-

C140E-TRANSFER CASE MOTOR BLOCKED

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
With the ignition on and no system undervoltage or overvoltage condition present.
- **Set Condition:**
The Final Drive Control Module is unable to engage the requested range.

Possible Causes
INTERMITTENT TRANSFER CASE MOTOR BLOCKED
TRANSFER CASE INTERNAL CONDITION
TRANSFER CASE MOTOR
FINAL DRIVE CONTROL MODULE

Diagnostic Test**1. DTC IS ACTIVE**

Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Go to 5

2. TRANSFER CASE INTERNAL CONDITION

Turn the ignition off.

Inspect the Transfer Case in accordance with the Service Information to determine if there are any mechanical conditions that are preventing the Shift Motor from engaging the requested range.

Are any mechanical conditions preventing the Shift Motor from engaging the requested range?

Yes >> Repair or replace the Transfer Case in accordance with the Service Information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Go to 3

3. TRANSFER CASE MOTOR

Turn the ignition off.

Using the wiring diagram/schematic as a guide, inspect all wiring and connectors that pertain to this circuit.

If any problems are found, repair as necessary and retest.

If no other problems are found, replace the Transfer Case Motor in accordance with the Service Information.

Ignition on, engine not running.

Cycle the Transfer Case Selector Switch to each position several times during a test drive.

With the scan tool, select View DTCs.

Is the DTC status Active?

Yes >> Go to 4

No >> Test complete.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

C140E-TRANSFER CASE MOTOR BLOCKED (CONTINUED)**4. FINAL DRIVE CONTROL MODULE**

Using the wiring diagram/schematic as a guide, inspect all wiring and connectors that pertain to this circuit.

Were any problems found?

Yes >> Repair as necessary.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Replace the Final Drive Control Module in accordance with the Service Information.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes >> Repair as necessary.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Test complete.

C140F-TRANSFER CASE RANGE POSITION SENSOR ERRATIC PERFORMANCE

C140F-TRANSFER CASE RANGE POSITION SENSOR ERRATIC PERFORMANCE (CONTINUED)

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**
With the ignition on and no system undervoltage or overvoltage condition present.
- **Set Condition:**
The Final Drive Control Module detects excessive voltage fluctuation on the Mode Sensor Signal circuit.

Possible Causes
INTERMITTENT TRANSFER CASE RANGE POSITION SENSOR ERRATIC PERFORMANCE DTC
(K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT SHORT TO VOLTAGE
(K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT HIGH RESISTANCE
(K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT SHORT TO GROUND
(T313) MODE SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
(T313) MODE SENSOR SIGNAL CIRCUIT HIGH RESISTANCE
(T313) MODE SENSOR SIGNAL CIRCUIT SHORT TO GROUND
(K594) DRIVETRAIN SENSOR RETURN CIRCUIT SHORT TO VOLTAGE
(K594) DRIVETRAIN SENSOR RETURN CIRCUIT HIGH RESISTANCE
TRANSFER CASE MOTOR
FINAL DRIVE CONTROL MODULE

Diagnostic Test**1. DTC IS ACTIVE**

NOTE: This DTC sets when the Final Drive Control Module detects excessive voltage fluctuation on the Mode Sensor Signal circuit. Perform a thorough inspection of all wiring and connectors between the sensor and the control module.

Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Go to 14

C140F-TRANSFER CASE RANGE POSITION SENSOR ERRATIC PERFORMANCE (CONTINUED)

2. (T504) DRIVETRAIN 5 VOLT SUPPLY VOLTAGE ERRATIC

NOTE: This DTC sets when the Final Drive Control Module detects excessive voltage fluctuation on the Mode Sensor Signal circuit. Perform a thorough inspection of all wiring and connectors between the sensor and the control module.

Turn the ignition off.

Disconnect the Transfer Case Motor harness connector.

Turn the ignition on.

Measure the voltage of the (T504) Drivetrain 5 Volt Supply circuit.

NOTE: Voltage should be approximately 5.0 volts and steady. Compare any slight fluctuations found to a known good circuit in order to verify voltmeter functionality.

Is the voltage approximately 5.0 volts and steady?

Yes >> Go to 6

No >> Go to 3

3. (T504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT INTERMITTENT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Final Drive Control Module C2 harness connector.

Turn the ignition on.

Measure the voltage of the (T504) Drivetrain 5 Volt Supply circuit.

Monitor the voltmeter while performing a wiggle test on the wiring harness and connectors.

Is any voltage detected on the circuit during the wiggle test?

Yes >> Repair the (T504) Drivetrain 5 Volt Supply circuit for an intermittent short to voltage.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Go to 4

C140F-TRANSFER CASE RANGE POSITION SENSOR ERRATIC PERFORMANCE (CONTINUED)**4. (T504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT HIGH RESISTANCE**

Measure the resistance of the (T504) Drivetrain 5 Volt Supply circuit between the Transfer Case Motor harness connector and the Final Drive Control Module C2 harness connector.

Monitor the ohmmeter while performing a wiggle test on the wiring harness and connectors.

Is the resistance ever above 5.0 ohms during the wiggle test?

Yes >> Repair the (T504) Drivetrain 5 Volt Supply circuit for an intermittent open circuit or high resistance.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Go to 5

**5. (T504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT INTERMITTENT SHORT TO GROUND**

Measure the resistance between ground and the (T504) Drivetrain 5 Volt Supply circuit.

Monitor the ohmmeter while performing a wiggle test on the wiring harness and connectors.

Is the resistance ever below 5.0 ohms during the wiggle test?

Yes >> Repair the (T504) Drivetrain 5 Volt Supply circuit for an intermittent short to ground.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Go to 13

C140F-TRANSFER CASE RANGE POSITION SENSOR ERRATIC PERFORMANCE (CONTINUED)

6. T-CASE POSITION SENSOR VOLTAGE

Turn the ignition off.

Connect the Final Drive Control Module C2 harness connector.

Connect a jumper wire between the (T313) Mode Sensor Signal circuit and the (K594) Drivetrain Sensor Return circuit in the Transfer Case Motor harness connector.

Turn the ignition on.

With the Scan Tool select Data Display and monitor the T-Case Position Sensor Voltage while performing a wiggle test on the wiring and connectors between the sensor and control module.

NOTE: Voltage should be approximately 0.0 volts and steady.

Is the T-Case Position Sensor Voltage approximately 0.0 volts and steady?

Yes >> Go to 12

No >> Go to 7

7. (T313) MODE SENSOR SIGNAL CIRCUIT INTERMITTENT SHORT TO VOLTAGE

NOTE: Remove the previously installed jumper wire.

Turn the ignition off.

Disconnect the Final Drive Control Module C2 harness connector.

Turn the ignition on.

Measure the voltage of the (T313) Mode Sensor Signal circuit.

Monitor the voltmeter while performing a wiggle test on the wiring harness and connectors.

Is any voltage detected on the circuit during the wiggle test?

Yes >> Repair the (T313) Mode Sensor Signal circuit for an intermittent short to voltage.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Go to 8

C140F-TRANSFER CASE RANGE POSITION SENSOR ERRATIC PERFORMANCE (CONTINUED)

8. (K594) DRIVETRAIN SENSOR RETURN CIRCUIT INTERMITTENT SHORT TO VOLTAGE

Measure the voltage of the (K594) Drivetrain Sensor Return circuit. Monitor the voltmeter while performing a wiggle test on the wiring harness and connectors.

Is any voltage detected on the circuit during the wiggle test?

- Yes** >> Repair the (K594) Drivetrain Sensor Return circuit for an intermittent short to voltage. Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
- No** >> Go to 9

9. (T313) MODE SENSOR SIGNAL CIRCUIT HIGH RESISTANCE

Turn the ignition off.

Measure the resistance of the (T313) Mode Sensor Signal circuit between the Transfer Case Motor harness connector and the Final Drive Control Module C2 harness connector.

Monitor the ohmmeter while performing a wiggle test on the wiring harness and connectors.

Is the resistance ever above 5.0 ohms during the wiggle test?

- Yes** >> Repair the (T313) Mode Sensor Signal circuit for an intermittent open circuit or high resistance. Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
- No** >> Go to 10

C140F-TRANSFER CASE RANGE POSITION SENSOR ERRATIC PERFORMANCE (CONTINUED)

10. (K594) DRIVETRAIN SENSOR RETURN CIRCUIT HIGH RESISTANCE

Measure the resistance of the (K594) Drivetrain Sensor Return circuit between the Transfer Case Motor harness connector and the Final Drive Control Module C2 harness connector.

Monitor the ohmmeter while performing a wiggle test on the wiring harness and connectors.

Is the resistance ever above 5.0 ohms during the wiggle test?

Yes >> Repair the (K594) Drivetrain Sensor Return circuit for an intermittent open circuit or high resistance.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Go to 11

11. (T313) MODE SENSOR SIGNAL CIRCUIT INTERMITTENT SHORT TO GROUND

Measure the resistance between ground and the (T313) Mode Sensor Signal circuit.

Monitor the ohmmeter while performing a wiggle test on the wiring harness and connectors.

Is the resistance ever below 5.0 ohms during the wiggle test?

Yes >> Repair the (T313) Mode Sensor Signal circuit for an intermittent short to ground.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Go to 13

C140F-TRANSFER CASE RANGE POSITION SENSOR ERRATIC PERFORMANCE (CONTINUED)**12. TRANSFER CASE MOTOR**

NOTE: This DTC sets when the Final Drive Control Module detects excessive voltage fluctuation on the Mode Sensor Signal circuit. Perform a thorough inspection of all wiring and connectors between the sensor and the control module.

Using the schematic as a guide, inspect the Final Drive Control Module power and ground circuits.

Were any problems found?

- Yes** >> Repair as necessary.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
- No** >> Replace the Transfer Case Motor in accordance with the Service Information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
-

13. FINAL DRIVE CONTROL MODULE

NOTE: This DTC sets when the Final Drive Control Module detects excessive voltage fluctuation on the Mode Sensor Signal circuit. Perform a thorough inspection of all wiring and connectors between the sensor and the control module.

Using the schematic as a guide, inspect the Final Drive Control Module power and ground circuits.

Were any problems found?

- Yes** >> Repair as necessary.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
- No** >> Replace the Final Drive Control Module in accordance with the Service Information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
-

14. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

- Yes** >> Repair as necessary.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
- No** >> Test complete.
-

C1413-4 HI/LO SELECT SWITCH CIRCUIT STUCK

C1413-4 HI/LO SELECT SWITCH CIRCUIT STUCK (CONTINUED)

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**
With the ignition on and no system undervoltage or overvoltage condition present.
- **Set Condition:**
Valid voltage for 4HI/4LO switch active present for a calibratable time or when shifter is not in neutral.

Possible Causes
INTERMITTENT 4 HI/LO SELECT SWITCH CIRCUIT STUCK DTC
TRANSFER CASE SELECTOR SWITCH
FINAL DRIVE CONTROL MODULE

Diagnostic Test**1. NEUTRAL INDICATOR CONTROL CIRCUIT DTC IS ACTIVE**

Turn the ignition on.

With the scan tool, select View DTCs in the Final Drive Control Module.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Go to 4

2. TRANSFER CASE SELECTOR SWITCH

Turn the ignition off.

Disconnect the Transfer Case Selector Switch.

Ignition on, engine not running.

With the scan tool, select Data Display and read the 4wd Range Switch Voltage.

The switch voltage should be approximately 0 volts.

Turn the ignition off.

Connect a jumper wire between the (K504) Drivetrain 5 Volt Supply circuit and the (K977) Mode Select circuit in the Transfer Case Selector Switch connector.

Ignition on, engine not running.

With the scan tool, read the 4wd Range Switch Voltage.

The switch voltage should be approximately 5 volts.

Does the voltage display as described?

Yes >> Replace the Transfer Case Selector Switch.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Go To 3

C1413-4 HI/LO SELECT SWITCH CIRCUIT STUCK (CONTINUED)

3. FINAL DRIVE CONTROL MODULE

View repair.

Repair

Replace the Final Drive Control Module in accordance with the Service information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes >> Repair as necessary.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Test complete.

C1414-NEUTRAL SELECT SWITCH CIRCUIT STUCK

C1414-NEUTRAL SELECT SWITCH CIRCUIT STUCK (CONTINUED)

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**
With the ignition on and no system undervoltage or overvoltage condition present.
- **Set Condition:**
Valid voltage for Neutral switch active present for a calibratable time.

Possible Causes
INTERMITTENT NEUTRAL SELECT SWITCH CIRCUIT STUCK DTC
TRANSFER CASE SELECTOR SWITCH
FINAL DRIVE CONTROL MODULE

Diagnostic Test

1. DTC IS ACTIVE

Turn the ignition on.
With the scan tool, select View DTCs in the Final Drive Control Module.

Is the status Active for this DTC?

- Yes** >> Go to 2
No >> Go to 4

2. TRANSFER CASE SELECTOR SWITCH

Turn the ignition off.
Disconnect the Transfer Case Selector Switch.
Ignition on, engine not running.
With the scan tool select Data Display and read the 4wd Range Switch Voltage.
The switch voltage should be approximately 0 volts.
Turn the ignition off.
Connect a jumper wire between the (K504) Drivetrain 5 Volt Supply circuit and the (K977) Mode Select circuit in the Transfer Case Selector Switch connector.
Ignition on, engine not running.
With the scan tool, read the 4wd Range Switch Voltage.
The switch voltage should be approximately 5 volts.

Does the voltage display as described?

- Yes** >> Replace the Transfer Case Selector Switch.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
No >> Go To 3

C1414-NEUTRAL SELECT SWITCH CIRCUIT STUCK (CONTINUED)

3. FINAL DRIVE CONTROL MODULE

View repair.

Repair

Replace the Final Drive Control Module in accordance with the Service information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes >> Repair as necessary.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Test complete.

C1415- TRANSFER CASE MOTOR CURRENT PERFORMANCE

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**
With the ignition on and no system undervoltage or overvoltage condition present.
- **Set Condition:**
 1. Current reading greater than 1A for 200 msec with no motor activation.
 2. Current reading never greater than 1A during a completed range or neutral shift.

Possible Causes
INTERMITTENT TRANSFER CASE MOTOR CURRENT PERFORMANCE TRANSFER CASE MOTOR FINAL DRIVE CONTROL MODULE

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Go to 4

2. TRANSFER CASE MOTOR

Turn the ignition off.

Using the wiring diagram/schematic as a guide, inspect all wiring and connectors that pertain to this circuit.

If any problems are found, repair as necessary and retest.

If no other problems are found, replace the Transfer Case Motor in accordance with the Service Information.

Ignition on, engine not running.

Cycle the Transfer Case Selector Switch to each position several times during a test drive.

With the scan tool, select View DTCs.

Is the DTC status Active?

Yes >> Go to 3

No >> Test complete.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

3. FINAL DRIVE CONTROL MODULE

Using the wiring diagram/schematic as a guide, inspect all wiring and connectors that pertain to this circuit.

Were any problems found?

Yes >> Repair as necessary.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Replace the Final Drive Control Module in accordance with the Service Information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

C1415- TRANSFER CASE MOTOR CURRENT PERFORMANCE (CONTINUED)

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes >> Repair as necessary.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Test complete.

C1444-TRANSFER CASE MOTOR OVERUSE

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**
With the ignition on.
- **Set Condition:**
A calibrated motor abuse limit has been achieved. The FDCM models the motor use and has determined that excessive motor activations have occurred.

Possible Causes
INTERMITTENT TRANSFER CASE MOTOR OVERUSE TRANSFER CASE SELECTOR SWITCH FINAL DRIVE CONTROL MODULE

Diagnostic Test

1. DTC IS ACTIVE

NOTE: Diagnose and repair any system voltage or Transfer Case related DTCs in the FDCM before continuing with this test.

Ignition on, engine not running.

With the scan tool, Clear Stored DTCs.

Test drive the vehicle.

During the test drive, move the Transfer Case Selector Switch to each position several times in accordance with the Service Information.

With the scan tool, select View DTCs.

Does this DTC reset?

Yes >> Go to 2

No >> Go to 4

2. TRANSFER CASE SELECTOR SWITCH

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors relative to this circuit.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Were any problems found?

Yes >> Repair as necessary.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Go to 3

C1444-TRANSFER CASE MOTOR OVERUSE (CONTINUED)**3. FINAL DRIVE CONTROL MODULE**

Ignition off.

Replace the Transfer Case Selector Switch in accordance with the Service Information.

Ignition on, engine not running.

With the scan tool, Clear Stored DTCs.

Test drive the vehicle.

During the test drive, move the Transfer Case Selector Switch to each position several times in accordance with the Service Information.

With the scan tool, select View DTCs.

Does this DTC reset?

- Yes** >> Replace the Final Drive Control Module in accordance with the Service Information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
- No** >> Test Complete.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
-

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

- Yes** >> Repair as necessary.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
- No** >> Test complete.
-

C2100-BATTERY VOLTAGE LOW (FDKM)

C2100-BATTERY VOLTAGE LOW (FDCM) (CONTINUED)

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**
Continuously.
- **Set Condition:**
The Final Drive Control Module detects that system voltage is below 8.5 volts for 10 seconds with engine RPM greater than 1500.

Possible Causes
INTERMITTENT BATTERY VOLTAGE LOW CHARGING SYSTEM DTCS PRESENT FINAL DRIVE CONTROL MODULE POWER CIRCUITS OPEN OR HIGH RESISTANCE FINAL DRIVE CONTROL MODULE

Diagnostic Test**1. CHARGING SYSTEM DTCS PRESENT**

Ignition on.

With the scan tool, select View DTCs in the Powertrain Control Module.

Are there any Charging System or related voltage DTCS present?

Yes >> Refer to the symptom list and perform any Charging System DTC diagnostic procedures before continuing with this test.

No >> Go to 2

2. DTC IS ACTIVE

With the scan tool, select View DTCs in the Final Drive Control Module.

Is the status Active for this DTC?

Yes >> Go to 3

No >> Go to 5

C2100-BATTERY VOLTAGE LOW (FDCM) (CONTINUED)

3. FINAL DRIVE CONTROL MODULE POWER CIRCUITS OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Final Drive Control Module C1 harness connector.

Turn the ignition on.

With a 12-volt test light connected to ground, check the Fused B+ circuits in the Final Drive Control Module C1 harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly for each of the Fused B+ circuits?

Yes >> Go to 4

No >> Repair the Fused B+ circuit(s) for an open circuit or high resistance.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

4. FINAL DRIVE CONTROL MODULE

View repair.

Repair

Replace the Final Drive Control Module in accordance with the Service information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes >> Repair as necessary.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Test complete.

C2101-BATTERY VOLTAGE HIGH (FDCM)

C2101-BATTERY VOLTAGE HIGH (FDCM) (CONTINUED)

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**
Continuously.
- **Set Condition:**
The Final Drive Control Module detects that system voltage is above 16.0 volts for 10 seconds with engine RPM greater than 350.

Possible Causes
INTERMITTENT BATTERY VOLTAGE HIGH CHARGING SYSTEM DTCS PRESENT FINAL DRIVE CONTROL MODULE GROUND CIRCUITS OPEN OR HIGH RESISTANCE FINAL DRIVE CONTROL MODULE

Diagnostic Test**1. CHARGING SYSTEM DTCS PRESENT**

Ignition on.

With the scan tool, select View DTCs in the Powertrain Control Module.

Are there any Charging System or related voltage DTCS present?

Yes >> Refer to the symptom list and perform any Charging System DTC diagnostic procedures before continuing with this test.

No >> Go to 2

2. DTC IS ACTIVE

With the scan tool, select View DTCs in the Final Drive Control Module.

Is the status Active for this DTC?

Yes >> Go to 3

No >> Go to 5

3. FINAL DRIVE CONTROL MODULE GROUND CIRCUITS OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Final Drive Control Module C1 and C2 harness connectors.

Turn the ignition on.

With a 12-volt test light connected to B+, check the Ground circuits in the Final Drive Control Module C1 and C2 harness connectors.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly for each of the Ground circuits?

Yes >> Go to 4

No >> Repair the Ground circuit(s) for an open circuit or high resistance.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

C2101-BATTERY VOLTAGE HIGH (FDCM) (CONTINUED)

4. FINAL DRIVE CONTROL MODULE

View repair.

Repair

Replace the Final Drive Control Module in accordance with the Service information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes >> Repair as necessary.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Test complete.

C2109-DRIVETRAIN SUPPLY VOLTAGE CIRCUIT LOW (FDCM)

C2109-DRIVETRAIN SUPPLY VOLTAGE CIRCUIT LOW (FDCM) (CONTINUED)

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**
With the ignition on and no system undervoltage or overvoltage condition present.
- **Set Condition:**
The Final Drive Control Module detects an open circuit on the Transfer Case Motor Lock Signal circuit, the Front Differential Solenoid Control circuit and the Rear Differential Solenoid Control circuit.

Possible Causes
INTERMITTENT DRIVETRAIN SUPPLY VOLTAGE CIRCUIT LOW (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT SHORT TO GROUND (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT OPEN FINAL DRIVE CONTROL MODULE

Diagnostic Test

1. DTC IS ACTIVE

Ignition on.
With the scan tool, select View DTCs.

Is the status Active for this DTC?

- Yes** >> Go to 2
No >> Go to 5

2. (T301) SWITCHED BATTERY SOLENOID SUPPLY CIRCUIT SHORT TO GROUND

Turn the ignition off.
Disconnect the Transfer Case Motor harness connector.
Disconnect the Final Drive Control Module C1 harness connector.
Measure the resistance between ground and the (T301) Switched Battery Solenoid Supply circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Repair the (T301) Switched Battery Solenoid Supply circuit for a short to ground.
No >> Go to 3

C2109-DRIVETRAIN SUPPLY VOLTAGE CIRCUIT LOW (FDCM) (CONTINUED)

3. (T317) TRANSFER CASE MOTOR LOCK SIGNAL OPEN

Measure the resistance of the (T317) Transfer Case Motor Lock Signal circuit.

Is the resistance above 5.0 ohms?

- Yes** >> Repair the (T317) Transfer Case Motor Lock Signal circuit for a short to ground.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
- No** >> Go to 4

4. FINAL DRIVE CONTROL MODULE

View repair.

Repair

Replace the Final Drive Control Module in accordance with the Service information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.
Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

- Yes** >> Repair as necessary.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
- No** >> Test complete.

C2111-DRIVETRAIN SENSOR SUPPLY CIRCUIT LOW (FDCM)

C2111–DRIVETRAIN SENSOR SUPPLY CIRCUIT LOW (FDCM) (CONTINUED)

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**
With the ignition on and no system undervoltage or overvoltage condition present.
- **Set Condition:**
The Final Drive Control Module detects that the Drivetrain Sensor Supply voltage is below 2.5 volts for 300 mS.

Possible Causes
INTERMITTENT DRIVETRAIN SENSOR SUPPLY CIRCUIT LOW (K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT SHORT TO GROUND TRANSFER CASE SELECTOR SWITCH TRANSFER CASE MOTOR FINAL DRIVE CONTROL MODULE

Diagnostic Test

1. 5 VOLT SUPPLY (REFERENCE) VOLTAGE BELOW 4.8 VOLTS

Turn the ignition on.
 With the scan tool, select Data Display in the FDCM.
 Monitor the 5 Volt Supply (Reference) Voltage.

Is the voltage below 4.8 volts?

- Yes** >> Go to 2
No >> Go to 6

2. TRANSFER CASE SELECTOR SWITCH

Turn the ignition off.
 Disconnect the Transfer Case Selector Switch harness connector.
 Turn the ignition on.
 With the scan tool, monitor the 5 Volt Supply (Reference) Voltage.

Is the voltage above 4.75 volts with the Transfer Case Selector Switch harness disconnected?

- Yes** >> Replace the Transfer Case Selector Switch in accordance with the Service Information.
 Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
No >> Go to 3

C2111-DRIVETRAIN SENSOR SUPPLY CIRCUIT LOW (FDCM) (CONTINUED)**3. TRANSFER CASE MOTOR**

Turn the ignition off.

Disconnect the Transfer Case Motor harness connector.

Turn the ignition on.

With the scan tool, monitor the 5 Volt Supply (Reference) Voltage.

Is the voltage above 4.75 volts with the Transfer Case Motor harness disconnected?

Yes >> Replace the Transfer Case Motor in accordance with the Service Information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Go to 4

4. (K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT SHORT TO GROUND

Turn the ignition off.

Disconnect the Final Drive Control Module harness connector.

Measure the resistance between ground and the (K504) Drivetrain 5 Volt Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (K504) Drivetrain 5 Volt Supply circuit for a short to ground.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Go to 5

**5. FINAL DRIVE CONTROL MODULE**

View repair.

Repair

Replace the Final Drive Control Module in accordance with the Service information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

C2111-DRIVETRAIN SENSOR SUPPLY CIRCUIT LOW (FDCM) (CONTINUED)

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes >> Repair as necessary.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Test complete.

C2112-DRIVETRAIN SENSOR SUPPLY CIRCUIT HIGH (FDCM)

C2112-DRIVETRAIN SENSOR SUPPLY CIRCUIT HIGH (FDCM) (CONTINUED)

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**
With the ignition on and no system undervoltage or overvoltage condition present.
- **Set Condition:**
The Final Drive Control Module detects that the Drivetrain Sensor Supply voltage is above 7.5 volts for 300 mS

Possible Causes
INTERMITTENT DRIVETRAIN SENSOR SUPPLY CIRCUIT HIGH DRIVETRAIN 5 VOLT SUPPLY CIRCUIT SHORT TO VOLTAGE FINAL DRIVE CONTROL MODULE

Diagnostic Test

1. 5 VOLT SUPPLY (REFERENCE) VOLTAGE IS ABOVE 5.2 VOLTS

Ignition on.

With the scan tool, select Data Display in the FDCM.

Monitor the 5 Volt Supply (Reference) Voltage.

Is the voltage above 5.2 volts?

Yes >> Go to 2

No >> Go to 4

2. (K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Transfer Case Motor harness connector.

Disconnect the Final Drive Control Module C2 harness connector.

Turn the ignition on.

Measure the voltage of the (K504) Drivetrain 5 Volt Supply circuit.

Is there any voltage present?

Yes >> Repair the (K504) Drivetrain 5 Volt Supply circuit for a short to voltage.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Go to 3

C2112-DRIVETRAIN SENSOR SUPPLY CIRCUIT HIGH (FDCM) (CONTINUED)

3. FINAL DRIVE CONTROL MODULE

View repair.

Repair

Replace the Final Drive Control Module in accordance with the Service information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes >> Repair as necessary.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Test complete.

C2113-DRIVETRAIN SENSOR SUPPLY VOLTAGE CIRCUIT OPEN (FDCM)

C2113-DRIVETRAIN SENSOR SUPPLY VOLTAGE CIRCUIT OPEN (FDCM) (CONTINUED)

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**
With the ignition on and no system undervoltage or overvoltage condition present.
- **Set Condition:**
The Final Drive Control Module detects that the 5V Supply (Reference) Voltage is correct, but the Transfer Case Selector Switch and Mode Sensor indicate a low voltage condition.

Possible Causes
INTERMITTENT DRIVETRAIN SENSOR SUPPLY VOLTAGE CIRCUIT OPEN (K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT OPEN (K594) DRIVETRAIN SENSOR RETURN CIRCUIT OPEN FINAL DRIVE CONTROL MODULE

Diagnostic Test

1. DTC IS ACTIVE

Ignition on.
With the scan tool, select View DTCs.

Is the status Active for this DTC?

- Yes** >> Go to 2
No >> Go to 5

2. (K504) DRIVETRAIN 5 VOLT SUPPLY CIRCUIT OPEN

Turn the ignition off.
Disconnect the Transfer Case Motor harness connector.
Disconnect the Final Drive Control Module C2 harness connector.
Measure the resistance of the (K504) Drivetrain 5 Volt Supply circuit.

Is the resistance above 5.0 ohms?

- Yes** >> Repair the (K504) Drivetrain 5 Volt Supply circuit for an open.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
No >> Go to 3

C2113-DRIVETRAIN SENSOR SUPPLY VOLTAGE CIRCUIT OPEN (FDCM) (CONTINUED)

3. (K594) DRIVETRAIN SENSOR RETURN CIRCUIT OPEN

Measure the resistance of the (K594) Drivetrain Sensor Return circuit.

Is the resistance above 5.0 ohms?

- Yes** >> Repair the (K594) Drivetrain Sensor Return circuit for an open.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
- No** >> Go to 4

4. FINAL DRIVE CONTROL MODULE

View repair.

Repair

Replace the Final Drive Control Module in accordance with the Service information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

- Yes** >> Repair as necessary.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
- No** >> Test complete.

C2201-INTERNAL CONTROLLER (FDCM)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Final Drive Control Module has detected a failure internal to the controller.

