Remove generator drive belt. Refer to 7, Cooling System for procedure.
3. Unsnap plastic insulator cap from B+ output terminal.
4. Remove B+ terminal mounting nut (3) at rear of generator. Disconnect terminal from generator.
5. Disconnect field wire connector (3) at rear of generator by pushing on connector tab.
6. Remove 2 generator mounting bolts (1).
7. Remove generator (2) from vehicle.

INSTALLATION

3.7L / 4.7L

1. Position generator (3) to engine and install 2 horizontal bolts (1) and 1 vertical bolt (2).
2. Tighten all 3 bolts. Refer to Torque Specifications.

3. Snap field wire connector (4) into rear of generator.
4. Install B+ terminal eyelet to generator output stud. Tighten mounting nut (2). Refer to Torque Specifications.

CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.

CAUTION: When installing a serpentine accessory drive belt, the belt **MUST** be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat. Refer to belt routing label in engine compartment, or refer to Belt Schematics in 7, Cooling System.

5. Install generator drive belt. Refer to 7, Cooling System for procedure.
6. Install negative battery cable to battery.

5.7L

1. Position generator (2) to engine and install 2 mounting bolts (1).
2. Tighten bolts. Refer to Torque Specifications.
3. Snap field wire connector (3) into rear of generator.
4. Install B+ terminal eyelet (3) to generator output stud. Tighten mounting nut. Refer to Torque Specifications.

CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.

CAUTION: When installing a serpentine accessory drive belt, the belt **MUST** be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat. Refer to belt routing label in engine compartment, or refer to Belt Schematics in 7, Cooling System.

5. Install generator drive belt. Refer to 7, Cooling System for procedure.
6. Install negative battery cable to battery.

REGULATOR, VOLTAGE**DESCRIPTION**

The Electronic Voltage Regulator (EVR) is not a separate component. It is actually a voltage regulating circuit located within the Powertrain Control Module (PCM). The EVR is not serviced separately. If replacement is necessary, the PCM must be replaced.

OPERATION

The amount of DC current produced by the generator is controlled by EVR circuitry contained within the PCM. This circuitry is connected in series with the generator's second rotor field terminal and its ground.

Voltage is regulated by cycling the battery voltage to control the strength of the rotor magnetic field. The EVR circuitry monitors system line voltage (B+) and battery temperature (refer to Battery Temperature Sensor for more information). It then determines a target charging voltage. If sensed battery voltage is 0.5 volts or lower than the target voltage, the PCM energizes the field winding until sensed battery voltage is 0.5 volts above target voltage. A circuit in the PCM cycles the battery side of the generator field up to 100 times per second (100Hz), but has the capability to full field to achieve the target voltage. If the charging rate cannot be monitored (limp-in), a duty cycle of 25% is used by the PCM in order to have some generator output.

STARTING

DESCRIPTION

The starting system consists of:

- Starter relay
- Starter motor (including an integral starter solenoid)

Other components to be considered as part of starting system are:

- Battery
- Battery cables
- Ignition switch and key lock cylinder
- Clutch pedal position switch (manual transmission)
- Park/neutral position switch (automatic transmission)
- Wire harnesses and connections.

The Battery, Starting, and Charging systems operate in conjunction with one another, and must be tested as a complete system. For correct operation of starting/charging systems, all components used in these 3 systems must perform within specifications. When attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used in each of these groups include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, volt/ohmmeter, battery charger, carbon pile rheostat (load tester), and 12-volt test lamp may be required.

Certain starting system components are monitored by the PCM and may produce a Diagnostic Trouble Code (DTC).

OPERATION

The starting system components form two separate circuits. A high-amperage feed circuit that feeds the starter motor between 150 and 350 amperes, and a low-amperage control circuit that operates on less than 20 amperes. The high-amperage feed circuit components include the battery, the battery cables, the contact disc portion of the starter solenoid, and the starter motor. The low-amperage control circuit components include the ignition switch, the park/neutral position switch, the starter relay, the electromagnetic windings of the starter solenoid, and the connecting wire harness components.

Battery voltage is supplied through the low-amperage control circuit to the coil battery terminal of the starter relay when the ignition switch is turned to the Start position. The park/neutral position switch is installed in series between the starter relay coil ground terminal and ground. This normally open switch prevents the starter relay from being

energized and the starter motor from operating unless the automatic transmission gear selector is in the Neutral or Park positions.

When the starter relay coil is energized, the normally open relay contacts close. The relay contacts connect the relay common feed terminal to the relay normally open terminal. The closed relay contacts energize the starter solenoid coil windings.

The energized solenoid pull-in coil pulls in the solenoid plunger. The solenoid plunger pulls the shift lever in the starter motor. This engages the starter overrunning clutch and pinion gear with the starter ring gear.

As the solenoid plunger reaches the end of its travel, the solenoid contact disc completes the high-amperage starter feed circuit and energizes the solenoid plunger hold-in coil. Current now flows between the solenoid battery terminal and the starter motor, energizing the starter.

Once the engine starts, the overrunning clutch protects the starter motor from damage by allowing the starter pinion gear to spin faster than the pinion shaft. When the ignition switch is released to the On position, the starter relay coil is de-energized. This causes the relay contacts to open. When the relay contacts open, the starter solenoid plunger hold-in coil is de-energized.

When the solenoid plunger hold-in coil is de-energized, the solenoid plunger return spring returns the plunger to its relaxed position. This causes the contact disc to open the starter feed circuit, and the shift lever to disengage the overrunning clutch and pinion gear from the starter ring gear.

DIAGNOSIS AND TESTING - STARTING SYSTEM

The battery, starting, and charging systems operate in conjunction with one another, and must be tested as a complete system. For correct starting/charging system operation, all of the components involved in these 3 systems must perform within specifications.

Starting System Diagnosis		
CONDITION	POSSIBLE CAUSE	CORRECTION
STARTER FAILS TO OPERATE.	1. Battery discharged or faulty.	1. Refer to Battery. Charge or replace battery, if required.
	2. Starting circuit wiring faulty.	2. Refer to 8, Wiring Diagrams. Test and repair starter feed and/or control circuits, if required.
	3. Starter relay faulty.	3. Refer to Starter Relay in Diagnosis and Testing. Replace starter relay if required.
	4. Ignition switch faulty.	4. Refer to Ignition Switch and Key Lock Cylinder. Replace ignition switch if required.
	5. Park/Neutral position switch faulty or misadjusted.	6. Refer to Park/Neutral Position Switch. Replace park/neutral position switch if required.
	6. Starter motor faulty.	8. If all other starting system components and circuits test OK, replace starter motor.
STARTER ENGAGES, FAILS TO TURN ENGINE.	1. Battery discharged or faulty.	1. Refer to Battery. Charge or replace battery if required.
	2. Starting circuit wiring faulty.	2. Refer to 8, Wiring Diagrams. Test and repair starter feed and/or control circuits if required.
	3. Starter motor faulty.	3. If all other starting system components and circuits test OK, replace starter motor assembly.
	4. Engine seized.	4. Refer to Engine Diagnosis in the Diagnosis and Testing section of 9, Engine.
STARTER ENGAGES, SPINS OUT BEFORE ENGINE STARTS.	1. Starter ring gear faulty.	1. Refer to Starter Motor Removal and Installation. Remove starter motor to inspect starter ring gear. Replace starter ring gear if required.
	2. Starter motor faulty.	2. If all other starting system components and circuits test OK, replace starter motor assembly.

Starting System Diagnosis		
CONDITION	POSSIBLE CAUSE	CORRECTION
STARTER DOES NOT DISENGAGE.	1. Starter motor improperly installed.	1. Refer to Starter Motor Removal and Installation. Tighten starter mounting hardware to correct torque specifications.
	2. Starter relay faulty.	2. Refer to Starter Relay Diagnosis and Testing. Replace starter relay if required.
	3. Ignition switch faulty.	3. Refer to Ignition Switch and Key Lock Cylinder. Replace ignition switch if required.
	4. Starter motor faulty.	4. If all other starting system components and circuits test OK, replace starter motor.

INSPECTION

For complete starter wiring circuit diagrams, refer to 8, Wiring Diagrams. Before removing any unit from starting system for repair or diagnosis, perform the following inspections:

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO 8, PASSIVE RESTRAINT SYSTEMS, BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- **Battery** - Visually inspect battery for indications of physical damage and loose or corroded cable connections. Determine state-of-charge and cranking capacity of battery. Charge or replace battery if required. Refer to **Battery** in 8, Battery. **Note: If equipped with diesel engine, a dual battery system may be used, and both batteries must be inspected.**
- **Ignition Switch** - Visually inspect ignition switch for indications of physical damage and loose or corroded wire harness connections. Refer to **Ignition Switch and Key Lock Cylinder**.
- **Park/Neutral Position Switch** - Visually inspect park/neutral position switch for indications of physical damage and loose or corroded wire harness connections. Refer to **Park/Neutral Position Switch** in 21, Transmission.
- **Starter Relay** - Visually inspect starter relay for indications of physical damage and loose or corroded wire harness connections.
- **Starter Motor** - Visually inspect starter motor for indications of physical damage and loose or corroded wire harness connections.
- **Starter Solenoid** - Visually inspect starter solenoid for indications of physical damage and loose or corroded wire harness connections.
- **Wiring** - Visually inspect wire harnesses for damage. Repair or replace any faulty wiring, as required. Refer to 8, Wiring Diagrams.

TESTING

COLD CRANKING TEST

For complete starter wiring circuit diagrams, refer to 8, Wiring Diagrams. The battery must be fully-charged and load-tested before proceeding. Refer to **Battery** in Battery.

1. Connect volt-ampere tester to battery terminals (1), (2) and (3). See instructions provided by manufacturer of volt-ampere tester being used.
2. Fully engage parking brake.
3. Place gearshift selector lever in Park position.
4. Verify that all lamps and accessories are turned off.
5. To prevent a gasoline engine from starting, remove Automatic ShutDown (ASD) relay. To prevent a diesel engine from starting, remove Fuel Pump Relay. These relays are located in Power Distribution Center (PDC). Refer to label on PDC cover for relay location.
6. Rotate and hold ignition switch in Start position. Note cranking voltage and current (amperage) draw readings shown on volt-ampere tester.
 - a. If voltage reads below 9.6 volts, refer to **Starter Motor** in Diagnosis and Testing. If starter motor is OK, refer to **Engine Diagnosis** in 9, Engine for further testing of engine. If starter motor is not OK, replace faulty starter motor.
 - b. If voltage reads above 9.6 volts and current (amperage) draw reads below specifications, refer to **Feed Circuit Test** in this section.
 - c. If voltage reads 12.5 volts or greater and starter motor does not turn, refer to **Control Circuit Testing** in this section.
 - d. If voltage reads 12.5 volts or greater and starter motor turns very slowly, refer to **Feed Circuit Test** in this section.

NOTE: A cold engine will increase starter current (amperage) draw reading, and reduce battery voltage reading.

FEED CIRCUIT TEST

The starter feed circuit test (voltage drop method) will determine if there is excessive resistance in high-amperage feed circuit. For complete starter wiring circuit diagrams, refer 8, Wiring Diagrams.

When performing these tests, it is important to remember that voltage drop is giving an indication of resistance between two points at which voltmeter probes are attached.

Example: When testing resistance of positive battery cable, touch voltmeter leads to positive battery cable clamp and cable connector at starter solenoid. If you probe positive battery terminal post and cable connector at starter solenoid, you are reading combined voltage drop in positive battery cable clamp-to-terminal post connection and positive battery cable.

The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing tests, be certain that following procedures are accomplished:

- Battery is fully-charged and load-tested. Refer to **Battery** in 8, Battery.
- Fully engage parking brake.
- Place gearshift selector lever in Park position.
- Verify that all lamps and accessories are turned off.

- To prevent a gasoline engine from starting, remove Automatic ShutDown (ASD) relay. To prevent a diesel engine from starting, remove Fuel Pump Relay. These relays are located in Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

1. Connect positive lead of voltmeter (1) to negative battery cable terminal post. Connect negative lead of voltmeter to negative battery cable clamp. Rotate and hold ignition switch in Start position. Observe voltmeter (1). If voltage is detected, correct poor contact between cable clamp and terminal post.

2. Connect positive lead of voltmeter (1) to positive battery terminal post. Connect negative lead of voltmeter to battery positive cable clamp. Rotate and hold ignition switch in Start position. Observe voltmeter (1). If voltage is detected, correct poor contact between cable clamp and terminal post.

3. Connect voltmeter (2) to measure between battery positive terminal post and starter solenoid battery terminal stud (3). Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten battery cable connection at solenoid. Repeat test. If reading is still above 0.2 volt, replace faulty positive battery cable.

4. Connect voltmeter (1) to measure between negative battery terminal post and a good clean ground on engine block (3). Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten negative battery cable attachment on engine block. Repeat test. If reading is still above 0.2 volt, replace faulty negative battery cable.

5. Connect positive lead of voltmeter (3) to starter housing (1). Connect negative lead of voltmeter to negative battery terminal post. Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, correct poor starter to engine block ground contact.
6. If equipped with dual battery system (certain diesel equipped models), connect positive lead of voltmeter to positive battery cable clamp on battery located on left side of vehicle. Connect negative lead of voltmeter to positive battery terminal post on battery located on right side of vehicle. Rotate and hold ignition switch in Start position. Observe voltmeter. If reading is above 0.2 volt, clean and tighten battery cables at both batteries. Repeat test. If reading is still above 0.2 volt, replace faulty positive battery cable.

If resistance tests detect no feed circuit problems, refer to **Starter Motor** in the Diagnosis and Testing.

CONTROL CIRCUIT TESTING

The starter control circuit components should be tested in the order in which they are listed, as follows:

- **Starter Relay** - Refer to **Starter Relay** Diagnosis and Testing.
- **Starter Solenoid** - Refer to **Starter Motor** Diagnosis and Testing.
- **Ignition Switch** - Refer to **Ignition Switch and Key Lock Cylinder**
- **Park/Neutral Position Switch** - Refer to **Park/Neutral Position Switch** in 21, Transmission.
- **Wire harnesses and connections** - Refer to 8, Wiring Diagrams.

STARTER

DIAGNOSIS AND TESTING - STARTER MOTOR

Correct starter motor operation can be confirmed by performing the following free running bench test. This test can only be performed with starter motor removed from vehicle. Refer to Specifications for starter motor specifications.

1. Remove starter motor from vehicle. Refer to Starter Motor Removal and Installation.
2. Mount starter motor securely in a soft-jawed bench vise. The vise jaws should be clamped on the mounting flange of starter motor. Never clamp on starter motor by field frame.
3. Connect a suitable volt-ampere tester and a 12-volt battery to starter motor in series, and set ammeter to 100 ampere scale. See instructions provided by manufacturer of volt-ampere tester being used.
4. Install jumper wire from solenoid terminal to solenoid battery terminal. The starter motor should operate. If starter motor fails to operate, replace faulty starter motor assembly.
5. Adjust carbon pile load of tester to obtain free running test voltage. Refer to Specifications for starter motor free running test voltage specifications.
6. Note reading on ammeter and compare reading to free running test maximum amperage draw. Refer to Specifications for starter motor free running test maximum amperage draw specifications.
7. If ammeter reading exceeds maximum amperage draw specification, replace faulty starter motor assembly.

REMOVAL

3.7L / 4.7L

1. Disconnect and isolate negative battery cable.
2. Raise and support vehicle.
3. Note: If equipped with 4WD and certain transmissions, a support bracket is used between front axle and side of transmission. Remove 2 support bracket bolts at transmission. Pry support bracket slightly to gain access to lower starter mounting bolt.
4. Remove two bolts (3) if equipped with an automatic transmission.
5. Move starter motor (4) towards front of vehicle far enough for nose of starter pinion housing to clear housing. Always support starter motor during this process, do not let starter motor hang from wire harness.
6. Tilt nose downwards and lower starter motor far enough to access and remove nut (2) that secures battery positive cable wire harness connector eyelet (1) to solenoid battery terminal stud. Do not let starter motor hang from wire harness.
7. Remove battery positive cable wire harness connector eyelet (5) from solenoid battery terminal stud.
8. Disconnect battery positive cable wire harness connector from solenoid terminal connector receptacle.
9. Remove starter motor.

5.7L V-8

1. Disconnect and isolate negative battery cable.
2. Raise and support vehicle.
3. Note: If equipped with 4WD and certain transmissions, a support bracket is used between front axle and side of transmission. Remove 2 support bracket bolts at transmission. Pry support bracket slightly to gain access to lower starter mounting bolt.
4. Remove two mounting bolts (2).
5. Move starter motor towards front of vehicle far enough for nose of starter pinion housing to clear housing. Always support starter motor (1) during this process, do not let starter motor hang from wire harness.
6. Tilt nose downwards and lower starter motor far enough to access and remove nut that secures battery positive cable wire harness connector eyelet to solenoid battery terminal stud. Do not let starter motor hang from wire harness.
7. Remove battery positive cable wire harness connector eyelet from solenoid battery terminal stud.
8. Disconnect battery positive cable wire harness connector from solenoid terminal connector receptacle.
9. Remove starter motor.

INSTALLATION

3.7L / 4.7L

1. Connect solenoid wire to starter motor (snaps on).
2. Position battery cable (1) to solenoid stud. Install and tighten battery cable eyelet nut (2). Refer to Torque Specifications. Do not allow starter motor to hang from wire harness.
3. Position starter motor (4) to transmission.
4. If equipped with automatic transmission, slide cooler tube bracket into position.
5. Install and tighten both bolts (3). Refer to Torque Specifications.
6. Lower vehicle.
7. Connect negative battery cable.

5.7L V-8

1. Connect solenoid wire to starter motor (snaps on).
2. Position battery cable to solenoid stud. Install and tighten battery cable eyelet nut. Refer to Torque Specifications. Do not allow starter motor to hang from wire harness.
3. Position starter motor (1) to engine.
4. If equipped with automatic transmission, slide cooler tube bracket into position.
5. Install and tighten both mounting bolts (2). Refer to Torque Specifications.
6. Lower vehicle.
7. Connect negative battery cable.