Possible Causes
FINAL DRIVE CONTROL MODULE

1. FINAL DRIVE CONTROL MODULE

NOTE: This DTC may set after updating the controller software. Erase this DTC, cycle the ignition off for 10 seconds and recheck. If this DTC resets, proceed with repair procedure. If it does not reset, repair is complete.

The Final Drive Control Module has detected an internal failure.

View repair

Repair

Replace the Final Drive Control Module in accordance with the Service Information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

C2206-CONFIGURATION ERROR (FDCM)

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**
With the ignition on.
- **Set Condition:**
The Final Drive Control Module hardware check has determined that module configuration does not match vehicle configuration.

Possible Causes
FINAL DRIVE CONTROL MODULE CONFIGURATION

1. FINAL DRIVE CONTROL MODULE CONFIGURATION

The Final Drive Control Module hardware check has determined that module configuration does not match vehicle configuration. Verify that the correct module part number is installed in the vehicle.

Turn the ignition on.

With the Scan Tool, verify that the VIN stored in the controller matches the vehicle VIN.

With the Scan Tool, select Clear Stored DTCs.

Cycle the ignition off, then on.

With the Scan Tool, select View DTCs.

Does this DTC reset?

- Yes** >> Replace the Final Drive Control Module in accordance with the Service Information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
- No** >> Test complete.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
-

C230A-NEUTRAL INDICATOR CONTROL CIRCUIT LOW

C230A-NEUTRAL INDICATOR CONTROL CIRCUIT LOW (CONTINUED)

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**
With the ignition on and no system undervoltage or overvoltage condition present.
- **Set Condition:**
The Final Drive Control Module detects low voltage on the Neutral Indicator Control Circuit when output is off.

Possible Causes
INTERMITTENT NEUTRAL INDICATOR CONTROL CIRCUIT LOW (G95) 4WD NEUTRAL INDICATOR CIRCUIT OPEN (G95) 4WD NEUTRAL INDICATOR CIRCUIT SHORTED TO GROUND TRANSFER CASE SELECTOR SWIITCH FINAL DRIVE CONTROL MODULE

Diagnostic Test

1. DTC IS ACTIVE

Ignition on.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

- Yes** >> Go to 2
No >> Go to 7

2. (G95) 4WD NEUTRAL INDICATOR CIRCUIT RESISTANCE TO GROUND

Turn the ignition off.

Disconnect the Final Drive Control Module C2 connector.

Measure the resistance between ground and the (G95) 4WD Neutral Indicator circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Go to 3
No >> Go to 4

C230A-NEUTRAL INDICATOR CONTROL CIRCUIT LOW (CONTINUED)

3. (G95) 4WD NEUTRAL INDICATOR CIRCUIT SHORT TO GROUND

Disconnect the Transfer Case Selector Switch connector.
 Measure the resistance between ground and the (G95) 4WD Neutral Indicator circuit.

Is the resistance below 5.0 ohms?

- Yes** >> Repair the (G95) 4WD Neutral Indicator circuit for a short to ground.
 Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
- No** >> Go to 5

4. (G95) 4WD NEUTRAL INDICATOR CIRCUIT OPEN

Disconnect the Transfer Case Selector Switch connector.
 Measure the resistance of the (G95) 4WD Neutral Indicator circuit.

Is the resistance above 5.0 ohms?

- Yes** >> Repair the open (G95) 4WD Neutral Indicator circuit.
 Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
- No** >> Go to 6

C230A-NEUTRAL INDICATOR CONTROL CIRCUIT LOW (CONTINUED)

5. TRANSFER CASE SELECTOR SWITCH

View repair.

Repair

Replace the Transfer Case Selector Switch in accordance with the Service information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

6. FINAL DRIVE CONTROL MODULE

View repair.

Repair

Replace the Final Drive Control Module in accordance with the Service information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes >> Repair as necessary.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Test complete.

C230B- NEUTRAL INDICATOR CONTROL CIRCUIT HIGH

C230B- NEUTRAL INDICATOR CONTROL CIRCUIT HIGH (CONTINUED)

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**
With the ignition on and no system undervoltage or overvoltage condition present.
- **Set Condition:**
The Final Drive Control Module detects high voltage on the Neutral Indicator Control Circuit when output is on.

Possible Causes
INTERMITTENT NEUTRAL INDICATOR CONTROL CIRCUIT HIGH (G95) 4WD NEUTRAL INDICATOR CIRCUIT OPEN (G95) 4WD NEUTRAL INDICATOR CIRCUIT SHORTED TO VOLTAGE TRANSFER CASE SELECTOR SWIITCH FINAL DRIVE CONTROL MODULE

Diagnostic Test

1. NEUTRAL INDICATOR CONTROL CIRCUIT DTC IS ACTIVE

Ignition on.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

- Yes** >> Go to 2
No >> Go to 7

2. (G95) 4WD NEUTRAL INDICATOR CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Final Drive Control Module C2 harness connector.

Turn the ignition on.

Measure the voltage of the (G95) 4WD Neutral Indicator circuit.

Is there any voltage present?

- Yes** >> Go to 3
No >> Go to 4

C230B- NEUTRAL INDICATOR CONTROL CIRCUIT HIGH (CONTINUED)

3. (G95) 4WD NEUTRAL INDICATOR CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Transfer Case Selector Switch harness connector.

Turn the ignition on.

Measure the voltage of the (G95) 4WD Neutral Indicator circuit.

Is there any voltage present?

Yes >> Repair the (G95) 4WD Neutral Indicator circuit for a short to voltage.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Go to 5

4. (G95) 4WD NEUTRAL INDICATOR CIRCUIT OPEN

Turn the ignition off.

Disconnect the Transfer Case Selector Switch connector.

Measure the resistance of the (G95) 4WD Neutral Indicator Control circuit.

Is the resistance above 5.0 ohms?

Yes >> Repair the open (G95) 4WD Neutral Indicator circuit.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Go to 6

C230B- NEUTRAL INDICATOR CONTROL CIRCUIT HIGH (CONTINUED)

5. TRANSFER CASE SELECTOR SWITCH

View repair.

Repair

Replace the Transfer Case Selector Switch in accordance with the Service information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

6. FINAL DRIVE CONTROL MODULE

View repair.

Repair

Replace the Final Drive Control Module in accordance with the Service information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes >> Repair as necessary.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Test complete.

U0401–IMPLAUSIBLE DATA RECEIVED FROM ECM (FDCM)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
With the ignition on for 4 seconds, no CAN BUS circuit error condition present, no lost communication with PCM condition present, and no system undervoltage or overvoltage condition present.
- **Set Condition:**
The Final Drive Control Module is receiving implausible data for pedal position, engine RPM, torque, or engine coolant temperature from the PCM.

Possible Causes
POWERTRAIN DTCS PRESENT
FINAL DRIVE CONTROL MODULE

Diagnostic Test**1. POWERTRAIN DTCS PRESENT**

Ignition on.

With the scan tool, select View DTCs in the Powertrain Control Module.

Are there any DTCs present?

- Yes** >> Refer to the symptom list and perform the applicable diagnostic procedure.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
- No** >> Replace the Final Drive Control Module in accordance with the Service Information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
-

U0402-IMPLAUSIBLE DATA RECEIVED FROM TCM (FDCM)

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**

With the ignition on for 4 seconds, no CAN BUS circuit error condition present, no lost communication with TCM condition present, and no system undervoltage or overvoltage condition present.

- **Set Condition:**

The Final Drive Control Module is receiving implausible data for gear or PRNDL position from the TCM.

Possible Causes
TRANSMISSION DTCS PRESENT
FINAL DRIVE CONTROL MODULE

Diagnostic Test**1. TRANSMISSION DTCS PRESENT**

Ignition on.

With the scan tool, select View DTCs in the Transmission Control Module.

Are there any DTCs present?

Yes >> Refer to the symptom list and perform the applicable diagnostic procedure.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Replace the Final Drive Control Module in accordance with the Service Information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

U0415–IMPLAUSIBLE DATA RECEIVED FROM ABS (FDCM)

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**

With the ignition on for 4 seconds, no CAN BUS circuit error condition present, no lost communication with ABS condition present, and no system undervoltage or overvoltage condition present.

- **Set Condition:**

The Final Drive Control Module is receiving implausible data for vehicle speed, wheel speed, brake switch status, longitudinal acceleration, yaw rate, or lateral acceleration from the ABS controller.

Possible Causes
ANTILOCK BRAKE SYSTEM DTCS PRESENT
FINAL DRIVE CONTROL MODULE

Diagnostic Test**1. ABS DTCS PRESENT**

Ignition on.

With the scan tool, select View DTCs in the Antilock Brake Controller.

Are there any DTCs present?

Yes >> Refer to the symptom list and perform the applicable diagnostic procedure.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

No >> Replace the Final Drive Control Module in accordance with the Service Information.

Perform the TRANSFER CASE VERIFICATION TEST-VER 1.

U0429—IMPLAUSIBLE DATA RECEIVED FROM SCM (FDCM)

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**
With the ignition on for 4 seconds, no CAN BUS circuit error condition present, no lost communication with SCM condition present, and no system undervoltage or overvoltage condition present.
- **Set Condition:**
The Final Drive Control Module is receiving implausible data for sensor status from the SCM.

Possible Causes
STEERING COLUMN CONTROL MODULE DTCS PRESENT
FINAL DRIVE CONTROL MODULE

Diagnostic Test**1. STEERING COLUMN CONTROL MODULE DTCS PRESENT**

Ignition on.

With the scan tool, select View DTCs in the Steering Column Control Module.

Are there any DTCs present?

- Yes** >> Refer to the symptom list and perform the applicable diagnostic procedure.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
- No** >> Replace the Final Drive Control Module in accordance with the Service Information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
-

U0431–IMPLAUSIBLE DATA RECEIVED FROM FCM (FDCM)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
With the ignition on for 4 seconds, no CAN BUS circuit error condition present, no lost communication with FCM condition present, and no system undervoltage or overvoltage condition present.
- **Set Condition:**
The Final Drive Control Module is receiving no message or implausible data for Ambient Temperature from the FCM.

Possible Causes
FRONT CONTROL MODULE DTCS PRESENT
FINAL DRIVE CONTROL MODULE

Diagnostic Test**1. FRONT CONTROL MODULE DTCS PRESENT**

Ignition on.

With the scan tool, select View DTCs in the Front Control Module.

Are there any DTCs present?

- Yes** >> Refer to the symptom list and perform the applicable diagnostic procedure.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
- No** >> Replace the Final Drive Control Module in accordance with the Service Information.
Perform the TRANSFER CASE VERIFICATION TEST-VER 1.
-

TRANSFER CASE - NV140 - SERVICE INFORMATION

DESCRIPTION

NV140 Cross Section

1 - MAINSHAFT
2 - REAR OUTPUT SHAFT FLANGE
3 - FRONT OUTPUT SHAFT AND FLANGE

4 - INPUT SEAL
5 - DIFFERENTIAL

The NV140 is a single-speed transfer case and it is used in the Quadra-Trac I Full-Time 4-Wheel Drive System. It provides full-time 4-wheel drive. The transfer case operates with an open center differential dividing engine torque nearly evenly with 48 percent of engine torque to the front axle and 52 percent of engine torque to the rear axle. The Brake Traction Control System, which combines standard ABS and Traction Control, provides resistance to any wheel that is slipping to allow additional torque transfer to wheels with traction.

The Quadra-Trac I system with NV 140 single-speed transfer case provides the following benefits:

- No shift lever or driver interaction required.
- Full-time four-wheel drive provides smooth operation and vehicle stability under all conditions because torque is constantly being transferred.
- Even torque distribution provides traction to maintain forward motion under most conditions.
- The Brake Traction Control System (BTCS) works in tandem with full-time four-wheel drive. BTCS provides resistance to any wheel that is slipping to allow additional torque transfer to wheels with traction.
- Robust design and improved sealing enhance reliability.
- No maintenance required.

OPERATION

Full-time 4-wheel drive distributes even torque to all wheels under all conditions. The transfer case center differential evenly divides torque to the front and rear axles, while also allowing the driveshafts to rotate at different speeds to account for front and rear wheels traveling different distances while turning. Given that the drive shafts can rotate at different speeds, the vehicle can remain in full-time 4-wheel drive mode indefinitely, even on dry pavement, without threat of damage to the drivetrain. The vehicle uses Brake Traction Control to modulate the torque from one wheel to another across each axle and the transfer case.

REMOVAL

1. Raise vehicle.
2. Remove transfer case drain plug (3) and drain the transfer case lubricant.

CAUTION: Do not allow propshafts to hang at attached end. Damage to joint can result.

3. Remove the front and rear propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

4. Support transmission with jack stand.
5. Remove rear crossmember and skid plate, if equipped.
6. Disconnect transfer case vent hose (4).
7. Support transfer case with transmission jack and secure with chains.
8. Remove nuts (2) attaching transfer case (1) to transmission (3).
9. Pull transfer case and jack rearward to disengage transfer case.
10. Remove transfer case from under vehicle.

DISASSEMBLY

1. Remove the bolts (1) holding the dampner (2) to the rear housing (3).

2. Remove the dampner (1) from the rear housing (2).

3. Position transfer case on shallow drain pan. Remove drain plug (3) and drain lubricant remaining in case.

4. Using Holder C-3281 (1), remove the rear companion flange (2) nut. If flange is difficult to remove by hand, remove it with bearing splitter, or with standard two jaw puller. Be sure puller tool is positioned securely on flange.

5. Remove the rear output shaft flange (1) from the output shaft (2). If necessary, use a suitable 2 or 3 jaw puller to remove the output shaft flange.

6. Support transfer case so rear case is facing upward.
7. Remove bolts (2) holding front housing (3) to rear housing (1).

8. Loosen rear case with flat blade screwdriver to break sealer bead. Insert screwdriver blade only into notches provided at each end of case.
9. Remove rear housing (1) from front housing (2).

10. Remove front drive sprocket retaining ring (2) from the front output shaft (1).

11. Remove mainshaft drive sprocket retaining ring.
12. Remove the mode hub spacer (2) from the mode hub (3) and output shaft (1).

13. Remove the front drive sprocket (1), mainshaft drive sprocket (2), and the drive chain as one.

14. Remove the mainshaft and differential assembly (1) from the front housing (2).

15. Remove the input gear thrust washer (1) from the input gear (2).

16. Remove the screws (2) holding the chain guide rails (1) to the front housing.

17. Remove the drive chain guide (1) from the transfer case.

18. Remove the differential snap-ring (1).

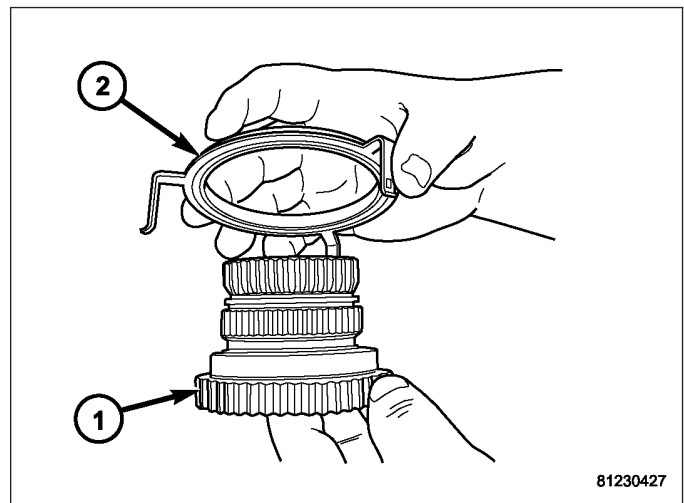

19. Remove the differential assembly (1) from the mainshaft (2).

20. Remove the mode hub (2) and mode hub retainer from the differential assembly (1).

21. Remove the mode hub retainer (1) from the mode hub (2).

22. Remove the retaining ring (2) from the front output shaft (1).

23. Remove the front output shaft (2) from the front housing (1) and the front output shaft front bearing.
24. Remove the front output shaft seal with a suitable pry tool or a screw mounted in a slide hammer.

25. Remove the input shaft seal with a suitable pry tool or a screw mounted in a slide hammer.
26. Remove the input gear (2) from the front housing (1).

ASSEMBLY

1. Remove the input shaft bearing from the front housing (3) with Handle C-4171 (1) and Installer 8693A (2).

2. Install the input gear bearing into the front housing (3) using Installer 8152 (2), inverted, and Handle C-4171 (1).

3. Using Installer 7829A (2) and Handle C-4171 (1), remove front output shaft bearing from the front housing (3).

4. Start front output shaft bearing in the front housing. Using Installer 8152 (2), inverted, and Handle C-4171 (1), seat the bearing in the front housing (3).

5. Remove the rear output shaft bearing from the rear case using Installer 5066 and Handle C-4171.
6. Install the rear output shaft bearing into the rear housing (3) using Installer 8152 (2), inverted, and Handle C-4171 (1).

7. Install the input gear (2) into the front housing (1).
8. Install the new input shaft seal with Installer 9672 and Handle C-4171.

9. Install a new front output shaft seal with Installer 6560.
10. Install the front output shaft (2) into the front housing (1) and the front output shaft front bearing.

11. Install the retaining ring (2) onto the front output shaft (1).

12. Lubricate mainshaft splines with recommended transmission fluid.

NOTE: Replace the mode hub retainer if the legs were distorted during removal.

13. Install the mode hub retainer (1) onto the mode hub (2).

14. Install the mode hub (2) and mode hub retainer onto the differential assembly (1). Make sure the retainer is fully seated onto the differential.

15. Install the differential assembly (1) onto the main-shaft (2).

16. Install the differential snap-ring (1).

17. Install the drive chain guide (1) onto the transfer case.

18. Install the screws (2) to hold the chain guide rail (1) to the front housing. Tighten the screws to 5-8 N·m (44-71 in.lbs.).

19. Install the input gear thrust washer (1) onto the input gear (2).

20. Install the mainshaft and differential assembly (1) into the front housing (2) and input gear.

21. Install the front drive sprocket (1), mainshaft drive sprocket (2), and drive chain (3) as one.

22. Install the front output shaft (1) drive sprocket retaining ring (2).

- 23. Install the mode hub spacer (2) onto the output shaft (1) and the mode hub (3).
- 24. Install the mainshaft drive sprocket retaining ring onto the mainshaft.

- 25. Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of front case. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.
- 26. Install the rear housing (1) onto the front housing (2).

- 27. Install the bolts (2) to hold the rear housing (1) to the front housing (3). Tighten the bolts to 25-28 N·m (18.5-20.5 ft.lbs.).

- 28. Install a new rear output shaft seal into the rear housing with Installer C-3972A.
- 29. Install the rear output shaft flange (1) onto the output shaft (2).

- 30. Using Holder C-3281 (1), install the rear companion flange (2) nut. Tighten the bolts to 122-176 N·m (90-130 ft.lbs.).

- 31. Install the transfer case dampner (1) onto the rear housing (2).

32. Install the bolts (1) to hold the dampner (2) to the rear housing (3). Tighten the bolts to 25-28 N-m (18.5-20.5 ft.lbs.).

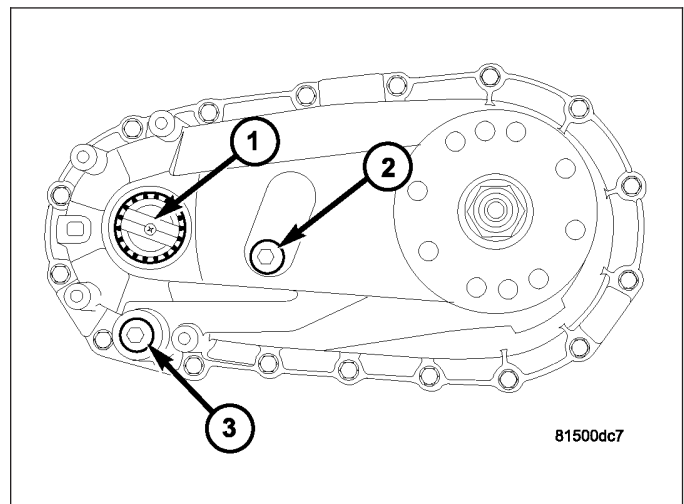

INSTALLATION

1. Mount transfer case on a transmission jack.
2. Secure transfer case to jack with chains.
3. Position transfer case under vehicle.
4. Align transfer case (1) and transmission (3) shafts and install transfer case onto the transmission.
5. Install and tighten transfer case attaching nuts (2) to 35 N-m (26 ft. lbs.) torque.
6. Connect front propeller shaft and install rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

7. Fill transfer case with correct fluid. Check transmission fluid level. Correct as necessary.
8. Install the transfer case fill plug (1). Tighten the plug to 20-34 N-m (15-25 ft.lbs.).
9. Install rear crossmember and skid plate, if equipped. Tighten crossmember bolts to 41 N-m (30 ft. lbs.) torque.
10. Remove transmission jack and support stand.
11. Lower vehicle and verify transfer case shift operation.

SPECIFICATIONS**TRANSFER CASE - NV140****TORQUE SPECIFICATIONS**

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.

Installer - 8693A

Installer, Seal - 9672

FLUID

STANDARD PROCEDURE - FLUID DRAIN/REFILL

The fill (2) and drain (3) plugs are both in the rear case.

1. Raise vehicle.
2. Position drain pan under transfer case.
3. Remove drain and fill plugs and drain lubricant completely.
4. Install drain plug. Tighten plug to 20-34 N·m (15-25 ft. lbs.).
5. Remove drain pan.
6. Fill transfer case to bottom edge of fill plug opening with the required fluid. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION)
7. Install and tighten fill plug to 20-34 N·m (15-25 ft. lbs.).
8. Lower vehicle.

SEAL-FRONT OUTPUT SHAFT

REMOVAL

The front output shaft seal cannot be serviced in the vehicle. The transfer case must be disassembled to remove the front output shaft and seal.

SEAL-REAR OUTPUT SHAFT

REMOVAL

1. Remove the rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
2. Using Holder C-3281 (1), remove the rear companion flange (2) nut.

3. Remove the rear output shaft flange (1) from the output shaft (2). If necessary, use a suitable 2 or 3 jaw puller to remove the output shaft flange.
4. Remove the rear output shaft seal with a suitable pry tool or a screw mounted in a slide hammer.

INSTALLATION

1. Install a new rear output shaft seal into the rear cover with Installer C-3972A.
2. Install the rear output shaft flange (1) onto the output shaft (2).

3. Using Holder C-3281 (1), install the rear companion flange (2) nut. Tighten the bolts to 122-176 N-m (90-130 ft.lbs.).
4. Install the rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
5. Check the transfer case fluid level. (Refer to 21 - TRANSMISSION/TRANSFER CASE/FLUID - STANDARD PROCEDURE) Correct as necessary.

TRANSFER CASE - NV245 - SERVICE INFORMATION

DESCRIPTION

814daf1d

NV245 Transfer Case

- | | |
|------------------------|-----------------------------------|
| 1 - CLUTCH ASSEMBLY | 7 - ANTI-ROTATION BRACKET |
| 2 - OIL PUMP | 8 - SHIFT MOTOR AND MODE SENSOR |
| 3 - REAR OUTPUT FLANGE | 9 - FRONT OUTPUT SHAFT AND FLANGE |
| 4 - DAMPER | 10 - LOW RANGE PLANETARY |
| 5 - ROLL PIN | 11 - INPUT SEAL |
| 6 - SECTOR ROLLER | 12 - DIFFERENTIAL |

The NV245 transfer case provides Full-Time Active Four-Wheel Drive for optimum traction in a wide range of conditions and is used in Quadra-Trac® II and Quadra-Drive® II systems. The transfer case center differential distributes torque 48 percent to the front axle and 52 percent to the rear axle along with an electronically controlled clutch pack that is coupled to the center differential for torque biasing. The NV245 electronics provide an active system because it can anticipate and prevent slip. The transfer case can redistribute 100 percent of torque to the front or rear axle, depending on need. For added traction when traversing steep grades, rough terrain or extremely slippery/poor traction surfaces at low speeds, the transfer case can be switched into 4WD Low, which multiplies engine torque 2.72 times and locks the clutch pack for maximum traction at all times. The Neutral mode allows the vehicle to be flat towed behind another vehicle.

Electric shifting is accomplished with a T-handle transfer case lever in the shifter assembly to provide simplified operation and positive engagement of 4 Low. A pushpin button is provided to shifting the transfer case into NEUTRAL.

OPERATION

ACTIVE TRANSFER CASE CONTROLS

Controls for the NV245 transfer case active clutch (torque biasing device) are located in the Final Drive Control Module (FDCM) and communicated on the CAN C bus. The FDCM monitors wheel speeds at the front and rear axles to detect wheel slippage. A complete vehicle dynamics model calculates slip at each tire for given vehicle-operating conditions. The clutch pack in the transfer case is engaged to minimize the speed difference between the front and rear axle, resulting in torque transfer to the axle with higher traction. The electronically controlled wet clutch pack uses an electric motor to actuate a sector plate. The sector plate actuates a clutch lever that applies normal force to the multi-disc wet clutch pack bridging the differential. The clutch discs are alternately splined to the front and rear driveshafts. When normal force is applied to this clutch pack, torque is transferred to equalize speed differences between front and rear axles.

TRANSFER CASE MODES

The transfer case operates in active full-time four-wheel drive (4 High Full-Time) unless the driver chooses 4-wheel drive Low or Neutral. A chrome T-handle momentary contact lever in the shifter assembly labeled 4WD Low allows the driver to select 4WD Low when a set of conditions is met. A separate Neutral pushbutton switch located beside the 4WD Low T-Handle is used by the operator to enter Neutral when a set of conditions is met. An indicator located in the instrument cluster indicates when 4WD Low is active. There is an indicator next to the Neutral button to indicate Neutral position as well as a message in the EVIC in the cluster that states "4WD SYSTEM IN NEUTRAL."

ELECTRIC SHIFT MECHANISM

All of the switching functions use resistive multiplexing to tell the Final Drive Control Module (FDCM) which mode to select. The FDCM operates an electric motor that shifts the transfer case. The FDCM obtains additional data necessary for operation and to provide diagnostic outputs via the CAN network. The electric shift mechanism helps protect the transfer case against internal damage by preventing a shift to 4WD Low range unless the vehicle speed is below 3 mph (5 km/hr) and the transmission is in Neutral. To shift the transfer case into Neutral for towing the vehicle, the pushpin button next to the range shifter must be depressed with a pen and a set of shift conditions must be met.

Through communication with various modules over the CAN network, the FDCM knows vehicle speed, automatic transmission position, engine run status, ignition status and brake switch position, some or all of which are required to determine whether shifts between 4WD Low, 4WD High or Neutral will be allowed. Diagnostic outputs include fault codes and the ability to "read" switch position and position sensor output. A warning message in the EVIC in the cluster indicates if a malfunction occurs in the electricshift system. A motor and encoder (position sensor) replace a lever on the shaft that shifts the transfer case. When a shift is called for, the motor turns the shaft until the sensor indicates that the correct angular position has been reached. To prevent the transfer case from making unintended shifts, the switch must be in position for 0.25 seconds before a shift will take place. A shift can take up to 1-2 seconds from the time that the switch is moved for full travel. If the shift is not completed in the appropriate time, the module will repeat the action up to five times. Misalignment of the gears in the transfer case may block a shift, in which case the sensor will detect this; the motor will then reverse and try again to complete the shift. Blockage can occur if the vehicle is stationary when the shift is initiated, but if the vehicle is moving as recommended when the shift is initiated, blockage is unlikely. If the shift is not completed after five attempts, the cluster indicator will flash and the driver will have to return the switch to its former position and repeat the operation.

DIAGNOSIS AND TESTING

TRANSFER CASE - NV245

DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
Transfer case difficult to shift or will not shift into desired range.	1) Transfer case electronically controlled shift system malfunction.	1) Verify proper operation per the appropriate diagnostic manual.
	2) Insufficient or incorrect lubricant.	2) Drain and refill transfer case with the correct quantity of Mopar® ATF +4, Automatic Transmission Fluid.
	3) Internal transfer case components binding, worn, or damaged.	3) Repair or replace components as necessary.
Transfer case noisy in all drive modes.	1) Insufficient or incorrect lubricant.	1) Drain and refill transfer case with the correct quantity of Mopar® ATF +4, Automatic Transmission Fluid.
	2) Internal transfer case components binding, worn, or damaged.	2) Repair or replace components as necessary.
Transfer case noisy while in, or jumps out of, 4LO.	1) Transfer case not completely engaged in 4LO position.	1) While rolling 2-3 MPH and the transmission in NEUTRAL, or the clutch depressed on vehicles equipped with a manual transmission, shift the transfer case to the AWD or 4LOCK position, and then back into the 4LO position.
	2) Range fork damaged, inserts worn, or fork is binding on the shift rail.	2) Repair or replace components as necessary.
	3) Low range gear worn or damaged.	3) Repair or replace components as necessary.
Lubricant leaking from transfer case seals or vent.	1) Transfer case overfilled.	1) Drain lubricant to the correct level.
	2) Transfer case vent closed or restricted.	2) Clean or replace vent as necessary.
	3) Transfer case seals damaged or installed incorrectly.	3) Replace suspect seal.