RELAY-STARTER MOTOR

DESCRIPTION

The starter relay is an electromechanical device that switches battery current to the pull-in coil of the starter solenoid when the ignition switch is turned to the Start position. The starter relay is located in the Power Distribution Center (PDC) in the engine compartment. See the PDC cover for relay identification and location.

The starter relay is a International Standards Organization (ISO) relay. Relays conforming to ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions.

The starter relay cannot be repaired or adjusted. If faulty or damaged, it must be replaced.

OPERATION

The ISO relay consists of an electromagnetic coil, a resistor or diode, and three (two fixed and one movable) electrical contacts. The movable (common feed) relay contact is held against one of the fixed contacts (normally closed) by spring pressure. When electromagnetic coil is energized, it draws the movable contact away from normally closed fixed contact, and holds it against the other (normally open) fixed contact.

When electromagnetic coil is de-energized, spring pressure returns movable contact to normally closed position. The resistor or diode is connected in parallel with electromagnetic coil within relay, and helps to dissipate voltage spikes produced when coil is de-energized.

REMOVAL

The starter relay is located in the Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

1. Disconnect and isolate negative battery cable.
2. Remove cover from Power Distribution Center (PDC) for relay identification and location.
3. Remove starter relay from PDC.
4. Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.
5. Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

INSTALLATION

1. Push down firmly on starter relay until terminals are fully seated into PDC receptacle.
2. Install PDC cover.
3. Connect battery cable.

HEATED GLASS - SERVICE INFORMATION

DESCRIPTION

CAUTION: Grid lines can be damaged or scraped off with sharp instruments. Care should be taken in cleaning glass or removing foreign materials, decals or stickers. Normal glass cleaning solvents or hot water used with rags or toweling is recommended.

The rear window defogger system, also known as electric backlight (EBL), consists of two vertical bus bars (1) linked by a series of grid lines (2) fired onto the inside surface of the rear window (3).

The EBL system is turned On or Off by a switch and timing circuit integral to the A/C-heater control located at the center of the instrument panel.

Circuit protection is provided by two cartridge fuses located in the junction block (JB) inside of the vehicle. One fuse is for the heated rear window grid control circuit and the other fuse is for the heated outside mirror grid circuit, when equipped.

OPERATION

The electric backlight (EBL) system is controlled by a momentary switch (1) located in the A/C-heater control (2) on the instrument panel. When the rear window defogger switch is pressed to the On position, the A/C-heater control energizes the rear window defogger (EBL) relay and battery current is then directed through the relay and to the rear window defogger grid lines and the heated outside rear view mirrors, when equipped. The grid lines heat the glass to help clear the rear window and outside mirror surfaces of fog or frost.

An amber indicator (3) in the rear window defogger switch will illuminate to indicate when the EBL system is turned on. The A/C-heater control contains the EBL system control circuitry including the timer logic.

NOTE: The EBL system turns off automatically after ten minutes of initial operation. Each following activation cycle of the EBL system will last five minutes.

The EBL system will be automatically turned off after an initial programmed time interval of about ten minutes. After the initial time interval has expired, if the rear window defogger switch is turned on again during the same ignition cycle, the EBL system will automatically turn off after about five minutes. The EBL system will automatically shut off if the ignition switch is turned to the Off position, or it can be turned off manually by pressing the rear window defogger switch a second time.

Repair of the rear window defogger grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent (Refer to 8 - ELECTRICAL/HEATED GLASS/REAR WINDOW DEFOGGER GRID - STANDARD PROCEDURE - GRID LINE AND TERMINAL REPAIR).

DIAGNOSIS AND TESTING

ELECTRIC BACKLIGHT (EBL) SYSTEM

NOTE: Illumination of the defogger switch indicator lamp does not necessary mean that electrical current is reaching the rear glass heating grid lines.

NOTE: For circuit descriptions and diagrams of the rear window defogger system, refer to 8W - WIRING DIAGRAM INFORMATION.

Operation of the electric backlight (EBL) system can be confirmed by the following:

1. If equipped with the automatic temperature control (ATC) heating-A/C system, use a scan tool and check for diagnostic trouble codes (DTCs) related to the A/C-heater control. If equipped with the manual temperature control (MTC) heating-A/C system, use the A/C-heater control to check for diagnostic trouble codes (DTCs) related to the A/C-heater control (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - HVAC SELF DIAGNOSTICS). If no DTCs are found, go to Step 2. If any DTCs are found, repair as required, then proceed to Step 2

2. Turn the ignition switch to the On position. Set the rear window defogger switch in the On position. The rear window defogger operation can be checked by feeling the rear window or outside rear view mirror glass surfaces. A distinct difference in temperature between the grid lines (4 and 5) and the adjacent clear glass or the mirror glass should be detected within three to four minutes of operation.

3. If a temperature difference is not detected, use a 12-volt DC voltmeter and contact the rear glass heating grid terminal A (1) with the negative lead, and terminal B (2) with the positive lead. The voltmeter should read battery voltage. If the voltmeter does not read battery voltage, check the following:

- Confirm that the ignition switch is in the On position.
- Make sure that the rear glass heating grid feed wire (3) and ground wire (6) are connected to the terminals. Confirm that the ground wire has continuity to ground.
- Check the EBL relay and the fuses located in the junction block (JB) inside of the vehicle. The relay and fuses must be tight in their receptacles and all electrical connections must be secure.

When the above steps have been completed and the rear glass heating grid is still inoperative, one or more of the following is faulty:

- Rear window defogger switch in the A/C-heater control.
 - Rear window defogger grid lines (all grid lines would have to be broken, or the power feed or the ground wire disconnected, for the entire heating grid to be inoperative).
4. If the EBL system operation has been verified but the rear window defogger LED indicator does not illuminate, replace the A/C-heater control (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CONTROL-A/C HEATER - REMOVAL).

GRID-REAR WINDOW DEFOGGER

STANDARD PROCEDURE

GRID LINE AND TERMINAL REPAIR

WARNING: Materials contained in the Repair Kit (Part Number 04549275) may cause skin or eye irritation. The kit contains epoxy resin and amine type hardener, which are harmful if swallowed. Avoid contact with the skin and eyes. For skin contact, wash the affected areas with soap and water. For contact with the eyes, flush with plenty of water. Do not take internally. If taken internally, induce vomiting and call a physician immediately. Use with adequate ventilation. Do not use near fire or flame. Contains flammable solvents. Keep out of the reach of children. Failure to follow the warnings could result in possible personal injury or death.

Repair of the rear glass heating grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent.

1. Mask the repair area with masking tape (3) so that the conductive epoxy can be applied neatly. Extend the epoxy application onto the grid line (2) or the bus bar on each side of the break (1).
2. Follow the instructions in the repair kit for preparing the damaged area.
3. Remove the package separator clamp and mix the two conductive epoxy components thoroughly within the packaging. Fold the package in half and cut the center corner to dispense the epoxy.
4. For grid line repairs, mask the area to be repaired with masking tape or use a template.
5. Apply the epoxy through the slit in the masking tape or template. Overlap both ends of the break by at least 19 millimeters (0.75 inch).
6. For a terminal or pigtail wire replacement, mask the adjacent areas so the epoxy can be extended onto the adjacent grid line as well as the bus bar. Apply a thin layer of epoxy to the area where the terminal or pigtail wire was fastened and onto the adjacent grid line.
7. Apply a thin layer of conductive epoxy to the terminal or bare wire end of the pigtail and place it in the proper location on the bus bar. To prevent the terminal or pigtail wire from moving while the epoxy is curing, it must be wedged or clamped.
8. Carefully remove the masking tape or template.

CAUTION: Do not allow the glass surface to exceed 204° C (400° F) when using a heat gun, or the glass may fracture.

9. Allow the epoxy to cure 24 hours at room temperature, or carefully use a heat gun for fifteen minutes. When using a heat gun, hold it approximately 25.4 centimeters (10 inches) from the repair and do not allow the glass surface to exceed 204° C (400° F).
10. After the conductive epoxy is properly cured, remove the wedge or clamp from the terminal or pigtail wire.
11. Connect the wire harness leads to the grid terminals or pigtail wires and verify EBL operation.

RELAY-REAR WINDOW DEFOGGER

DESCRIPTION

The rear window defogger (EBL) relay (1) is a International Standards Organization (ISO)-type relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns (2). The EBL relay is an electromechanical device that switches fused battery current to the rear window defogger grid and when equipped, switches fused battery current through a fuse in the junction block (JB) to the outside rear view mirror heating grids. The EBL relay is energized when the relay coil is provided a ground path by the control circuitry within the A/C-heater control.

The EBL relay is located in the JB in the engine compartment.

OPERATION

The ISO-standard rear window defogger (EBL relay is an electromechanical switch that uses a low current input controlled by the A/C-heater control to control the high current output to the rear window defogger grid lines. The movable, common feed relay contact is held against the fixed, normally closed relay contact by spring pressure. When the electromagnetic relay coil is energized, it draws the movable common feed relay contact away from the fixed, normally closed relay contact and, holds it against the fixed, normally open relay contact. This action allows high current to flow to the rear window defogger grid lines.

When the relay coil is de-energized, spring pressure returns the movable relay contact back against the fixed, normally closed contact point. The resistor or diode is connected in parallel with the relay coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The EBL relay terminals are connected to the vehicle electrical system through a receptacle in the junction block (JB). The inputs and outputs of the EBL relay include:

- Terminal (30) receives battery current from a fused B(+) circuit at all times.
- Terminal (85) receives a ground through the EBL relay control circuit only when the A/C-heater control electronically pulls the circuit to ground.
- Terminal (86) receives fused battery current through the run relay only when the run relay coil is energized.
- Terminal (87) provides battery current to the rear window defogger grid through the EBL relay output circuit only when the EBL relay coil is energized.
- Terminal (87A) is not connected to any circuit in this application, but provides a battery current output only when the EBL relay coil is de-energized.

The EBL relay cannot be repaired and, if faulty or damaged, it must be replaced. Refer to the appropriate wiring information for diagnosis and testing of the ISO-standard relay and for complete rear window defogger (EBL) wiring diagrams.

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the junction block (JB) (1) from underneath the instrument panel (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/JUNCTION BLOCK - REMOVAL).
3. Remove the EBL relay (2) from the top side of the JB.

INSTALLATION

1. Position the EBL relay (2) into the proper receptacle of the junction block (1) located in the passenger compartment.
2. Align the EBL relay terminals with the terminal cavities in the JB receptacle and push down firmly on the relay until the terminals are fully seated.
3. Install the junction block (JB) (1) (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/JUNCTION BLOCK - INSTALLATION).
4. Reconnect the negative battery cable.

SWITCH-REAR WINDOW DEFOGGER

DESCRIPTION

The switch for the rear window defogger (EBL) system (1) is integrated into the A/C-heater control (2), which is located in the center of the instrument panel. When the rear window defogger switch is activated, the timing circuit integral to the A/C-heater control operates the rear window defogger (EBL) relay. An amber indicator (3) in the rear window defogger switch will illuminate to indicate when the EBL system is turned on.

When the EBL relay is activated, current is directed to the rear window defogger grid lines and when equipped, to the heated outside rear view mirrors. The grid lines heat the window and mirror glass to help clear the surfaces of fog or frost.

OPERATION

An LED indicator will illuminate when the rear window defogger switch is activated. When the switch is activated, the A/C-heater control operates the rear window defogger (EBL) relay. The EBL relay controls the current flow to the heating grid of the rear window and when equipped, the heated outside rear view mirrors.

NOTE: The EBL system turns off automatically after ten minutes of initial operation. Each following activation cycle of the EBL system will last five minutes.

The EBL system will initially be on for approximately ten minutes or until the rear window defogger switch or the ignition switch is turned off. After the initial time interval has expired, if the defogger switch is turned On again during the same ignition cycle, the EBL system will automatically turn off after about five minutes.

The rear window defogger switch and the rear window defogger LED indicator cannot be repaired and, if faulty or damaged, the A/C-heater control must be replaced (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CONTROL-A/C HEATER - REMOVAL).

HEATED MIRRORS - SERVICE INFORMATION		OPERATION	8
DESCRIPTION	8		

HEATED MIRRORS - SERVICE INFORMATION

DESCRIPTION

The optional heated mirror system is controlled by the momentary rear window defogger switch (1) which is integral to the A/C-heater control (2). An amber indicator lamp in the switch (3) will illuminate to indicate when the rear window defogger (EBL) system is turned on.

The heated mirror system only operates in concert with the EBL system, and will be automatically shut off after a programmed time interval of about ten minutes. After the initial time interval has expired, if the defogger switch is turned on again during the same ignition cycle, the heated mirror system will automatically shut off after about five minutes.

The heated mirror system will automatically shut off if the ignition switch is turned to the Off position, or it can be shut off manually by pressing the rear window defogger switch a second time.

Circuit protection is provided by a cartridge fuse located in the junction block (JB).

OPERATION

When the rear window defogger switch is pressed, the rear window defogger (EBL) system becomes activated and an electric heater grid located behind the glass of each of the outside rear view mirrors is energized. When energized, each of these heater grids produce heat to help clear the outside rear view mirrors of ice, snow, or fog.

If the outside mirror heating grids are both inoperative, refer to 8 - ELECTRICAL/HEATED GLASS - DIAGNOSIS AND TESTING in this group. If only one of the outside mirror heating grids is inoperative, refer to 8 - ELECTRICAL/POWER MIRRORS - DIAGNOSIS AND TESTING.

The heating grid behind each outside mirror glass cannot be repaired and, if faulty or damaged, the mirror glass must be replaced (Refer to 23 - BODY/EXTERIOR/MIRROR-SIDE VIEW - GLASS - REMOVAL).

HEATED SEATS - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B1085-LEFT HEATED SEAT SWITCH INPUT CIRCUIT LOW

B1085-LEFT HEATED SEAT SWITCH INPUT CIRCUIT LOW (CONTINUED)

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Ignition on.
- **Set Condition:** This code is set when the Cluster detects the heated seat switch sense circuit is shorted low.

Possible Causes
(P365) LEFT HEATED SEAT SWITCH SENSE SHORTED TO GROUND LOWER SWITCH BANK CLUSTER

Diagnostic Test**1. VERIFY THAT DTC B1085-LEFT HEATED SEAT SWITCH INPUT CIRCUIT LOW IS ACTIVE**

With the scan tool, record and erase DTC's

Cycle the ignition switch off then back on.

With the scan tool, read DTC's.

Does the DTC B1085 LEFT HEATED SEAT SWITCH INPUT CIRCUIT LOW reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.

2. HEATED SEAT SWITCH

With the scan tool, record and erase DTC's

Disconnect the lower switch bank connector.

Cycle the ignition switch off then back on.

With the scan tool, read DTC's.

Does the DTC B1085 LEFT HEATED SEAT SWITCH INPUT CIRCUIT LOW reset?

Yes >> Go To 3

No >> Replace the lower switch bank.
Perform BODY VERIFICATION TEST – VER 1.

B1085-LEFT HEATED SEAT SWITCH INPUT CIRCUIT LOW (CONTINUED)**3. CHECK THE (P365) LEFT HEATED SEAT SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Disconnect the Cluster C3 connector.

Measure the resistance between ground and the (P365) Left Heated Seat Switch Sense circuit.

Was the resistance below 5.0 ohms?

Yes >> Repair the (P365) Left Heated Seat Switch Sense circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1.

No >> Replace the Cluster.

Perform BODY VERIFICATION TEST – VER 1.

B1088-RIGHT HEATED SEAT SWITCH INPUT CIRCUIT LOW

B1088-RIGHT HEATED SEAT SWITCH INPUT CIRCUIT LOW (CONTINUED)

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Ignition on.
- **Set Condition:** This code is set whenever the Cluster detects the heated seat switch sense circuit is shorted low.

Possible Causes
(P366) RIGHT HEATED SEAT SWITCH SENSE SHORTED TO GROUND LOWER SWITCH BANK CLUSTER

Diagnostic Test**1. VERIFY THAT DTC B1088-RIGHT HEATED SEAT SWITCH INPUT CIRCUIT LOW IS ACTIVE**

With the scan tool, record and erase DTC's

Cycle the ignition switch off then back on.

With the scan tool, read DTC's.

Does the DTC B1088 RIGHT HEATED SEAT SWITCH INPUT CIRCUIT LOW reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.

2. HEATED SEAT SWITCH

With the scan tool, record and erase DTC's

Disconnect the lower switch bank connector.

Cycle the ignition switch off then back on.

With the scan tool, read DTC's.

Does the DTC B1088 RIGHT HEATED SEAT SWITCH INPUT CIRCUIT LOW reset?

Yes >> Go To 3

No >> Replace the lower switch bank.
Perform BODY VERIFICATION TEST – VER 1.

B1088-RIGHT HEATED SEAT SWITCH INPUT CIRCUIT LOW (CONTINUED)

3. CHECK THE (P366) RIGHT HEATED SEAT SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND

Disconnect the Cluster C3 connector.

Measure the resistance between ground and the (P366) Right Heated Seat Switch Sense circuit.

Was the resistance below 5.0 ohms?

Yes >> Repair the (P366) Right Heated Seat Switch Sense circuit for a short to ground.