REMOVAL

1. Shift transfer case into NEUTRAL.
2. Raise vehicle.
3. Remove transfer case drain plug (2) and drain transfer case lubricant.

4. Support transmission (3) with jack stand.
5. Remove rear crossmember and skid plate, if equipped.
6. Disconnect front propeller shaft from transfer case at companion flange. Remove rear propeller shaft from vehicle. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

CAUTION: Do not allow propshafts to hang at attached end. Damage to joint can result.

7. Disconnect the transfer case shift motor and mode sensor connector.
8. Disconnect transfer case vent hose (4).
9. Support transfer case (1) with transmission jack.
10. Secure transfer case to jack with chains.
11. Remove nuts (2) attaching transfer case to transmission.
12. Pull transfer case and jack rearward to disengage transfer case.
13. Remove transfer case from under vehicle.

DISASSEMBLY

1. Place the transfer case in a shallow pan and remove the fill (1) and drain (2) plugs to drain the remainder of the fluid.

2. Using Holder C-3281 (1), remove the rear companion flange (2) nut.

3. Remove the rear output shaft flange (1) from the output shaft (2). If necessary, use a suitable 2 or 3 jaw puller to remove the output shaft flange.

4. Remove the bolts (1) holding the shift motor and mode sensor assembly (2) to the transfer case.

5. Remove the shift motor and mode sensor assembly (1) from the shift sector (2) and the transfer case (3).

- Remove the bolts (3) holding the rear cover (2) onto the rear housing (1).

- Remove the rear cover (1) from the rear housing (2).

- Using a suitable punch, remove the roll-pin (2) holding the sector roller (4) to the shift rail (3).

9. Remove the sector roller (1) from the shift rail (2).

10. Remove the anti-rotation bracket (1) from the shift rail (2).

11. Remove the clutch lever rail plug (1) from the rear housing.

12. Remove the clutch lever rail (2) from the rear housing (1).

13. Remove the oil pump inner rotor (2) from the output shaft (1) and rear housing (3).

14. Remove the oil pump outer rotor (2) from the output shaft (1) and rear housing (3).

15. Remove the bolts (2) holding the rear housing (1) to the front housing (3).

16. Remove the rear output shaft (1) retaining ring (2).

17. Remove the rear housing (1) from the front housing (2).

18. Remove the clutch lever assembly (1) from the mainshaft and shift rail.

19. Remove the thrust bearing support plate retaining ring (2) from the output shaft (1).

20. Remove the thrust bearing support plate (2) from the output shaft (1).

21. Remove the thrust bearing (2) from the output shaft (1).

22. Remove the clutch pressure plate (2) from the output shaft (1) and clutch assembly.

23. Remove the wave spring (2) from the output shaft (1).

24. Remove the clutch assembly (2) from the output shaft (1).

25. Remove the front output shaft (1) drive sprocket retaining ring (2).

26. Remove the front drive sprocket (1), mainshaft drive sprocket (2), and drive chain (3) as one.

27. Remove the screws (2) holding the chain guide rails (1) to the front housing.

28. Remove the drive chain guides (1) from the transfer case.

29. Remove the mainshaft and differential assembly (1) from the front housing (2).

30. Remove intermediate clutch shaft (2) snap-ring (1).

31. Remove the intermediate clutch shaft thrust ring (1).

32. Remove the intermediate clutch shaft (1).

33. Remove the differential snap-ring (1).

34. Remove the differential assembly (1) from the mainshaft (2).

35. Remove the mode hub (2) and mode hub retainer from the differential assembly (1).

36. Remove the mode hub retainer (1) from the mode hub (2).

37. Remove the range fork (1) and range hub (2) as one.

38. Remove the retaining ring (2) from the front output shaft (1).

39. Remove the front output shaft (2) from the front housing (1) and the front output shaft front bearing.

40. Remove the oil pick-up tube and screen (1) from the rear housing.

41. Remove the oil pick-up tube o-ring (2) from the rear housing (1).

- 42. Remove the retaining ring (2) from the shift sector shaft (1).

- 43. Remove the shift sector (2) from the front housing (1).

- 44. Remove the input shaft seal with a suitable pry tool or a screw mounted in a slide hammer.
- 45. Remove the retaining ring (2) holding the input gear assembly into the front housing.

46. Remove the input gear and low range planetary assembly (1) from the front housing.

47. Remove the snap-ring (2) holding the input gear (1) into the low range planetary (3).

48. Remove the input gear (1) and lock plate (2) from the low range planetary (3) and remove the lock plate.

49. Remove the top thrust washer (no tabs) (2) from the input gear (1).

50. Remove the bottom thrust washer (3 tabs) (1) from the low range planetary (2).

ASSEMBLY

1. Remove the input shaft bearing (1) from the front case (2) with suitable snap-ring pliers.
2. Transfer the retaining ring to the new bearing if necessary and install the bearing into the front case.

3. Remove the front output shaft bearing retaining ring from inside the front case half.
4. Using Installer 6436 and Handle C-4171, remove front output shaft bearing.
5. Start front output shaft bearing in case. Then seat bearing with Handle C-4171 (3) and Installer C-4210 (2).
6. Install front output shaft bearing retaining ring.

7. Remove the rear output shaft bearing retaining ring from inside the rear housing.
8. Remove the rear output shaft bearing from the rear case using Installer 5066 (2) and Handle C-4171 (3).
9. Install the rear output shaft bearing into the rear case using Remover/Installer 8281 (2) and Handle C-4171 (3).
10. Install the rear output shaft bearing retaining ring into the rear housing, from inside the rear housing.

11. Install the bottom thrust washer (3 tabs) (1) into the low range planetary (2).

12. Install the top thrust washer (no tabs) (2) onto the input gear (1).

13. Install the input gear (1) and lock plate (2) into the low range planetary (3) and install the lock plate.

14. Install the snap-ring (2) to hold the input gear (1) into the low range planetary (3).

- 15. Install the input gear and low range planetary assembly (1) into the front housing.

- 16. Install the retaining ring (2) holding the input gear assembly into the front housing.
- 17. Install the new input shaft seal with Installer 9672 and Handle C-4171.

- 18. Install the shift sector (2) into the front housing (1).

19. Install the retaining ring (2) onto the shift sector shaft (1).

20. Install the oil pick-up tube o-ring (2) into the rear housing (1).

21. Prime the oil pickup tube by pouring a little oil into the tube before installation.
22. Install the oil pick-up tube and screen (1) into the rear housing.

- 23. Install a new front output shaft seal with Installer 6560.
- 24. Install the front output shaft (2) into the front housing (1) and the front output shaft front bearing.

- 25. Install the retaining ring (2) onto the front output shaft (1).

- 26. Install the range fork (1) and range hub (2) as one into the input gear/low range planetary.

27. Lubricate mainshaft splines with recommended transmission fluid.

NOTE: Replace the mode hub retainer if the legs were distorted during removal.

28. Install the mode hub retainer (1) onto the mode hub (2).

29. Install the mode hub (2) and mode hub retainer onto the differential assembly (1). Make sure the retainer is fully seated onto the differential.

30. Install the differential assembly (1) onto the mainshaft (2).

31. Install the differential snap-ring (1).

32. Install the intermediate clutch shaft (1).

33. Install the clutch shaft thrust ring (1).

34. Install clutch shaft (2) snap-ring (1).

35. Install the mainshaft and differential assembly (1) into the front housing (2), range hub, and input gear/low range planetary.

36. Install the drive chain guides (1) onto the transfer case.

37. Install the screws (2) to hold the chain guide rails (1) to the front housing. Tighten the screws to 5-8 N·m (44-71 in.lbs.).

38. Install the front drive sprocket (1), mainshaft drive sprocket (2), and drive chain (3) as one.

39. Install the front output shaft (1) drive sprocket retaining ring (2).

40. Install the clutch assembly (2) onto the output shaft (1).

41. Install the wave spring (2) onto the output shaft (1).

42. Install the clutch pressure plate (2) onto the output shaft (1) and clutch assembly.

43. Install the thrust bearing (2) onto the output shaft (1).

44. Install the thrust bearing support plate (2) onto the output shaft (1).

45. Install the thrust bearing support plate retaining ring (2) onto the output shaft (1).

46. Install the clutch lever assembly (1) onto the mainshaft and shift rail.

47. Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of front case. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.

48. Install the rear housing (1) into the front housing (2).

49. Install the bolts (2) to hold the rear housing (1) to the front housing (3). Tighten the bolts to 25-28 N·m (18.5-20.5 ft.lbs.).

50. Install the rear output shaft (1) retaining ring (2).

Lubricate the oil pump components with transmission fluid before installation.

51. Install the oil pump outer rotor (2) onto the output shaft (1) and into the rear housing (3).

52. Install the oil pump inner rotor (2) onto the output shaft (1) and into the rear housing (3).

53. Install the clutch lever rail (2) into the rear housing (1) and clutch lever.

54. Install the clutch lever rail plug (1) into the rear housing.

55. Install the anti-rotation bracket (1) onto the shift rail (2).

56. Install the sector roller (1) onto the shift rail (2).
57. Using a suitable punch, align the holes in the sector roller with the hole in the shift rail and install the roll-pin to secure the sector roller to the shift rail.
58. Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of rear housing as shown (2). Keep sealer bead width to maximum of 3 mm (1/8 inch). Do not use excessive amount of sealer as excess could be displaced into the oil pump.

59. Install a new rear output shaft seal into the rear cover with Installer C-3972A.
60. Install the rear cover (1) onto the rear housing (2).

61. Install the bolts (3) holding the rear cover (2) onto the rear housing (1). Tighten the bolts to 25-28 N·m (18.5-20.5 ft.lbs.).

62. Install the shift motor and mode sensor assembly (1) onto the shift sector (2) and the transfer case (3).

63. Install the bolts (1) to hold the shift motor and mode sensor assembly (2) to the transfer case. Tighten the bolts to 25-28 N·m (18.5-20.5 ft.lbs.).

64. Install the rear output shaft flange (1) onto the output shaft (2).

65. Using Holder C-3281 (1), install the rear companion flange (2) nut. Tighten the bolts to 122-176 N·m (90-130 ft.lbs.).

INSTALLATION

1. Mount transfer case (1) on a transmission jack.
2. Secure transfer case to jack with chains.
3. Position transfer case under vehicle.
4. Align transfer case (2) and transmission (3) shafts and install transfer case onto transmission.
5. Install and tighten transfer case attaching nuts (2) to 35 N·m (26 ft. lbs.) torque.
6. Connect the transfer case vent hose (4) to the transfer case.

7. Install rear crossmember and skid plate, if equipped.
8. Remove transmission jack and support stand.
9. Connect front propeller shaft and install rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)
10. Fill transfer case with correct fluid. Check transmission fluid level. Correct as necessary.
11. Install the transfer case fill plug (1). Tighten the plug to 20-34 N·m (15-25 ft.lbs.).
12. Connect the shift motor and mode sensor wiring connector.
13. Lower vehicle and verify transfer case shift operation.

FLUID

STANDARD PROCEDURE - FLUID DRAIN/REFILL

The fill and drain plugs are both in the rear case.

1. Raise vehicle.
2. Position drain pan under transfer case.
3. Remove drain and fill plugs and drain lubricant completely.
4. Install drain plug. Tighten plug to 20-34 N·m (15-25 ft. lbs.).
5. Remove drain pan.
6. Fill transfer case to bottom edge of fill plug opening with the required fluid. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION)
7. Install and tighten fill plug to 20-34 N·m (15-25 ft. lbs.).
8. Lower vehicle.

SEAL-FRONT OUTPUT SHAFT

REMOVAL

The front output shaft seal cannot be serviced in the vehicle. The transfer case must be disassembled to remove the front output shaft and seal.

SENSOR-MODE

DESCRIPTION

The transfer case mode sensor (3) provides the Final Drive Control Module (FDCM) feedback about the position of the transfer case. The sensor consists of a linear analog position sensor that converts the motor output shaft position into a DC signal. The sensor may rotate a full 360 degrees. The operating envelope or sector rotation is -5 to 180 degrees. The FDCM must supply 5VDC (+/- 0.5v) to the sensor whenever the FDCM is not in sleep mode and monitors the shift motor position. The sensor position is monitored when the ignition is in the RUN position and for 10 seconds after the ignition is shifted to the OFF position. The sensor is mechanically linked to the shaft of the cam which allows the transfer case to shift. The mode sensor will draw less than 20 mA of current during operation.

OPERATION

During normal vehicle operation, the Final Drive Control Module (FDCM) monitors the mode sensor outputs at least every 2 milliseconds when the shift motor is stationary or active.

Refer to SHAFT ANGLE vs. TRANSFER CASE POSITION for the relative angles of the transfer case shift sector versus the interpreted transfer case gear operating mode.

SHAFT ANGLE vs. TRANSFER CASE POSITION

Shaft Angle (Degrees)	Transfer Case Position
0	AWD
-20	4LOW

NOTE: All the parameter voltages referred to in the following information are calibrated items in the controller software and are subject to change.

NOTE: For a further explanation of Phase 1 through 3 shifting, (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSFER CASE CONTROL MODULE - OPERATION).

The following information describes the different mode sensor positions:

- 4LOCK TARGET REGION - The position shall be considered 4LOCK if the voltage is greater than or equal to encoder_4LOCK_min Volts and it is also less than or equal to encoder_4LOCK_max Volts.
- AWD TARGET REGION - The position shall be considered AWD if the voltage is greater than or equal to encoder_AWD_min Volts and it is also less than or equal to encoder_AWD_max Volts.
- AWD SHIFT LIMIT - During Phase 2 and Phase 3 shifting, shifts may become unidirectional when a voltage is greater than or equal to encoder_AWD_min Volts has been reached.

The mode sensor position will be considered invalid by the FDCM if the voltage is greater than or equal to encoder_High_Range_Limit Volts or if it is less than or equal to encoder_Low_Range_Limit Volts.

If FDCM loses the encoder signal during a shift, the FDCM will respond with a shift back in the opposite direction of travel to first attempt to find the encoder signal. If the signal is not found, the FDCM will drive motor in AWD direction for 1 second.

Refer to MODE SENSOR VOLTAGES table for the mode sensor voltages.

MODE SENSOR VOLTAGES

Parameter Name	Voltage
encoder_4LOW_Min	4.19
encoder_4LOW_Max	4.35
encoder_AWD_Min	0.45
encoder_AWD_Max	0.55
encoder_High_Range_Limit	4.51
encoder_Low_Range_Limit	0.20

SWITCH-TRANSFER CASE SELECTOR

DESCRIPTION

The selector switch assembly is mounted in the right side of the shifter assembly and consists of a momentary contact T-handle for shifts to and from 4LOW and a recessed button for shifts into and out of NEUTRAL.

ASSEMBLY-SHIFT MOTOR/MODE SENSOR

DESCRIPTION

The shift motor (3) is an electromechanical device consisting of a DC permanent magnet motor, a gear train, and an analog position sensor. The shift motors' overall function is to move and lock a gear that moves the range fork and clutch lever found in the transfer case. This allows the transfer case to be shifted electrically to multiple operating positions (4LOW and AWD). The operating current of the shift motor under stall conditions is 30 amps maximum at 72° F with 13.5 volts, at the motor leads.

OPERATION

Shifting in the transfer case occurs when a Pulse Width Modulated (PWM) voltage is supplied to the shift motor by the Final Drive Control Module (FDCM). A linear analog position sensor located inside the shift motor, provides the FDCM with the motors' angular, rotational position. With this information, the FDCM continuously knows the motors' position, and therefore allows it to accurately control the motors' operation, including voltage polarity which is used to control motor direction.

REMOVAL

NOTE: New shift motor assemblies are shipped in the AWD position. If a new shift motor assembly must be installed, it will be necessary to shift the transfer case to the AWD position prior to motor installation.

1. Raise the vehicle on a suitable hoist.
2. Disengage the wiring connector from the shift motor and mode sensor assembly.
3. Remove the bolts (1) holding the shift motor and mode sensor assembly (2) onto the transfer case.

4. Separate the shift motor and mode sensor assembly (1) from the transfer case (3) and shift sector (2).

INSTALLATION

1. Verify that the shift motor o-ring is clean and properly positioned inside the machined o-ring groove of the shift motor.
2. Add high temperature grease between the shift motor assembly and the transfer case mating surface for sealing purposes.

NOTE: Verify that the missing tooth (2) in the shift motor drive spline (1)...

NOTE: ...and the transfer case drive spline (1) missing tooth (2) are aligned. It may be necessary to manually shift the transfer case if the shift motor and transfer case shaft are not aligned.

3. Position the shift motor and mode sensor assembly (1) onto the transfer case (3) and shift sector (2).

4. Install the bolts (1) to hold the assembly (2) onto the transfer case. Tighten the bolts to 25-28 N-m (18.5-20.5 ft.lbs.).

CAUTION: If the original shift motor and mode sensor assembly bolts are reused, be sure to use Mopar® Lock & Seal or Loctite™ 242 to replenish the lock patch material originally found on the bolts

5. Engage the wiring connector to the shift motor and mode sensor assembly.
6. Refill the transfer case as necessary.
7. Lower vehicle and verify transfer case operation.

SEAL-REAR OUTPUT SHAFT

REMOVAL

1. Remove the rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
2. Using Holder C-3281 (1), remove the rear companion flange (2) nut.

3. Remove the rear output shaft flange (1) from the output shaft (2). If necessary, use a suitable 2 or 3 jaw puller to remove the output shaft flange.
4. Remove the rear output shaft seal with a suitable pry tool or a screw mounted in a slide hammer.

INSTALLATION

1. Install a new rear output shaft seal into the rear cover with Installer C-3972A.
2. Install the rear output shaft flange (1) onto the output shaft (2).

3. Using Holder C-3281 (1), install the rear companion flange (2) nut. Tighten the bolts to 122-176 N-m (90-130 ft.lbs.).
4. Install the rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
5. Check the transfer case fluid level. (Refer to 21 - TRANSMISSION/TRANSFER CASE/FLUID - STANDARD PROCEDURE) Correct as necessary.

TIRES/WHEELS

DIAGNOSIS AND TESTING

TIRE AND WHEEL RUNOUT

Radial runout is the difference between the high and low points on the tire or wheel.

Lateral runout is the **wobble** of the tire or wheel.

Lateral runout of more than 2.0 mm (.080 inch) measured near the shoulder of the tire may cause the vehicle to shake.

Radial runout of more than 1.5 mm (.060 inch) measured at the center line of the tread may cause the vehicle to shake.

Sometimes radial runout can be reduced. Relocate the wheel and tire assembly on the mounting studs (See Method 1). If this does not reduce runout to an acceptable level, the tire can be rotated on the wheel. (See Method 2).

METHOD 1 (RELOCATE WHEEL ON HUB)

1. Drive vehicle a short distance to eliminate tire flat spotting from a parked position.
2. Check wheel bearings and adjust if adjustable or replace if necessary.
3. Check the wheel mounting surface.
4. Relocate wheel on the mounting, two studs over from the original position.
5. Tighten wheel nuts until all are properly torqued, to eliminate brake distortion.
6. Check radial runout. If still excessive, mark tire sidewall, wheel, and stud at point of maximum runout and proceed to Method 2.

METHOD 2 (RELOCATE TIRE ON WHEEL)

NOTE: Rotating the tire on wheel is particularly effective when there is runout in both tire and wheel.

1. Remove tire from wheel and mount wheel on service dynamic balance machine.
2. Check the wheel radial runout.

3. Check the wheel lateral runout.
 - STEEL WHEELS: Radial runout 0.031 in., Lateral runout 0.031 in. (maximum)
 - ALUMINUM WHEELS: Radial runout 0.02 in., Lateral runout 0.025 in. (maximum)
4. If point of greatest wheel lateral runout is near original chalk mark, remount tire 180 degrees. Recheck runout.

STANDARD PROCEDURE

MATCH MOUNTING

Wheels and tires that are mounted means that the high spot of the tire is matched to the low spot on the wheel rim. Each are marked with a bright colored temporary label on the outboard surface for alignment. The wheel is also marked permanently on the inside of the rim in the tire well. This permanent mark may be a paint dot or line, a permanent label or a stamped impression such as an X. An optional location mark is a small spherical indentation on the vertical face of the outboard flange on some non styled base steel wheels. The tire must be removed to locate the permanent mark on the inside of the wheel.

Before dismounting a tire from its wheel, a reference mark should be placed on the tire at the valve stem location. This reference will ensure that it is remounted in the original position on the wheel.

1. Remove the tire and wheel assembly from the vehicle and mount on a service dynamic balance machine.
2. Measure the total runout on the center of the tire tread rib (3) with a dial indicator. Record the indicator reading. Mark the tire to indicate the high spot (2). Place a mark on the tire at the valve stem (4) location (1).

3. Break down the tire and remount it 180 degrees on the rim (1)(2).
4. Measure the total indicator runout again. Mark the tire to indicate the high spot.

5. If runout is still excessive, the following procedures must be done.
 - If the high spot is within 101.6 mm (4.0 in.) of the first spot and is still excessive, replace the tire.
 - If the high spot is within 101.6 mm (4.0 in.) of the first spot on the wheel, the wheel may be out of specifications. Refer to Wheel and Tire Runout.
 - If the high spot is NOT within 101.6 mm (4.0 in.) of either high spot, draw an arrow on the tread from second high spot (1) to first (2). Break down the tire and remount it 90 degrees on rim in that direction. This procedure will normally reduce the runout to an acceptable amount, if not replace the rim.

TIRE AND WHEEL BALANCE

It is recommended that a two plane service dynamic balancer be used when a tire and wheel assembly require balancing. Refer to balancer operation instructions for proper cone mounting procedures. Typically use front cone mounting method for steel wheels. For aluminum wheel use back cone mounting method without cone spring.

NOTE: Static should be used only when a two plane balancer is not available.

NOTE: Cast aluminum and forged aluminum wheels require coated balance weights and special alignment equipment.

Wheel balancing can be accomplished with either on or off vehicle equipment. When using on-vehicle balancing equipment, remove the opposite wheel/tire. Off-vehicle balancing is recommended.

For static balancing, find the location of the heavy spot (1) causing the imbalance (5). Counter balance wheel directly opposite the heavy spot. Determine weight required to counter balance the area of imbalance (4). Place half of this weight on the **inner** rim flange (3) and the other half on the **outer** rim flange (3).

For dynamic balancing (3), the balancing equipment is designed to locate the amount of weight to be applied to both the inner and outer rim flange (2).

ROTATION

Tires on the front and rear operate at different loads and perform different steering, driving, and braking functions. For these reasons they wear at unequal rates and tend to develop irregular wear patterns. These effects can be reduced by rotating the tires at regular intervals. The benefits of tire rotation are:

- Increase tread life
- Maintain traction levels
- A smooth, quiet ride

The suggested method of tire rotation is shown in graphic. Other rotation methods can be used, but they will not provide all the tire longevity benefits.

SPECIFICATIONS

CAUTION: DO NOT USE CHROME PLATED LUG NUTS WITH CHROME PLATED WHEELS.

TIRES

DESCRIPTION

TIRES

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe brake applications
- High speed driving
- Excessive speeds on turns
- Striking curbs and other obstacles

Radial-ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE). This will help to achieve a greater tread life.

TIRE IDENTIFICATION

Tire type, size, aspect ratio and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the chart to decipher the tire identification code.

Performance tires have a speed rating letter after the aspect ratio number. The speed rating is not always printed on the tire sidewall. These ratings are:

- **Q** up to 100 mph
- **S** up to 112 mph
- **T** up to 118 mph
- **U** up to 124 mph
- **H** up to 130 mph
- **V** up to 149 mph
- **Z** more than 149 mph (consult the tire manufacturer for the specific speed rating)

An All Season type tire will have either **M + S**, **M & S** or **M-S** (indicating mud and snow traction) imprinted on the side wall.

TIRE CHAINS

Tire snow chains may be used on **certain** models. Refer to the Owner's Manual for more information.

RADIAL-PLY TIRES

Radial-ply tires improve handling, tread life and ride quality, and decrease rolling resistance.

Radial-ply tires must always be used in sets of four. Under no circumstances should they be used on the front only. They may be mixed with temporary spare tires when necessary. A maximum speed of 50 MPH is recommended while a temporary spare is in use.

Radial-ply tires have the same load-carrying capacity as other types of tires of the same size. They also use the same recommended inflation pressures.

The use of oversized tires, either in the front or rear of the vehicle, can cause vehicle drive train failure. This could also cause inaccurate wheel speed signals when the vehicle is equipped with Anti-Lock Brakes.

The use of tires from different manufactures on the same vehicle is NOT recommended. The proper tire pressure should be maintained on all four tires.

TIRE INFLATION PRESSURES

WARNING: OVER OR UNDER INFLATED TIRES CAN AFFECT VEHICLE HANDLING AND TREAD WEAR. THIS MAY CAUSE THE TIRE TO FAIL SUDDENLY, RESULTING IN LOSS OF VEHICLE CONTROL.

Under inflation will cause rapid shoulder wear (1), tire flexing, and possible tire failure.

Over inflation will cause rapid center wear (1) reduction in the tire's ability to cushion shocks.

Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- Vehicle drift

For proper tire pressure specification refer to the vehicles Owners Manual.

TIRE PRESSURE FOR HIGH SPEED

Refer to the Vehicles Owners Manual package.

SPARE / TEMPORARY TIRE

The temporary spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 50 M.P.H. when using the temporary spare tire. Refer to Owner's Manual for complete details.

FULL SIZE, SPARE WHEEL WITH MATCHING TIRE

The spare is a full usage wheel with a matching tire, It can be used within the (posted legal) speed limits or distance limitations as of the rest of the vehicles four tires. Refer to Owner's Manual for complete details.

REPLACEMENT TIRES

The original equipment tires provide a proper balance of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

WARNING: FAILURE TO EQUIP THE VEHICLE WITH TIRES HAVING ADEQUATE SPEED CAPABILITY CAN RESULT IN SUDDEN TIRE FAILURE.

DIAGNOSIS AND TESTING

PRESSURE GAUGES

A quality air pressure gauge is recommended to check tire pressure. After checking the air pressure, replace valve cap finger tight.

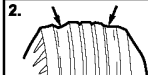

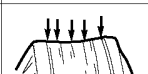

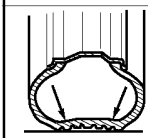

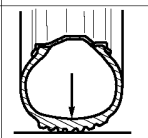

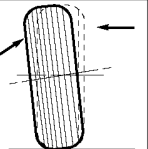

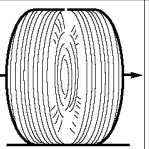

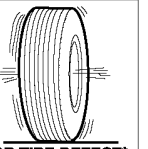

TREAD WEAR INDICATORS

Tread wear indicators (3) are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators (3) will appear as a 13 mm (1/2 in.) band.

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

TIRE WEAR PATTERNS

CONDITION	RAPID WEAR AT SHOULDERS	RAPID WEAR AT CENTER	CRACKED TREADS	WEAR ON ONE SIDE	FEATHERED EDGE	BALD SPOTS	SCALLOPED WEAR
EFFECT	1.  2. 						
CAUSE	UNDER-INFLATION OR LACK OF ROTATION 	OVER-INFLATION OR LACK OF ROTATION 	UNDER-INFLATION OR EXCESSIVE SPEED*	EXCESSIVE CAMBER 	INCORRECT TOE 	UNBALANCED WHEEL OR TIRE DEFECT* 	LACK OF ROTATION OF TIRES OR WORN OR OUT-OF-ALIGNMENT SUSPENSION.
CORRECTION	ADJUST PRESSURE TO SPECIFICATIONS WHEN TIRES ARE COOL ROTATE TIRES			ADJUST CAMBER TO SPECIFICATIONS	ADJUST TOE-IN TO SPECIFICATIONS	DYNAMIC OR STATIC BALANCE WHEELS	

* HAVE TIRE INSPECTED FOR FUTURE USE.

812014d7

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other.

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread.

TIRE NOISE OR VIBRATION

Radial-ply tires are sensitive to force impulses caused by improper mounting, vibration, wheel defects, or possibly tire imbalance.

To find out if tires are causing the noise or vibration, drive the vehicle over a smooth road at varying speeds. Note the noise level during acceleration and deceleration. The engine, differential and exhaust noises will change as speed varies, while the tire noise will usually remain constant.

TIRE/VEHICLE LEAD

Use the following Vehicle Lead Diagnosis And Correction Chart to diagnose and correct a vehicle lead or drift problem.

STANDARD PROCEDURE

TIRE REPAIR AREA

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (1). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before removing the tire from the wheel. Use lubrication such as a mild soap solution when dismounting or mounting tire. Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and tighten to proper torque specification.

CLEANING

TIRES

Remove the protective coating on the tires before delivery of a vehicle. This coating may cause deterioration of the tires.

To remove the protective coating, apply warm water and let it soak for a few minutes. Afterwards, scrub the coating away with a soft bristle brush. Steam cleaning may also be used to remove the coating.

NOTE: DO NOT use gasoline, mineral oil, oil-based solvent or a wire brush for cleaning.

SPECIFICATIONS

SPARE TIRE WINCH

REMOVAL

NOTE: "Do NOT use impact tools on the Spare Tire Winch assembly to raise or lower the Spare Tire.

1. Remove the spare tire.
2. Raise and support the vehicle.
3. Remove the three bolts securing the spare tire winch to the body and then remove the winch.

INSTALLATION

1. Install the winch to the body and tighten the three bolts to 39 N·m (28 ft.lbs.).
2. Lower the vehicle.

NOTE: "Do NOT use impact tools on the Spare Tire Winch assembly to raise or lower the Spare Tire.

3. Install the spare tire back into position.

WHEELS

DESCRIPTION

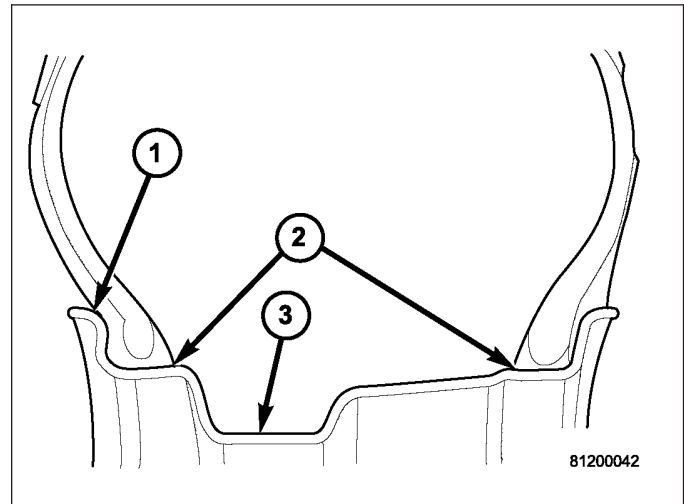

WHEEL DESIGN

The rim size is on the vehicle safety certification label located on the drivers door shut face. The size of the rim is determined by the drivetrain package. Original equipment wheels/rims are designed for operation up to the specified maximum vehicle capacity.

All models use stamped steel, cast aluminum or forged aluminum wheels. Every wheel has raised sections between the rim flanges (1) and rim drop well (3) called safety humps (2).

Initial inflation of the tire forces the bead over these raised sections. In case of rapid loss of air pressure, the raised sections help hold the tire on the wheel.

The wheel studs and nuts are designed for specific applications. All aluminum and some steel wheels have wheel stud nuts with an enlarged nose. This enlarged nose is necessary to ensure proper retention of the wheels. Do not use replacement studs or nuts with a different design or lesser quality.

DIAGNOSIS AND TESTING

WHEEL INSPECTION

Inspect wheels for:

- Excessive run out
- Dents or cracks
- Damaged wheel lug nut holes
- Air Leaks from any area or surface of the rim

NOTE: Do not attempt to repair a wheel by hammering, heating or welding.

If a wheel is damaged an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: FAILURE TO USE EQUIVALENT REPLACEMENT WHEELS MAY ADVERSELY AFFECT THE SAFETY AND HANDLING OF THE VEHICLE. USED WHEELS ARE NOT RECOMMENDED. THE SERVICE HISTORY OF THE WHEEL MAY HAVE INCLUDED SEVERE TREATMENT OR VERY HIGH MILEAGE. THE RIM COULD FAIL WITHOUT WARNING.

STANDARD PROCEDURE

WHEEL INSTALLATION

The wheel studs and nuts are designed for specific applications. They must be replaced with equivalent parts. Do not use replacement parts of lesser quality or a substitute design. All aluminum and some steel wheels have wheel

stud nuts which feature an enlarged nose. This enlarged nose is necessary to ensure proper retention of the aluminum wheels.

NOTE: Do not use chrome plated lug nuts with chrome plated wheels.

Before installing the wheel, be sure to remove any build up of corrosion on the wheel mounting surfaces (1). Ensure wheels (2) are installed with good metal-to-metal contact. Improper installation could cause loosening of wheel nuts. This could affect the safety and handling of your vehicle.

To install the wheel (2), first position it properly on the mounting surface (1). All wheel nuts (3) should then be tightened just snug.

Gradually tighten them in sequence to the proper torque specification. **Never use oil or grease on studs or nuts.**

WHEEL REPLACEMENT

The wheel studs and nuts are designed for specific applications. They must be replaced with equivalent parts. Do not use replacement parts of lesser quality or a substitute design. All aluminum and some steel wheels have wheel stud nuts which feature an enlarged nose. This enlarged nose is necessary to ensure proper retention of the aluminum wheels.

NOTE: Do not use chrome plated lug nuts with chrome plated wheels.

Before installing the wheel, be sure to remove any build up of corrosion on the wheel mounting surfaces. Ensure wheels are installed with good metal-to-metal contact. Improper installation could cause loosening of wheel nuts. This could affect the safety and handling of your vehicle.

To install the wheel, first position it properly on the mounting surface. All wheel nuts should then be tightened just snug. Gradually tighten them in sequence to the proper torque specification. **Never use oil or grease on studs or nuts.**

Wheels must be replaced if they have:

- Excessive runout

- Bent or dented
- Leak air through welds
- Have damaged bolt holes

Wheel repairs employing hammering, heating, or welding are not allowed.

Original equipment wheels are available through your dealer. Replacement wheels from any other source should be equivalent in:

- Load carrying capacity
- Diameter
- Pilot Bore Diameter
- Width
- Offset
- Mounting configuration

Failure to use equivalent replacement wheels may affect the safety and handling of your vehicle. Replacement with **used** wheels is not recommended. Their service history may have included severe treatment.

STUDS

REMOVAL

FRONT WHEEL STUD

CAUTION: Do not use a hammer to remove wheel studs.

1. Raise and support vehicle.
2. Remove wheel and tire assembly.
3. Remove brake caliper, caliper adapter and rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
4. Remove stud (2) from hub with Remover C-4150-A (1).

REAR WHEEL STUD

CAUTION: Do not use a hammer to remove wheel studs.

1. Raise and support vehicle.
2. Remove wheel and tire assembly.

3. Remove brake caliper and rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL).
4. Remove stud (2) from hub with Remover 8677 (1).

5. Remove the stud (1) from between the hub/bearing and brake shoes (2)

INSTALLATION

FRONT WHEEL STUD

CAUTION: Do not use a hammer to remove wheel studs.

1. Install the new stud into the hub flange.
2. Install the three washers onto the stud, then install the lug nut with the flat side of the nut against the washers.
3. Tighten the lug nut until the stud is pulled into the hub flange. Verify that the stud is properly seated into the flange.
4. Remove the lug nut and washers.
5. Install the brake rotor, caliper adapter, and caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
6. Install the wheel and tire assembly, use new lug nut on stud or studs that were replaced.
7. Remove the support and lower vehicle.

REAR WHEEL STUD

1. Install the new stud (1) into the hub flange by rotating the stud (1) in between the hub/bearing and park brake shoes (2).

2. Install the three washers onto the stud, then install the lug nut with the flat side of the nut against the washers.
3. Tighten the lug nut until the stud is pulled into the hub flange. Verify that the stud is properly seated into the flange.
4. Remove the lug nut and washers.
5. Install the brake rotor and caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
6. Install the wheel and tire assembly, use new lug nut on stud or studs that were replaced.
7. Remove the support and lower vehicle.

TIRE PRESSURE MONITORING SYSTEM

DESCRIPTION

BASE TIRE PRESSURE MONITORING

This system will consist of tire pressure monitoring sensors attached to each wheel through the valve stem mounting hole, a central receiver module (WCM) and a amber colored indicator lamp. A sensor shall be installed in the spare wheel if the vehicle is equipped with a matching full size spare wheel and tire assembly.

PREMIUM TIRE PRESSURE MONITORING

The system will consist of tire pressure monitoring sensors attached to each wheel through the valve stem mounting hole, a wireless control module (WCM), Three Wheel Sensor transponders are mounted in the wheel wells (2 in the front and 1 in the rear wheel wells). a re-configurable dot matrix display module and an amber colored ISO standard Indicator Lamp. A sensor shall be installed in the spare wheel if the vehicle is equipped with a matching full size spare wheel and tire assembly.

WIRELESS CONTROL MODULE (WCM)

The receiver circuit for the TPM system is integrated into the WCM. The WCM also includes the Remote Keyless Entry (RKE) receiver and the Sentry Key Immobilizer (SKIM) receiver. All three receivers share a number of common components. The WCM decodes the RF signals transmitted by each of the vehicle's tire pressure sensors. The decoded information is used to determine if "warning" or "fault" conditions exist within the TPM system.

The WCM communicates with the module that controls the "ISO Indicator Lamp" and the text display (Premium system), via the vehicle bus system (CAN B).

Upon detection of a warning or fault condition, the WCM will send a request to illuminate the Indicator Lamp. Also, upon detection of a warning or fault condition, the display module will send a request to sound the "chime". A chime will only be requested once per ignition cycle per warning or fault condition detected.

The WCM will store all warning and fault conditions, placard pressure values, low-pressure threshold values and low pressure threshold hysteresis values in memory that can be accessed through diagnostic communication. If new sensors are introduced to the vehicle, the data stored for the sensor being replaced will be deleted.

The WCM will store all wheel sensor ID's and locations and faults in memory that can be accessed through diagnostic communication. All other data values transmitted from each wheel sensor shall be stored in the WCM memory.

OPERATION

BASE TIRE PRESSURE MONITORING

The tire pressure monitoring system is designed to operate without loss of function for all types of standard tire constructions. (Function with different types of run flat tire constructions needs to be evaluated for each design). The wheel sensor shall monitor tire pressure, air temperature inside the tire, wheel acceleration and the sensor internal battery status for all four active road tires. The sensor will broadcast this information, along with a unique 32 bit ID, to a central receiver circuit located inside the WCM. The information received by the WCM will be decoded and stored in memory (RAM) in the WCM. If a "warning" or "fault" condition exists, the WCM will send a bus message request to illuminate the amber colored indicator lamp and to sound the chime.

If the WCM detects a warning or fault condition at ignition key "on" it will wait ten seconds +/- 10 % before sending the first request to illuminate the Indicator Lamp. This will assure that the display module has concluded its bulb check period. The display module will request a chime once per ignition cycle for each "warning" or "fault" condition detected. A "warning" or "fault" condition will remain enabled until the problem causing the condition is corrected and removed/reset.

The WCM shall continuously monitor for the receipt of tire pressure RF message transmissions from the wheel sensors during both the ignition key "on" and key "off" cycles. The wheel sensor ID's and the location of each sensor (e.g. Tire 1, Tire 2 etc.) are stored in the WCM non-volatile memory during the initial Manufacturing Plant Process, or during a service procedure, as required. The recommended "placard pressure", "low-pressure threshold" and "Hysteresis Pressure Values" for the tires installed on the vehicle, are stored in the WCM non-volatile memory during the initial Manufacturing Plant Process, or during a service procedure, as required. (Note: For vehicles with optional wheel/tire sizes and significantly different tire placard pressures, the placard pressure value and the low-pressure threshold value shall be re-programmable by the dealer to accommodate the customer selected wheel/tire combinations recommended by DaimlerChrysler).

PREMIUM TIRE PRESSURE MONITORING

The tire pressure monitoring system is designed to operate without loss of function for all types of standard tire constructions. (Function with different types of run flat tire constructions needs to be evaluated for each design). The wheel sensor shall monitor tire pressure, air temperature inside the tire, wheel acceleration and the sensor internal battery status for all four active road tires and the spare tire, if so equipped. The sensor will broadcast this information, along with a unique 32 bit ID, to a central receiver circuit located inside the WCM. The information received by the WCM will be decoded and stored in (RAM) memory in the WCM. The WCM will send bus messages to the re-configurable display module to display the pressures of the four active road tires in vehicle position. The spare tire pressure is monitored but it is not displayed.

If a "warning" or "fault" condition exists, the WCM will send a bus message request to display the text messages and, when required, illuminate the amber colored ISO Indicator Lamp. "Warnings" and "faults" are described in more detail below. If the WCM detects a warning or fault condition at ignition key "on" it will wait ten seconds +/- 10% before sending the first request to illuminate the Indicator Lamp and to display the text messages. This will assure that the display module has concluded its bulb check period. The display module will request a chime once per ignition cycle for each "warning" or "fault" condition detected. A "warning" or "fault" condition will remain enabled until the problem causing the condition is corrected and removed/reset

The WCM shall continuously monitor for the receipt of tire pressure RF message transmissions from the wheel sensors during both the ignition key "on" and key "off" cycles. The wheel sensor ID's and the location of each sensor (e.g. Left Front, Right Front etc.) are stored in the WCM non-volatile memory during the initial Manufacturing Plant Process, or during a service procedure, as required. The recommended "placard pressure", "low-pressure threshold" and Hysteresis Pressure Values for the tires installed on the vehicle, are stored in the WCM non-volatile

memory during the initial Manufacturing Plant Process, as described later in this document or during a service procedure as required. (Note: For vehicles with optional wheel/tire sizes and significantly different tire placard pressures, the placard pressure value and the low-pressure threshold value shall be re-programmable by the dealer to accommodate the customer selected wheel/tire combinations recommended by DaimlerChrysler).

DIAGNOSIS AND TESTING - TIRE PRESSURE MONITORING SYSTEM

All Tire Pressure Monitoring System Faults are specific to one location. If a "BATTERY LOW" or "SENSOR FAILURE" fault is detected, the location will be displayed (Premium Systems). The appropriate sensor/transmitter can then be replaced. If a single sensor/transmitter cannot be detected by the WCM, replace that sensor transmitter. If none of the sensors/transmitters can be detected, refer to symptoms in the WCM section. For additional system description and diagnosis, refer to Tire Pressure Monitoring in the Body Diagnostic manual.

SPECIFICATIONS

Transponder Rear	3	—	25

SENSOR

DESCRIPTION

On vehicles equipped with Tire Pressure Monitoring (TPM), one tire pressure sensor (6) is mounted to each wheel (5) in place of the traditional tire valve stem. Each sensor has an internal battery that lasts up to 10 years. The battery is not serviceable. At the time of battery failure, the sensor must be replaced.

The TPM system operates on a 315 MHz radio frequency. The 315 MHz sensors can be easily identified by a white outline oval (black center) insignia (3) on the sensor body.

The Export TPM system operates on a 434 MHz radio frequency. The 434 MHz sensors can be easily identified by a solid white oval insignia (3) on the body.

CAUTION: Although 315 MHz and 434 MHz sensors are identical in size and shape, they are not interchangeable. Always make sure the correct sensor is being used.

The TPM sensors are designed for original style factory wheels. **Do not attempt to install a tire pressure sensor in an aftermarket wheel.**

The serviceable components of the tire pressure sensor are :

- Sensor-To-Wheel Seal (2) and Metal Washer (1)
- Valve Stem Cap (4)
- Valve Stem Core
- Valve Stem Nut (with pressed-in washer) (3)

The valve stem caps and cores used are specifically designed for the tire pressure monitoring sensors. Although similar to standard valve stem caps and cores, they are different. The valve stem cap has a special seal inside to keep moisture and corrosion out. The valve stem core has a special nickel coating to protect from corrosion.

OPERATION

The battery operated tire pressure sensors lay dormant (Park Mode), then wake and start transmitting (Drive Mode) when the vehicle first reaches speeds over 20 mph (32 km/h). Once the wheels stop rotating for a period of approximately 20 minutes, the sensors shut down until again awoken. Although not transmitting as when in Drive Mode, while in Park Mode, the sensors still transmit approximately once every 13 hours to let the receiver know air pressure status at that time.

Using an RF signal, each sensor transmits tire pressure data approximately once every minute. Each sensor's (transmitter) broadcast is uniquely coded so that the wireless control module (WCM) can monitor the state of each of the sensors on the four rotating road wheels. The WCM automatically learns and stores the sensor's ID while driving after a sensor has been replaced. **There is no formal retraining procedure necessary.**

For additional information, refer to appropriate diagnostic information.

CAUTION

CAUTION: The use of tire sealants is strictly prohibited for vehicles equipped with the Tire Pressure Monitoring system. Tire sealants can clog tire pressure sensors.

CAUTION: Tire pressure sensor valve stem caps and cores are specially designed for the sensors. Due to risk of corrosion, do not use a standard valve stem cap or core in a tire pressure sensor in place of the original equipment style sensor cap and core.

CAUTION: Do not attempt to install a tire pressure sensor in an aftermarket wheel. Use tire pressure sensors in original style factory wheels only.

CAUTION: Any time a sensor is to be installed in a wheel, a new seal and washer must be installed on the stem to ensure air tight sealing.

NOTE: TPM thresholds have been established for the original tire size equipped on the vehicle. Use original size tires only to maintain system accuracy.

DIAGNOSIS AND TESTING

TIRE PRESSURE SENSOR

NOTE: Tire pressure may increase from 2 to 6 psi (14 to 41 kPa) during normal driving conditions. Do NOT reduce this normal pressure build up.

When diagnosing a tire pressure issue, always check air pressure in the tires first with a known accurate air gauge. Adjust air pressure as necessary to that listed on the Tire Inflation Pressure Label (Placard) provided with the vehicle (usually applied to the driver's side B-pillar). After adjusting air pressure in a tire, allow approximately two minutes for the message or indicator lamp to go out.

Check the tire pressure indicator lamp in the instrument cluster. If the lamp is illuminating continuously, proceed as listed below. If the indicator lamp is flashing on/off for 10 seconds, once every ten minutes, there is a system fault detected. Refer to the appropriate diagnostic information.

If air pressure in any tire is low, inspect **all** the tires for leaks. A water "dunk tank" or other water test may be used to check for a leak around the sensor as long as any water at the valve core is removed once the procedure is completed. The water can be easily expelled from the core area by pushing in on the core for several seconds, allowing escaping air to drive out any moisture. Reinflate the tire as necessary. Always make sure the original valve stem cap is securely installed to keep moisture out of the sensor.

If the gauge-read pressure in the tires does not indicate a tire pressure issue, refer to the appropriate diagnostic information.

REMOVAL

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove the tire and wheel assembly. (Refer to 22 - TIRES/WHEELS - REMOVAL)

CAUTION: The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Retain this valve stem cap for reuse. Do not substitute a regular valve stem cap in its place.

CAUTION: The valve stem used on this vehicle is made of aluminum and the core is nickel plated brass. The original valve stem core must be reinstalled and not substituted with a valve stem core made of a different material. This is required to prevent corrosion in the valve stem caused by the different metals.

3. Dismount tire from wheel following tire changer manufacturers instructions while paying special attention to the following to avoid damaging the pressure sensor:

- a. When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor. That includes both front and rear beads of the tire.
- b. When preparing to dismount the tire from the wheel, carefully insert the mounting/dismounting tool at the valve stem $\pm 10^\circ$, then proceed to dismount the tire from the wheel. Use this process on both the upper and lower tire beads.

4. Remove sensor nut (3) retaining sensor to wheel. While removing nut, hold pressure against rear of metal valve stem (See Arrow) to keep valve stem from pushing rearward, damaging antenna strap.
5. Remove sensor (1) from wheel (2).

INSTALLATION

NOTE: Before reinstalling an existing tire pressure sensor, replace seal (2) and metal washer (1) at base of sensor valve stem (6) to ensure proper sealing.

1. Wipe area clean around sensor/valve stem mounting hole in wheel (5). Make sure surface of wheel is not damaged.

814994ad

CAUTION: To avoid damaging sensor antenna strap (1), hold pressure against rear of metal valve stem (2) while sensor is inserted through wheel mounting hole and nut is installed.

8149b7c9

2. Insert sensor (1) through wheel (2) as shown keeping pressure against rear of metal valve stem (See Arrow). Potted side of sensor is to be positioned toward wheel. Do not attempt to mount sensor otherwise, damage may occur.
3. Install sensor nut (with pressed-in washer) (3) by hand.

81499796

NOTE: Before tightening sensor nut, push downward on sensor housing (2) in an attempt to make it flush with interior contour of wheel (1).

4. While holding sensor in position, tighten sensor nut to 7.5 N·m (66 in. lbs.) torque.

CAUTION: Over-torquing the sensor nut by as little as 12 N·m (106 in. lbs.) may result in sensor separation from the valve stem. Under this condition, the sensor may still function, however, the condition should be corrected immediately.

5. Mount tire on wheel following tire changer manufacturers instructions, paying special attention to the following to avoid damaging tire pressure sensor:

- a. Rotating Wheel Tire Changers- Once the wheel is mounted to the changer, position the sensor valve stem (2) approximately 210° from the head of the changer (located at 1) in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire. Use this procedure on both the upper and lower tire beads.

- b. Rotating Tool Tire Changers - Position the wheel on the changer so that the sensor valve stem (1) is located approximately 210° clockwise from the installation end of the mounting/dismounting tool (2) once the tool is mounted for tire installation. Make sure the sensor is clear of the lower bead breaker area (3) to avoid damaging the sensor when the breaker rises. Rotate the tool (2) in a counterclockwise direction to mount the tire. Use this procedure on both the upper and lower tire beads.

6. Adjust air pressure to that listed on Tire Inflation Pressure Label (Placard) provided with vehicle (usually applied to driver's side B-pillar). Make sure **original style** valve stem cap is securely installed to keep moisture out of sensor.
7. Install tire and wheel assembly on vehicle (Refer to 22 - TIRES/WHEELS - INSTALLATION).
8. Lower vehicle.
9. Drive vehicle for a minimum of five minutes while maintaining a continuous speed above 20 mph (32 km/h). During this time the system will learn the new sensor ID code and will clear any DTC's automatically.

NOTE: If a sensor cannot be trained, refer to appropriate diagnostic information.

TRANSPONDER

DESCRIPTION - PREMIUM SYSTEM

A transponder is located in three of the four wheel wells of the vehicle to provide the SKREEM with the location of the tire pressure sensors on the vehicle. The transponders are located in the left front, right front and right rear wheel wells. A fourth transponder is not necessary in the remaining wheel well due to the process-of-elimination theory. Once the system knows the location of the first three sensors it assumes the location of the fourth tire pressure sensor is in the left rear tire.

OPERATION - PREMIUM SYSTEM

Transponders located in three of the four wheel wells of the vehicle to provide the Wireless Control Module (WCM) located in the Sentry Key Remote Entry Module (SRKEEM) with the location of the tire pressure sensors on the vehicle. The transponders are located in the left front, right front and right rear wheel wells. A fourth transponder is not necessary in the remaining wheel well due to the process-of-elimination theory. Once the system knows the location of the first three sensors it assumes the location of the fourth tire pressure sensor is in the left rear tire.

REMOVAL

FRONT TRANSPONDER

1. Raise and support the vehicle.
2. Remove the wheel well housing cover (2).

3. Remove the mounting screw (1) for the transponder (2).
4. Disconnect the electrical connector (3) and remove the transponder (2) from the vehicle.

REAR TRANSPONDER

1. Raise and support the vehicle.
2. Remove the mounting screw (1) for the transponder (4).
3. Disconnect the electrical connector (3) and remove the transponder (4) from the vehicle.

INSTALLATION

FRONT TRANSPONDER

1. Install the transponder (2) to the vehicle and reconnect the electrical connector (3).
2. Install the mounting screw (1) for the transponder (2). Tighten to 4 N·m (35 in. lbs.).

3. Install the wheel well housing cover (2).
4. Lower the vehicle.

REAR TRANSPONDER

1. Install the transponder (4) to the vehicle and reconnect the electrical connector (3).
2. Install the mounting screw (1) for the transponder (4) 3 N·m (25 in. lbs.).
3. Lower the vehicle.

TIRE PRESSURE MONITORING SYSTEM - ELECTRICAL DIAGNOSIS

DIAGNOSIS AND TESTING

C0077-LOW TIRE PRESSURE

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Continuously.
- **Set Condition:**
A low pressure condition will exist when the tire pressure falls below or is equal to the low pressure threshold value as specified for the vehicle.

Possible Causes
INTERMITTENT PERFORMANCE DTC INCORRECT TIRE PRESSURE TIRE PRESSURE SENSOR WCM (SKREEM)

Diagnostic Test

1. DTC STATUS IS ACTIVE

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?

Yes >> Go to 2

No >> Go to 4

2. LOW TIRE PRESSURE

NOTE: The DTC can be caused by many different factors and might not be a sensor/transmitter or a WCM (SKREEM) fault. Interference from other elements will over power the sensor/transmitter RF frequency making erratic operation to the in the TPM system. Check the vehicle for aftermarket accessories that could compromise the RF frequency signal before diagnosing the TPM system.

Correct all tire pressure to the recommended specifications and wait 2 minutes.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Go to 3

No >> Test Complete.

C0077-LOW TIRE PRESSURE (CONTINUED)**3. TIRE PRESSURE SENSOR**

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

No >> Test Complete.

4. INTERMITTENT TIRE PRESSURE SENSOR DTC

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Repair as necessary.

No >> Test complete.

C1501-TIRE PRESSURE SENSOR 1 INTERNAL

C1501-TIRE PRESSURE SENSOR 1 INTERNAL (CONTINUED)

For a complete wiring diagram Refer to Section 8W

Theory of Operation

The tire pressure sensor actively monitors the air pressure and air temperature inside the tire, the sensor internal battery status, and the radial acceleration of the wheel. Each sensor has a unique ID code. The sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Wireless Control Module (SKREEM).

- **When Monitored:**
With vehicle speed greater than 15 m.p.h. (24 km/h).
- **Set Condition:**
The WCM (SKREEM) will monitor the signals from the four active road tire sensors. A loss of signal error is detected when eight consecutive blocks of data are not received or cannot be accurately decoded. An internal sensor hardware error condition will be set when an error in the accelerometer, pressure sensor, or temperature sensor is detected.

Possible Causes
INTERMITTENT TIRE PRESSURE SENSOR INTERNAL DTC
TIRE PRESSURE SENSOR
WIRELESS CONTROL MODULE (SKREEM)

Diagnostic Test

1. DTC STATUS IS ACTIVE

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?

Yes >> Go to 2

No >> Go to 4

2. TIRE PRESSURE SENSOR

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Go to 3

No >> Test Complete.

3. WIRELESS CONTROL MODULE (SKREEM)

C1506-LEFT FRONT TIRE PRESSURE TRIGGER MODULE PERFORMANCE

C1506–LEFT FRONT TIRE PRESSURE TRIGGER MODULE PERFORMANCE (CONTINUED)

For a complete wiring diagram Refer to Section 8W

Theory of Operation

The Tire Pressure Trigger Module is used to automatically learn the location of each wheel sensor on the vehicle. The module is controlled and activated in sequence by the Wireless Control Module (SKREEM) over a LIN bus. When activated, the module will generate a 125 KHz signal of sufficient field strength to trigger the tire pressure sensor and force a RF transmission from the sensor.

- **When Monitored:**

Continuously.

- **Set Condition:**

The WCM (SKREEM) will monitor the messages from each Tire Pressure Trigger Module over the LIN bus. If any of the messages are not received, or are received other than as expected, a DTC will set. When the condition is corrected, or is no longer detected, as acknowledged via a LIN bus message, the WCM will reset the appropriate trigger module fault status.

Possible Causes

Is there any voltage present?

Yes >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to voltage.

No >> Go to 3

**3. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to ground.

No >> Go to 4

C1507-RIGHT FRONT TIRE PRESSURE TRIGGER MODULE PERFORMANCE (CONTINUED)

4. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

Is the resistance above 5.0 ohms?

Yes >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for an open circuit or high resistance.

No >> Go to 5

5. (F924) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition on.

Using a 12-volt test light connect to ground, check the (F924) Fused Ignition Switch Output (Run) circuit.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 6

No >> Repair the (F924) Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.

C1507–RIGHT FRONT TIRE PRESSURE TRIGGER MODULE PERFORMANCE (CONTINUED)**6. (Z924) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE**

Using a 12-volt test light connect to 12 volts, check each of the (Z924) Ground circuit(s).

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 7

No >> Repair the (Z924) Ground circuit(s) for an open circuit or high resistance.

**7. TIRE PRESSURE TRIGGER MODULE**

Turn the ignition off.

Replace the appropriate Tire Pressure Trigger Module in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Go to 8

No >> Test Complete.