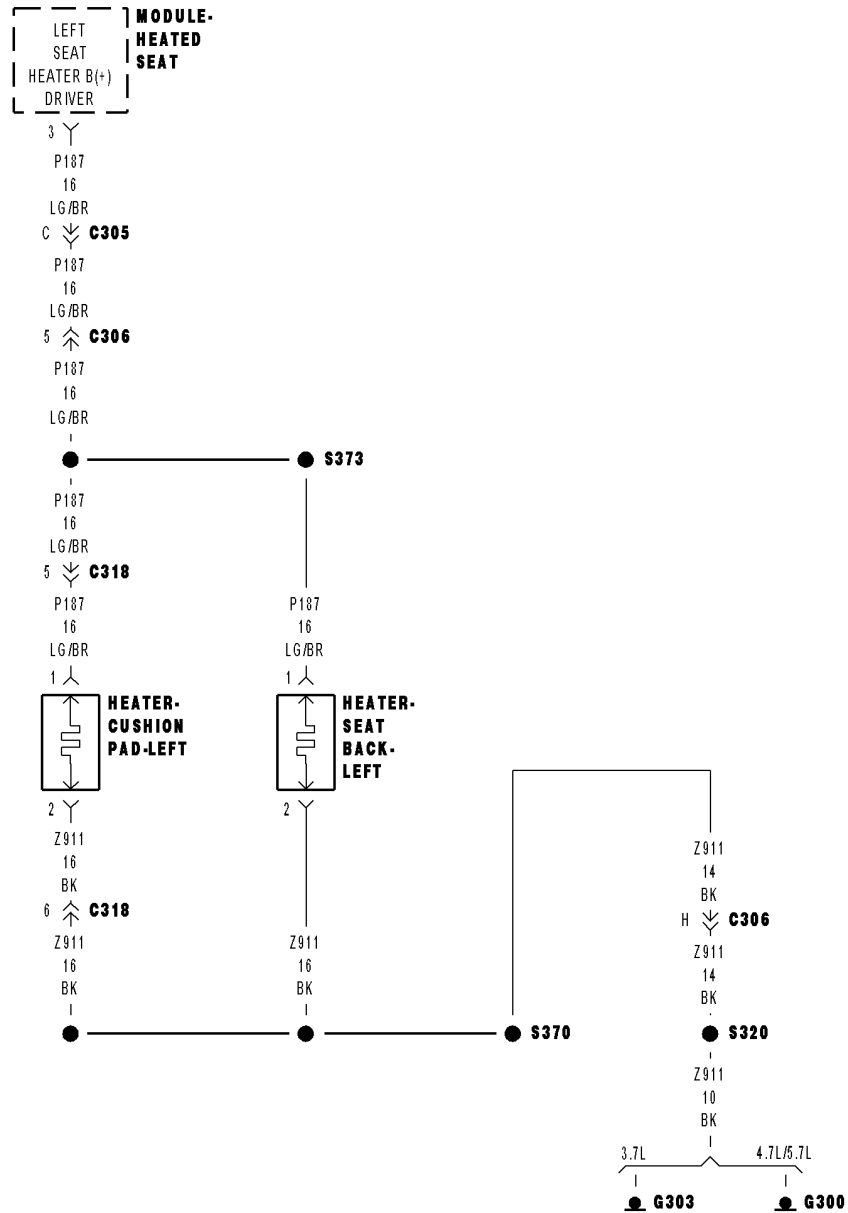

Perform BODY VERIFICATION TEST – VER 1.

No >> Replace the Cluster.

Perform BODY VERIFICATION TEST – VER 1.

B1092-FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW

B1092-FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW (CONTINUED)

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:** Ignition on, during the heated seat operation.
- **Set Condition:** This code is set immediately after the Heated Seat Module detects the control circuit shorted to ground.

Possible Causes
(P187) LEFT SEAT HEATER B(+) DRIVER SHORTED TO GROUND
SEAT HEATER ELEMENT PIGTAIL HARNESS SHORTED
SEAT CUSHION HEATER ELEMENT SHORTED
SEAT BACK HEATER ELEMENT SHORTED
HEATED SEAT MODULE

Diagnostic Test

1. VERIFY THAT DTC B1092-FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW IS ACTIVE

With the scan tool, record and erase DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

Does the DTC B1092 FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.

2. DISCONNECT LEFT SEAT INLINE CONNECTOR AND READ DTC'S

Disconnect the left seat C306 inline connector.

NOTE: Check connectors - Clean and repair as necessary.

With the scan tool, erase HSM DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

Does the scan tool display the same DTC?

Yes >> Go To 6

No >> Go To 3

B1092-FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW (CONTINUED)**3. CHECK THE (P187) LEFT SEAT HEATER B(+) DRIVER FOR A SHORT TO GROUND**

Measure between the (P187) Left Seat Heater B(+) Driver circuit at the seat inline connector (seat side) and the seat frame for a short to ground.

Is the resistance below 1000 ohms?

- Yes** >> Repair/replace the pigtail/heating element as necessary for a short to ground condition.
Perform BODY VERIFICATION TEST – VER 1.
- No** >> Go To 4

**4. CHECK THE LEFT CUSHION PAD HEATER RESISTANCE**

Disconnect the Left Cushion Pad Heater 2 – way connector.

Check the resistance of the cushion heater element by measuring between the Left Seat Heater B(+) Driver and the Ground circuit at the left cushion pad connector (component side).

Was the resistance below 3.5 ohms?

- Yes** >> Replace the heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1.
- No** >> Go To 5

**5. CHECK THE LEFT SEAT BACK HEATER RESISTANCE**

Disconnect the Left Seat Back Heater 2 – way connector.

NOTE: Check connectors - Clean and repair as necessary.

Check the resistance of the seat back heater element by measuring between the Left Seat Heater B(+) Driver and the Ground circuit at the left seat back connector (component side).

Is the resistance below 4.0 ohms?

- Yes** >> Replace the seat back heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1
- No** >> Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent short to ground.
Perform BODY VERIFICATION TEST – VER 1

B1092-FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW (CONTINUED)

6. Check the Left Seat Heater B(+) Driver circuit for a short to ground

Disconnect the Heated Seat Module connector.

NOTE: Check connectors - Clean and repair as necessary.

Measure the Left Seat Heater B(+) Driver circuit to ground at the HSM connector.

Is the resistance below 5.0 ohms?

Yes >> Repair the Left Seat Heater B(+) Driver circuit for a short to ground.

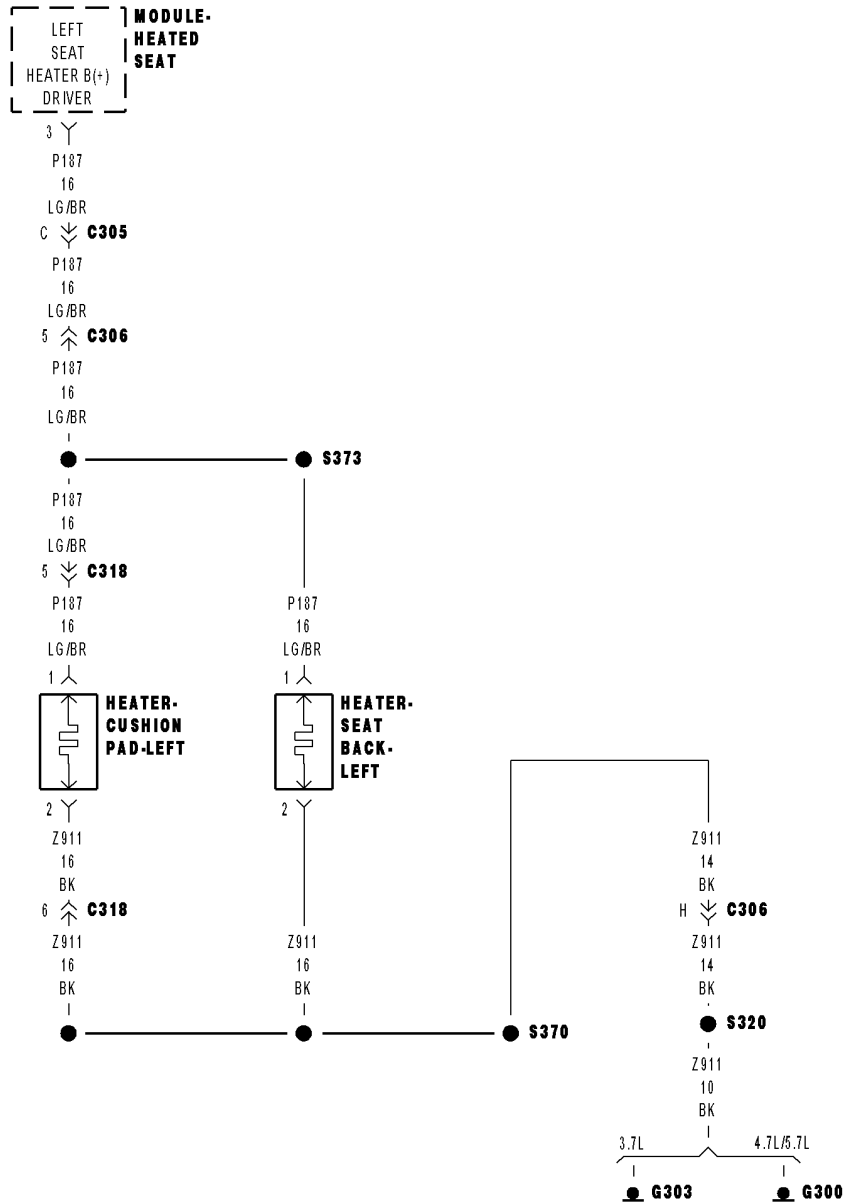

Perform BODY VERIFICATION TEST – VER 1.

No >> Replace the Heated Seat Module.

Perform BODY VERIFICATION TEST – VER 1.

B1094-FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN

B1094-FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN (CONTINUED)

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Ignition on, during the heated seat operation.
- **Set Condition:** This code is set immediately after the Heated Seat Module detects an open in the seat heater B(+) driver circuit.

Possible Causes
LEFT SEAT HEATER B(+) DRIVER WIRE OPEN GROUND WIRE OPEN SEAT CUSHION HEATER ELEMENT OPEN SEAT BACK HEATER ELEMENT OPEN HEATED SEAT MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. VERIFY THAT DTC B1094-FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN IS ACTIVE

With the scan tool, record and erase DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

Does the DTC B1094 FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.

B1094-FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN (CONTINUED)**2. CHECK FOR AN OPEN SEAT HEATER B(+) DRIVER FROM HSM TO SEAT CUSHION**

Disconnect the Left Cushion Pad Heater 2 – way connector.

Disconnect the Heated Seat Module 6 – way connector.

NOTE: Check connectors - Clean and repair as necessary.

Measure the resistance of the Left Seat Heater B(+) Driver circuit from the HSM 6 – way to the Cushion Pad Heater 2 – way connector.

Is the resistance below 2 ohms?

Yes >> Go To 3

No >> Repair the open Seat Heater B(+) Driver circuit.
Perform BODY VERIFICATION TEST – VER 1.

**3. CHECK THE LEFT SEAT HEATER CUSHION GROUND CIRCUIT**

Using a 12-volt test light connected to 12-volts, check the ground circuit at the Heater Cushion Pad 2 – way connector.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the open ground circuit.
Perform BODY VERIFICATION TEST – VER 1.

B1094-FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN (CONTINUED)

4. CHECK THE LEFT CUSHION PAD HEATER RESISTANCE

Check the resistance of the Cushion Pad Heater element by measuring between the Left Seat Heater B(+) Driver and the Ground circuit at the 2 – way connector (component side).

Is the resistance above 4.9 ohms?

- Yes** >> Replace the seat cushion pad heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1.
- No** >> 5
Perform BODY VERIFICATION TEST – VER 1.

5. CHECK THE LEFT SEAT BACK HEATER RESISTANCE

Disconnect the Left Seat Back Heater 2 – way connector.

NOTE: Check connectors - Clean and repair as necessary.

Check the resistance of the seat back heater element by measuring between the Left Seat Heater B(+) Driver and the Ground circuit at the connector 2 – way (component side).

Is the resistance above 5.5 ohms?

- Yes** >> Replace the seat back heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1.
- No** >> 6
Perform BODY VERIFICATION TEST – VER 1.

6. CHECK THE LEFT SEAT BACK HEATER GROUND CIRCUIT

Using a 12-volt test light connected to 12-volts, check the ground circuit at the Seat Back Heater 2 – way connector.

Does the test light illuminate brightly?

- Yes** >> Go To 7
- No** >> Repair the open ground circuit.
Perform BODY VERIFICATION TEST – VER 1.

B1094-FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN (CONTINUED)**7. CHECK FOR AN OPEN SEAT HEATER B(+) DRIVER FROM HSM TO SEAT BACK****NOTE: Check connectors - Clean and repair as necessary.**

Measure the Left Seat Heater B(+) Driver circuit from the Seat Back connector to the HSM connector.

Is the resistance below 2.0 ohms?

- Yes** >> Replace the Heated Seat Module.
Perform BODY VERIFICATION TEST – VER 1.
- No** >> Repair the Left Seat Heater B(+) Driver circuit for an open back to the splice.
Perform BODY VERIFICATION TEST – VER 1.

B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW

B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW (CONTINUED)

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Ignition on, during the heated seat operation.
- **Set Condition:** This code is set immediately after the Heated Seat Module detects the control circuit shorted to ground.

Possible Causes
(P188) LEFT SEAT HEATER B(+) DRIVER SHORTED TO GROUND
SEAT HEATER ELEMENT PIGTAIL HARNESS SHORTED
SEAT CUSHION HEATER ELEMENT SHORTED
SEAT BACK HEATER ELEMENT SHORTED
HEATED SEAT MODULE

Diagnostic Test**1. VERIFY THAT DTC B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW IS ACTIVE**

With the scan tool, record and erase DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

Does the DTC B1096 FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.

2. DISCONNECT RIGHT SEAT INLINE CONNECTOR AND READ DTC'S

Disconnect the right seat C305 inline connector.

NOTE: Check connectors - Clean and repair as necessary.

With the scan tool, erase HSM DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

Does the scan tool display the same DTC?

Yes >> Go To 6

No >> Go To 3

B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW (CONTINUED)

3. CHECK THE (P188) RIGHT SEAT HEATER B(+) DRIVER FOR A SHORT TO GROUND

Measure between the (P188) Right Seat Heater B(+) Driver circuit at the seat inline connector (seat side) and the seat frame for a short to ground.

Is the resistance below 1000 ohms?

- Yes** >> Repair/replace the pigtail/heating element as necessary for a short to ground condition.
Perform BODY VERIFICATION TEST – VER 1.
- No** >> Go To 4

4. CHECK THE RIGHT CUSHION PAD HEATER RESISTANCE

Disconnect the Right Cushion Pad Heater 2 – way connector. Check the resistance of the cushion heater element by measuring between the Right Seat Heater B(+) Driver and the Ground circuit at the right cushion pad connector (component side).

Was the resistance below 3.5 ohms?

- Yes** >> Replace the heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1.
- No** >> Go To 5

5. CHECK THE RIGHT SEAT BACK HEATER RESISTANCE

Disconnect the Right Seat Back Heater 2 – way connector. **NOTE: Check connectors - Clean and repair as necessary.** Check the resistance of the seat back heater element by measuring between the Right Seat Heater B(+) Driver and the Ground circuit at the right seat back connector (component side).

Is the resistance below 4.0 ohms?

- Yes** >> Replace the seat back heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1
- No** >> Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent short to ground.
Perform BODY VERIFICATION TEST – VER 1

B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW (CONTINUED)**6. Check the Right Seat Heater B(+) Driver circuit for a short to ground**

Disconnect the Heated Seat Module connector.

NOTE: Check connectors - Clean and repair as necessary.

Measure the Right Seat Heater B(+) Driver circuit to ground at the HSM connector.

Is the resistance below 5.0 ohms?

Yes >> Repair the Right Seat Heater B(+) Driver circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1.

No >> Replace the Heated Seat Module.

Perform BODY VERIFICATION TEST – VER 1.

B1098-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN

B1098-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN (CONTINUED)

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Ignition on, during the heated seat operation.
- **Set Condition:** This code is set immediately after the Heated Seat Module detects an open in the seat heater B(+) driver circuit.

Possible Causes
RIGHT SEAT HEATER B(+) DRIVER WIRE OPEN GROUND WIRE OPEN SEAT CUSHION HEATER ELEMENT OPEN SEAT BACK HEATER ELEMENT OPEN HEATED SEAT MODULE

--

Diagnostic Test**1. VERIFY THAT DTC B1098-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN IS ACTIVE**

With the scan tool, record and erase DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

Does the DTC B1098 FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.

B1098-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN (CONTINUED)

2. CHECK FOR AN OPEN SEAT HEATER B(+) DRIVER FROM HSM TO SEAT CUSHION

Disconnect the Right Cushion Pad Heater 2 – way connector.
 Disconnect the Heated Seat Module 6 – way connector.

NOTE: Check connectors - Clean and repair as necessary.
 Measure the resistance of the Right Seat Heater B(+) Driver circuit from the HSM 6 – way to the Cushion Pad Heater 2 – way connector.

Is the resistance below 2 ohms?

- Yes** >> Go To 3
- No** >> Repair the open Seat Heater B(+) Driver circuit.
 Perform BODY VERIFICATION TEST – VER 1.

3. CHECK THE RIGHT SEAT HEATER CUSHION GROUND CIRCUIT

Using a 12-volt test light connected to 12-volts, check the ground circuit at the Heater Cushion Pad 2 – way connector.

Does the test light illuminate brightly?

- Yes** >> Go To 4
- No** >> Repair the open ground circuit.
 Perform BODY VERIFICATION TEST – VER 1.

B1098-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN (CONTINUED)**4. CHECK THE RIGHT CUSHION PAD HEATER RESISTANCE**

Check the resistance of the Cushion Pad Heater element by measuring between the Right Seat Heater B(+) Driver and the Ground circuit at the 2 – way connector (component side).

Is the resistance above 4.9 ohms?

- Yes** >> Replace the seat cushion pad heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1.
- No** >> 5
Perform BODY VERIFICATION TEST – VER 1.

**5. CHECK THE RIGHT SEAT BACK HEATER RESISTANCE**

Disconnect the Right Seat Back Heater 2 – way connector.