8. WIRELESS CONTROL MODULE (SKREEM)

View repair.

Repair

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

9. INTERMITTENT TIRE PRESSURE TRIGGER MODULE DTC

The conditions necessary to set this DTC are not present at this time.

Using the wiring schematic as a guide, inspect the wiring and connectors relative to this circuit.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

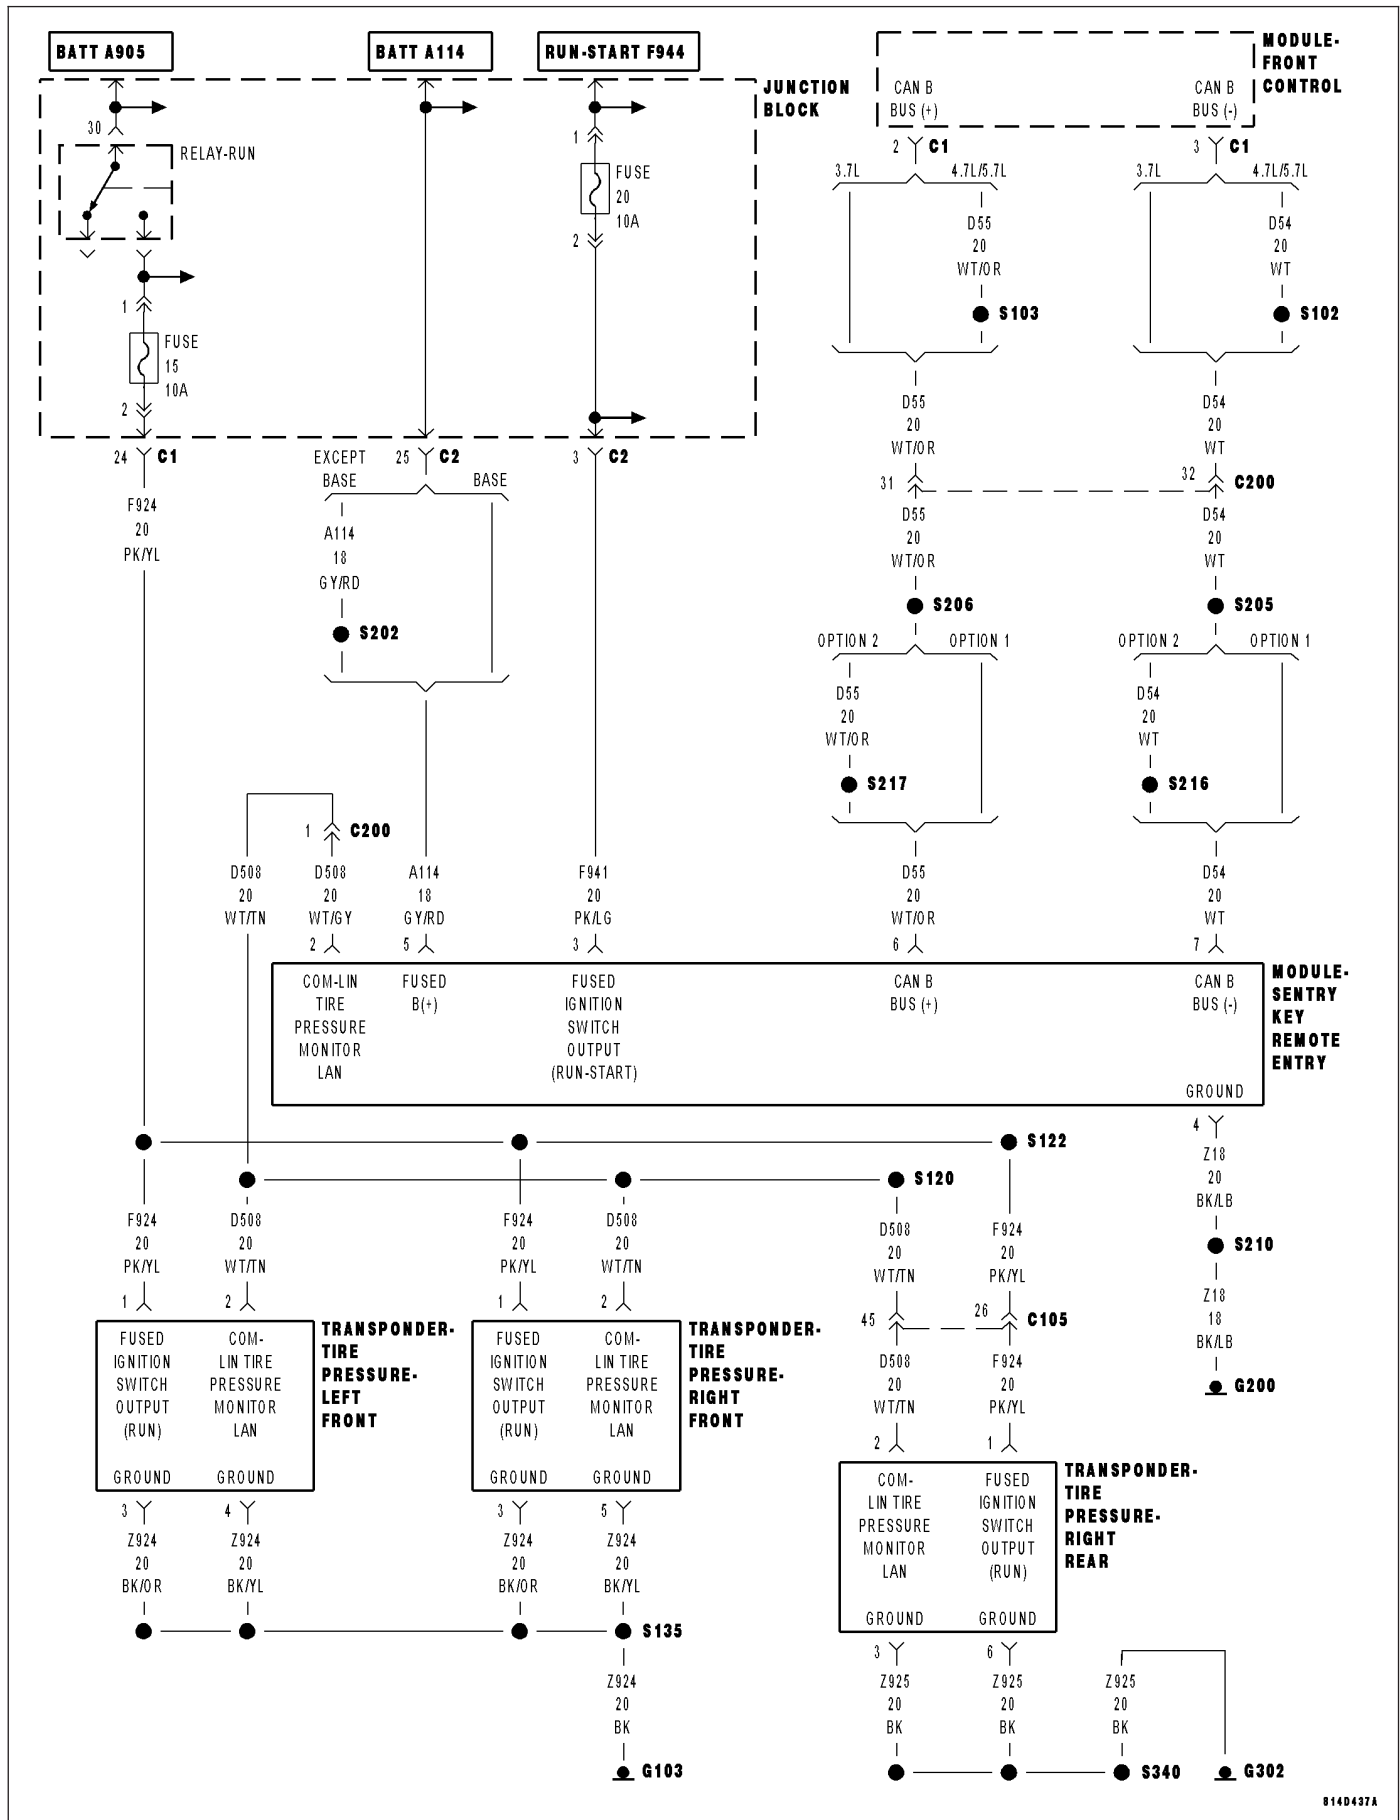

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Return to the first step of this test and perform the diagnostic procedure.

No >> Test complete.

C1509-RIGHT REAR TIRE PRESSURE TRIGGER MODULE PERFORMANCE

C1509–RIGHT REAR TIRE PRESSURE TRIGGER MODULE PERFORMANCE (CONTINUED)

For a complete wiring diagram Refer to Section 8W

Theory of Operation

The Tire Pressure Trigger Module is used to automatically learn the location of each wheel sensor on the vehicle. The module is controlled and activated in sequence by the Wireless Control Module (SKREEM) over a LIN bus. When activated, the module will generate a 125 KHz signal of sufficient field strength to trigger the tire pressure sensor and force a RF transmission from the sensor.

- **When Monitored:**

Continuously.

- **Set Condition:**

The WCM (SKREEM) will monitor the messages from each Tire Pressure Trigger Module over the LIN bus. If any of the messages are not received, or are received other than as expected, a DTC will set. When the condition is corrected, or is no longer detected, as acknowledged via a LIN bus message, the WCM will reset the appropriate trigger module fault status.

Possible Causes
INTERMITTENT TIRE PRESSURE TRIGGER MODULE PERFORMANCE DTC (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE (F924) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE (Z925) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE TIRE PRESSURE TRIGGER MODULE WIRELESS CONTROL MODULE (SKREEM)

Diagnostic Test**1. DTC STATUS IS ACTIVE**

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?

Yes >> Go to 2

No >> Go to 9

C1509-RIGHT REAR TIRE PRESSURE TRIGGER MODULE PERFORMANCE (CONTINUED)

2. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Tire Pressure Transponder harness connector.

Disconnect the Sentry Key Remote Entry Module harness connector.

Turn the ignition on.

Measure the voltage of the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

Is there any voltage present?

Yes >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to voltage.

No >> Go to 3

3. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to ground.

No >> Go to 4

C1509-RIGHT REAR TIRE PRESSURE TRIGGER MODULE PERFORMANCE (CONTINUED)**4. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE**

Measure the resistance of the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

Is the resistance above 5.0 ohms?

Yes >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for an open circuit or high resistance.

No >> Go to 5

**5. (F924) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE**

Turn the ignition on.

Using a 12-volt test light connect to ground, check the (F924) Fused Ignition Switch Output (Run) circuit.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 6

No >> Repair the (F924) Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.

C1509–RIGHT REAR TIRE PRESSURE TRIGGER MODULE PERFORMANCE (CONTINUED)

6. (Z925) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE

Using a 12-volt test light connect to 12 volts, check each of the (Z925) Ground circuit(s).

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

- Yes** >> Go to 7
- No** >> Repair the (Z925) Ground circuit(s) for an open circuit or high resistance.

7. TIRE PRESSURE TRIGGER MODULE

Turn the ignition off.
 Replace the appropriate Tire Pressure Trigger Module in accordance with the Service Information.
 With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).
 Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.
 With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

- Yes** >> Go to 8
- No** >> Test Complete.

8. WIRELESS CONTROL MODULE (SKREEM)

View repair.

Repair

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

9. INTERMITTENT TIRE PRESSURE TRIGGER MODULE DTC

The conditions necessary to set this DTC are not present at this time.
 Using the wiring schematic as a guide, inspect the wiring and connectors relative to this circuit.
 Refer to any Technical Service Bulletins that may apply to this condition.
 With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).
 Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.
 With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

- Yes** >> Return to the first step of this test and perform the diagnostic procedure.
- No** >> Test complete.

C150A-LEFT FRONT TIRE PRESSURE TRIGGER MODULE VOLTAGE HIGH

C150A-LEFT FRONT TIRE PRESSURE TRIGGER MODULE VOLTAGE HIGH (CONTINUED)

For a complete wiring diagram Refer to Section 8W

Theory of Operation

The Tire Pressure Trigger Module is used to automatically learn the location of each wheel sensor on the vehicle. The module is controlled and activated in sequence by the Wireless Control Module (SKREEM) over a LIN bus. When activated, the module will generate a 125 KHz signal of sufficient field strength to trigger the tire pressure sensor and force a RF transmission from the sensor.

- **When Monitored:**
Continuously.
- **Set Condition:**
The WCM receives a message from the Tire Pressure Trigger Module indicating that an over voltage condition has been detected.

Possible Causes
INTERMITTENT TIRE PRESSURE TRIGGER MODULE PERFORMANCE DTC (F924) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE (Z924) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE TIRE PRESSURE TRIGGER MODULE WIRELESS CONTROL MODULE (SKREEM)

Diagnostic Test

1. DTC STATUS IS ACTIVE

Turn the ignition on.

NOTE: If a system or battery voltage high DTC is set in the Wireless Control Module (SKREEM) or in the PCM, repair the voltage DTC before continuing with this test.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?

Yes >> Go to 2

No >> Go to 6

2. (F924) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition on.

Using a 12-volt test light connect to ground, check the (F941) Fused Ignition Switch Output (Run) circuit.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 3

No >> Repair the (F924) Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.

C150A-LEFT FRONT TIRE PRESSURE TRIGGER MODULE VOLTAGE HIGH (CONTINUED)**3. (Z924) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE**

Using a 12-volt test light connect to 12 volts, check each of the (Z924) Ground circuit(s).

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 4

No >> Repair the (Z924) Ground circuit(s) for an open circuit or high resistance.

**4. TIRE PRESSURE TRIGGER MODULE**

Turn the ignition off.

Replace the appropriate Tire Pressure Trigger Module in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Go to 5

No >> Test Complete.

5. WIRELESS CONTROL MODULE (SKREEM)

View repair.

Repair

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

6. INTERMITTENT TIRE PRESSURE TRIGGER MODULE DTC

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

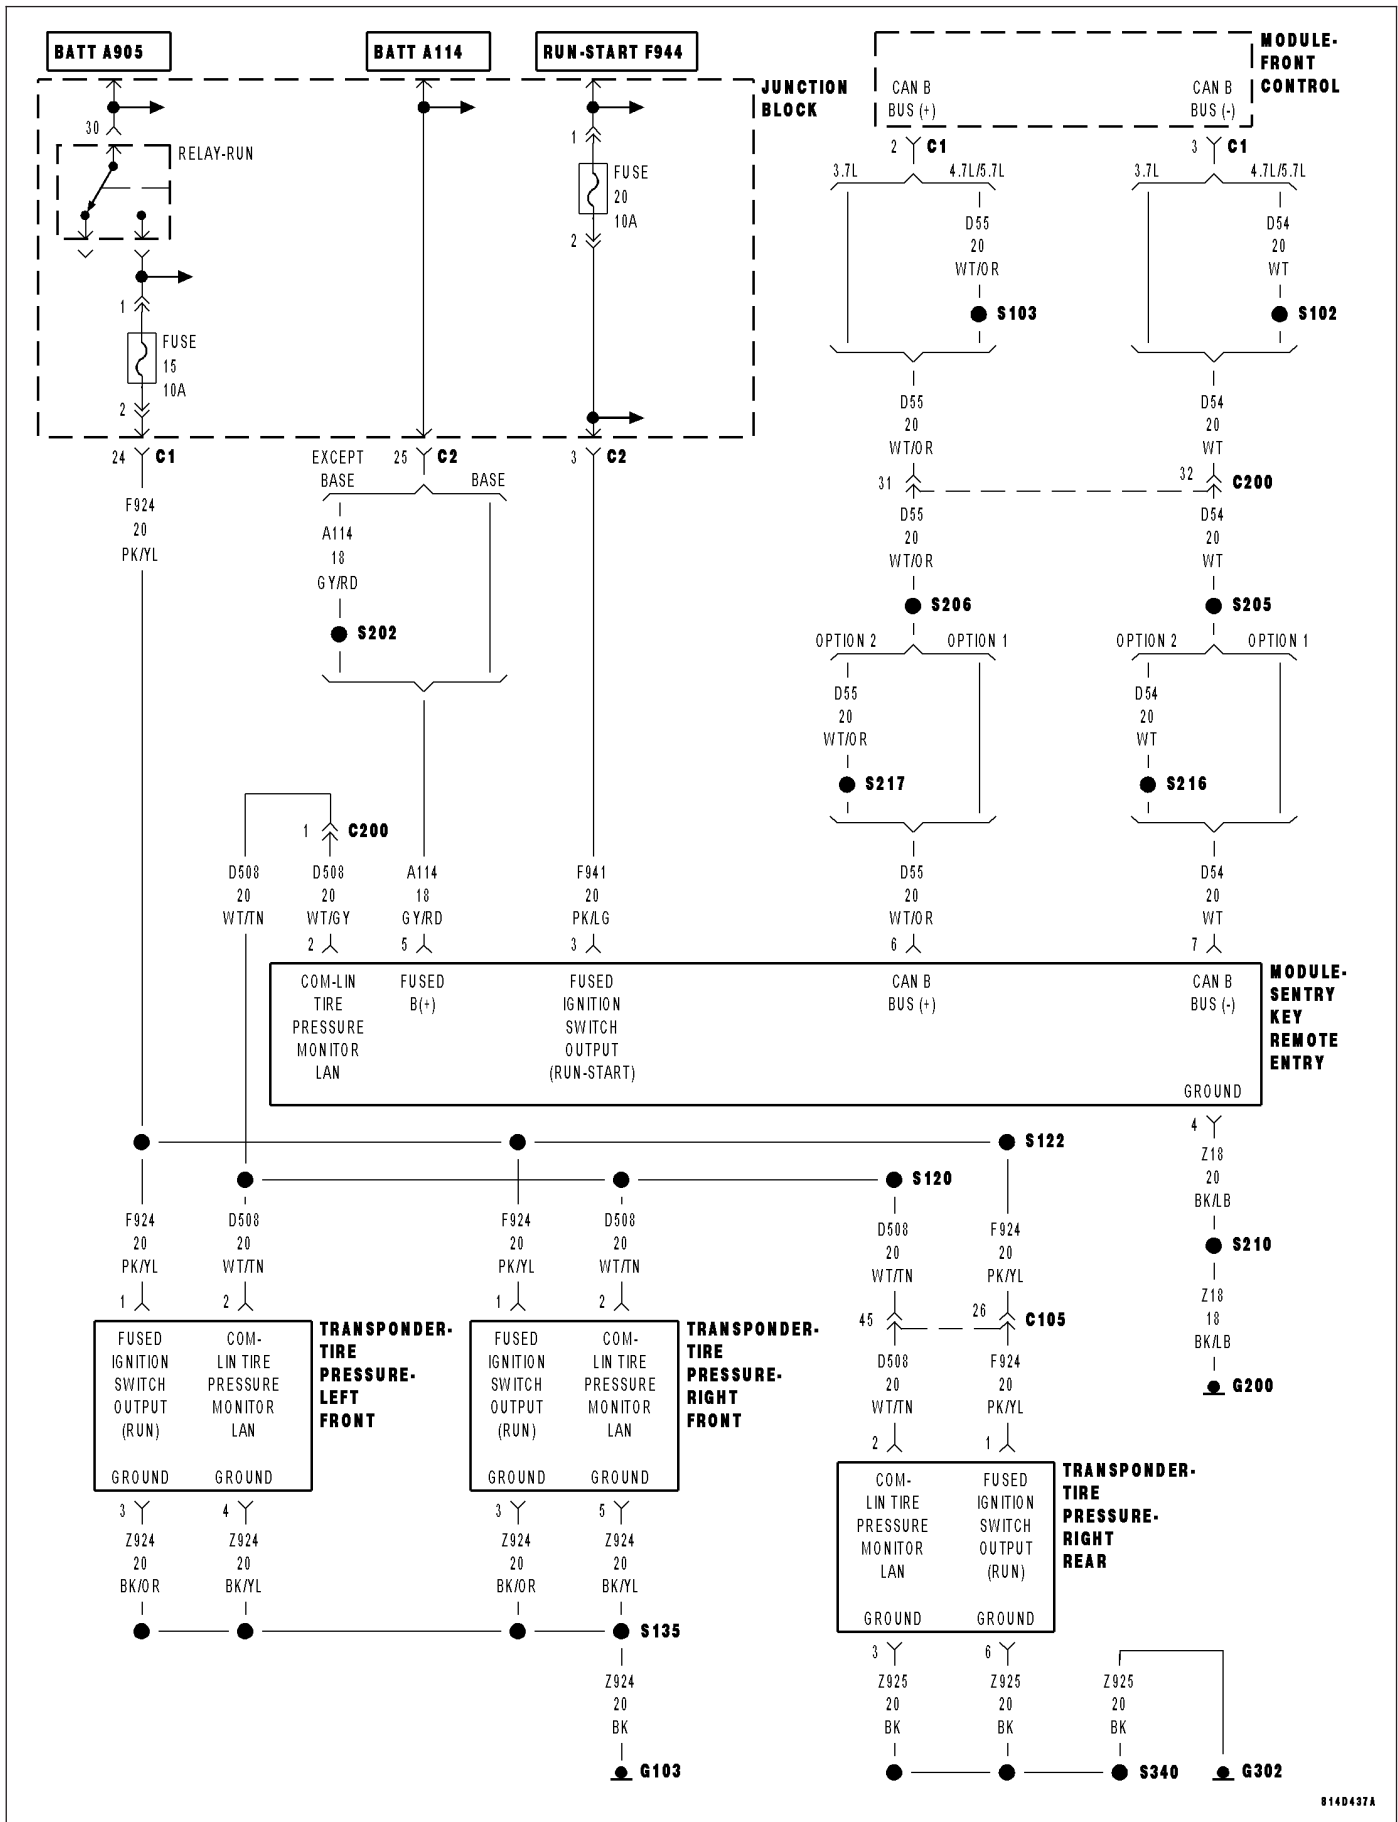

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Return to the first step of this test and perform the diagnostic procedure.

No >> Test complete.

C150B-RIGHT FRONT TIRE PRESSURE TRIGGER MODULE VOLTAGE HIGH

C150B–RIGHT FRONT TIRE PRESSURE TRIGGER MODULE VOLTAGE HIGH (CONTINUED)

For a complete wiring diagram Refer to Section 8W

Theory of Operation

The Tire Pressure Trigger Module is used to automatically learn the location of each wheel sensor on the vehicle. The module is controlled and activated in sequence by the Wireless Control Module (SKREEM) over a LIN bus. When activated, the module will generate a 125 KHz signal of sufficient field strength to trigger the tire pressure sensor and force a RF transmission from the sensor.

- **When Monitored:**
Continuously.
- **Set Condition:**
The WCM receives a message from the Tire Pressure Trigger Module indicating that an over voltage condition has been detected.

Possible Causes

INTERMITTENT TIRE PRESSURE TRIGGER MODULE PERFORMANCE DTC
(F924) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE
(Z924) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE
TIRE PRESSURE TRIGGER MODULE
WIRELESS CONTROL MODULE (SKREEM)

Diagnostic Test**1. DTC STATUS IS ACTIVE**

Turn the ignition on.

NOTE: If a system or battery voltage high DTC is set in the Wireless Control Module (SKREEM) or in the PCM, repair the voltage DTC before continuing with this test.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?

Yes >> Go to 2

No >> Go to 6

2. (F924) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition on.

Using a 12-volt test light connect to ground, check the (F924) Fused Ignition Switch Output (Run) circuit.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 3

No >> Repair the (F924) Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.

C150B–RIGHT FRONT TIRE PRESSURE TRIGGER MODULE VOLTAGE HIGH (CONTINUED)

3. (Z924) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE

Using a 12–volt test light connect to 12 volts, check each of the (Z924) Ground circuit(s).

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

- Yes** >> Go to 4
- No** >> Repair the (Z924) Ground circuit(s) for an open circuit or high resistance.

4. TIRE PRESSURE TRIGGER MODULE

Turn the ignition off.
 Replace the appropriate Tire Pressure Trigger Module in accordance with the Service Information.
 With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).
 Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.
 With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

- Yes** >> Go to 5
- No** >> Test Complete.

5. WIRELESS CONTROL MODULE (SKREEM)

View repair.

Repair

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

6. INTERMITTENT TIRE PRESSURE TRIGGER MODULE DTC

The conditions necessary to set this DTC are not present at this time.
 Refer to any Technical Service Bulletins that may apply to this condition.
 With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).
 Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.
 With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

- Yes** >> Return to the first step of this test and perform the diagnostic procedure.
- No** >> Test complete.

C150C-RIGHT REAR TIRE PRESSURE TRIGGER MODULE VOLTAGE HIGH

C150C–RIGHT REAR TIRE PRESSURE TRIGGER MODULE VOLTAGE HIGH (CONTINUED)

For a complete wiring diagram Refer to Section 8W

Theory of Operation

The Tire Pressure Trigger Module is used to automatically learn the location of each wheel sensor on the vehicle. The module is controlled and activated in sequence by the Wireless Control Module (SKREEM) over a LIN bus. When activated, the module will generate a 125 KHz signal of sufficient field strength to trigger the tire pressure sensor and force a RF transmission from the sensor.

- **When Monitored:**
Continuously.

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Return to the first step of this test and perform the diagnostic procedure.

No >> Test complete.

TIRE SENSOR 1 LOW PRESSURE ALERT

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Continuously.
- **Set Condition:**
The fault is set when there is a low tire pressure condition or sensor pressure measurement failure from the sensor/transmitter.

Possible Causes
INTERMITTENT PERFORMANCE DTC INCORRECT TIRE PRESSURE TIRE PRESSURE SENSOR WCM (SKREEM)

Diagnostic Test

1. TIRE SENSOR LOCATION PROCEDURE

NOTE: If the TPM indicator is illuminated, check for a low tire pressure condition. If the TPM indicator is flashing, check for DTCs.

NOTE: The following test is to locate the Tire Pressure Sensor/Transmitter. If the tires have been rotated, the Tire Pressure Sensor/Transmitter are no longer in sequence from the factory. Faults are linked to the sensor/transmitter IDs. You **MUST** locate the correct Tire Pressure Sensor/Transmitter that set the fault before continuing.

Set all tire pressures to the recommended specifications and recheck for fault/alert.

The fault will set within two minutes when the at 20 PSI.

Turn the ignition on.

Starting with the left front wheel, deflate the tire down to 20 PSI and wait 2 minutes.

If the TPMS fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified.

NOTE: Once a fault/alert has set, it will establish the location of the tire pressure sensors/transmitter. Repeat steps until the applicable Tire Pressure Sensor/Transmitter has been located.

Once the correct sensor/transmitter has been located continue.

Continue

Go to 2

2. LOW TIRE PRESSURE

NOTE: The DTC can be caused by many different factors and might not be a sensor/transmitter or a WCM (SKREEM) fault. Interference from other elements will over power the sensor/transmitter RF frequency making erratic operation to the in the TPM system. Check the vehicle for aftermarket accessories that could compromise the RF frequency signal before diagnosing the TPM system.

Correct all tire pressure to the recommended specifications and wait 2 minutes.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Go to 3

No >> Go to 4

TIRE SENSOR 1 LOW PRESSURE ALERT (CONTINUED)**3. TIRE PRESSURE SENSOR**

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

No >> Test Complete.

4. TIRE PRESSURE CORRECTION/INTERMITTENT

NOTE: If the tire pressure was out of specification and by adjusting the pressure corrected the DTC, the test is complete. If the tire pressure was within specification and were unable to reset the DTC an intermittent condition is present and the below steps may aid in identifying the failure.

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Repair as necessary.

No >> Test complete.

TIRE SENSOR 1 TRANSMIT FAILURE

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Continuously.
- **Set Condition:**
The fault is set when the WCM (SKREEM) does not receive eight consecutive RF transmissions from the sensor/transmitter

Possible Causes
INTERMITTENT PERFORMANCE DTC INCORRECT TIRE PRESSURE TIRE PRESSURE SENSOR WCM (SKREEM)

Diagnostic Test

1. TIRE SENSOR LOCATION PROCEDURE

NOTE: If the TPM indicator is illuminated, check for a low tire pressure condition. If the TPM indicator is flashing, check for DTCs.

NOTE: The following test is to locate the Tire Pressure Sensor/Transmitter. If the tires have been rotated, the Tire Pressure Sensor/Transmitter are no longer in sequence from the factory. Faults are linked to the sensor/transmitter IDs. You **MUST** locate the correct Tire Pressure Sensor/Transmitter that set the fault before continuing.

Set all tire pressures to the recommended specifications and recheck for fault/alert.

The fault will set within two minutes when the at 20 PSI.

Turn the ignition on.

Starting with the left front wheel, deflate the tire down to 20 PSI and wait 2 minutes.

If the TPMS fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified.

NOTE: Once a fault/alert has set, it will establish the location of the tire pressure sensors/transmitter. Repeat steps until the applicable Tire Pressure Sensor/Transmitter has been located.

Once the correct sensor/transmitter has been located continue.

Continue

Go to 2

2. LOW TIRE PRESSURE

NOTE: The DTC can be caused by many different factors and might not be a sensor/transmitter or a WCM (SKREEM) fault. Interference from other elements will over power the sensor/transmitter RF frequency making erratic operation to the in the TPM system. Check the vehicle for aftermarket accessories that could compromise the RF frequency signal before diagnosing the TPM system.

Correct all tire pressure to the recommended specifications and wait 2 minutes.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

2. LOW TIRE PRESSURE

NOTE: The DTC can be caused by many different factors and might not be a sensor/transmitter or a WCM (SKREEM) fault. Interference from other elements will over power the sensor/transmitter RF frequency making erratic operation to the in the TPM system. Check the vehicle for aftermarket accessories that could compromise the RF frequency signal before diagnosing the TPM system.

Correct all tire pressure to the recommended specifications and wait 2 minutes.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Go to 3

No >> Go to 4

TIRE SENSOR 2 TRANSMIT FAILURE (CONTINUED)**3. TIRE PRESSURE SENSOR**

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

No >> Test Complete.

4. TIRE PRESSURE CORRECTION/INTERMITTENT

NOTE: If the tire pressure was out of specification and by adjusting the pressure corrected the DTC, the test is complete. If the tire pressure was within specification and were unable to reset the DTC an intermittent condition is present and the below steps may aid in identifying the failure.

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Repair as necessary.

No >> Test complete.

TIRE SENSOR 3 LOW PRESSURE ALERT

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Continuously.
- **Set Condition:**
The fault is set when there is a low tire pressure condition or sensor pressure measurement failure from the sensor/transmitter.

Possible Causes
INTERMITTENT PERFORMANCE DTC INCORRECT TIRE PRESSURE TIRE PRESSURE SENSOR WCM (SKREEM)

Diagnostic Test

1. TIRE SENSOR LOCATION PROCEDURE

NOTE: If the TPM indicator is illuminated, check for a low tire pressure condition. If the TPM indicator is flashing, check for DTCs.

NOTE: The following test is to locate the Tire Pressure Sensor/Transmitter. If the tires have been rotated, the Tire Pressure Sensor/Transmitter are no longer in sequence from the factory. Faults are linked to the sensor/transmitter IDs. You **MUST** locate the correct Tire Pressure Sensor/Transmitter that set the fault before continuing.

Set all tire pressures to the recommended specifications and recheck for fault/alert.

The fault will set within two minutes when the at 20 PSI.

Turn the ignition on.

Starting with the left front wheel, deflate the tire down to 20 PSI and wait 2 minutes.

If the TPMS fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified.

NOTE: Once a fault/alert has set, it will establish the location of the tire pressure sensors/transmitter. Repeat steps until the applicable Tire Pressure Sensor/Transmitter has been located.

Once the correct sensor/transmitter has been located continue.

Continue

Go to 2

2. LOW TIRE PRESSURE

NOTE: The DTC can be caused by many different factors and might not be a sensor/transmitter or a WCM (SKREEM) fault. Interference from other elements will over power the sensor/transmitter RF frequency making erratic operation to the in the TPM system. Check the vehicle for aftermarket accessories that could compromise the RF frequency signal before diagnosing the TPM system.

Correct all tire pressure to the recommended specifications and wait 2 minutes.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Go to 3

No >> Go to 4

TIRE SENSOR 3 LOW PRESSURE ALERT (CONTINUED)**3. TIRE PRESSURE SENSOR**

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

No >> Test Complete.

4. TIRE PRESSURE CORRECTION/INTERMITTENT

NOTE: If the tire pressure was out of specification and by adjusting the pressure corrected the DTC, the test is complete. If the tire pressure was within specification and were unable to reset the DTC an intermittent condition is present and the below steps may aid in identifying the failure.

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Repair as necessary.

No >> Test complete.

TIRE SENSOR 3 TRANSMIT FAILURE

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
Continuously.
- **Set Condition:**
The fault is set when the WCM (SKREEM) does not receive eight consecutive RF transmissions from the sensor/transmitter

Possible Causes
INTERMITTENT PERFORMANCE DTC INCORRECT TIRE PRESSURE TIRE PRESSURE SENSOR WCM (SKREEM)

Diagnostic Test

1. TIRE SENSOR LOCATION PROCEDURE

NOTE: If the TPM indicator is illuminated, check for a low tire pressure condition. If the TPM indicator is flashing, check for DTCs.

NOTE: The following test is to locate the Tire Pressure Sensor/Transmitter. If the tires have been rotated, the Tire Pressure Sensor/Transmitter are no longer in sequence from the factory. Faults are linked to the sensor/transmitter IDs. You **MUST** locate the correct Tire Pressure Sensor/Transmitter that set the fault before continuing.

Set all tire pressures to the recommended specifications and recheck for fault/alert.

The fault will set within two minutes when the at 20 PSI.

Turn the ignition on.

PRNDL MESSAGE MISSING

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**
With the ignition on.
- **Set Condition:**
This DTC will set if the PRNDL message is not received for more than 5 seconds.

Possible Causes
INTERMITTENT PRNDL MESSAGE MISSING DTC
PCM DTCS PRESENT
CLUSTER DTCS PRESENT
WIRELESS CONTROL MODULE (SKREEM)

Diagnostic Test

1. DTC STATUS IS ACTIVE

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?

Yes >> Go to 2

No >> Go to 5

2. DTCS PRESENT IN PCM

Cycle the ignition off and on.

With the scan tool, select View DTCs in the Powertrain Control Module (PCM).

Are there any DTCS present on the PCM?

Yes >> Refer to the appropriate diagnostic procedure for the PCM DTC.

No >> Go to 3

3. DTCS PRESENT IN THE CLUSTER

Cycle the ignition off and on.

With the scan tool, select View DTCs in the Instrument Cluster (CCN).

Are there any DTCS present on the Cluster?

Yes >> Refer to the appropriate diagnostic procedure for the Cluster DTC.

No >> Go to 4

PRNDL MESSAGE MISSING (CONTINUED)**4. WIRELESS CONTROL MODULE (SKREEM)**

Inspect the wiring and connectors relative to this circuit.

Monitor the scan tool data relative to this circuit while performing a wiggle test on the wiring and connectors. Look for the DTC to reset or for the data to change other than as expected.

Refer to any Technical Service Bulletins that may apply to this condition.

If no problems are found view repair.

Repair

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

5. INTERMITTENT PRNDL MESSAGE MISSING DTC

The conditions necessary to set this DTC are not present at this time.

Inspect the wiring and connectors relative to this circuit.

Monitor the scan tool data relative to this circuit while performing a wiggle test on the wiring and connectors. Look for the DTC to reset or for the data to change other than as expected.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Return to the beginning of this test and perform the diagnostic procedure as necessary.

No >> Test complete.

VEHICLE SPEED MESSAGE MISSING

For a complete wiring diagram Refer to Section 8W

- **When Monitored:**
With the ignition on.
- **Set Condition:**
This DTC will set if the Vehicle Speed message is not received for more than 5 seconds.

Possible Causes
INTERMITTENT VEHICLE SPEED MESSAGE MISSING DTC PCM DTCS PRESENT CLUSTER DTCS PRESENT WIRELESS CONTROL MODULE (SKREEM)

Diagnostic Test

1. DTC STATUS IS ACTIVE

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?

Yes >> Go to 2

No >> Go to 5

2. DTCS PRESENT IN PCM

Cycle the ignition off and on.

With the scan tool, select View DTCs in the Powertrain Control Module (PCM).

Are there any DTCS present on the PCM?

Yes >> Refer to the appropriate diagnostic procedure for the PCM DTC.

No >> Go to 3

3. DTCS PRESENT IN THE CLUSTER

Cycle the ignition off and on.

With the scan tool, select View DTCs in the Instrument Cluster (CCN).

Are there any DTCS present on the Cluster?

Yes >> Refer to the appropriate diagnostic procedure for the Cluster DTC.

No >> Go to 4

VEHICLE SPEED MESSAGE MISSING (CONTINUED)**4. WIRELESS CONTROL MODULE (SKREEM)**

Inspect the wiring and connectors relative to this circuit.

Monitor the scan tool data relative to this circuit while performing a wiggle test on the wiring and connectors. Look for the DTC to reset or for the data to change other than as expected.

Refer to any Technical Service Bulletins that may apply to this condition.

If no problems are found view repair.

Repair

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

5. INTERMITTENT VEHICLE SPEED MESSAGE MISSING DTC

The conditions necessary to set this DTC are not present at this time.

Inspect the wiring and connectors relative to this circuit.

Monitor the scan tool data relative to this circuit while performing a wiggle test on the wiring and connectors. Look for the DTC to reset or for the data to change other than as expected.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Return to the beginning of this test and perform the diagnostic procedure as necessary.

No >> Test complete.

WARNING

SAFETY PRECAUTIONS AND WARNINGS

WARNING: Use an osha approved breathing filter when spraying paint or solvents in a confined area. Personal injury can result.

- Avoid prolonged skin contact with petroleum or alcohol – based cleaning solvents. Personal injury can result.
- Do not stand under a hoisted vehicle that is not properly supported on safety stands. Personal injury can result.

CAUTION: When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other components. Damage to vehicle can result.

- Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.
- Always have a fire extinguisher ready for use when welding.
- Disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is OFF. Damage to electrical system can result.
- Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.
- Do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.
- Do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.

DIAGNOSIS AND TESTING

WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or

door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

WATER LEAK TESTS

WARNING: Do not use electric shop lights or tools in water test area. Personal injury can result.

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating on door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

ROAD TESTING WIND NOISE

1. Drive the vehicle to verify the general location of the wind noise.
2. Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

STANDARD PROCEDURE

BODY LUBRICATION

All mechanisms and linkages should be lubricated when necessary. This will maintain ease of operation and provide protection against rust and excessive wear. The weatherstrip seals should be lubricated to prolong their life as well as to improve door sealing.

All applicable exterior and interior vehicle operating mechanisms should be inspected and cleaned. Pivot/sliding contact areas on the mechanisms should then be lubricated.

1. When necessary, lubricate the operating mechanisms with the specified lubricants.
2. Apply silicone lubricant to a cloth and wipe it on door seals to avoid over-spray that can soil passenger's clothing.
3. Before applying lubricant, the component should be wiped clean. After lubrication, any excess lubricant should be removed.
4. The hood latch, latch release mechanism, latch striker, and safety latch should be lubricated periodically.
5. The door lock cylinders should be lubricated twice each year (preferably autumn and spring).
 - Spray a small amount of lock cylinder lubricant directly into the lock cylinder.
 - Apply a small amount to the key and insert it into the lock cylinder.
 - Rotate it to the locked position and then back to the unlocked position several times.
 - Remove the key. Wipe the lubricant from it with a clean cloth to avoid soiling of clothing.

HEAT STAKING

1. Remove trim panel.
2. Bend or move the trim panel components at the heat staked joints. Observe the heat staked locations and/or component seams for looseness.
3. Heat stake the components.

- a. If the heat staked or component seam location is loose, hold the two components tightly together and using a soldering gun with a flat tip, melt the material securing the components together. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
 - b. If the heat staked material is broken or missing, use a hot glue gun to apply new material to the area to be repaired. The panels that are being heat staked must be held together while the applying the glue. Once the new material is in place, it may be necessary to use a soldering gun to melt the newly applied material. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
4. Allow the repaired area to cool and verify the repair.
 5. Install trim panel.

PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on DaimlerChrysler Motors vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

Rigid Plastics:

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include SMC, ABS, and Polycarbonates.

Semi-Rigid Plastics:

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

Flexible Plastics:

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

Repair Procedure:

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

Adhesion Promoter/Surface Modifier:

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

SAFETY PRECAUTION AND WARNINGS

WARNING:

- Eye protection should be used when servicing components. Personal injury can result.
- Use an OSHA approved breathing mask when mixing epoxy, grinding, and spraying paint or solvents in a confined area. Personal injury can result.
- Avoid prolonged skin contact with resin, petroleum, or alcohol based solvents. Personal injury can result.
- Do not venture under a hoisted vehicle that is not properly supported on safety stands. Personal injury can result.

NOTE:

- When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.
- Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.

RIGID, SEMI-RIGID, AND FLEXIBLE PLASTIC PARTS TYPES

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
ASA	ACRYLONITRILE STYRENE ACRYLITE	LURAN S	CONSOLES, GRILLES
ABS	ACRYLONITRILE BUTADIENE STYRENE	TERLURAN	"A" PILLARS, CONSOLES, GRILLES
ABS/PC	ABS/PC ALLOY	PULSE, PROLOY, BAYBLEND	DOORS, INSTRUMENT PANELS
ABS/PVC	ABS/PV ALLOY	PROLOY, PULSE, LUSTRAN, CYCLOVIN	DOOR PANELS, GRILLES, TRIM
BMC	BULK MOLDING COMPOUND	BMC	FENDER EXTENSIONS
EMA	EHTYLENE METHYL ACRYLATE/IONOMER	SURLYN, EMA, IONOMER	BUMPER GUARDS, PADS
METTON	METTON	METTON	GRILLES, KICK PANELS, RUNNING BOARDS
MPPO	MODIFIED POLYPHENYLENE OXIDE	MPPO	SPOILER ASSEMBLY
PA	POLYAMID	ZYTEL, VYDYNE, PA, MINLON	FENDERS, QUARTER PANELS
PET	THERMOPLASTIC POLYESTER	RYNITE	TRIM
PBT/PPO	PBT/PPO ALLOY	GERMAX	CLADDINGS
PBTP	POLYBUTYLENE THEREPTHALATE	PBT, PBTP, POCAN, VALOX	WHEEL COVERS, FENDERS, GRILLES
PBTP/EEBC	POLYBUTYLENE THEREPTHALATE/EEBC ALLOY	BEXLOY, "M", PBTP/EEBC	FASCIAS, ROCKER PANEL, MOLDINGS
PC	POLYCARBONATE	LEXAN, MERLON, CALIBRE, MAKROLON PC	TAIL LIGHT LENSES, IP TRIM, VALANCE PANELS
PC/ABS	PC/ABS ALLOY	GERMAX, BAY BLENDS, PULSE	DOORS, INSTRUMENT PANELS
PPO	POLYPHENYLENE OXIDE	AZDEL, HOSTALEN, MARLEX, PRFAX, NORYL, GTX, PPO	INTERIOR TRIM, DOOR PANELS, SPLASH SHIELDS, STEERING COLUMN SHROUD
PPO/PA	POLYPHENYLENE/ POLYAMID	PPO/PA, GTX 910	FENDERS, QUARTER PANELS
PR/FV	FIBERGLASS REINFORCED PLASTIC	FIBERGLASS, FV, PR/FV	BODY PANELS
PS	POLYSTYRENE	LUSTREX, STYRON, PS	DOOR PANELS, DASH PANELS
RTM	RESIN TRANSFER MOLDING COMPOUND	RTM	BODY PANELS
SMC	SHEET MOLDED COMPOUND	SMC	BODY PANELS
TMC	TRANSFER MOLDING COMPOUND	TMC	GRILLES

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
UP	UNSATURATED POLYESTER (THERMOSETTING)	SMC, BMC, TMC, ZMC, IMC, XSMC, UP	GRILLE OPENING PANEL, LIFTGATES, FLARESIDE FENDERS, FENDER EXTENSIONS
EEBC	ETHER/ESTER BLOCKED CO-POLYMER	EEBC	BUMPERS
EEBC/PBTP	EEBC/POLYBUTYLENE TEREPHTHALATE	EEBC, PBTP, BEXLOY	BUMPER, ROCKER PANELS
EMPP	ETHYLENE MODIFIED POLYPROPYLENE	EMPP	BUMPER COVERS
EPDM	ETHYLENE/ PROPPOYLENE DIENE MONOMER	EPDM, NORDEL, VISTALON	BUMPERS
EPM	ETHYLENE/ PROPPOYLENE CO- POLYMER	EPM	FENDERS
MPU	FOAM POLYURETHANE	MPU	SPOILERS
PE	POLYETHYLENE	ALATHON, DYLAN, LUPOLEN, MARLEX	-
PP	POLYPROPYLENE (BLENDS)	NORYL, AZDEL, MARLOX, DYLAN, PRAVEX	INNER FENDER, SPOILERS, KICK PANELS
PP/EPDM	PP/EPDM ALLOY	PP/EPDM	SPOILERS, GRILLES
PUR	POLYURETHANE	COLONELS, PUR, PU	FASCIAS, BUMPERS
PUR/PC	PUR/PC ALLOY	TEXIN	BUMPERS
PVC	POLYVINYL CHLORIDE	APEX, GEON, VINYLITE	BODY MOLDINGS, WIRE INSULATION, STEERING WHEELS
RIM	REACTION INJECTED MOLDED POLYURETHANE	RIM, BAYFLEX	FRONT FASCIAS, MODULAR WINDOWS
RRIM	REINFORCED REACTION INJECTED MOLDED	PUR, RRIM	FASCIAS, BODY PANELS, BODY TRIMS
TPE	THERMO POLYETHYLENE	TPE, HYTREL, BEXLOY-V	FASCIAS, BUMPERS, CLADDINGS
TPO	THERMOPOLYOLEFIN	POLYTROPE, RENFLEX, SANTOPRENE, VISAFLEX, ETA, APEX, TPO, SHIELDS, CLADDINGS	BUMPERS, END CAPS, TELCAR, RUBBER, STRIPS, SIGHT, INTERIOR B POST
TPP	THERMO-POLYPROPYLENE	TPP	BUMPERS
TPU	THERMOPOLYURETHANE, POLYESTER	TPU, HYTREL, TEXIN, ESTANE	BUMPERS, BODY SIDE, MOLDINGS, FENDERS, FASCIAS

PANEL SECTIONING

If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel. To bond two plastic panels together, a reinforcement must overlap both panels. The panels must be "V'd" at a 20 degree angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

When bonding plastic panels, Follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

PANEL REINFORCEMENT

Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement and. Open meshed fiberglass dry wall tape can be used to form a reinforcement. The dry wall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more dry wall tape used, the stronger the repair.

Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.

When repairing plastic, the damaged area is first "V'd" out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20 degree angle will increase the bonding surface for a repair. It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.

- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used.
- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength and appearance without exceeding the value of the replacement part.

- When plastic repairs are required, it is recommended that the part be left on the vehicle when every possible. That will save time, and the panel will remain stationary during the repair. Misalignment can cause stress in the repair areas and can result in future failure.

VISUAL INSPECTION

Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind.

PANEL SURFACE PREPARATION

If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area should be stripped of paint and freed from wax and oil. Scuff surfaces around repair area with 360 grit wet/dry sandpaper, or equivalent, to assure adhesion of repair materials.

PATCHING PANELS

An panel that has extensive puncture type damage can be repaired by cutting out the damaged material. Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20 degrees to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.

PANEL PATCH FABRICATIONS

A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (dry wall tape). Perform the following operation if required:

1. Cover waxed paper or plastic with adhesive backed nylon mesh (dry wall tape) larger than the patch required.
2. Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.
3. Apply a liberal coat of adhesive over the reinforcement mesh. If necessary apply a second or third coat of adhesive and mesh after first coat has cured. The thickness of the patch should be the same as the repair area.

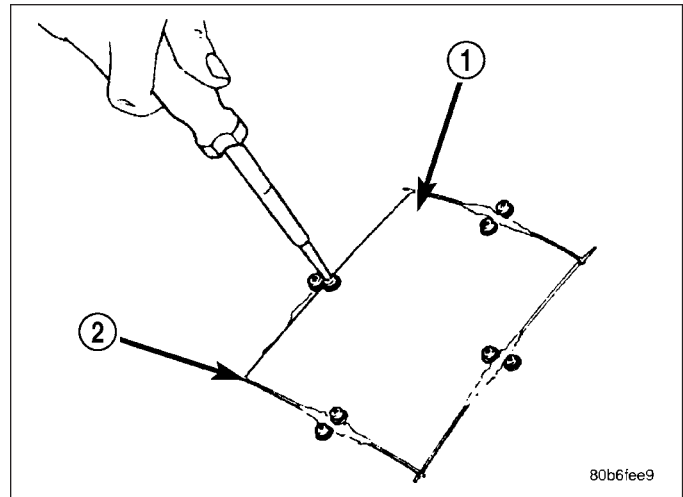

4. After patch has cured, peel waxed paper or plastic from the back of the patch.
5. If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

PANEL PATCH INSTALLATION

1. Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.
2. Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.
3. Using the pattern as a guide, cut the patch to size.
4. Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch in the cutout.
5. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole.
6. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.
7. Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.
8. Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.
9. Mix enough adhesive to cover one side of all support squares.
10. Apply adhesive to cover one side of all support squares.
11. Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares.
12. Position patch in cutout against support squares and adjust patch until the gap is equal along all sides.
13. Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.
14. Apply a coat of adhesive to the exposed ends of the support squares.

15. Install screws to hold the patch to support squares. Tighten screws until patch surface is flush with panel surface.
16. Allow adhesive to cure, and remove all screws.

17. Using a 125 mm (5 in.) 24 grit disc grinder, grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 2 mm (0.080 in.) deep path across the gaps around the patch. With compressed air, blow dust from around patch.

18. Apply adhesive backed nylon mesh (dry wall tape) over gaps around patch.
19. Mix enough adhesive to cover the entire patch area.

20. Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair.

PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

BUZZ, SQUEAK & RATTLE

Buzz, Squeak & Rattles (BSR) may be caused by any one or more of the following and may be corrected as indicated:

- Loose fasteners should be tightened to specifications.
- Damaged or missing clips should be replaced.
- Damaged trim panels should be replaced.
- Incorrectly installed trim panels should be reinstalled properly.

Many BSR complaints such as loose trim, can be serviced using the Mopar® Parts BSR Noise Reduction Kit. This kit contains various tapes including foam, flock and anti-squeak used to eliminate noises caused by metal, plastic and vinyl components. Long life lubricants and greases can also be used on a variety of components. Refer to the Buzz, Squeak & Rattle Kit table for material contents and usage.

Buzz, Squeak & Rattle Kit

ITEM	FEATURES	APPLICATIONS	SERVICE TEMP
Itch And Squeak Tape	An abrasion resistant material thin enough to conform to most irregular surfaces. Stops most itches and squeaks.	Between metal and metal, metal and plastic, metal and vinyl, vinyl and plastic. Interior. Examples: Trim panels and bezels.	-40° to 225° Fahrenheit (-40° to 107° Celsius)
Black Nylon Flock	Nylon Flock with an aggressive acrylic adhesive. Provides for cushioning and compression fit, also isolates components. Water-resistant.	Between metal and metal, metal and plastic, vinyl and plastic. Examples: Pull cups, bezels, clips, ducts, top cover to glass, cowl panel.	-40° to 180° Fahrenheit (-40° to 82° Celsius)
High Density Urethane Foam	Tear resistant, highly resilient and durable.	Between metal and metal, metal and plastic. Water-resistant. Examples: I/P, heavy metal rattles, isolating brackets.	-40° to 180° Fahrenheit (-40° to 82° Celsius)
Open Cell Foam Tape	Soft foam conforms to irregular surfaces.	Wire harness and connector wrap. Examples: Seals, gasket, wiring, heat ducts.	-40° to 180° Fahrenheit (-40° to 82° Celsius)
Closed Cell Low Density Foam Tape	Soft, conformable. Water-resistant.	Wherever bulk is needed. Prevents closing flutters and rattles when applied to door watershed. Examples: Door, I/P.	-40° to 180° Fahrenheit (-40° to 82° Celsius)
NYE® Grease 880	Long life.	Suspensions. Examples: Strut busings, sway bars.	-40° to 390° Fahrenheit (-40° to 200° Celsius)
Krytox® Oil	Long life. Will not dry out or harm plastics or rubber.	When access is not possible, oil will migrate to condition. Vinyl, rubber, plastic, metal. Examples: Convertible top bushings, pull cups trim panel inserts.	-30° to 400° Fahrenheit (-34° to 205° Celsius)
Krytox® Grease	Long life. Will not dry out or harm plastics or rubber.	Vinyl, rubber, plastic, metal, glass. Examples: Weather-strips, backlite and windshield moldings.	-30° to 400° Fahrenheit (-34° to 205° Celsius)

CHANNEL-GLASS

REMOVAL

1. Remove the outside rearview mirror (Refer to 23 - BODY/EXTERIOR/OUTSIDE REARVIEW MIRROR - REMOVAL).
2. Remove the front door glass (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - REMOVAL).
3. Remove the weatherstrip from the front glass run channel.
4. Remove the nut (2) that secures the top of the front glass run channel (1) to the inside door panel.
5. Loosen the nut (3) that secures the bottom of the run channel to the keyed hole on the inside door panel.
6. Lift the front glass run channel upward within the door far enough to disengage the nut that secures the bottom of the run channel to the keyed hole on the inside door panel.
7. Remove the front glass run channel from the door.

INSTALLATION

1. Position the front glass run channel (1) onto the door.
2. Engage the nut (3) into the keyed hole on the inside door panel.
3. Install the nut (2) that secures the top of the front glass run channel to the inside door panel. Tighten the nut to 10 N·m (89 in. lbs.).
4. Tighten the nut that secures the bottom of the front glass run channel to the inside door panel to 10 N·m (89 in. lbs.).
5. Install the weatherstrip onto the front glass run channel.
6. Install the front door glass (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - INSTALLATION).
7. Install the outside rearview mirror (Refer to 23 - BODY/EXTERIOR/OUTSIDE REARVIEW MIRROR - INSTALLATION).

8131818f

CYLINDER-LOCK

REMOVAL

NOTE: A door lock cylinder is used only on the driver side front door exterior handle.

1. Remove the exterior door handle (1) from the outside of the driver side front door (Refer to 23 - BODY/DOOR - FRONT/EXTERIOR HANDLE - REMOVAL).
2. Using hand pressure, push on the face of the lock cylinder (2) until it pops out of the cavity in the back of the door handle.

81512705

INSTALLATION

NOTE: A door lock cylinder is used only on the driver side front door exterior handle.

1. Insert the lock cylinder (2) into the cavity on the back of the driver side exterior door handle (1).
2. Align the lock cylinder in the handle by aligning the two screw holes on the lock cylinder housing with the mounting holes of the door handle.
3. Install the exterior door handle onto the outside of the driver side front door (Refer to 23 - BODY/DOOR - FRONT/EXTERIOR HANDLE - INSTALLATION).

DOOR

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Disconnect the front door wire harness connector from the body wire harness.
3. Using a grease pencil or equivalent, mark the location of the front door hinges (1 and 2) on the A-pillar.
4. Support the front door with a suitable lifting device and remove the four bolts (3) that secure the front door hinges to the A-pillar.
5. Carefully remove the door from the body.
6. If required, remove the front door hinges from the door (Refer to 23 - BODY/DOOR - FRONT/HINGE - REMOVAL).

INSTALLATION

1. If removed, install the front door hinges (1 and 2) onto the door (Refer to 23 - BODY/DOOR - FRONT/HINGE - INSTALLATION).
2. Carefully position the door to the body and support the door with a suitable lifting device.
3. Loosely install the four bolts (3) that secure the front door hinges to the A-pillar.
4. Align the door to the body using the reference marks made during the removal procedure and tighten the bolts to 28 N·m (21 ft. lbs.).
5. Connect the front door wire harness to the body wire harness.
6. Reconnect the negative battery cable.
7. If necessary, adjust the front door (Refer to 23 - BODY/DOOR-FRONT - ADJUSTMENTS).

ADJUSTMENTS

ADJUSTMENT

NOTE: It is recommended that you adjust the rear door before adjusting the front door (Refer to 23 - BODY/DOORS - REAR/DOOR - ADJUSTMENTS).

- Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.
- During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper bolts to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.
- A suitable body sealant should be used when removing or moving the hinges.

FORE/AFT

NOTE: Fore/aft (lateral) door adjustment is done by loosening the hinge to the body fasteners one hinge at a time and moving the door to the correct position.

1. Support the front door with a suitable lifting device.
2. Loosen the four bolts (3) that secure the front door hinges (1 and 2) to the A-pillar.
3. Adjust the front door to the correct position (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).
4. Tighten the upper bolt of the upper hinge to the A-pillar to 28 N·m (21 ft. lbs.).
5. Tighten the upper bolt of the lower hinge to 28 N·m (21 ft. lbs.).
6. Tighten the remaining hinge bolts to 28 N·m (21 ft. lbs.).

UP/DOWN

NOTE: Up/down door adjustment is done by loosening either the hinge to the body fasteners or the hinge to door fasteners and moving the door to the correct position.

NOTE: When the up/down adjustments are done correctly, the top of the door is positioned over flush to the roof (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).