NOTE: Check connectors - Clean and repair as necessary.

Check the resistance of the seat back heater element by measuring between the Right Seat Heater B(+) Driver and the Ground circuit at the connector 2 – way (component side).

Is the resistance above 5.5 ohms?

- Yes** >> Replace the seat back heater element as necessary.
Perform BODY VERIFICATION TEST – VER 1.
- No** >> 6
Perform BODY VERIFICATION TEST – VER 1.

**6. CHECK THE RIGHT SEAT BACK HEATER GROUND CIRCUIT**

Using a 12-volt test light connected to 12-volts, check the ground circuit at the Seat Back Heater 2 – way connector.

Does the test light illuminate brightly?

- Yes** >> Go To 7
- No** >> Repair the open ground circuit.
Perform BODY VERIFICATION TEST – VER 1.

B1098-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN (CONTINUED)

7. CHECK FOR AN OPEN SEAT HEATER B(+) DRIVER FROM HSM TO SEAT BACK

NOTE: Check connectors - Clean and repair as necessary.

Measure the Right Seat Heater B(+) Driver circuit from the Seat Back connector to the HSM connector.

Is the resistance below 2.0 ohms?

- Yes** >> Replace the Heated Seat Module.
Perform BODY VERIFICATION TEST – VER 1.
- No** >> Repair the Right Seat Heater B(+) Driver circuit for an open back to the splice.
Perform BODY VERIFICATION TEST – VER 1.

B10BB-LEFT HEATED SEAT SWITCH INPUT CIRCUIT STUCK

B10BB-LEFT HEATED SEAT SWITCH INPUT CIRCUIT STUCK (CONTINUED)

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Ignition on.
- **Set Condition:** This code is set when the Cluster detects a stuck heated seat switch.

Possible Causes
(P365) LEFT HEATED SEAT SWITCH SENSE PARTIALLY SHORTED TO GROUND LOWER SWITCH BANK CLUSTER

Diagnostic Test

1. VERIFY THAT DTC B10BB-LEFT HEATED SEAT SWITCH INPUT CIRCUIT STUCK IS ACTIVE

With the scan tool, record and erase DTC's

Cycle the ignition switch off then back on.

With the scan tool, read DTC's.

Does the DTC B10BB LEFT HEATED SEAT SWITCH INPUT CIRCUIT STUCK reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.

2. HEATED SEAT SWITCH

With the scan tool, record and erase DTC's

Disconnect the lower switch bank.

Cycle the ignition switch off then back on.

With the scan tool, read DTC's.

Does the DTC B10BB LEFT HEATED SEAT SWITCH INPUT CIRCUIT STUCK reset?

Yes >> Go To 3

No >> Replace the lower switch bank.
Perform BODY VERIFICATION TEST – VER 1.

B10BB-LEFT HEATED SEAT SWITCH INPUT CIRCUIT STUCK (CONTINUED)**3. CHECK THE (P365) LEFT HEATED SEAT SWITCH SENSE CIRCUIT FOR A PARTIAL SHORT TO GROUND**

Disconnect the Cluster C3 connector.

Measure the resistance between ground and the (P365) Left Heated Seat Switch Sense circuit.

Was the resistance below 10k ohms?

- Yes** >> Repair the (P365) Left Heated Seat Switch Sense circuit for a short to ground.
Perform BODY VERIFICATION TEST – VER 1.
- No** >> Replace the Cluster.
Perform BODY VERIFICATION TEST – VER 1.

B10BC-RIGHT HEATED SEAT SWITCH INPUT CIRCUIT STUCK

B10BC-RIGHT HEATED SEAT SWITCH INPUT CIRCUIT STUCK (CONTINUED)

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Ignition on.
- **Set Condition:** This code is set whenever the Cluster detects a stuck heated seat switch.

Possible Causes
(P366) RIGHT HEATED SEAT SWITCH SENSE PARTIALLY SHORTED TO GROUND LOWER SWITCH BANK CLUSTER

Diagnostic Test**1. VERIFY THAT DTC B10BC-RIGHT HEATED SEAT SWITCH INPUT CIRCUIT STUCK IS ACTIVE**

With the scan tool, record and erase DTC's

Cycle the ignition switch off then back on.

With the scan tool, read DTC's.

Does the DTC B10BC RIGHT HEATED SEAT SWITCH INPUT CIRCUIT STUCK reset?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.

2. HEATED SEAT SWITCH

With the scan tool, record and erase DTC's

Disconnect the lower switch bank.

Cycle the ignition switch off then back on.

With the scan tool, read DTC's.

Does the DTC B10BC RIGHT HEATED SEAT SWITCH INPUT CIRCUIT STUCK reset?

Yes >> Go To 3

No >> Replace the lower switch bank.
Perform BODY VERIFICATION TEST – VER 1.

B10BC-RIGHT HEATED SEAT SWITCH INPUT CIRCUIT STUCK (CONTINUED)

3. CHECK THE (P366) RIGHT HEATED SEAT SWITCH SENSE CIRCUIT FOR A PARTIAL SHORT TO GROUND

Disconnect the Cluster C3 connector.

Measure the resistance between ground and the (P366) Right Heated Seat Switch Sense circuit.

Was the resistance below 10K ohms?

- Yes** >> Repair the (P366) Right Heated Seat Switch Sense circuit for a short to ground.
Perform BODY VERIFICATION TEST – VER 1.
- No** >> Replace the Cluster.
Perform BODY VERIFICATION TEST – VER 1.

B210D-BATTERY VOLTAGE LOW

MODULE-HEATED SEAT

B210D-BATTERY VOLTAGE LOW (CONTINUED)

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Engine running, during heated seat operation.
- **Set Condition:** This code is set immediately after the Heated Seat Module receives a low charging system voltage message over the CAN B Bus or detects voltage under 11.3 volts on the (A33) Fused B(+) circuit.

Possible Causes
CHARGING SYSTEM VOLTAGE LOW (A33) FUSED B(+) CIRCUIT HEATED SEAT MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. CHECK PCM FOR CHARGING SYSTEM DTC

With the scan tool, read Powertrain Control Module DTC's.

Are there any Charging System DTC's set in the Powertrain Control Module?

- Yes** >> (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING) for Charging System diagnostic procedures.
- No** >> Go To 2
 Perform BODY VERIFICATION TEST – VER 1.

2. VERIFY THAT DTC B210D-BATTERY VOLTAGE LOW IS ACTIVE

With the scan tool, record and erase DTC's

Turn the ignition switch to the Off position then start the engine and let run for one minute.

With the scan tool, read DTC's.

Does the DTC B210D-BATTERY VOLTAGE LOW reset?

- Yes** >> Go To 3
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
 Perform BODY VERIFICATION TEST – VER 1.

B210D-BATTERY VOLTAGE LOW (CONTINUED)**3. CHECK THE VOLTAGE ON THE (A33) FUSED B(+) CIRCUIT**

Disconnect the Heated Seat Module connector.

NOTE: Check connectors - Clean and repair as necessary.

Start the engine and let idle.

Measure the voltage on the (A33) Fused B(+) circuit at the HSM connector and compare to voltage at the vehicle battery.

Is the voltage at the HSM connector the same as measured at the battery?

Yes >> Replace the Heated Seat Module in accordance with the service information.

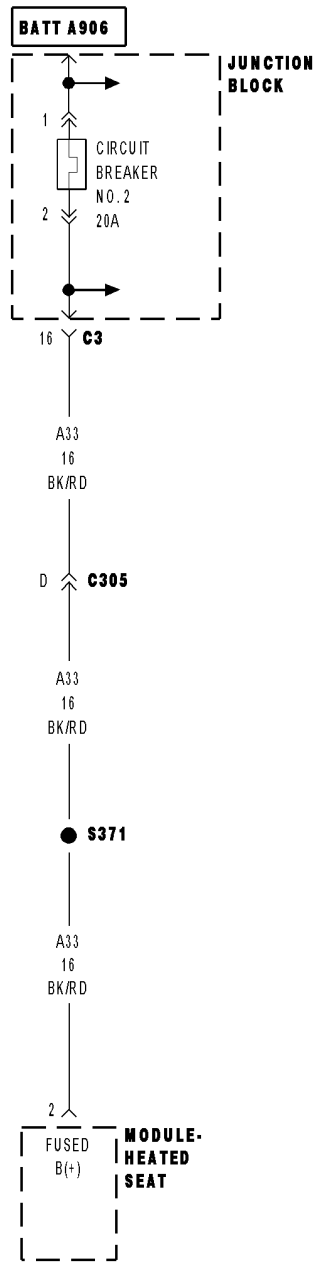

Perform BODY VERIFICATION TEST – VER 1.

No >> Repair the (A33) Fused B(+) circuit as necessary.

Perform BODY VERIFICATION TEST – VER 1.

B210E-BATTERY VOLTAGE HIGH

MODULE-HEATED SEAT

B210E-BATTERY VOLTAGE HIGH (CONTINUED)

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Engine running, during heated seat operation.
- **Set Condition:** This code is set immediately after the Heated Seat Module receives a high charging system voltage message over the CAN B Bus or detects voltage over 15 volts on the (A33) Fused B(+) circuit.

Possible Causes
CHARGING SYSTEM VOLTAGE HIGH (A33) FUSED B(+) CIRCUIT HEATED SEAT MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test**1. CHECK PCM FOR CHARGING SYSTEM DTC**

With the scan tool, read Powertrain Control Module DTC's.

Are there any Charging System DTC's set in the Powertrain Control Module?

- Yes** >> (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING) for Charging System diagnostic procedures.
- No** >> Go To 2

2. VERIFY THAT DTC B210E-BATTERY VOLTAGE HIGH IS ACTIVE

With the scan tool, record and erase DTC's

Turn the ignition switch to the Off position then start the engine and let run for one minute.

Attempt to operate the heated seats.

With the scan tool, read DTC's.

Does the DTC B210E-BATTERY VOLTAGE HIGH reset?

- Yes** >> Go To 3
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.

B210E-BATTERY VOLTAGE HIGH (CONTINUED)

3. CHECK THE VOLTAGE ON THE (A33) FUSED B(+) CIRCUIT

Disconnect the Heated Seat Module connector.

NOTE: Check connectors - Clean and repair as necessary.

Start the engine and let idle.

Measure the voltage on the (A33) Fused B(+) circuit at the HSM connector and compare to voltage at the vehicles battery.

Is the voltage at the HSM connector the same as measured at the battery?

Yes >> Replace the Heated Seat Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1.

No >> Repair the (A33) Fused B(+) circuit as necessary.

Perform BODY VERIFICATION TEST – VER 1.

814a7240

B221A-HEATED SEAT MODULE INTERNAL

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Ignition on.
- **Set Condition:** This code is set immediately if the Heated Seat Module internal self test fails.

Possible Causes
HEATED SEAT MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. VERIFY THAT DTC B221A-HEATED SEAT MODULE INTERNAL IS ACTIVE

With the scan tool, record and erase DTC's

Cycle the ignition switch off then back on.

With the scan tool, read DTC's.

Does the DTC B221A-HEATED SEAT MODULE INTERNAL reset?

- Yes** >> Replace the Heated Seat Module.
Perform BODY VERIFICATION TEST – VER 1.
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
Perform BODY VERIFICATION TEST – VER 1.
-

U0019-CAN B BUS - HSM

U0019–CAN B BUS – HSM (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Continuously
- **Set Condition:**
Whenever the Can B Bus (+) or B Bus (–) circuit is open, shorted to voltage or shorted to ground, this code will set.

Possible Causes
CAN B BUS DTC's IN FRONT CONTROL MODULE (D54) CAN B BUS (–) CIRCUIT OPEN (D55) CAN B BUS (+) CIRCUIT OPEN HEATED SEAT MODULE

Diagnostic Test**1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display U0019 CAN B BUS CIRCUIT?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. CHECK FRONT CONTROL MODULE DTC's

With the scan tool, read Front Control Module DTC's

Does the scan tool display any CAN B BUS DTC's – ACTIVE?

Yes >> Refer to the symptom list for problems related to Communication in the ELECTRICAL.– ELECTRONIC CONTROL MODULES – ELECTRICAL DIAGNOSES section.

No >> Go to 3

U0019-CAN B BUS – HSM (CONTINUED)

3. CAN B BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Heated Seat Module connector.

Disconnect the Front Control Module C1 connector.

Measure the resistance of the (D55) Can B Bus (+) circuit between the Front Control Module C1 connector and the Heated Seat Module connector.

Is the resistance below 2.0 ohms?

Yes >> Go To 4

No >> Repair the Can B Bus (+) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

4. CAN B BUS (-) CIRCUIT OPEN

Measure the resistance of the (D54) Can B Bus (-) circuit between the Front Control Module C1 connector and the Heated Seat Module connector.

Is the resistance below 2.0 ohms?

Yes >> Replace the Heated Seat Module.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the Can B Bus (-) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0154-LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE

For a complete wiring diagram Refer to Section 8W.

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0164-LOST COMMUNICATION WITH HVAC CONTROL MODULE

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM)

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0169-LOST COMMUNICATION WITH SUNROOF CONTROL MODULE

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0184-LOST COMMUNICATION WITH RADIO

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0195-LOST COMMUNICATION WITH SDARS

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0196-LOST COMMUNICATION WITH VEHICLE ENTERTAINMENT CONTROL MODULE

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0197-LOST COMMUNICATION WITH HANDS FREE PHONE

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0199-LOST COMMUNICATION WITH DRIVER DOOR MODULE

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0200-LOST COMMUNICATION WITH PASSENGER DOOR MODULE

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0209-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0212-LOST COMMUNICATION WITH SCCM

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0231-LOST COMMUNICATION WITH RAIN SENSING MODULE

For a complete wiring diagram Refer to Section 8W.

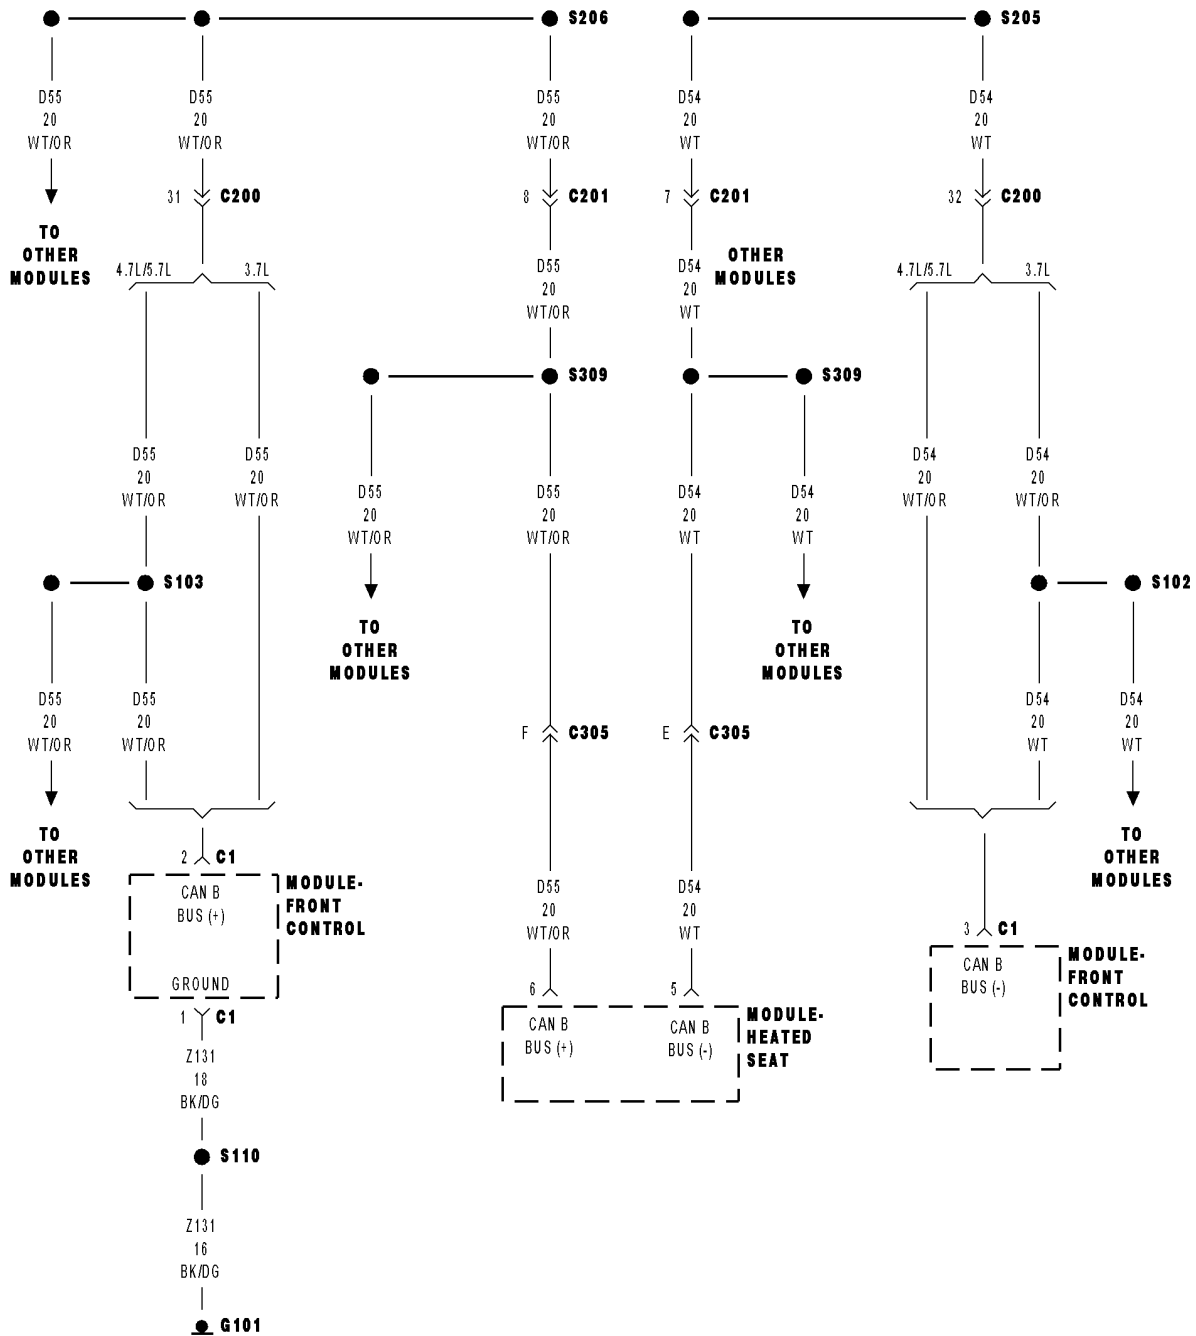

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0241-LOST COMMUNICATION WITH AUTO HIGHBEAM HEADLAMP CONTROL MODULE

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U1107-ECU IN SINGLE-WIRE MODE – HSM

U1107-ECU IN SINGLE-WIRE MODE – HSM (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Continuously
- **Set Condition:**
This code will set if either the Can B Bus (+) or (-) circuits are open.

Possible Causes
CAN B BUS DTC's IN FRONT CONTROL MODULE (D54) CAN B BUS (-) CIRCUIT OPEN (D55) CAN B BUS (+) CIRCUIT OPEN HEATED SEAT MODULE

Diagnostic Test**1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTC's.

Does the scan tool display U1107 ECU IN SINGLE-WIRE MODE?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

2. CHECK FRONT CONTROL MODULE DTC's

With the scan tool, read Front Control Module DTC's

Does the scan tool display any CAN B BUS DTC's – ACTIVE?

Yes >> Refer to the symptom list for problems related to Communication in the ELECTRICAL.– ELECTRONIC CONTROL MODULES – ELECTRICAL DIAGNOSES section.

No >> Go to 3

U1107-ECU IN SINGLE-WIRE MODE – HSM (CONTINUED)

3. CAN B BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Heated Seat Module connector.

Disconnect the Front Control Module C1 connector.

Measure the resistance of the (D55) Can B Bus (+) circuit between the Front Control Module C1 connector and the Heated Seat Module connector.

Is the resistance below 2.0 ohms?

Yes >> Go To 4

No >> Repair the Can B Bus (+) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

4. CAN B BUS (-) CIRCUIT OPEN

Measure the resistance of the (D54) Can B Bus (-) circuit between the Front Control Module C1 connector and the Heated Seat Module connector.

Is the resistance below 2.0 ohms?

Yes >> Replace the Heated Seat Module.
Perform BODY VERIFICATION TEST - VER 1.

No >> Repair the Can B Bus (-) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1.

BODY VERIFICATION TEST – VER 1

Diagnostic Test

1. Perform Body Verification Test

Disconnect all jumper wires and reconnect all previously disconnected components and connectors.

Ensure that all accessories are turned off.

Ensure that the battery is fully charged.

Turn the ignition on.

With the scan tool, record and erase DTCs from all modules.

If an electronic control module was replaced, select the applicable module from the scan tool menu and press “Misc. Functions”. If the module has programable features, program as necessary.

If repairs were made to any of the HVAC door actuator circuits, with the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. The test must pass before proceeding to the next step.

If repairs were made to any of the HVAC doors, linkage, door actuators, or door actuator circuits, with the scan tool in HVAC, select System Tests and then select Actuator Calibration Test. The test must pass before proceeding to the next step.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Operate all functions of the system that caused the original concern.

With the scan tool, select ECU View.

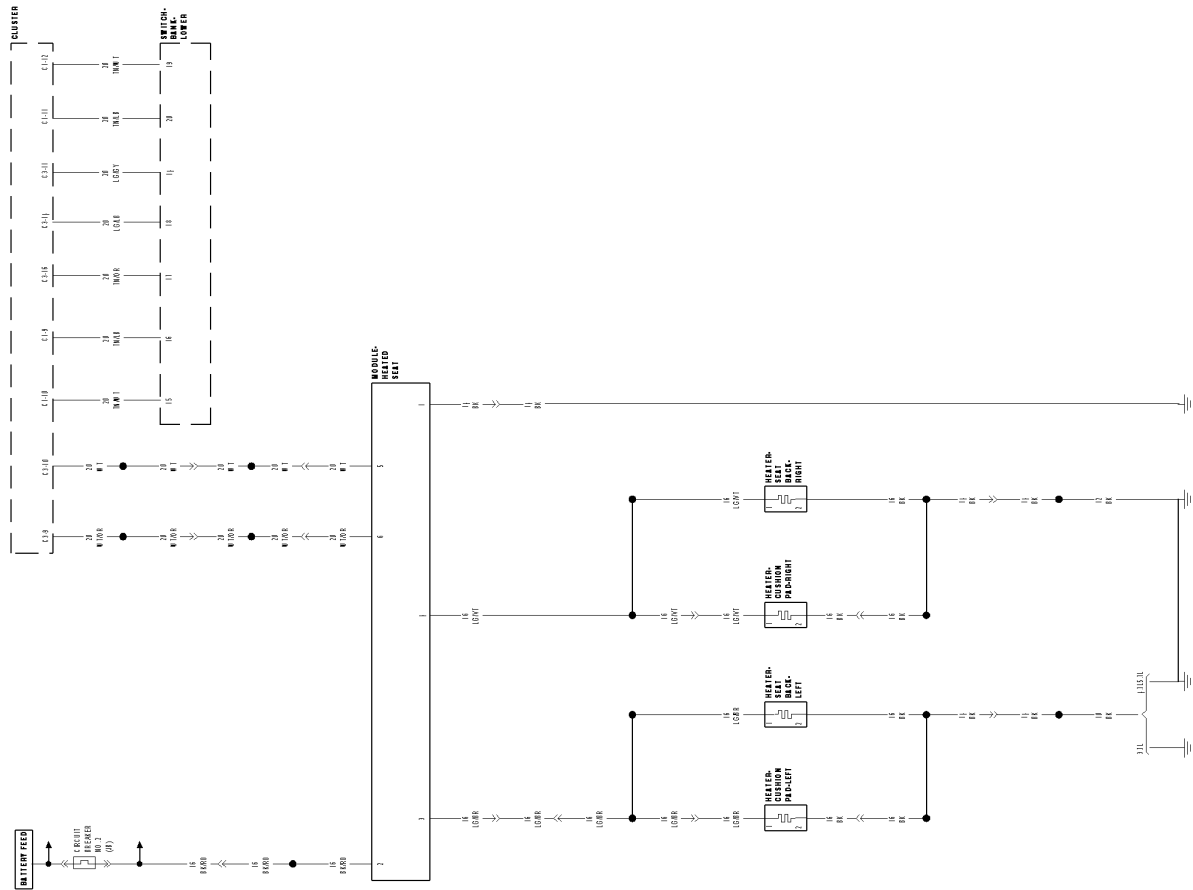

Check for DTCs in the modules.

Are DTCs present in any of the modules or is the original condition still present?

Yes >> The repair is not complete. Refer to the related category for the DTC or symptom that is still present.

No >> The repair is complete.

HEATED SEATS - SERVICE INFORMATION

DESCRIPTION

WARNING: The front passenger seat assembly contains critical components that affect the front passenger airbag deployment. Correctly functioning front passenger seat components are critical for the Occupant Classification System (OCS) to properly classify the front passenger and calculate the proper airbag deployment. Unapproved modifications or service procedures to the front passenger seat assembly, its related components, or trim cover may inadvertently change the airbag deployment in case of a frontal crash. This could result in death or serious injury to the front seat passenger if the vehicle is involved in an accident. The following requirements must be strictly adhered to:

- Do not modify the front passenger seat assembly or components in any way.
- Do not modify the front seat center console or center position seat in any way.
- Do not use prior or future model year seat trim covers not designated for the specific model being repaired. Always use the correct seat trim cover specified for the vehicle.
- Do not replace the seat trim cover with an aftermarket trim cover.
- Do not add a secondary trim cover other than those approved by DaimlerChrysler/Mopar.
- At no time should any Supplemental Restraint System (SRS) component or SRS related component or fastener be modified or replaced with any part except those which are approved by DaimlerChrysler/Mopar.

Vehicles with the heated seat option can be visually identified by the two heated seat switches located in the center stack of the instrument panel. The heated seat system allows the driver and front seat passenger to select from two different levels of electrical seat heating (HI/LO). The heated seat system for this vehicle includes the following major components, which are described in further detail later in this section:

- **Heated Seat Elements** - Four heated seat elements are used per vehicle. Two heated seat elements are integral to each seat, one in the seat back and the other in the seat cushion.
- **Heated Seat Module** - One heated seat module is used per vehicle. The Heated Seat Module is mounted under the right front seat. This module contains the control logic and software for the front heated seat system. The module communicates on the Controller Area Network (CAN) data bus.
- **Heated Seat Switches** - Two heated seat switches are used per vehicle, one for each heated seat. Both switches are mounted in the instrument panel center stack.
- **Instrument Cluster (CCN)** - A Cab Compartment Node (CCN) is part of the instrument cluster on this vehicle. The CCN utilizes integrated software and information carried on the CAN data bus. The CCN serves as the link between the heated seat switches and the heated seat module.

OPERATION

The heated seat system operates on battery current received through a fuse in the Integrated Power Module (IPM). Fused ignition switch output (run) circuits are used, so that the heated seat system will only operate when the ignition switch is in the On position. The heated seat system will turn Off automatically whenever the ignition switch is turned to any position except On.

A Heated Seat Module is used to control the heated seat system. The module responds to heated seat switch messages and ignition switch status inputs by controlling the 12v output to the front seat heating elements through integral solid-state relays.

When either of the heated seat switches are depressed a resistance signal is sent to the Cab Compartment Node (CCN) or instrument cluster. The CCN then sends a message via the Controller Area Network (CAN) data bus to the heated seat module, signaling the module to energize the heating element for the selected seat. Amber Light Emitting Diodes (LEDs) in the top portion of each switch indicate the level of heat in use: Two LEDs are illuminated for high, one for low, and none for off. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

The heated seat module energizes an integral solid-state relay, which supplies battery current to the heating elements. When high-temperature heating is selected, the heaters provide a boosted heat level during the first four minutes of operation after heating is activated. The heat output then drops to the normal high-temperature level. If high-level heating is selected, the control system will automatically switch to the low level after two hours of continuous operation. At that time, the number of illuminated LEDs changes from two to one, indicating the change. Operation on the low setting also turns off automatically after two hours.

The module will automatically turn off the heating elements if it detects an OPEN or LOW short in the heating element circuit.

DIAGNOSIS AND TESTING

HEATED SEAT SYSTEM

In order to obtain conclusive testing, the heated seat system and the Controller Area Network (CAN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.7v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the heated seat system is attempted, the battery should be fully-charged.

HEATER-CUSHION PAD

DESCRIPTION

Vehicles equipped with the optional heated seat system have two, carbon fiber heated seat elements, located in each front seat. One heating element is used for each seat cushion and another for each seat back.

Each of the heated seat element consists of multiple heating circuits operating in parallel throughout the carbon fiber element. The heated seat elements are captured between the leather trim cover and the seat cushion assembly. If a malfunction occurs in one or more of the individual carbon fiber circuits, the others will continue to provide heat.

The heated seat elements cannot be repaired. If found to be damaged or inoperative, a new heating element assembly must be installed.

OPERATION

One end of the heated seat element is connected to ground at all times through a splice under the seat. Battery current is directed to the other end of the heated seat element by the heated seat module. The heated seat module will energize the heated seat element when the heated seat switch is depressed in the Low or High position.

As electrical current passes through the heated seat element, the resistance of the wire used in the element disperses some of the electrical current in the form of heat. The heat produced by the heated seat element then radiates through the underside of the seat cushion and seat back trim covers, warming the seat cover and its occupant.

DIAGNOSIS AND TESTING

HEATED SEAT ELEMENT

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

The wire harness connectors (2&3) for the heating elements are located under the seat (1).

NOTE: When checking heated seat elements for continuity, be certain to move the heating element being checked. Moving the element, such as sitting in the seat will eliminate the possibility of an intermittent open in the element which would only be evident if the element was in a certain position. Failure to check the element in various positions could result in an incomplete test.

1. Locate and disconnect the seat electrical connector.
2. Check the resistance between the circuit leading in and out of the suspect heated seat element. The resistance should be between 3.8 - 4.8 ohms for a seat cushion element and 4.3 - 5.4 ohms for a seat back element. If OK, (Refer to 8 - ELECTRICAL/ HEATED SEATS - DIAGNOSIS AND TESTING). If not OK, replace the inoperative heated seat element.

811c4f26

REMOVAL

NOTE: Do not remove the factory installed heating elements (3) from the seat or seat back cushions. The original element is permanently attached and cannot be removed without permanent damage. The replacement heating element is designed to be applied directly on top of the inoperative factory installed heating element.

1. Disconnect and isolate the battery negative cable.
2. Remove the appropriate seat cushion, (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - REMOVAL) or seat back trim cover, (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION / COVER - REMOVAL).
3. Disconnect the inoperative heated seat cushion or seat back element electrical connectors (2).
4. Locate the wires leading from the inoperative heating element and cut them off flush with the edge of the original heating element.

INSTALLATION

1. Peel off the adhesive backing on the back of the replacement heating element (2) and stick directly on top of the factory installed heating element (1).

CAUTION: During the installation of the replacement heating element, be careful not to fold or crease the element assembly. Folds or creases will cause premature failure.

2. Connect the new heating element electrical connectors (3&4).
3. Connect the battery negative cable.
4. Verify heated seat system operation.
5. Install the appropriate seat cushion, (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - INSTALLATION) or seat back trim cover, (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION / COVER - INSTALLATION).

NOTE: Make certain the seat wire harness is correctly routed through the seat and seat back. The excess wire between the cushion and back elements should be securely tucked between the rear of the cushion foam and the rear carpet flap of the trim cover.

MODULE-HEATED SEATS

DESCRIPTION

The heated seat module (3) is located under the right front seat (1). It has a single electrical connector (2) and four locking tabs that secure it to the mounting bracket (4). The module can be accessed from under the front right seat with the seat in the full back position. The mounting bracket (4) is bolted to the seat frame assembly (5).

The heated seat module is a microprocessor designed to use Controller Area Network (CAN) data bus messages from the instrument cluster also known as the Cabin Compartment Node (CCN). The CCN receives inputs from the heated seat switches and in turn signals the heated seat module to operate the heated seat elements for both front seats.

OPERATION

The heated seat module operates on fused battery current received from the ignition switch. The module is grounded to the body at all times through the electrical connector. Inputs to the module include Controller Area Network (CAN) data bus messages and standard hardwired 12volt power and ground. In response to the CAN inputs the heated seat module will control the battery current to the appropriate heated seat elements.

When a heated seat switch CAN data bus signal is received by the heated seat module, the module energizes the selected heated seat element. The Low heat set point is about 38C (100.4°F), and the High heat set point is about 42C (107.6°F).

If the heated seat module detects a heated seat element OPEN or SHORT circuit, it will record and store the appropriate diagnostic trouble code (DTC).

DIAGNOSIS AND TESTING

HEATED SEAT MODULE

In order to obtain conclusive testing, the heated seat system and the Controller Area Network (CAN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.7v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the heated seat system is attempted, the battery should be fully-charged.

REMOVAL

CAUTION: The Heated Seat Module mounting tabs can be damaged during module removal and installation. Use care to properly align tabs to prevent binding that could result in tab breakage.

1. Position the right front seat to the full rearward position.
2. Disconnect and isolate the battery negative cable.
3. Disconnect the wire harness connector (2) from the heated seat module (3).
4. Unsnap the heated seat module retaining clips from the mounting bracket (4).
5. Remove the heated seat module (3) from the vehicle.

8145010d

INSTALLATION

CAUTION: The Heated Seat Module mounting tabs can be damaged during module removal and installation. Use care to properly align tabs to prevent binding that could result in tab breakage.

1. Install the heated seat module (2) into the vehicle.
2. Position the retaining clips (1) with the retaining holes (3) in the mounting bracket (4). Firmly apply even pressure to the module (2) until all four retaining clips (1) snap into place.

3. Connect the wire harness connector (2) to the heated seat module (3).
4. Connect the battery negative cable.
5. Check for proper heated seat system operation.

SWITCH-HEATED SEAT

DESCRIPTION

The heated seat switches are both mounted in the instrument panel. The two switches are part of the lower instrument panel switch pod assembly. If either of the switches is damaged or inoperative the complete switch pod assembly must be replaced.

Each heated seat switch provides a resistor-multi-plexed signal to the Cab Compartment Node (CCN). Amber Light Emitting Diodes (LEDS) in the top portion of each switch indicate the level of heat in use: Two LEDs are illuminated for high, one for low, and none for off. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

The LED indicator lamps in each heated seat switch cannot be repaired. If the LED lamps are inoperative or damaged, or the switch is inoperative or damaged the complete switch pod assembly must be replaced.

OPERATION

The heated seat switches receive battery current through a fused ignition switch output (run) circuit when the ignition switch is in the On position. Depressing the heated seat switch provides a hard-wired resistor multiplexed signal to the Cabin Compartment Node (CCN). The CCN is responsible for supplying the Controller Area Network (CAN) data bus message to the heated seat module, signaling the module to power the heated seat element of the selected seat and maintain the temperature setting.

If the heated seat switch is depressed to a different position (Low or High) than the currently selected state, the CCN will go through the process again to change the temperature setting. If a heated seat switch is depressed a second time to the same position as the currently selected state, the CCN and heated seat module interprets the second input as a request to turn the seat heater OFF. The CCN will then signal the heated seat module to turn the heated seat elements for that seat off.