1. Support the front door with a suitable lifting device.
2. Loosen the two bolts (1) that secure the striker (2) and the shim (3) to the B-pillar.

NOTE: When adjustment of the door requires the loosening of the door to hinge fasteners, it will be necessary to separate the epoxy bonded washers with a chisel or other suitable tool.

3. If necessary, loosen the four nuts (4) that secure the door hinges (2 and 3) to the front door.
4. Separate the epoxy bonded washers (1) from the hinges with a chisel or other suitable tool.

5. If necessary, loosen the four bolts (3) that secure the front door hinges (1 and 2) to the A-pillar.

6. Adjust the front door to the correct position (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).
7. Tighten the four nuts (4) that secure the door hinges (2 and 3) to the front door to 28 N·m (21 ft. lbs.).

1. Tighten the upper bolt (3) of the upper hinge (1) to the A-pillar to 28 N·m (21 ft. lbs.).
2. Tighten the upper bolt of the lower hinge (2) to 28 N·m (21 ft. lbs.).
3. Tighten the remaining hinge bolts to 28 N·m (21 ft. lbs.).

4. Tighten the two bolts (1) that secure the striker (2) and the shim (3) to the B-pillar. Tighten the bolts to 28 N·m (21 ft. lbs.).

IN/OUT

NOTE: In/out door adjustment is done by loosening the hinge to door fasteners one hinge at a time and moving the door to the correct position.

1. Support the front door with a suitable lifting device.
2. Loosen the two bolts (1) that secure the striker (2) and the shim (3) to the B-pillar.

NOTE: When adjustment of the front door requires the loosening of the door to hinge fasteners, it will be necessary to separate the epoxy bonded washers with a chisel or other suitable tool.

3. Loosen the four nuts (4) that secure the door hinges (2 and 3) to the front door.
4. Separate the epoxy bonded washers (1) from the hinges with a chisel or other suitable tool.
5. Adjust the front door to the correct position (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).
6. Tighten the four nuts that secure the door hinges to the front door. Tighten the nuts to 28 N·m (21 ft. lbs.).

7. Tighten the two bolts (1) that secure the striker (2) and the shim (3) to the B-pillar. Tighten the bolts to 28 N·m (21 ft. lbs.).

GLASS

REMOVAL

1. Remove the outer belt weatherstrip (1) from the front door.
2. Remove the trim panel from the inside of the front door (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
3. Remove the speaker from the inside of the front door (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL).
4. Remove the watershield from the inside of the front door (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - REMOVAL).
5. Using the regulator (4), move the front door glass (2) up or down as required to access the two window regulator glass clamp bolts (3).
6. Loosen the bolt in each of the window regulator glass clamps far enough to release the door glass from the clamps.
7. Disengage the door glass from the window regulator glass clamps.
8. Lower the regulator down as required for access to remove the door glass.
9. Carefully rotate the door glass within the window opening and remove the glass from the door through the window opening.

INSTALLATION

1. Carefully lower the door glass (2) into the door through the window opening.
2. Rotate the door glass into position and engage it to the window regulator glass clamps.
3. Using the regulator (4), move the front door glass up or down as required to access to the two window regulator glass clamp bolts (3).
4. Tighten the bolts in each of the window regulator glass clamps to 10 N·m (90 in. lbs.).
5. Install the watershield onto the inside of the front door (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - INSTALLATION).
6. Install the speaker onto the inside of the front door (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION).
7. Install the trim panel onto the inside of the front door (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).
8. Install the outer belt weatherstrip (1) onto the front door.

HANDLE-EXTERIOR

REMOVAL

1. Remove the window regulator from the inside of the front door (Refer to 23 - BODY/DOOR - FRONT/WINDOW REGULATOR - REMOVAL).
2. Disconnect the two actuator rods (2) from the front exterior handle (1).
3. If equipped, disconnect the exterior handle wire lead from the wire retainer and the door wire harness connector.

4. Remove the three bolts (2) that secure the exterior handle (1) to the front door and remove the handle.
5. If necessary, remove the lock cylinder from the driver side exterior door handle (Refer to 23 - BODY/DOOR - FRONT/LOCK CYLINDER - REMOVAL).

INSTALLATION

1. If removed, install the lock cylinder into the driver side front exterior handle (Refer to 23 - BODY/DOOR - FRONT/LOCK CYLINDER - INSTALLATION).
2. Position the exterior handle (1) to the mounting hole on the outside of the front door.
3. Install the three bolts (2) that secure that exterior handle to the door. Tighten the bolts to 5 N·m (44 in. lbs.).

4. Connect the actuator rods (2) to the front exterior handle (1).
5. If equipped, connect the exterior handle wire lead to the wire retainer and the door wire harness connector.
6. Install the front window regulator (Refer to 23 - BODY/DOOR - FRONT/WINDOW REGULATOR - INSTALLATION).

HINGE

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Disconnect the front door wire harness connector from the body wire harness.
3. Using a grease pencil or equivalent, mark the location of the front door hinges (1 and 2) on the A-pillar.
4. Support the front door with a suitable lifting device and remove the four bolts (3) that secure the front door hinges to the A-pillar.
5. Carefully remove the front door from the body and place it on a workbench.

6. Using a grease pencil or equivalent, mark the location of the door hinges (2 and 3) on the front door.

NOTE: The epoxy bonded washers do not need to be separated from the door hinges. If the washers are removed, the door may need to be readjusted.

7. Remove the four nuts (4) that secure the front door hinges to the door and remove the hinges.
8. If required, remove the washers (1) from the front door hinges.

INSTALLATION

1. Position the front door hinges onto the door.

NOTE: If the epoxy bonded washers are separated from the door hinges, the door may need to be adjusted.

2. If removed, install the epoxy bonded washers (1).
3. Loosely install the nuts (4) that secure the hinges to the front door.
4. Align the hinges to the door using the reference marks made during the removal procedure and tighten the nuts to 28 N·m (21 ft. lbs.).

5. Carefully position the front door to the body and support the door with a suitable lifting device.
6. Loosely install the four bolts (3) that secure the front door hinges (1 and 2) to the A-pillar.
7. Align the front door to the body using the reference marks made during the removal procedure and tighten the bolts to 28 N·m (21 ft. lbs.).
8. Connect the front door wire harness to the body wire harness.
9. Reconnect the negative battery cable.
10. If necessary, adjust the front door (Refer to 23 - BODY/DOOR-FRONT - ADJUSTMENTS).

LATCH

REMOVAL

1. Raise the front window to the full up position and remove the front door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
2. Position the watershield out of the way and disconnect the two actuator rods (2) from the exterior handle (1).

3. Disconnect the interior handle actuator rod (3) from the front door latch (1) and remove the rod.
4. Disconnect the door wire harness connector (2) from the front door latch.
5. Remove the three bolts (4) that secure the front door latch to the door and remove the latch and actuator rods as an assembly.
6. If required, remove all of the actuator rods from the actuator.

INSTALLATION

1. If removed, install the actuator rods onto the front door latch (1) and engage the retainers.
2. Position the front door latch and actuator rods into the door as an assembly.
3. Install the three bolts (4) that secure the front door latch to the door. Tighten the bolts to 10 N·m (89 in. lbs.).
4. Connect the door wire harness connector (2) to the front door latch.
5. Install the interior handle actuator rod (3) onto the front door latch and engage the retainer.

6. Connect the actuator rods (2) to the front exterior handle (1).
7. Reposition the watershield to the front door and install the door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).
8. If necessary, adjust the front door latch (Refer to 23 - BODY/DOOR - FRONT/LATCH - ADJUSTMENTS).

ADJUSTMENTS

ADJUSTMENT

1. Locate the access hole in the door to adjust the door latch (1) and remove the mylar tape (2).
2. Loosen the adjustment screw (3).
3. Operate the door handles several times to reduce any possible linkage binding and tighten the adjustment screw to 3 N·m (30 in. lbs.).
4. Operate the door handle again to verify proper operation and reinstall the mylar tape.

PANEL-TRIM

REMOVAL

CAUTION: Door panel retention clips are designed to be used only once. Retention clips should be discarded and replaced with new clips each time the door trim panel is removed from the door. Failure to replace retention clips will result in poor door panel retention and possible customer dissatisfaction.

1. Disconnect and isolate the battery negative cable.
2. Remove the three screws (2) that secure the front door trim panel (1) to the door.
3. Carefully pull the front door trim panel far away from the door to disengage the seven plastic door trim panel retention clips (3) from the door.
4. Lift the rear of the panel upward slightly to disengage the interior door latch lock link and knob from the rear of the door panel.

5. Position the front door trim panel far enough away to access the door wire harness connectors (1) and the interior door handle actuator rod (3).
6. Disconnect the interior door handle actuator rod from the interior door handle (4).
7. Disconnect the wire harness connectors (2) from the power door switch assembly.
8. Remove and discard the seven plastic door trim panel retention clips.

INSTALLATION

CAUTION: Door panel retention clips are designed to be used only once. Retention clips should be discarded and replaced with new clips each time the door trim panel is removed from the door. Failure to replace retention clips will result in poor door panel retention and possible customer dissatisfaction.

1. Install seven new plastic door trim panel retention clips onto the inside of the front door trim panel.
2. Position the door trim panel near the front door and connect the door wire harness connectors (2) to the power door switch assembly connectors (1).
3. Connect the interior door handle actuator rod (3) to the interior door handle (4) and engage the retainer.

4. Lift the trim panel (1) over the inside of the door far enough to engage the interior door latch lock link and knob into the hole at the upper rear corner of the trim panel.
5. Position the trim panel to the inside of the door and fully engage the seven new plastic door trim panel retention clips (3) to the door.
6. Install the three screws (2) that secure door trim panel to the door. Tighten the screws to 2 N·m (16 in. lbs.).
7. Reconnect the negative battery cable.

REGULATOR-WINDOW

REMOVAL

1. Remove the trim panel from the inside of the front door (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
2. Position the watershield out of the way and using the regulator (3), move the front door glass up or down as required to access the two window regulator glass clamp bolts (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - REMOVAL).
3. Loosen the bolt in each of the window regulator glass clamps far enough to release the door glass from the clamps.
4. Disengage the door glass from the window regulator glass clamps and lift the glass out of the regulator clamps and into its full up position, then tape the glass securely into place.
5. Remove the two bolts (2) that secure the bottom of the window regulator rails to the inside of the door.
6. Loosen the three bolts (1) that secure the regulator rails to the keyed holes (5) on the inside of the door.
7. Lift the regulator rails upward within the door far enough to disengage the bolts from the three keyed holes in the door.
8. Lower the regulator rails within the door far enough to access and disconnect the wire harness connector (4) from the regulator motor through the large access hole in the center of the door and remove the regulator.

INSTALLATION

1. Load the window regulator (3) into the front door through the large access hole in the center of the door and connect the wire harness connector (4) to the regulator motor.
2. Engage the three bolts (1) into the keyed holes (5) on the inside of the door.
3. Install the two bolts (2) that secure the bottom of the regulator rails to the door. Tighten the bolts to 10 N·m (90 in. lbs.).
4. Tighten the bolts that secure the regulator rails to the three keyed holes on the inside of the door. Tighten the bolts to 10 N·m (90 in. lbs.).
5. Carefully remove the tape securing the door glass in its full up position, then lower the glass and engage it into the two window regulator glass clamps (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - INSTALLATION).
6. Using the regulator, move the front door glass up or down as required to access to the two window regulator glass clamp bolts.
7. Tighten the bolts in each of the window regulator glass clamps to 10 N·m (90 in. lbs.).
8. Install the watershield and the trim panel onto the inside of the front door (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

STRIKER

REMOVAL

1. Using a grease pencil or equivalent, mark the location of the door latch striker (2) on the B-pillar.
2. Remove the two bolts (1) that secure the striker and the shim (3) to the B-pillar and remove the striker and shim.

INSTALLATION

1. Position the door latch striker (2) and the shim (3) onto the B-pillar and loosely install the two bolts (1).
2. Align the door latch striker to the B-pillar using the reference marks made during the removal procedure and tighten the bolts to 28 N·m (21 ft. lbs.).
3. If necessary, adjust the front door latch striker (Refer to 23 - BODY/DOOR - FRONT/LATCH STRIKER - ADJUSTMENTS).

ADJUSTMENTS

1. Using a grease pencil or equivalent, mark the location of the door latch striker (2) and shim (3) on the B-pillar to aid in adjustment.
2. Loosen the two bolts (1) that secure the door latch striker to the B-pillar.
3. To adjust the rear gap and flush measurement, change the position of the door latch striker and then tighten the two bolts to 28 N·m (21 ft. lbs.) (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).
4. Verify correct door and latch position.

WATERSHIELD

REMOVAL

1. Remove the trim panel from the inside of the front door (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
2. Remove the speaker from the inside of the front door (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL).

CAUTION: Do not allow the watershield adhesive to become contaminated with dirt or other foreign substances. If the watershield becomes contaminated or damaged, replace it.

3. Carefully remove the watershield (1) from around the perimeter of the door (2).
4. Separate the watershield from the interior handle actuator rod and the door wire harness and remove the watershield.

INSTALLATION

CAUTION: Do not allow the watershield or adhesive to become contaminated with dirt or other foreign substances. If the watershield becomes contaminated or damaged, replace it.

NOTE: Be sure that the watershield is fully sealed around the perimeter of the door.

1. Position the interior handle actuator rod and the wire harness through the holes in the watershield (1) and install the watershield to the door (2).
2. Install the speaker onto the inside of the front door (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION)
3. Install the trim panel onto the inside of the front door (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

CHANNEL-GLASS

REMOVAL

1. Remove the rear door glass (Refer to 23 - BODY/DOORS - REAR/DOOR GLASS - REMOVAL).
2. Remove the weatherstrip from the rear glass run channel (2).
3. Loosen the bolt (3) that secures the top of the rear glass run channel to the keyed hole on the inside door panel.
4. Remove the bolt (4) that secures the bottom of the run channel to the inside door panel.
5. Lift the rear glass run channel upward within the door far enough to disengage the bolt that secures the top of the run channel to the keyed hole on the inside door panel.
6. Remove the rear glass run channel from the door.

INSTALLATION

1. Position the rear glass run channel (1) onto the rear door.
2. Engage the bolt (3) into the keyed hole on the inside door panel.
3. Install the bolt (2) that secures the bottom of the rear glass run channel to the inside door panel. Tighten the bolt to 10 N·m (89 in. lbs.).
4. Tighten the bolt that secures the top of the rear glass run channel to the inside door panel to 10 N·m (89 in. lbs.).
5. Install the weatherstrip onto the rear glass run channel.
6. Install the rear door glass (Refer to 23 - BODY/DOORS - REAR/DOOR GLASS - INSTALLATION).

DOOR

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Disconnect the rear door wire harness connector from the body wire harness.
3. Using a grease pencil or equivalent, mark the location of the rear door hinges (2 and 3) on the B-pillar.
4. Support the rear door with a suitable lifting device and remove the four bolts (1 and 4) that secure the rear door hinges to the B-pillar.
5. Carefully remove the door from the body.
6. If required, remove the rear door hinges from the door (Refer to 23 - BODY/DOORS - REAR/HINGE - REMOVAL).

INSTALLATION

1. If removed, install the rear door hinges (2 and 3) onto the door (Refer to 23 - BODY/DOORS - REAR/HINGE - INSTALLATION).
2. Carefully position the rear door to the body and support the door with a suitable lifting device.
3. Loosely install the four bolts (1 and 4) that secure the rear door hinges to the B-pillar.
4. Align the rear door to the body using the reference marks made during the removal procedure and tighten the bolts to 28 N·m (21 ft. lbs.).
5. Connect the rear door wire harness to the body wire harness.
6. Reconnect the negative battery cable.
7. If necessary, adjust the rear door (Refer to 23 - BODY/DOORS - REAR/DOOR - ADJUSTMENTS).

ADJUSTMENTS

ADJUSTMENT

NOTE: Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.

- During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper bolts to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.
- A suitable body sealant should be used when removing or moving the hinges.

FORE/AFT

NOTE: Fore/aft (lateral) door adjustment is done by loosening the hinge to the body fasteners one hinge at a time and moving the door to the correct position.

1. Support the rear door with a suitable lifting device.
2. Loosen the four bolts (1 and 4) that secure the rear door hinges (2 and 3) to the B-pillar.
3. Adjust the rear door to the correct position (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).
4. Tighten the upper bolt of the upper hinge to the B-pillar to 28 N·m (21 ft. lbs.).
5. Tighten the upper bolt of the lower hinge to 28 N·m (21 ft. lbs.).
6. Tighten the remaining hinge bolts to 28 N·m (21 ft. lbs.).

UP/DOWN

NOTE: Up/down door adjustment is done by loosening either the hinge to the body fasteners or the hinge to door fasteners and moving the door to the correct position.

NOTE: When the up/down adjustments are done correctly, the top of the door is positioned over flush to the roof (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).

1. Support the rear door with a suitable lifting device.
2. Loosen the two bolts (1) that secure the striker (2) and the shim (3) to the C-pillar.

NOTE: When adjustment of the rear door requires the loosening of the door to hinge fasteners, it will be necessary to separate the epoxy bonded washers with a chisel or other suitable tool.

3. If necessary, loosen the four nuts (4) that secure the door hinges (2 and 3) to the rear door.
4. Separate the epoxy bonded washers (1) from the hinges with a chisel or other suitable tool.

5. If necessary, loosen the four bolts (1 and 4) that secure the rear door hinges (2 and 3) to the B-pillar.

6. Adjust the rear door to the correct position (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).
7. Tighten the four nuts (4) that secure the door hinges (2 and 3) to the rear door to 28 N·m (21 ft. lbs.).

8. Tighten the upper bolt (1) of the upper hinge (2) to the B-pillar to 28 N·m (21 ft. lbs.).
9. Tighten the upper bolt (4) of the lower hinge (3) to 28 N·m (21 ft. lbs.).
10. Tighten the remaining hinge bolts to 28 N·m (21 ft. lbs.).

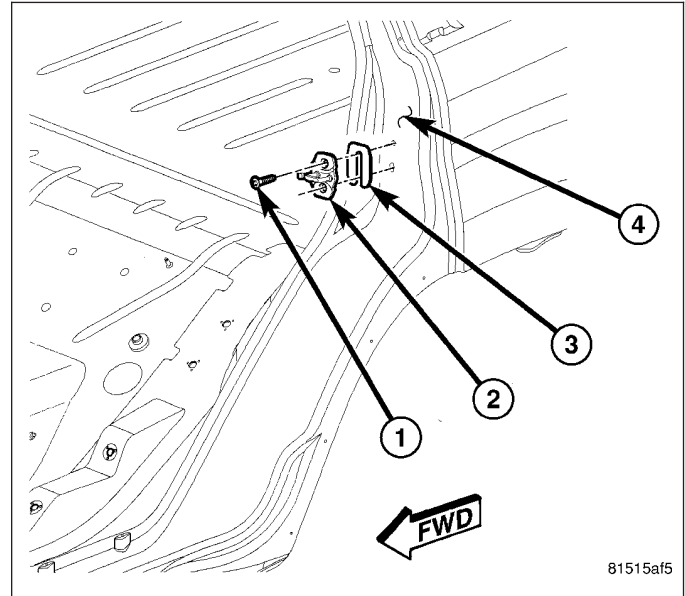

11. Tighten the two bolts (1) that secure the striker (2) and the shim (3) to the C-pillar. Tighten the bolts to 28 N·m (21 ft. lbs.).

IN/OUT

NOTE: In/out door adjustment is done by loosening the hinge to door fasteners one hinge at a time and moving the door to the correct position.

1. Support the rear door with a suitable lifting device.
2. Loosen the two bolts (1) that secure the striker (2) and the shim (3) to the C-pillar.

NOTE: When adjustment of the rear door requires the loosening of the door to hinge fasteners, it will be necessary to separate the epoxy bonded washers with a chisel or other suitable tool.

3. Loosen the four nuts (4) that secure the door hinges (2 and 3) to the rear door.
4. Separate the epoxy bonded washers (1) from the hinges with a chisel or other suitable tool.
5. Adjust the rear door to the correct position (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).
6. Tighten the four nuts that secure the door hinges to the rear door. Tighten the nuts to 28 N·m (21 ft. lbs.).

7. Tighten the two bolts (1) that secure the striker (2) and the shim (3) to the C-pillar. Tighten the bolts to 28 N·m (21 ft. lbs.).

GLASS

REMOVAL

1. Remove the outer belt weatherstrip from the rear door.
2. Remove the trim panel from the inside of the rear door (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL).
3. If equipped, remove the speaker from the inside of the rear door (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL).
4. Remove the watershield from the inside of the rear door (Refer to 23 - BODY/DOORS - REAR/WATERSHIELD - REMOVAL).
5. Using the regulator (2), move the rear door glass up or down as required to access the two window regulator glass clamp bolts (1).
6. Loosen the bolt in each of the window regulator glass clamps far enough to release the door glass from the clamps.
7. Disengage the door glass from the window regulator glass clamps.
8. Lower the regulator down as required for access to remove the door glass.
9. Carefully rotate the door glass within the window opening and remove the glass from the door through the window opening.

INSTALLATION

1. Carefully lower the door glass into the rear door through the window opening.
2. Rotate the door glass into position and engage it to the window regulator glass clamps.
3. Using the regulator (2), move the rear door glass up or down as required to access to the two window regulator glass clamp bolts (1).
4. Tighten the bolts in each of the window regulator glass clamps to 10 N·m (90 in. lbs.).
5. Install the watershield onto the inside of the rear door (Refer to 23 - BODY/DOORS - REAR/WATERSHIELD - INSTALLATION).
6. If equipped, install the speaker onto the inside of the rear door (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION).
7. Install the trim panel onto the inside of the rear door (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION).
8. Install the outer belt weatherstrip onto the rear door.

HANDLE-EXTERIOR

REMOVAL

1. Remove the window regulator from the inside of the rear door (Refer to 23 - BODY/DOORS - REAR/WINDOW REGULATOR - REMOVAL).
2. Disconnect the actuator rod (1) from the rear exterior handle (2).

3. Remove the three bolts (2) that secure the exterior handle (1) to the rear door and remove the handle.

INSTALLATION

1. Position the exterior handle (1) to the mounting hole on the outside of the rear door.
2. Install the three bolts (2) that secure that exterior handle to the door. Tighten the bolts to 5 N·m (44 in. lbs.).

3. Connect the actuator rod (1) to the rear exterior handle (2).
4. Install the rear window regulator (Refer to 23 - BODY/DOORS - REAR/WINDOW REGULATOR - INSTALLATION).

HINGE

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Disconnect the rear door wire harness connector from the body wire harness.
3. Using a grease pencil or equivalent, mark the location of the rear door hinges (2 and 3) on the B-pillar.
4. Support the rear door with a suitable lifting device and remove the four bolts (1 and 4) that secure the rear door hinges to the B-pillar.
5. Carefully remove the rear door from the body and place it on a workbench.

6. Using a grease pencil or equivalent, mark the location of the door hinges (2 and 3) on the rear door.

NOTE: The epoxy bonded washers do not need to be separated from the door hinges. If the washers are removed, the door may need to be readjusted.

7. Remove the four nuts (4) that secure the rear door hinges to the door and remove the hinges.
8. If required, remove the washers (1) from the rear door hinges.

INSTALLATION

1. Position the rear door hinges onto the door.

NOTE: If the epoxy bonded washers are separated from the door hinges, the door may need to be adjusted.

2. If removed, install the epoxy bonded washers (1).
3. Loosely install the nuts (4) that secure the hinges to the rear door.
4. Align the hinges to the door using the reference marks made during the removal procedure and tighten the nuts to 28 N·m (21 ft. lbs.).

5. Carefully position the rear door to the body and support the door with a suitable lifting device.
6. Loosely install the four bolts (1 and 4) that secure the rear door hinges (2 and 3) to the B-pillar.
7. Align the rear door to the body using the reference marks made during the removal procedure and tighten the bolts to 28 N·m (21 ft. lbs.).
8. Connect the rear door wire harness to the body wire harness.
9. Reconnect the negative battery cable.
10. If necessary, adjust the rear door (Refer to 23 - BODY/DOORS - REAR/DOOR - ADJUSTMENTS).

LATCH

REMOVAL

1. Raise the rear window to the full up position and remove the rear door trim panel (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL).
2. Position the watershield out of the way and disconnect the actuator rod (1) from the exterior handle (2).

3. Disconnect the interior handle actuator rod from the rear door latch (3) and remove the rod.
4. Disconnect the door wire harness connector (2) from the rear door latch.
5. Remove the three bolts (1) that secure the rear door latch to the door and remove the latch and actuator rods as an assembly.
6. If required, remove all of the actuator rods from the actuator.

INSTALLATION

1. If removed, install the actuator rods onto the rear door latch (3) and engage the retainers.
2. Position the rear door latch and actuator rods into the door as an assembly.
3. Install the three bolts (1) that secure the rear door latch to the door. Tighten the bolts to 10 N·m (89 in. lbs.).
4. Connect the door wire harness connector (2) to the rear door latch.
5. Install the interior handle actuator rod onto the rear door latch and engage the retainer.

6. Connect the actuator rod (1) to the rear exterior handle (2).
7. Reposition the watershield to the rear door and install the door trim panel (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION).
8. If necessary, adjust the rear door latch (Refer to 23 - BODY/DOORS - REAR/LATCH - ADJUSTMENTS).

ADJUSTMENTS

ADJUSTMENT

1. Locate the access hole in the door to adjust the door latch (1) and remove the mylar tape (2).
2. Loosen the adjustment screw (3).
3. Operate the door handles several times to reduce any possible linkage binding and tighten the adjustment screw to 3 N·m (30 in. lbs.).
4. Operate the door handle again to verify proper operation and reinstall the mylar tape.

PANEL-TRIM

REMOVAL

CAUTION: Door panel retention clips are designed to be used only once. Retention clips should be discarded and replaced with new clips each time the door trim panel is removed from the door. Failure to replace retention clips will result in poor door panel retention and possible customer dissatisfaction.

1. Disconnect and isolate the battery negative cable.
2. Remove the two screws (2) that secure the rear door trim panel (1) to the door.
3. Carefully pull the rear door trim panel far away from the door to disengage the six plastic door trim panel retention clips (3) from the door.
4. Lift the rear of the panel upward slightly to disengage the interior door latch lock link and knob from the rear of the door panel.

5. Position the rear door trim panel far enough away to access the door panel wire harness connector (1) and the interior door handle actuator rod (2).
6. Disconnect the interior door handle actuator rod from the interior door handle.
7. Disconnect the wire harness connector (3) from the power door switch assembly.
8. Remove and discard the six plastic door trim panel retention clips.

INSTALLATION

CAUTION: Door panel retention clips are designed to be used only once. Retention clips should be discarded and replaced with new clips each time the door trim panel is removed from the door. Failure to replace retention clips will result in poor door panel retention and possible customer dissatisfaction.

1. Install six new plastic door trim panel retention clips onto the inside of the rear door trim panel.
2. Position the door trim panel near the rear door and connect the door wire harness connector (3) to the power door switch assembly (1).
3. Connect the interior door handle actuator rod (3) to the interior door handle and engage the retainer.

4. Lift the rear trim panel (1) over the inside of the door far enough to engage the interior door latch lock link and knob into the hole at the upper rear corner of the trim panel.
5. Position the trim panel to the inside of the door and fully engage the new plastic door trim panel retention clips (3) to the door.
6. Install the two screws (2) that secure door trim panel to the door. Tighten the screws to 2 N·m (16 in. lbs.).
7. Reconnect the negative battery cable.

REGULATOR-WINDOW

REMOVAL

1. Remove the trim panel from the inside of the rear door (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL).
2. Position the watershield out of the way and using the regulator, move the rear door glass up or down as required to access the two window regulator glass clamp bolts (Refer to 23 - BODY/DOORS - REAR/DOOR GLASS - REMOVAL).
3. Loosen the bolt in each of the window regulator glass clamps far enough to release the door glass from the clamps.
4. Disengage the door glass from the window regulator glass clamps and lift the glass out of the regulator clamps and into its full up position, then tape the glass securely into place.
5. Remove the bolt (4) that secures the bottom of the window regulator to the inside of the door.
6. Loosen the two bolts (1) that secure the regulator to the keyed holes (2) on the inside of the door.
7. Lift the regulator upward within the door far enough to disengage the bolts from the two keyed holes in the door.
8. Lower the regulator within the door far enough to access and disconnect the wire harness connector (3) from the regulator motor through the large access hole in the door and remove the regulator.