DIAGNOSIS AND TESTING

HEATED SEAT SWITCH

In order to obtain conclusive testing, the heated seat system and the Controller Area Network (CAN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.0v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the heated seat system is attempted, the battery should be fully-charged.

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument panel center bezel, (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).
3. Remove the lower instrument panel switch pod fasteners.
4. Remove the lower instrument panel switch pod from the vehicle.

INSTALLATION

NOTE: There are different instrument panel switch pods available based on the option content of the vehicle. Ensure the switch pod being installed matches the vehicle options.

1. Position the lower instrument panel switch pod into the instrument panel center bezel.
2. Install the lower instrument panel switch pod fasteners.
3. Install the instrument panel center bezel, (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).
4. Connect the battery negative cable.
5. Verify heated seat system operation.

DIAGNOSIS AND TESTING

B2336-HORN CONTROL CIRCUIT LOW – FCM

B2336–HORN CONTROL CIRCUIT LOW – FCM (CONTINUED)

For the Horn System circuit diagram (Refer to 8 - ELECTRICAL/HORN - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
Continuously
- **Set Condition:**
If the Front Control Module (FCM) senses either excessively low or no voltage on the (X4) Horn Relay Control circuit.

Possible Causes
(A43) FUSED B(+) CIRCUIT SHORTED TO GROUND
(X4) HORN RELAY CONTROL CIRCUIT SHORTED TO GROUND
(A1) / (A913) CIRCUIT OPEN TO HORN FUSE
(A43) FUSED B(+) CIRCUIT OPEN
(X4) HORN RELAY CONTROL CIRCUIT OPEN
HORN FUSE
HORN RELAY
INTEGRATED POWER MODULE (IPM)
FRONT CONTROL MODULE (FCM)

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.
 With the scan tool, record and erase DTCs.
 Operate the Horn Switch several times.
 Cycle the ignition from on to off 3 times and leave on.
 With the scan tool, read DTCs.

Does the scan tool display: B2336 HORN CONTROL CIRCUIT LOW?

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
 Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B2336-HORN CONTROL CIRCUIT LOW – FCM (CONTINUED)**2. CHECK THE HORN FUSE**

Turn the ignition off.

Remove and inspect the Horn fuse.

Is the Horn Fuse open?

Yes >> Go To 3

No >> Reinstall the Horn Fuse. Then, Go To 7.

**3. CHECK FOR A SHORTED HORN RELAY**

Install a known good relay in place of the Horn Relay.

Replace the Horn fuse.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Operate the Horn Switch several times.

Cycle the ignition from on to off 3 times and leave on.

With the scan tool, read DTCs.

Does the scan tool display: B2336 HORN CONTROL CIRCUIT LOW?

Yes >> Go To 4

No >> Replace the original Horn Relay.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B2336-HORN CONTROL CIRCUIT LOW – FCM (CONTINUED)

4. CHECK THE (A43) FUSED B(+) CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Remove the Horn Relay.

Remove the Horn Fuse.

Measure the resistance of the (A43) Fused B(+) circuit between ground and Cavity 86 of the Horn Relay connector in the Integrated Power Module (IPM).

Measure the resistance of the (A43) Fused B(+) circuit between ground and Cavity 30 of the Horn Relay connector in the Integrated Power Module (IPM).

Is the resistance below 10000.0 ohms?

Yes >> Replace the Integrated Power Module (IPM) in accordance with the Service Information.
 Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 5

5. CHECK THE (X4) HORN RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

Remove the Front Control Module (FCM) in accordance with the Service Information.

Measure the resistance of the (X4) Horn Relay Control circuit between ground and Cavity 85 of the Horn Relay connector in the Integrated Power Module (IPM).

Is the resistance below 10000.0 ohms?

Yes >> Replace the Integrated Power Module (IPM) in accordance with the Service Information.
 Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Front Control Module (FCM) in accordance with the Service Information. Then, Go To 6.

B2336-HORN CONTROL CIRCUIT LOW – FCM (CONTINUED)**6. CHECK FOR A SHORTED INTEGRATED POWER MODULE (IPM)**

Install the original Horn Relay.

Replace the Horn fuse.

Turn the ignition on.

With the scan tool, record and erase DTCs.

Operate the Horn Switch several times.

Cycle the ignition from on to off 3 times and leave on.

With the scan tool, read DTCs.

Does the scan tool display: B2336 HORN CONTROL CIRCUIT LOW?

- Yes** >> Replace the Integrated Power Module (IPM) in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**7. CHECK FOR POWER TO THE HORN FUSE**

Turn the ignition on.

Using a 12-volt test light connected to ground, check for power to the Horn Fuse.

Does the test light illuminate brightly?

- Yes** >> Go To 8
- No** >> Repair the (A1) / (A913) circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B2336-HORN CONTROL CIRCUIT LOW – FCM (CONTINUED)

8. CHECK FOR AN OPEN HORN RELAY

Turn the ignition off.
 Install a known good relay in place of the Horn Relay.
 Turn the ignition on.
 With the scan tool, record and erase DTCs.
 Operate the Horn Switch several times.
 Cycle the ignition from on to off 3 times and leave on.
 With the scan tool, read DTCs.

Does the scan tool display: B2336 HORN CONTROL CIRCUIT LOW?

- Yes** >> Go To 9
- No** >> Replace the original Horn Relay.
 Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

9. CHECK THE (A43) FUSED B(+) CIRCUIT FOR AN OPEN

Turn the ignition off.
 Remove the Horn Relay.
 Remove the Horn Fuse.
 Measure the resistance of the (A43) Fused B(+) circuit between the Horn Fuse (output cavity) and Cavity 86 of the Horn Relay connector in the Integrated Power Module (IPM).
 Measure the resistance of the (A43) Fused B(+) circuit between the Horn Fuse (output cavity) and Cavity 30 of the Horn Relay connector in the Integrated Power Module (IPM).

Is the resistance below 5.0 ohms?

- Yes** >> Go To 10
- No** >> Replace the Integrated Power Module (IPM) in accordance with the Service Information.
 Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B2336-HORN CONTROL CIRCUIT LOW - FCM (CONTINUED)**10. CHECK THE (X4) HORN RELAY CONTROL CIRCUIT FOR AN OPEN**

Remove the Front Control Module (FCM) in accordance with the Service Information.

Measure the resistance of the (X4) Horn Relay Control circuit between Cavity 85 of the Horn Relay connector in the Integrated Power Module (IPM) and Cavity 47 of the FCM 49-Way connector.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Front Control Module (FCM) in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Integrated Power Module (IPM) in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B2337-HORN CONTROL CIRCUIT HIGH – FCM

B2337–HORN CONTROL CIRCUIT HIGH – FCM (CONTINUED)

For the Horn System circuit diagram (Refer to 8 - ELECTRICAL/HORN - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Continuously
- **Set Condition:**
If the Front Control Module (FCM) senses excessive voltage on the (X4) Horn Relay Control circuit.

Possible Causes
(X4) HORN RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE HORN RELAY INTEGRATED POWER MODULE (IPM) FRONT CONTROL MODULE (FCM)

Diagnostic Test**1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Operate the Horn Switch several times.

Cycle the ignition from on to off 3 times and leave on.

With the scan tool, read DTCs.

Does the scan tool display: B2337 HORN CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR A SHORTED HORN RELAY

Turn the ignition off.

Install a known good relay in place of the Horn Relay.

Turn the ignition on.

With the scan tool erase DTCs.

Operate the Horn Switch several times.

Cycle the ignition from on to off 3 times and leave on.

With the scan tool, read DTCs.

Does the scan tool display: B2337 HORN CONTROL CIRCUIT HIGH?

Yes >> Go To 3

No >> Replace the original Horn Relay.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B2337-HORN CONTROL CIRCUIT HIGH – FCM (CONTINUED)

3. CHECK THE (X4) HORN RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Remove the Horn Relay.

Remove the Front Control Module (FCM) in accordance with the Service Information.

Turn the ignition on.

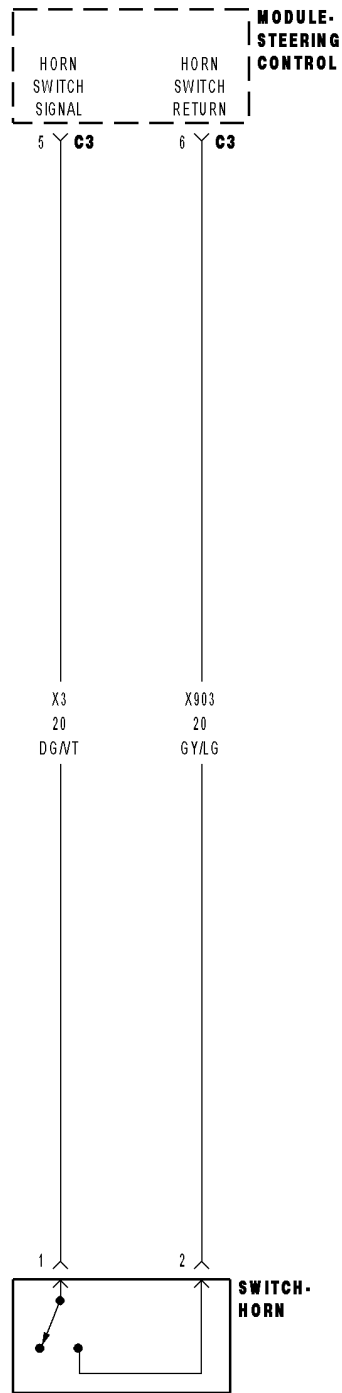

Measure the voltage of the (X4) Horn Relay Control circuit.

Is the voltage above 0.2 volts?

- Yes** >> Replace the Integrated Power Module (IPM) in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Front Control Module (FCM) in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B2339-HORN SWITCH STUCK — SCCM

B2339–HORN SWITCH STUCK — SCCM (CONTINUED)

For the Horn System circuit diagram (Refer to 8 - ELECTRICAL/HORN - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The Horn Switch connects to the Steering Column Control Module (SCCM) via a serial sub-bus called the LIN bus. The SCCM monitors the Horn Switch status. When the switch status changes (switch is pressed or released), the SCCM processes the request and broadcasts it on the CAN B Bus where it is read and processed by the Front Control Module (FCM).

- **When Monitored:**
Continuously.
- **Set Condition:**
If the Steering Column Control Module (SCCM) senses that the Horn Switch is in the Set position for more than 50 seconds.

Possible Causes
(X3) HORN SWITCH SIGNAL CIRCUIT SHORTED TO (X903) HORN SWITCH RETURN CIRCUIT (X3) HORN SWITCH SIGNAL CIRCUIT SHORTED TO GROUND HORN SWITCH STEERING COLUMN CONTROL MODULE (SCCM)

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

NOTE: If DTC P0562 BATTERY VOLTAGE LOW or DTC P0563 BATTERY VOLTAGE HIGH is active along with this DTC, diagnose and repair the battery voltage related DTC first.

Turn the ignition on.

With the Scan Tool, select View DTCs in the Steering Column Control Module (SCCM).

Does the scan tool display DTC B2339 HORN SWITCH STUCK active?

Yes >> Go To 2

No >> The conditions necessary to set this DTC are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. In addition, wiggle test the wiring and connectors while monitoring the scan tool data relative to this circuit. Look for the data to change or for the DTC to set as active during the wiggle test. Repair as necessary.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B2339-HORN SWITCH STUCK — SCCM (CONTINUED)**2. TEST THE HORN SWITCH**

Turn the ignition off.

Remove the Driver Airbag in accordance with the Service information.

Disconnect the Horn Switch connector.

Measure the resistance between the (X3) Horn Switch Signal circuit and the (X903) Horn Switch Return circuit in the Horn Switch while pressing and releasing the switch several times.

Does the ohmmeter reading indicate continuity when the switch is pressed and no continuity when the switch is released?

Yes >> Go To 3

No >> Replace the Horn Switch in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. CHECK THE (X3) HORN SWITCH SIGNAL CIRCUIT FOR A SHORT TO THE (X903) HORN SWITCH RETURN CIRCUIT

Disconnect the Steering Control Module C3 connector.

Measure the resistance between the (X3) Horn Switch Signal circuit and the (X903) Horn Switch Return circuit in the Horn Switch Connector.

Is the resistance below 10000.0 ohms?

Yes >> Repair the (X3) Horn Switch Signal circuit for a short to the (X903) Horn Switch Return circuit.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

B2339-HORN SWITCH STUCK — SCCM (CONTINUED)

4. CHECK THE (X3) HORN SWITCH SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (X3) Horn Switch Signal circuit in the Horn Switch Connector.

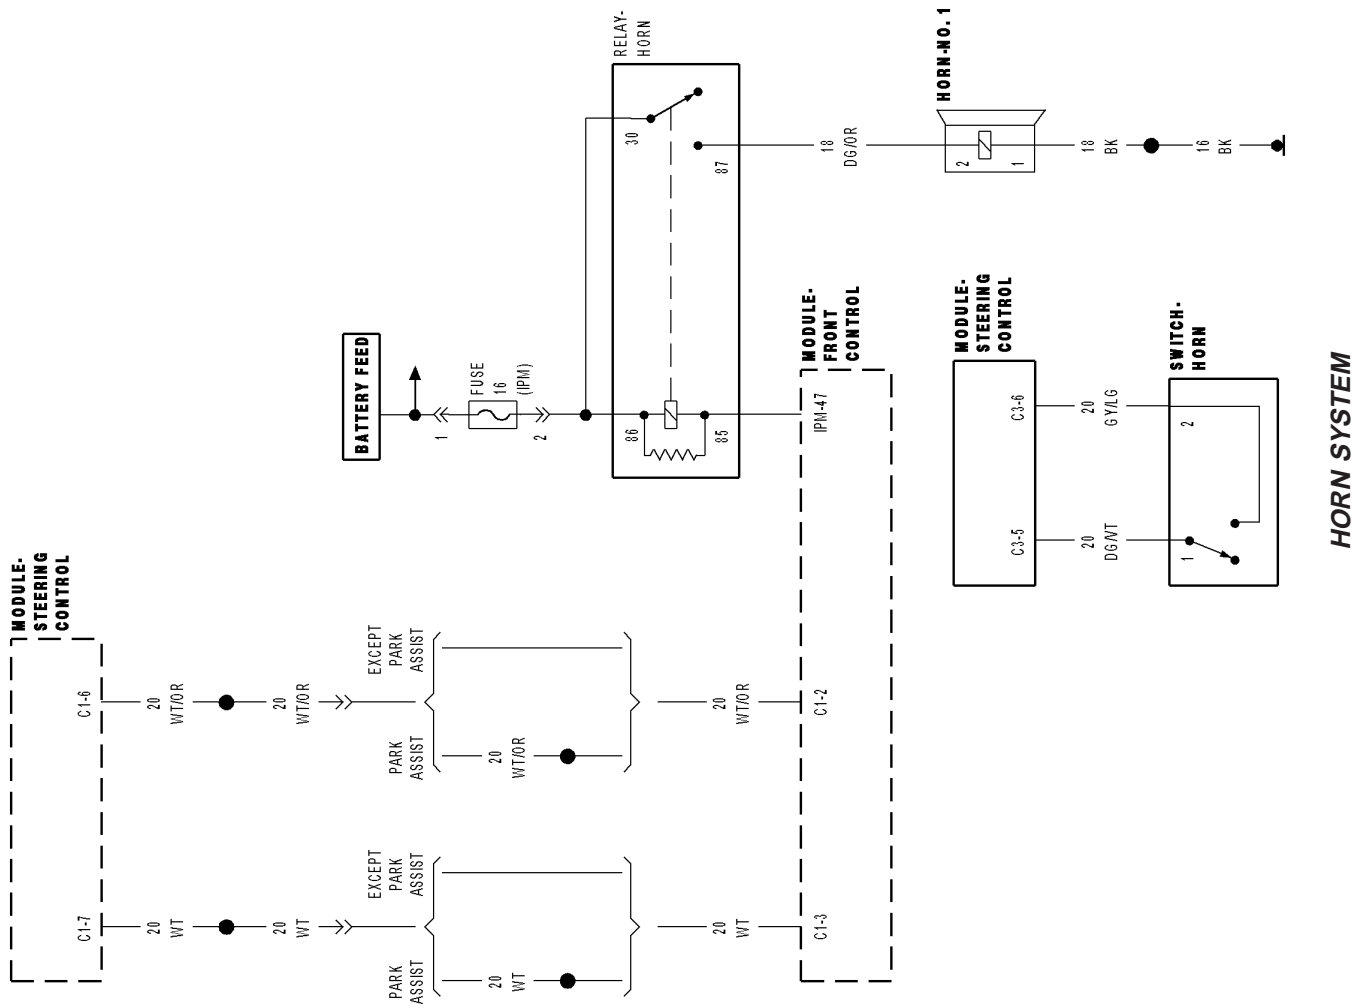

Is the resistance below 10000.0 ohms?

- Yes** >> Repair the (X3) Horn Switch Signal circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Steering Column Control Module (SCCM) in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

HORN SYSTEM - SERVICE INFORMATION

DESCRIPTION

The dual-note horn system features dual electromagnetic horn units. The horn system includes the following major components:

- **Horn** - The two horns are located on the right side of the vehicle behind the fascia.
- **Horn Switch** - The horn switch is located in the driver airbag trim cover.

OPERATION

The horn system operates on battery current received through a fuse in the Integrated Power Module (IPM). The horn system circuit is designed so that the system will remain operational, regardless of the ignition switch position.

DIAGNOSIS AND TESTING - HORN SYSTEM

The most reliable, efficient, and accurate means to diagnose the horn system requires the use of a scan tool and the proper Diagnostic Procedures information.

Refer to the appropriate wiring information.

In most cases, any problem involving continually sounding horns can be quickly alleviated by removing the horn fuse from the Integrated Power Module (IPM).

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

HORN

DIAGNOSIS AND TESTING

HORN

The most reliable, efficient, and accurate means to diagnose the horn system requires the use of a scan tool and the proper Diagnostic Procedures information.

Refer to the appropriate wiring information.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Raise and support the vehicle.
3. Remove the lower front half of the inner liner from the right front fender wheel house.
4. Disconnect the electrical harness connectors.
5. Remove the mounting fastener.
6. Remove both horns and the mounting bracket as a unit.

INSTALLATION

1. Position both horns and the mounting bracket.
2. Install and tighten the mounting fastener.
3. Connect the electrical harness connectors.
4. Install the lower front half of the inner liner to the right front fender wheel house.
5. Lower the vehicle.
6. Connect the battery negative cable.

SWITCH-HORN

DESCRIPTION

A center-blow, normally open, resistive membrane-type horn switch is secured in a plastic tray that is inserted in a pocket sewn on the front of the driver side airbag retainer strap. The horn switch is concealed behind the driver side airbag module trim cover.

The steering wheel and steering column must be properly grounded in order for the horn switch to function properly. The horn switch and plastic tray are serviced as a unit. If the horn switch is damaged or inoperative, or if the driver side airbag is deployed, the horn switch and tray must be replaced as a unit.

DIAGNOSIS AND TESTING

HORN SWITCH

The most reliable, efficient, and accurate means to diagnose the horn system requires the use of a scan tool and the proper Diagnostic Procedures information.

For complete circuit diagrams, refer to the appropriate wiring information.

WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

1. Disconnect and isolate the battery negative cable.
2. Remove the trim cover from the driver side airbag. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).
3. Remove the horn switch (2) and tray (6) as a unit from the pouch on the retaining strap of the driver side airbag (5)

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

1. Install the horn switch (2) and tray as a unit into the pouch on the retaining strap of the driver side airbag (5).

NOTE: Be certain that the tray is facing the airbag module, that the horn switch is facing the trim cover, that the horn switch feed wire is on the left, and that the horn switch ground wire is on the right.

2. Install the trim cover onto the driver side airbag. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION) for the procedure.
3. Connect the battery negative cable.

IGNITION SYSTEMS - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B211E-IGNITION RUN/ACC/PAD CONTROL CIRCUIT LOW

B211E-IGNITION RUN/ACC/PAD CONTROL CIRCUIT LOW (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Front Control Module will set this DTC within 500ms if the (P305) Accessory Delay Relay Control circuit is open or shorted to ground.

Possible Causes
(P305) ACCESSORY DELAY RELAY CONTROL CIRCUIT OPEN (P305) ACCESSORY DELAY RELAY CONTROL CIRCUIT SHORTED TO GROUND ACCESSORY DELAY RELAY FRONT CONTROL MODULE

Diagnostic Test**1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. ACCESSORY DELAY RELAY

Turn the ignition off.

Install a substitute relay in place of the original Accessory Delay Relay.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active FCM DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 3

No >> Replace the original Accessory Delay Relay.
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

B211E-IGNITION RUN/ACC/PAD CONTROL CIRCUIT LOW (CONTINUED)**3. (P305) ACCESSORY DELAY RELAY CONTROL CIRCUIT OPEN**

Turn the ignition off.

Remove the FCM from the Integrated Power Module.

Remove the Accessory Delay Relay from the Rear Junction Block.

Measure the resistance of the (P305) Accessory Delay Relay Control circuit from the Front Control Module IPM connector to the Relay connector.

Is the resistance below 10.0 ohms?

Yes >> Go To 4

No >> Repair the (P305) Accessory Delay Relay Control circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**4. (P307) ACCESSORY DELAY RELAY CONTROL CIRCUIT SHORTED TO GROUND**

Measure the resistance between ground and the (P305) Accessory Delay Relay Control circuit at the relay cavity (85).

Is the resistance below 100.0 ohms?

Yes >> Repair the (P305) Accessory Delay Relay Control circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

No >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

B211F-IGNITION RUN/ACC/PAD CONTROL CIRCUIT HIGH

B211F-IGNITION RUN/ACC/PAD CONTROL CIRCUIT HIGH (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Front Control Module will set this DTC within 500ms if the (P305) Ignition Run/Acc/Pad Relay Control circuit is shorted to voltage.

Possible Causes
(P305) ACCESSORY DELAY RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE ACCESSORY DELAY RELAY FRONT CONTROL MODULE

Diagnostic Test**1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. ACCESSORY DELAY RELAY

Turn the ignition off.

Install a substitute relay in place of the original Accessory Delay Relay.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active FCM DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 3

No >> Replace the original relay.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

B211F-IGNITION RUN/ACC/PAD CONTROL CIRCUIT HIGH (CONTINUED)

3. (P305) ACCESSORY DELAY RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Remove the FCM from the Integrated Power Module.

Remove the Accessory Delay Relay from the Rear Junction Block.

Turn the ignition on.

Measure the voltage of the (P305) Accessory Delay Relay Control circuit at the relay connector (cavity 85).

Is there any voltage present?

- Yes** >> Repair the (P305) Accessory Delay Relay Control circuit for a short to voltage.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Inspect the wiring and connectors for damage or shorted circuits. If OK, replace and program the Front Control Module in accordance with the service information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

81468eb3

B2120-IGNITION RUN/ACC/PAD CONTROL CIRCUIT OPEN

B2120-IGNITION RUN/ACC/PAD CONTROL CIRCUIT OPEN (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Front Control Module will set this DTC within 500ms if the (P305) Ignition Accessory Delay Relay Control circuit is open.

Possible Causes
(P305) ACCESSORY DELAY RELAY CONTROL CIRCUIT OPEN ACCESSORY DELAY RELAY FRONT CONTROL MODULE

Diagnostic Test**1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. ACCESSORY DELAY RELAY

Turn the ignition off.

Install a substitute relay in place of the original Accessory Delay Relay.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active FCM DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 3

No >> Replace the original Accessory Delay Relay.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

B2120-IGNITION RUN/ACC/PAD CONTROL CIRCUIT OPEN (CONTINUED)**3. (P305) ACCESSORY DELAY RELAY CONTROL CIRCUIT OPEN**

Turn the ignition off.

Remove the FCM from the Integrated Power Module.

Remove the Accessory delay Relay from the Rear Junction Block.

Measure the resistance of the (P305) Accessory Delay Relay Control circuit from the FCM-IPM connector to the relay connector.

Is the resistance below 10.0 ohms?

No >> Repair the (P305) Accessory Delay Relay Control circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

Yes >> Inspect the wiring and connectors for damage or shorted circuits. If OK, replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

IGNITION SYSTEM - SERVICE INFORMATION

DESCRIPTION

The ignition system is controlled by the Powertrain Control Module (PCM) on all engines.

3.7L V-6 ENGINE

The 3.7L V-6 engine uses a separate ignition coil for each cylinder. The one-piece coil bolts directly to the cylinder head. Rubber boots seal the secondary terminal ends of the coils to the top of all 6 spark plugs. A separate electrical connector is used for each coil.

Because of coil design, spark plug cables (secondary cables) are not used. A distributor is not used with the 3.7L engine.

Two knock sensors (one for each cylinder bank) are used to help control spark knock.

The Auto Shutdown (ASD) relay provides battery voltage to each ignition coil.

The ignition system consists of:

- 6 Spark Plugs
- 6 Separate Ignition Coils
- 2 Knock Sensors
- Powertrain Control Module (PCM)
- Also to be considered part of the ignition system are certain inputs from the Crankshaft Position, Camshaft Position, Throttle Position, 2 knock and MAP Sensors

4.7L V-8 ENGINE

The 4.7L V-8 engine uses a separate ignition coil for each cylinder. The one-piece coil bolts directly to the cylinder head. Rubber boots seal the secondary terminal ends of the coils to the top of all 8 spark plugs. A separate electrical connector is used for each coil.

Because of coil design, spark plug cables (secondary cables) are not used. A distributor is not used with the 4.7L engine.

Two knock sensors (one for each cylinder bank) are used to help control spark knock.

The Auto Shutdown (ASD) relay provides battery voltage to each ignition coil.

The ignition system consists of:

- 8 Spark Plugs
- 8 Separate Ignition Coils
- 2 Knock Sensors
- Powertrain Control Module (PCM)
- Also to be considered part of the ignition system are certain inputs from the Crankshaft Position, Camshaft Position, Throttle Position, 2 knock and MAP Sensors

5.7L V-8 ENGINE

For additional information, also refer to Ignition Coil Description and Operation.

The 5.7L V-8 engine is equipped with 16 spark plugs. Two plugs are used for each cylinder. The 5.7L is also equipped with 8 separate and independent ignition coils. The one-piece coil bolts directly to the cylinder head cover and attaches the coils secondary output terminal directly to a spark plug using a rubber boot seal. Each coil is also equipped with a second output terminal. This second terminal connects a conventional spark plug cable directly to a spark plug on the opposite cylinder bank. A separate primary electrical connector is used for each coil.

Eight conventional spark plug cables are used with the 5.7L. These cables connect a coil on one cylinder bank, directly to a spark plug on the opposite cylinder bank. The cables are placed and routed in a special plastic loom to keep them separated. This loom is clipped to the intake manifold. To prevent a mismatch of cables, a corresponding spark plug / coil number is displayed on each plug cable: 1/6, 2/3, 4/7 and 5/8. These numbers (2) and (3) can also be found on the top of the intake manifold (1) to the right of the throttle body.

Two knock sensors (one for each cylinder bank) are used to help control spark knock.

The 5.7L engine will not use a conventional distributor.

The ignition system consists of:

- 16 Spark Plugs (2 per cylinder)
- 8 Separate, Dual-Secondary Output, Ignition Coils
- 2 Knock Sensors
- 8 Secondary Ignition Cables
- Powertrain Control Module (PCM)
- Also to be considered part of the ignition system are certain inputs from the Crankshaft Position, Camshaft Position, Throttle Position, 2 knock and MAP Sensors

SPECIFICATIONS

TORQUE - IGNITION

DESCRIPTION	N-m	Ft. Lbs.	In. Lbs.
Camshaft Position Sensor - 3.7L V-6 Engine	12	-	106

** Spark Plugs - 5.7L V-8 Engine	18 (± 3)	13 (± 2)	-
* Do not apply any sealant, thread-locker or adhesive to bolts. Poor sensor performance may result.			
** Torque critical tapered design. Do not exceed 15 ft. lbs.			

ENGINE FIRING ORDER - 3.7L V-6

1 - 6 - 5 - 4 - 3 - 2

ENGINE FIRING ORDER – 4.7L V-8

FIRING ORDER / CABLE ROUTING – 5.7L V-8 ENGINE

Eight conventional spark plug cables are used with the 5.7L. These cables connect a coil on one cylinder bank, directly to a spark plug on the opposite cylinder bank. The cables are placed and routed in a special plastic loom to keep them separated. This loom is clipped to the intake manifold. To prevent a mismatch of cables, a corresponding spark plug / coil number is displayed on each plug cable: 1/6, 2/3, 4/7 and 5/8. These numbers (2) and (3) can also be found on the top of the intake manifold (1) to the right of the throttle body.

SPARK PLUG CABLE RESISTANCE

MINIMUM	MAXIMUM
250 Ohms Per Inch	1000 Ohms Per Inch
3000 Ohms Per Foot	12,000 Ohms Per Foot

SPARK PLUGS

ENGINE	PLUG TYPE	ELECTRODE GAP
3.7L V-6	ZFR6F - 11G (NGK)	1.1 (0.042 in.)
4.7L V-8	RC12MCC4	1.01 mm (.040 in.)
5.7L V-8	Champion - RE14MCC4	1.14 mm (.045 in.)

IGNITION COIL RESISTANCE - 3.7L V-6

PRIMARY RESISTANCE 21-27°C (70-80°F)	SECONDARY RESISTANCE 21-27°C (70-80°F)
0.6 - 0.9 Ohms	6,000 - 9,000 Ohms

IGNITION COIL RESISTANCE - 4.7L V-8

PRIMARY RESISTANCE 21-27°C (70-80°F)	SECONDARY RESISTANCE 21-27°C (70-80°F)
0.6 - 0.9 Ohms	6,000 - 9,000 Ohms

IGNITION COIL RESISTANCE - 5.7L V-8

PRIMARY RESISTANCE @ 21-27°C (70-80°F)
0.558 - 0.682 Ohms (Plus or Minus 10% @ 70-80° F)

IGNITION TIMING

Ignition timing is not adjustable on any engine.

RELAY-AUTO SHUT DOWN

DESCRIPTION - PCM OUTPUT

The 5-pin, 12-volt, Automatic Shutdown (ASD) relay is located in the Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

OPERATION

PCM OUTPUT

The ASD relay supplies battery voltage (12+ volts) to the fuel injectors and ignition coil(s). With certain emissions packages it also supplies 12-volts to the oxygen sensor heating elements.

The ground circuit for the coil within the ASD relay is controlled by the Powertrain Control Module (PCM). The PCM operates the ASD relay by switching its ground circuit on and off.

The ASD relay will be shut-down, meaning the 12-volt power supply to the ASD relay will be de-activated by the PCM if:

- the ignition key is left in the ON position. This is if the engine has not been running for approximately 1.8 seconds.
- there is a crankshaft position sensor signal to the PCM that is lower than pre-determined values.

ASD SENSE - PCM INPUT

A 12 volt signal at this input indicates to the PCM that the ASD has been activated. The relay is used to connect the oxygen sensor heater element, ignition coil and fuel injectors to 12 volt + power supply.

This input is used only to sense that the ASD relay is energized. If the Powertrain Control Module (PCM) does not see 12 volts at this input when the ASD should be activated, it will set a Diagnostic Trouble Code (DTC).

REMOVAL

The ASD relay is located in the engine compartment within the Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

1. Remove PDC cover.
2. Remove relay from PDC.
3. Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.
4. Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

INSTALLATION

The ASD relay is located in the Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

1. Install relay to PDC.
2. Install cover to PDC.

SENSOR-CAMSHAFT POSITION

DESCRIPTION

3.7L V-6

The Camshaft Position Sensor (CMP) on the 3.7L 6-cylinder engine is bolted to the right-front side of the right cylinder head.

4.7L V-8

The Camshaft Position Sensor (CMP) on the 4.7L V-8 engine is bolted to the right-front side of the right cylinder head.

5.7L V-8

The Camshaft Position Sensor (CMP) on the 5.7L V-8 engine is located below the generator on the timing chain / case cover on the right/front side of engine.

OPERATION

3.7L V-6

The Camshaft Position Sensor (CMP) sensor on the 3.7L V-6 engine (3) contains a hall effect device referred to as a sync signal generator. A rotating target wheel (tonewheel) for the CMP is located (4) at the front of the camshaft for the right cylinder head (2). This sync signal generator detects notches (1) located on a tonewheel. As the tonewheel rotates, the notches pass through the sync signal generator. The signal from the CMP sensor is used in conjunction with the Crankshaft Position Sensor (CKP) to differentiate between fuel injection and spark events. It is also used to synchronize the fuel injectors with their respective cylinders.

When the leading edge of the tonewheel notch enters the tip of the CMP, the interruption of magnetic field causes the voltage to switch high, resulting in a sync signal of approximately 5 volts.

When the trailing edge of the tonewheel notch leaves then tip of the CMP, the change of the magnetic field causes the sync signal voltage to switch low to 0 volts.

4.7L V-8

The CMP sensor on the 4.7L engine contains a hall effect device called a sync signal generator to generate a fuel sync signal. This sync signal generator detects notches located on a tonewheel. The tonewheel (4) is located at the front of the camshaft for the right cylinder head (2). As the tonewheel rotates, the notches (1) pass through the sync signal generator. The pattern of the notches (viewed counter-clockwise from front of engine) is: 1 notch, 2 notches, 3 notches, 3 notches, 2 notches 1 notch, 3 notches and 1 notch. The signal from the CMP sensor is used in conjunction with the crankshaft position sensor to differentiate between fuel injection and spark events. It is also used to synchronize the fuel injectors with their respective cylinders.

5.7L V-8

The CMP sensor is used in conjunction with the crankshaft position sensor to differentiate between fuel injection and spark events. It is also used to synchronize the fuel injectors with their respective cylinders. The sensor generates electrical pulses. These pulses (signals) are sent to the Powertrain Control Module (PCM). The PCM will then determine crankshaft position from both the camshaft position sensor and crankshaft position sensor.

The tonewheel is located at the front of the camshaft (2). As the tonewheel rotates, notches (3) pass through the sync signal generator.

When the cam gear is rotating, the sensor will detect the notches. Input voltage from the sensor to the PCM will then switch from a low (approximately 0.3 volts) to a high (approximately 5 volts). When the sensor detects a notch has passed, the input voltage switches back low to approximately 0.3 volts.

REMOVAL

3.7L V-6

The Camshaft Position Sensor (CMP) on the 3.7L V-6 engine (3) is bolted to the front/top of the right cylinder head (1).

1. Disconnect electrical connector at CMP sensor.
2. Remove sensor mounting bolt (2).
3. Carefully twist sensor from cylinder head.
4. Check condition of sensor o-ring.

4.7L V-8

The Camshaft Position Sensor (CMP) on the 4.7L V-8 engine (2) is bolted to the front/top of the right cylinder head (1).

1. Raise and support vehicle.
2. Disconnect electrical connector (4) at CMP sensor.
3. Remove sensor mounting bolt (3).
4. Carefully twist sensor from cylinder head.
5. Check condition of sensor o-ring.

5.7L V-8

The Camshaft Position Sensor (CMP) on the 5.7L V-8 engine is located on right side of timing chain cover below generator (1).

1. Disconnect electrical connector (3) at CMP sensor.

2. Remove sensor mounting bolt (3).
3. Carefully twist sensor (2) from cylinder head.
4. Check condition of sensor o-ring.

INSTALLATION

3.7L V-6

1. Clean out machined hole in cylinder head.
2. Apply a small amount of engine oil to sensor o-ring.
3. Install sensor into cylinder head with a slight rocking and twisting action.

CAUTION: Before tightening sensor mounting bolt, be sure sensor is completely flush to cylinder head. If sensor is not flush, damage to sensor mounting tang may result.

4. Install mounting bolt and tighten. Refer to torque specifications.
5. Connect electrical connector to sensor.

4.7L V-8

1. Clean out machined hole in cylinder head.
2. Apply a small amount of engine oil to sensor o-ring.
3. Install sensor into cylinder head with a slight rocking action. Do not twist sensor into position as damage to o-ring may result.

CAUTION: Before tightening sensor mounting bolt, be sure sensor is completely flush to cylinder head. If sensor is not flush, damage to sensor mounting tang may result.

4. Install mounting bolt and tighten. Refer to Torque Specifications.
5. Connect electrical connector to sensor.

5.7L V-8

1. Clean out machined hole in cylinder head.
2. Apply a small amount of engine oil to sensor o-ring.
3. Install sensor into cylinder head with a slight rocking action. Do not twist sensor into position as damage to o-ring may result.

CAUTION: Before tightening sensor mounting bolt, be sure sensor is completely flush to timing chain cover. If sensor is not flush, damage to sensor mounting tang may result.

4. Install mounting bolt and tighten. Refer to Torque Specifications.
5. Connect electrical connector to sensor.

COIL-IGNITION

DESCRIPTION

3.7L V-6

The 3.7L V-6 engine uses 6 dedicated, and individually fired coil for each spark plug (2).

Each coil (1) is mounted directly into the cylinder head and onto the top of each spark plug (2).

4.7L V-8

The 4.7L V-8 engine uses 8 dedicated, and individually fired coil (1) for each spark plug. Each coil is mounted directly to the top of each spark plug.

5.7L V-8

The 5.7L V-8 engine uses 8 dedicated, and individually fired coil (1) for each pair of spark plugs.

Each coil (5) is mounted directly to the top of each spark plug. Each coil is bolted (6) to the valve cover.

OPERATION

3.7L V-6

Battery voltage is supplied to the 6 individual ignition coils from the ASD relay. The Powertrain Control Module (PCM) opens and closes each ignition coil ground circuit at a determined time for ignition coil operation.

Base ignition timing is not adjustable. By controlling the coil ground circuit, the PCM is able to set the base timing and adjust the ignition timing advance. This is done to meet changing engine operating conditions.

The ignition coil is not oil filled. The windings are embedded in an epoxy compound. This provides heat and vibration resistance that allows the ignition coil to be mounted on the engine.

Because of coil design, spark plug cables (secondary cables) are not used with the 3.7L V-6 engine.

4.7L V-8

Battery voltage is supplied to the 8 individual ignition coils from the ASD relay. The Powertrain Control Module (PCM) opens and closes each ignition coil ground circuit at a determined time for ignition coil operation.

Base ignition timing is not adjustable. By controlling the coil ground circuit, the PCM is able to set the base timing and adjust the ignition timing advance. This is done to meet changing engine operating conditions.

The ignition coil is not oil filled. The windings are embedded in an epoxy compound. This provides heat and vibration resistance that allows the ignition coil to be mounted on the engine.

Because of coil design, spark plug cables (secondary cables) are not used with the 4.7L V-8 engine.

5.7L V-8

The ignition system is controlled by the Powertrain Control Module (PCM) on all engines.

A "wasted spark" system is used on the 5.7L engine combining paired, or dual-firing coils, and 2 spark plugs per cylinder. The coils and spark plugs are connected with paired, secondary high-voltage cables.

Each cylinder is equipped with 1 dual-output coil. Meaning one coil mounts directly over one of the dual spark plugs for 1 high-voltage output. A second high-voltage output is supplied directly from the same coil (using a plug cable) to one of the dual spark plugs on a corresponding (paired) cylinder on the opposite cylinder bank.

Each coil fires 2 spark plugs simultaneously on each of the cylinder banks (one cylinder on compression stroke and one cylinder on exhaust stroke). **EXAMPLE** : When the #1 cylinder is on compression stroke and ready for spark, the #1 coil will fire one of the dual spark plugs on the #1 cylinder (directly below the coil). The other dual spark plug on the #1 cylinder will be fired by the #6 coil. At the same time, the #1 coil will fire a “wasted spark” to one of the dual spark plugs at the #6 cylinder as coil #6 also fires a “wasted spark” to one of the dual spark plugs at the #6 cylinder.

The firing order is paired at cylinders 1/6, 2/3, 4/7, 5/8. Basic cylinder firing order is 1–8–4–3–6–5–7–2.

Battery voltage is supplied to all of the ignition coils positive terminals from the ASD relay. If the PCM does not see a signal from the crankshaft and camshaft sensors (indicating the ignition key is ON but the engine is not running), it will shut down the ASD circuit.

Base ignition timing is not adjustable on the 5.7L V-8 engine. By controlling the coil ground circuits, the PCM is able to set the base timing and adjust the ignition timing advance. This is done to meet changing engine operating conditions.

The PCM adjusts ignition timing based on inputs it receives from:

- The engine coolant temperature sensor
- The crankshaft position sensor (engine speed)
- The camshaft position sensor (crankshaft position)
- The manifold absolute pressure (MAP) sensor
- The throttle position sensor
- Transmission gear selection

REMOVAL

3.7L V-6

An individual ignition coil is used for each spark plug (2). The coil fits into machined holes in the cylinder head. A mounting stud/nut secures each coil to the top of the intake manifold. The bottom of the coil is equipped with a rubber boot to seal the spark plug to the coil. Inside each rubber boot is a spring. The spring is used for a mechanical contact between the coil and the top of the spark plug. These rubber boots and springs are a permanent part of the coil and are not serviced separately. An o-ring (1) is used to seal the coil at the opening into the cylinder head.

1. Depending on which coil is being removed, the throttle body air intake tube or intake box may need to be removed to gain access to coil.
2. Disconnect electrical connector from coil by pushing downward on release lock on top of connector and pull connector from coil.
3. Clean area at base of coil with compressed air before removal.

4. Remove coil mounting nut (2) from mounting stud.
5. Carefully pull up coil from cylinder head opening with a slight twisting action.
6. Remove coil from vehicle.

4.7L V-8

An individual ignition coil (1) is used for each spark plug. The coil fits into machined holes in the cylinder head. A mounting stud/nut (3) secures each coil to the top of the intake manifold. The bottom of the coil is equipped with a rubber boot to seal the spark plug to the coil. Inside each rubber boot is a spring. The spring is used for a mechanical contact between the coil and the top of the spark plug. These rubber boots and springs are a permanent part of the coil and are not serviced separately. An o-ring is used to seal the coil at the opening into the cylinder head.

1. Depending on which coil is being removed, the throttle body air intake tube or intake box may need to be removed to gain access to coil.
2. Disconnect electrical connector (2) from coil by pushing downward on release lock on top of connector and pull connector from coil.
3. Clean area at base of coil with compressed air before removal.
4. Remove coil mounting nut (3) from mounting stud.
5. Carefully pull up coil from cylinder head opening with a slight twisting action.
6. Remove coil from vehicle.

5.7L V-8

Before removing or disconnecting any spark plug cables, note their original position. Remove cables one-at-a-time. To prevent ignition crossfire, spark plug cables **MUST** be placed in cable tray (routing loom) into their original position.

An individual ignition coil (1) is used at each cylinder. The coil mounts to the top of the valve cover with two bolts (2). The bottom of the coil is equipped with a rubber boot (3) to seal the spark plug to the coil. Inside each rubber boot is a spring. The spring is used for a mechanical contact between the coil and the top of the spark plug.

1. Depending on which coil is being removed, the throttle body air intake tube or intake box may need to be removed to gain access to coil.

2. Unlock electrical connector (4) by moving slide lock (1) first. Press on release lock (3) while pulling electrical connector from coil.
3. Disconnect secondary high-voltage cable (2) from coil with a twisting action.
4. Clean area at base of coil with compressed air before removal.
5. Remove two mounting bolts (6) (note that mounting bolts are retained to coil).
6. Carefully pull up coil from cylinder head opening with a slight twisting action.
7. Remove coil from vehicle.
8. Before installing spark plug cables to either the spark plugs or coils, or before installing a coil to a spark plug, apply dielectric grease to inside of boots.

INSTALLATION

3.7L V-6

1. Using compressed air, blow out any dirt or contaminants from around top of spark plug.
2. Check condition of coil o-ring and replace as necessary. To aid in coil installation, apply silicone to coil o-ring.
3. Position ignition coil into cylinder head opening and push onto spark plug. Do this while guiding coil base over mounting stud.
4. Install coil mounting stud nut. Refer to torque specifications.

5. Connect electrical connector to coil by snapping into position.
6. If necessary, install throttle body air tube.

4.7L V-8

1. Using compressed air, blow out any dirt or contaminants from around top of spark plug.
2. Check condition of coil o-ring and replace as necessary. To aid in coil installation, apply silicone to coil o-ring.
3. Position ignition coil into cylinder head opening and push onto spark plug. Do this while guiding coil base over mounting stud.
4. Install coil mounting stud nut. Refer to torque specifications.
5. Connect electrical connector to coil by snapping into position.
6. If necessary, install throttle body air tube.

5.7L V-8

1. Using compressed air, blow out any dirt or contaminants from around top of spark plug.
2. Before installing spark plug cables to either the spark plugs or coils, or before installing a coil to a spark plug, apply dielectric grease to inside of boots.
3. Position ignition coil into cylinder head opening and push onto spark plug. Twist coil into position.
4. Install 2 coil mounting bolts. Refer to torque specifications.
5. Connect electrical connector to coil by snapping into position.
6. Install cable to coil. To prevent ignition crossfire, spark plug cables **MUST** be placed in cable tray (routing loom) into their original position. Refer to Spark Plug Cable Removal for a graphic.
7. If necessary, install throttle body air tube.

SENSOR-KNOCK

DESCRIPTION

The sensors are used only with 3.7L V-6, 4.7L V-8 and 5.7L V-8 engines. On 3.7L V-6 and 4.7L V-8 engines, the 2 knock sensors are bolted into the cylinder block under the intake manifold.

On 5.7L V-8 engines, 2 knock sensors are also used. These are bolted into each side of the cylinder block (outside) under the exhaust manifold.

OPERATION

3.7L V-6 / 4.7L V-8 / 5.7L V-8 Engines Only

Two knock sensors are used; one for each cylinder bank. When the knock sensor detects a knock in one of the cylinders on the corresponding bank, it sends an input signal to the Powertrain Control Module (PCM). In response, the PCM retards ignition timing for all cylinders by a scheduled amount.

Knock sensors contain a piezoelectric material which constantly vibrates and sends an input voltage (signal) to the PCM while the engine operates. As the intensity of the crystal's vibration increases, the knock sensor output voltage also increases.

The voltage signal produced by the knock sensor increases with the amplitude of vibration. The PCM receives the knock sensor voltage signal as an input. If the signal rises above a predetermined level, the PCM will store that value in memory and retard ignition timing to reduce engine knock. If the knock sensor voltage exceeds a preset value, the PCM retards ignition timing for all cylinders. It is not a selective cylinder retard.

The PCM ignores knock sensor input during engine idle conditions. Once the engine speed exceeds a specified value, knock retard is allowed.

Knock retard uses its own short term and long term memory program.

Long term memory stores previous detonation information in its battery-backed RAM. The maximum authority that long term memory has over timing retard can be calibrated.

Short term memory is allowed to retard timing up to a preset amount under all operating conditions (as long as rpm is above the minimum rpm) except at Wide Open Throttle (WOT). The PCM, using short term memory, can respond quickly to retard timing when engine knock is detected. Short term memory is lost any time the ignition key is turned off.

NOTE: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors.

REMOVAL

3.7L V-6

The 2 knock sensors are bolted into the cylinder block under the intake manifold (1) and (2).

NOTE: The left sensor is identified by an identification tag (LEFT). It is also identified by a larger bolt head. The Powertrain Control Module (PCM) must have and know the correct sensor left/right positions. Do not mix the sensor locations.

1. Disconnect knock sensor dual pigtail harness from engine wiring harness. This connection is made near rear of engine.
2. Remove intake manifold. Refer to Engine section.
3. Remove sensor mounting bolts (2). Note foam strip on bolt threads. This foam is used only to retain the bolts to sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.
4. Remove sensors from engine.

4.7L V-8

The two knock sensors (1) are bolted into the cylinder block under the intake manifold (3).

NOTE: The left sensor is identified by an identification tag (LEFT). It is also identified by a larger bolt head. The Powertrain Control Module (PCM) must have and know the correct sensor left/right positions. Do not mix the sensor locations.

1. Disconnect knock sensor dual pigtail harness from engine wiring harness. This connection is made near rear of engine.
2. Remove intake manifold. Refer to Engine section.
3. Remove sensor mounting bolts (2). Note foam strip on bolt threads. This foam is used only to retain the bolts to sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.
4. Remove sensors from engine.

5.7L V8

Two sensors (1) are used. Each sensor is bolted into the outside of cylinder block below the exhaust manifold (3).

1. Raise vehicle.
2. Disconnect knock sensor electrical connector (5).
3. Remove sensor mounting bolt (2). Note foam strip on bolt threads. This foam is used only to retain the bolts to sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.
4. Remove sensor from engine.

**INSTALLATION****3.7L V-6 / 4.7L V-8**

NOTE: The left sensor is identified by an identification tag (LEFT). It is also identified by a larger bolt head. The Powertrain Control Module (PCM) must have and know the correct sensor left/right positions. Do not mix the sensor locations.

1. Thoroughly clean knock sensor mounting holes.
2. Install sensors into cylinder block.

NOTE: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors. The torque for the knock sensor bolt is relatively light for an 8mm bolt.

NOTE: Note foam strip on bolt threads. This foam is used only to retain the bolts to sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

3. Install and tighten mounting bolts. Refer to torque specification.
4. Install intake manifold. Refer to Engine section.
5. Connect knock sensor wiring harness to engine harness at rear of intake manifold.

5.7L V-8

1. Thoroughly clean knock sensor mounting hole.
2. Install sensor into cylinder block.

NOTE: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors. The torque for the knock sensor bolt is relatively light for an 8mm bolt.

NOTE: Note foam strip on bolt threads. This foam is used only to retain the bolts to sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

3. Install and tighten mounting bolt. Refer to torque specification.
4. Install electrical connector to sensor.

SPARK PLUG

DESCRIPTION

Resistor type spark plugs are used on all engines.

Sixteen spark plugs (2 per cylinder) are used with 5.7L V-8 engines.

REMOVAL

3.7L V-6

Each individual spark plug is located under each ignition coil. Each individual ignition coil must be removed to gain access to each spark plug. Refer to Ignition Coil Removal/Installation.

1. Remove necessary air filter tubing at throttle body.
2. Prior to removing ignition coil, spray compressed air around coil base at cylinder head.
3. Prior to removing spark plug, spray compressed air into cylinder head opening. This will help prevent foreign material from entering combustion chamber.
4. Remove spark plug from cylinder head using a quality socket with a rubber or foam insert. Also check condition of ignition coil o-ring and replace as necessary.
5. Inspect spark plug condition.

4.7L V-8

Each individual spark plug is located under each ignition coil. Each individual ignition coil must be removed to gain access to each spark plug. Refer to Ignition Coil Removal/Installation.

1. Remove necessary air filter tubing at throttle body.
2. Prior to removing ignition coil, spray compressed air around coil base at cylinder head.
3. Prior to removing spark plug, spray compressed air into cylinder head opening. This will help prevent foreign material from entering combustion chamber.
4. Remove spark plug from cylinder head using a quality socket with a rubber or foam insert. Also check condition of ignition coil o-ring and replace as necessary.
5. Inspect spark plug condition..

5.7L V-8

Eight of the 16 spark plugs are located under an ignition coil; the other 8 are not. If spark plug being removed is under coil, coil must be removed to gain access to spark plug. Refer to Ignition Coil Removal/Installation and observe all CAUTIONS and WARNINGS.

Before removing or disconnecting any spark plug cables, note their original position. Remove cables one-at-a-time. To prevent ignition crossfire, spark plug cables **MUST** be placed in cable tray (routing loom) into their original position. Refer to Spark Plug Cable Removal for a graphic.

Before installing spark plug cables to either the spark plugs or coils, apply dielectric grease to inside of boots.

1. Remove necessary air filter tubing at throttle body.
2. Prior to removing ignition coil (if coil removal is necessary), spray compressed air around coil base at cylinder head cover.
3. Prior to removing spark plug, spray compressed air into cylinder head opening. This will help prevent foreign material from entering combustion chamber.
4. Remove spark plug from cylinder head using a quality socket with a rubber or foam insert.
5. Inspect spark plug condition.

CLEANING

CLEANING AND ADJUSTMENT

The plugs may be cleaned using commercially available spark plug cleaning equipment. After cleaning, file center electrode flat with a small point file or jewelers file before adjusting gap.

CAUTION: Never use a motorized wire wheel brush to clean spark plugs. Metallic deposits will remain on spark plug insulator and will cause plug misfire.

Adjust spark plug gap with a gap gauging tool (1).

INSTALLATION

3.7L V-6

Special care should be taken when installing spark plugs into the cylinder head spark plug wells. Be sure the plugs do not drop into the plug wells as electrodes can be damaged.

Always tighten spark plugs to the specified torque. Over tightening can cause distortion resulting in a change in the spark plug gap or a cracked porcelain insulator.

1. Start the spark plug into the cylinder head by hand to avoid cross threading.
2. Tighten spark plugs. Refer to torque specifications.
3. Before installing ignition coil(s), check condition of coil o-ring and replace as necessary. To aid in coil installation, apply silicone to coil o-ring.
4. Install ignition coil(s). Refer to Ignition Coil Removal/Installation.

4.7L V-8