INSTALLATION

1. Load the window regulator into the rear door through the large access hole in the door and connect the wire harness connector (3) to the regulator motor.
2. Engage the two bolts (1) into the keyed holes (2) on the inside of the door.
3. Install the bolt (4) that secures the bottom of the regulator to the door. Tighten the bolt to 10 N·m (90 in. lbs.).
4. Tighten the bolts that secure the regulator to the two keyed holes on the inside of the door. Tighten the bolts to 10 N·m (90 in. lbs.).
5. Carefully remove the tape securing the rear door glass in its full up position, then lower the glass and engage it into the two window regulator glass clamps (Refer to 23 - BODY/DOORS - REAR/DOOR GLASS - INSTALLATION).
6. Using the regulator, move the rear door glass up or down as required to access to the two window regulator glass clamp bolts.
7. Tighten the bolts in each of the window regulator glass clamps to 10 N·m (90 in. lbs.).
8. Install the watershield and the trim panel onto the inside of the rear door (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION).

STRIKER

REMOVAL

1. Using a grease pencil or equivalent, mark the location of the door latch striker (2) on the C-pillar.
2. Remove the two bolts (1) that secure the striker and the shim (3) to the C-pillar and remove the striker and shim.

INSTALLATION

1. Position the door latch striker (2) and the shim (3) onto the C-pillar and loosely install the two bolts (1).
2. Align the door latch striker to the C-pillar using the reference marks made during the removal procedure and tighten the bolts to 28 N·m (21 ft. lbs.).
3. If necessary, adjust the rear door latch striker (Refer to 23 - BODY/DOORS - REAR/LATCH STRIKER - ADJUSTMENTS).

ADJUSTMENTS

ADJUSTMENT

1. Using a grease pencil or equivalent, mark the location of the door latch striker (2) and shim (3) on the C-pillar to aid in adjustment.
2. Loosen the two bolts (1) that secure the door latch striker to the C-pillar.
3. To adjust the rear gap and flush measurement, change the position of the door latch striker and then tighten the two bolts to 28 N·m (21 ft. lbs.) (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).
4. Verify correct door and latch position.

WATERSHIELD

REMOVAL

1. Remove the trim panel from the inside of the rear door (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL).
2. If equipped, remove the speaker from the inside of the rear door (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL).

CAUTION: Do not allow the watershield adhesive to become contaminated with dirt or other foreign substances. If the watershield becomes contaminated or damaged, replace it.

3. Carefully remove the watershield (1) from around the perimeter of the door (2).
4. Separate the watershield from the interior handle actuator rod and the door wire harness and remove the watershield.

INSTALLATION

CAUTION: Do not allow the watershield or adhesive to become contaminated with dirt or other foreign substances. If the watershield becomes contaminated or damaged, replace it.

NOTE: Be sure that the watershield is fully sealed around the perimeter of the door.

1. Position the interior handle actuator rod and the wire harness through the holes in the watershield (1) and install the watershield to the door (2).
2. If equipped, install the speaker onto the inside of the rear door (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION)
3. Install the trim panel onto the inside of the rear door (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION).

EXTERIOR

TABLE OF CONTENTS

INSTALLATION	62	INSTALLATION	66

BODY SIDE MOLDINGS

REMOVAL

1. Apply a length of masking tape on the body, parallel to the top edge of the molding to use as a guide, if necessary.
2. Warm the effected adhesive type molding and body metal to approximately 38°C (100°F) using a suitable heat lamp or heat gun.
3. Pull stick-on molding from painted surface.

INSTALLATION

1. Clean body surface with MOPAR® Super Kleen solvent or equivalent. Wipe surface dry with lint free cloth.
2. Remove protective cover from tape on back of molding. Apply molding to body below the masking tape guide.
3. Remove masking tape guide and firmly press molding to body surface to assure adhesion.

CROSSMEMBER-RADIATOR

REMOVAL

1. Remove the grill assembly, (Refer to 23 - BODY/ EXTERIOR/GRILLE - REMOVAL).
2. Remove the front hood seal.
3. Remove the center brace mounting nuts and remove hood latch.
4. Remove the outer crossmember mounting bolts.
5. Remove crossmember.

INSTALLATION

1. Install upper crossmember.
2. Install outer mounting bolts and tighten.
3. Install nuts attaching latch to radiator crossmember support. Tighten nuts to 11 N·m (8 ft. lbs.) torque.
4. Install grill assembly, (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).
- 5.
6. Check hood fit and adjust if required. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
7. Install hood seal.

FENDER REMOVAL

1. Mark fender location.
2. Remove wheel if necessary.
3. Remove wheel liner, (Refer to 23 - BODY/EXTERIOR/LF WHEELHOUSE SPLASH SHIELD - REMOVAL).
4. Remove front fascia as necessary, (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).

813287a2

5. Remove front lower mounting bolts.
6. Loosen rocker panel cover as necessary.
7. Remove rear lower mounting bolts.

8. Remove upper fender mounting bolts.

9. Remove fender from vehicle.

INSTALLATION

8132879d

1. Position fender on body.
2. If equipped, install radio antenna. (Refer to 8 - ELECTRICAL/AUDIO/ANTENNA BODY & CABLE - INSTALLATION)
3. Install all screws finger-tight.

813287a2

4. Align fender with adjacent body panels and reference marks. (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS)
5. Tighten all screws to 12 N·m (9 ft. lbs.).
6. Install rocker panel cover as necessary.

812d8c5b

7. Install front fascia as necessary, (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).

- 8. Install wheel liner, (Refer to 23 - BODY/EXTERIOR/LF WHEELHOUSE SPLASH SHIELD - INSTALLATION).
- 9. Install wheel if removed.

GRILLE

REMOVAL

- 1. Remove the 6 upper push pins (1).
- 2. Tip grill forward and remove grill (2).

INSTALLATION

1. Tip grill and latch bottom of grill (2) to front fascia.
2. Install the 6 upper mounting push pins (1).

LINER-FENDER & QUARTER PANEL

REMOVAL

1. If required remove wheel.
2. Remove pushpins.
3. Drill out rivets.
4. Remove liner.

INSTALLATION

1. Install liner.
2. Install pushpins and rivets.
3. Install wheel if removed.

MIRROR-OUTSIDE REARVIEW

REMOVAL

1. Remove the door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
2. Disconnect the wire harness connectors (2) from the mirror.
3. Remove the three nuts (1) that secure the mirror to the door and carefully remove the mirror.

INSTALLATION

1. Position the mirror onto the door.
2. Install the three nuts (1) that secure the mirror to the door. Tighten the nuts to 7 N·m (60 in. lbs.).
3. Connect the wire harness connectors (2) to the mirror.
4. Install the door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

PANEL-COWL TOP

REMOVAL

1. Remove wiper arms. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL)
2. Remove plenum seal.
3. Remove plastic push nuts attaching cowl cover to cowl.

4. Remove cowl cover from cowl.

INSTALLATION

1. Install tabs under windshield and rubber seal on top of windshield.
2. Install locating panel pins into sheet metal.
3. Install rear hood seal and foam blocks.
4. Install wiper arms, (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION).

RACK-LUGGAGE

REMOVAL

1. Remove luggage rack end covers, pull straight up.
2. Remove the mounting bolts.
3. Remove luggage rack bars.

INSTALLATION

1. Locate luggage rack bar.
2. Install mounting bolts.
3. Tighten mounting bolts.
4. Install luggage rack bar covers.

HOOD

TABLE OF CONTENTS

	page		page
HINGE		INSTALLATION	71
REMOVAL	67	RELEASE-HOOD LATCH	
INSTALLATION	68	REMOVAL	72
HOOD		INSTALLATION	72
REMOVAL	69	CYLINDER-HOOD SUPPORT	
INSTALLATION	69	REMOVAL	73
LATCH		INSTALLATION	74
REMOVAL	70		

HINGE

REMOVAL

NOTE: It is not necessary to remove the hood to replace the hood hinges. Hood hinges can be replaced one at a time.

1. Using a grease pencil or equivalent, mark the position of the hood hinge on the hood for the hinge being serviced.
2. Support the hood and disconnect the support cylinder (2) from the hood (Refer to 23 - BODY/HOOD/SUPPORT CYLINDER - REMOVAL).

3. Remove the bolts (3) that secure the hood hinge (1) to the hood (2)..
4. Remove the bolt that secures the hood hinge (1) to the front fender.

INSTALLATION

NOTE: It is not necessary to remove the hood to replace the hood hinges. Hood hinges can be replaced one at a time.

1. Position the hood hinge (1) onto the hood (2).
2. Align the hood to the hood hinge using the reference marks made during the removal procedure and install the bolts (3) that secure the hood hinge to the hood (2). Tighten the bolts to 20 N·m (15 ft. lbs.).

3. Install the bolts (2) that secure the hood hinge (1) to the fender rail. Tighten the bolt to 17 N·m (13 ft. lbs.).
4. Align the hood to the hood hinge using the reference marks made during the removal procedure and tighten the nuts to 23 N·m (17 ft. lbs.).
5. Install the support cylinder (4) (Refer to 23 - BODY/HOOD/SUPPORT CYLINDER - INSTALLATION).
6. If required, adjust the hood to the correct position (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).

HOOD

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the underhood lamp unit from the hood (1) (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/UNDERHOOD LAMP UNIT - REMOVAL).
3. Using a grease pencil or equivalent, mark the position of the hood hinges (1) on the hood.
4. Support the hood and disconnect the support cylinders (4) from the hood (Refer to 23 - BODY/HOOD/SUPPORT CYLINDER - REMOVAL).
5. Remove the two bolts that secure the hood to each hood hinge and remove the hood.

INSTALLATION

1. Position the hood onto the hood hinges (2) and loosely install the two nuts that secure the hood to each hood hinge (1).
2. Align the hood to the hood hinges (1) using the reference marks made during the Removal procedure and tighten the nuts to 23 N·m (17 ft. lbs.).
3. Install the support cylinders (4) to the hood (Refer to 23 - BODY/HOOD/SUPPORT CYLINDER - INSTALLATION).
4. Install the underhood lamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/UNDERHOOD LAMP UNIT - INSTALLATION).
5. Reconnect the negative battery cable.
6. If required, adjust the hood to the correct position (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).

LATCH

REMOVAL

1. Using a grease pencil or equivalent, mark the position of the hood latch (1) on the upper radiator crossmember.
2. Remove the two bolts (2) that secure the hood latch (1) to the upper radiator crossmember.

3. Disconnect the hood latch cable (2 and 3) from the hood latch (1).

INSTALLATION

1. Connect the hood latch cable (2 and 3) to the hood latch (1).

2. Position the hood latch (1) to the upper radiator crossmember and loosely install the two nuts (2) that secure the latch to the crossmember.
3. Align the hood latch (1) to the upper radiator crossmember using the reference marks made during the Removal procedure and tighten the bolts to 11 N·m (8 ft. lbs.).
4. If required, adjust the hood to the correct position (Refer to 23 - BODY/BODY STRUCTURE/GAP AND FLUSH - SPECIFICATIONS).

RELEASE-HOOD LATCH

REMOVAL

1. Remove the hood latch (Refer to 23 - BODY/ HOOD/LATCH - REMOVAL).
2. Remove release cable (2) from the three hood release cable retainers (1).

3. From inside the vehicle, remove the two bolts (2) that secure the hood release handle (1) to the cowl trim panel.
4. Remove the grommet from the cowl panel and remove the hood release cable and handle assembly (1).

INSTALLATION

1. Route the hood release cable through the cowl panel and install the grommet.
2. Position the hood release handle (2) onto the cowl trim panel.
3. Install the two bolts (2) that secure the hood release handle (1) to the instrument panel bracket. Tighten the bolts to 9 N·m (80 in. lbs.).

4. Route the hood release cable (2) along the left inner fender and the upper radiator crossmember and install the three hood release cable retainers (1).
5. Install the hood latch (Refer to 23 - BODY/HOOD/LATCH - INSTALLATION).

CYLINDER-HOOD SUPPORT

REMOVAL

NOTE: Lift the clips only enough to release the ball studs (1).

1. Support hood.
2. Disconnect the hood support cylinder (2) from the hood and the ball stud (1) on the fender rail.
3. If required, remove the upper ball stud from hood and the lower ball stud (1) from the fender rail.

INSTALLATION

1. If removed, install the upper ball stud onto the hood and the lower ball stud (1) onto the fender rail. Install the ball studs securely.

CAUTION: Do not push on the hood support cylinders at the middle of the support cylinder during installation. Failure to follow this caution can result in damage to the hood support cylinders.

NOTE: Install the hood support cylinders with the cylinder end connected to the hood as shown.

NOTE: If required, only release each retaining clip enough to install the ball socket onto the ball stud.

2. Install the hood support cylinder (2) over the upper and lower ball studs (1) and fully engage the retaining clips.

INSTRUMENT PANEL

WARNING

RESTRAINT SYSTEM

WARNING: To avoid personal injury or death, during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the daimlerchrysler mopar parts catalog.

WARNING: To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid personal injury or death on vehicles equipped with airbags, before performing any welding operations disconnect and isolate the battery negative (ground) cable and disconnect all wire harness connectors from the airbag control module (acm). Failure to take the proper precautions could result in accidental airbag deployment and other possible damage to the supplemental restraint system circuits and components.

WARNING: To avoid personal injury or death, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate, or bring into contact with electricity. Do not store at temperatures exceeding 93° c (200° f). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 2500 psi.

WARNING: To avoid personal injury or death, when handling a seat belt tensioner retractor, proper care should be exercised to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover.

WARNING: To avoid personal injury or death, replace all restraint system components only with parts specified in the daimlerchrysler mopar parts catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid personal injury or death, the fasteners, screws, and bolts originally used for the restraint system components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the restraint system. Any time a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the daimlerchrysler mopar parts catalog.

WARNING: To avoid personal injury or death, when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down.

BEZEL-CENTER

REMOVAL

1. Using a trim stick C-4755 or equivalent, separate the clips and the center bezel.
2. Disconnect the electrical connectors.

INSTALLATION

1. Connect all electrical connectors as necessary.
2. Position the center bezel in place and seat the clips fully.

BEZEL-CLUSTER

REMOVAL

1. Tilt the steering wheel down.
2. Grasp the upper edge of the cluster bezel and pull up and rearward.

813e0e4e

INSTALLATION

1. Align the cluster bezel over the slots and firmly press into place.

GLOVE BOX ASSEMBLY

REMOVAL

1. Open the glove box and push the stop tabs down to drop the glove box out of the instrument panel.
2. Rotate the box down and release the door hinges (2) at the bottom and remove the glove box.

INSTALLATION

1. Snap the lower glove box hinges (2) over the pivots (1) and rotate up.
2. Push the stop tabs down and close the glove box.

COVER-STEERING COLUMN OPENING

REMOVAL

1. Disconnect and isolate battery negative cable.
2. Remove the bolts (3) and remove the drivers side hush panel (2).

- Using a trim stick C-4755 or equivalent, separate the upper clips and rotate the cover down and release the lower hinges at the bottom and remove the opening cover.

INSTALLATION

- Snap the lower steering column opening cover hinges over the pivots and rotate up.

- Seat the upper fastener clips fully.

3. Install the hush panel (2) and install the screws (3).

ASSEMBLY-INSTRUMENT PANEL

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING)
2. Disconnect and isolate battery negative cable.
3. Remove the bolts (3) and remove the drivers side hush panel (2).

- Using a trim stick C-4755 or equivalent, separate the upper clips and rotate the cover down and release the lower hinges at the bottom and remove the opening cover.

WARNING: BEFORE SERVICING THE STEERING COLUMN THE AIRBAG SYSTEM MUST BE DISARMED. FAILURE TO DO SO MAY RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

- Remove the three bolts in the lower shroud (2).

NOTE: Use care not to break off the tangs on the shrouds.

- Then unsnap the lower shroud (2) from the upper shroud (1).

- Disconnect the steering column electrical connectors (3).

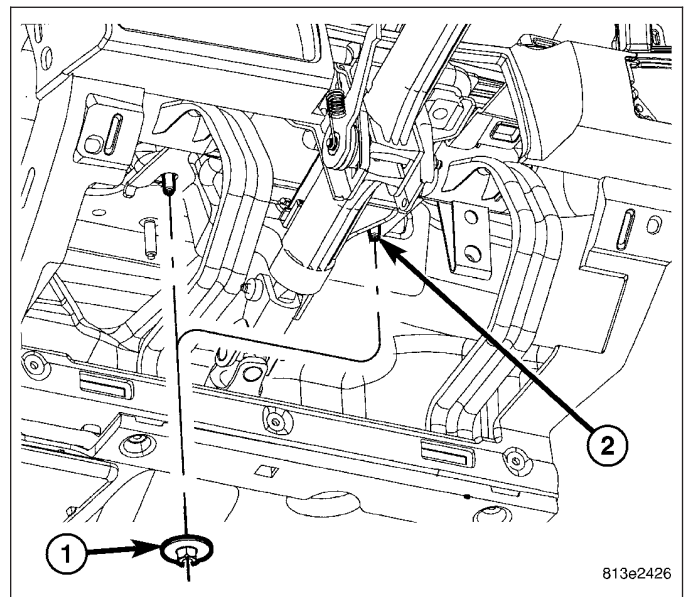

8. Remove the pinch bolt (2).
9. Remove the column support bolts (1).

10. Remove the column cross bolt (1) and slide the column (2) downward off the bracket and remove the steering column.

11. Remove the nuts (1) attaching the instrument panel to the pedal support bracket.

12. Using a trim stick C-4755 or equivalent, remove the ignition cylinder bezel.
13. Remove the screws (2) and remove the ignition cylinder (1).
14. Disconnect the electrical connector.

15. Using a trim stick C-4755 or equivalent, remove the left side cover.

16. Remove the left side door sill trim.

17. Remove the drivers side cowl trim panel.

18. Disconnect the electrical connectors.

19. Disconnect the electrical connectors.

20. Remove the bolts and disconnect the ground wires within the steering column opening to the left of the steering column.
21. Disconnect the white adjustable pedal electrical connector.

22. Remove the bolts (2) and remove the left a-pillar trim.* Right side shown, left side similar.

23. Remove the two left side bolts and one screw at the a-pillar support.* Right side shown, left side similar.

24. Using a trim stick C-4755 or equivalent, remove the shifter bezel ring.

25. Using a trim stick C-4755 or equivalent, remove the shifter bezel.

26. Remove the center console back cover (2) and disconnect the electrical connector (3).

27. Remove the screws (2) and remove the console (1).

28. Disconnect the electrical connectors under the console.

29. Open the glove box and push the stop tabs down to drop the glove box out of the instrument panel.
30. Rotate the box down and release the door hinges (2) at the bottom and remove the glove box.

31. Remove the passenger side hush panel.
32. Remove the right side door sill trim.* Left side door sill trim shown, right side similar.

33. Remove the nut (1), separate the right cowl trim panel and remove.

34. Remove the right side end cap.* Left side end cap shown, right side similar.

35. Disconnect the electrical connectors.

36. Remove the bolts and remove the right a-pillar trim panel.

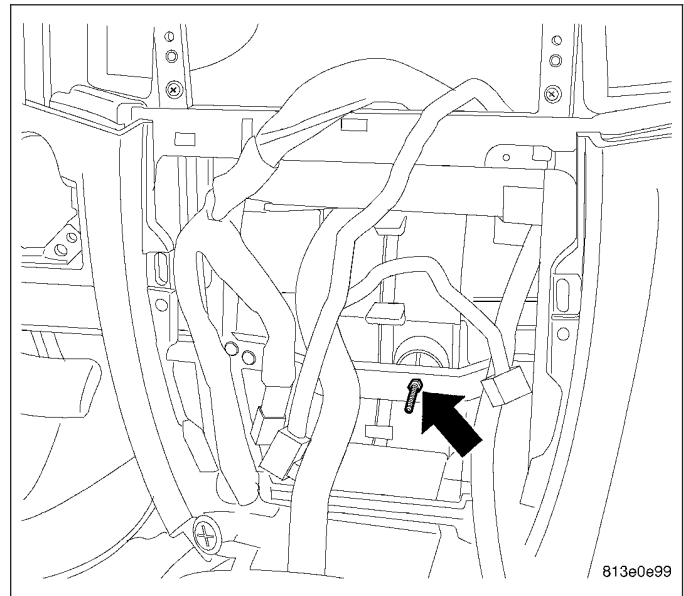

37. Remove the two right side bolts and one screw at the a-pillar support.

38. Using a trim stick C-4755 or equivalent, remove the defroster grills (2).
39. Remove the two fenceline nuts (1).

40. Using a trim stick C-4755 or equivalent, remove the radio bezel.
41. Using a trim stick C-4755 or equivalent, remove the center bezel and disconnect the electrical connectors.
42. Remove the nut from the HVAC support stud behind the center bezel.

43. Remove the screw to the HVAC from under the glove box opening.

44. Remove the HVAC bracket bolt from the glove box opening.

45. Remove the left and right center support brackets.
* Left side shown, right side similar.

46. Remove the center floor duct (3).

47. Remove the radio.
48. Remove the two HVAC bolts from the radio opening.
49. Remove the instrument panel assembly.

INSTALLATION

1. Before proceeding with installation of the instrument panel assembly, remove the load clips from each a-pillar and install onto the sides of the panel using the screw.

2. Place the instrument panel into the vehicle and position onto the a-pillars using the load clips (2).
3. Install the two bolts on the right side and tighten the bolts to 11 N·m (95 in. lbs.).

4. Install the two fenceline nuts (1).

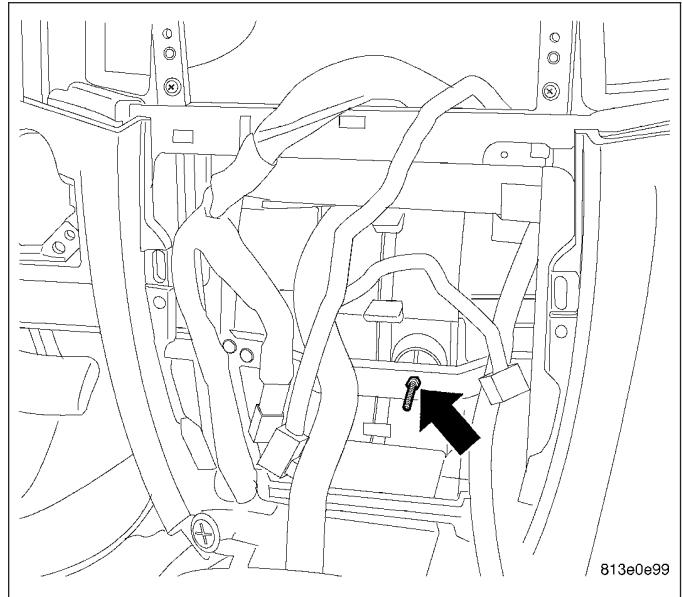

5. Guide the peddle support studs (3) on the drivers side, into the slots in the instrument panel reinforcement.

6. Position the center stack brackets (2) in front of the duct work.

7. Rotate the instrument panel back and guide the HVAC stud.

8. Continue to rotate the instrument panel back and guide the tube brackets located in the radio opening, into the HVAC.

9. Install the screw at the bottom of the column opening next to the center stack up from the bottom attaching the HVAC.

10. Install the bolt at the HVAC blower motor housing.

11. Install the screw at the bottom of the glove box opening to the blower motor housing support.

12. Snap the lower glove box hinges (2) over the pivots (1) and rotate up.
13. Push the stop tabs down and close the glove box.

14. Connect the right side wiring.

15. Install the right hush panel trim.
16. Install the right cowl trim and position the door seal back.

17. Position the right side door sill trim and seat fully.*
Left side shown, right side similar.

18. Install the right a-pillar trim, the bolts and position the door seal back.

19. Install the two bolts on the left side and tighten to 11 N·m (95 in. lbs.)* Right side shown, left side similar.

20. Position the right side end cap and seat fully.* Left side shown, right side similar.

21. Install the two nuts (1) on the studs (2) above the column tighten the nuts to 12 N·m (105 in. lbs.).

22. Connect the two left bulk connectors.

23. Connect the two fuse block connectors.

24. Connect the white connector to adjustable brake pedal.

25. Install the grounds within the steering column opening and install the bolts.

26. Install the left cowl trim panel (1) and install the nut (2).

27. Install the left door sill.

28. Install the column cross bolt (1) and tighten to 12 N·m (105 in. lbs.).

29. Position the steering column shaft into the slip joint.
30. Lift the column into position and install the bolts (1).
31. Tighten the bolts to 12 N·m (105 in. lbs.).
32. Slide the coupler onto the column shaft and install a **new** coupler bolt (2). Tighten the coupler bolt to 49 N·m (36 ft. lbs.).

- 33. Connect the shifter cable and electrical connectors to the ignition.
- 34. Install the ignition cylinder (1) and install the screws (2).
- 35. Position the ignition bezel and seat fully.

- 36. Connect the electrical connector (3) for the multi-function switch (2).

- 37. Install the upper shroud (1) on the column.
- 38. Install the lower shroud (2) to the column.
- 39. Snap the two halves back into place.
- 40. Install the three mounting bolts to secure the shroud in place.

41. Snap the steering column opening cover (2) lower hinges onto the pins and roll cover up.

42. Seat the upper retaining clips fully.

43. Install the hush panel.
44. Connect the column electrical connectors.
45. Install the column covers.

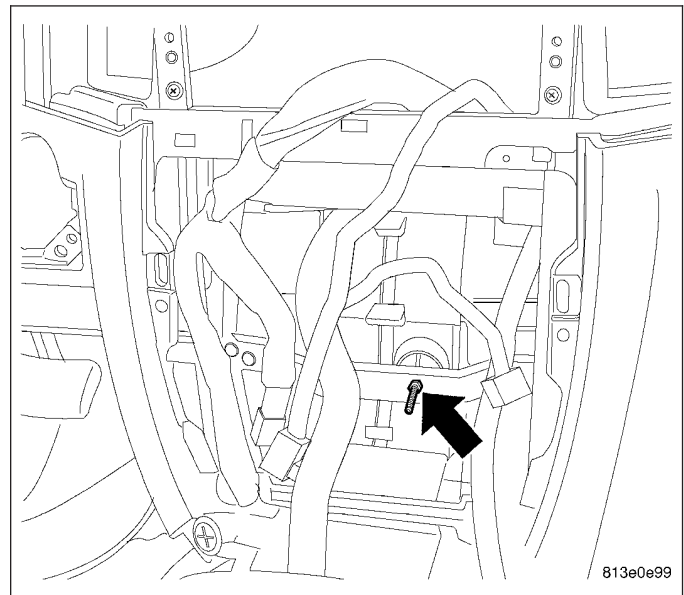

46. Install the left a-pillar trim, the bolts and position the door seal back.* Right a-pillar trim shown, left similar.

47. Position the left side end cap and seat fully.

48. Install the center support nut onto the stud.

49. Install the two HVAC bolts within the radio opening.
50. Install the radio.
51. Install the radio bezel.

52. Install the left and right center support brackets and nuts and tighten to 12 N·m (105 in. lbs.)* Left side shown, right side similar.

53. Position the center wire harness and connect the electrical connectors.
54. Install the center bezel.
55. Position the defroster vents (2) and seat fully.

56. Connect the center harness electrical connectors (ground, module, shifter, brake lever).

57. Install the center floor duct (3).
58. Position the console (1) into the vehicle and install the screws (2).

59. Connect the electrical connector (3) and install the rear cover (2) onto the console (1).

60. Position the shifter bezel and seat fully.

61. Position the shifter bezel trim ring and seat fully.

INTERIOR

CAUTION

CAUTION:: Do not attempt to remove interior trim panels or moldings without first removing the necessary adjacent trim panels or moldings. To avoid damaging the trim panels, ensure that all the fasteners are removed or disengaged before attempting to remove interior trim panels or moldings. Trim panels are somewhat flexible but can be damaged if handled improperly.

A-PILLAR TRIM/GRAB HANDLE

REMOVAL

1. Using a small flat-bladed tool, carefully open the two fastener covers located in the A-pillar trim panel.
2. Remove the two bolts that secure the A-pillar trim panel to the A-pillar and remove the trim panel.

INSTALLATION

1. Position the locating tabs of the A-pillar trim panel into the slots located in the top of the instrument panel.
2. Install the A-pillar trim panel onto the A-pillar and install the two bolts. Tighten the bolts to 6 N·m (55 in. lbs.).
3. Close the two fastener covers located in the A-pillar trim panel.

ASSIST HANDLE

REMOVAL

1. Pull the grab handle downward, remove the two screws that secure the grab handle to the roof panel, and remove the grab handle from the headliner.
2. If equipped, disconnect the reading lamp wire harness connector.

INSTALLATION

1. If equipped, connect the reading lamp wire harness connector.

2. Position the grab handle on the headliner and install the two screws that secure the grab handle to the roof panel. Tighten the screws to 2.2 N·m (20 in. lbs.).

B-PILLAR LOWER TRIM

REMOVAL

1. Adjust the front seat to its most forward position for easiest access to the front seat belt lower anchor cover (1) and the B-pillar trim.
2. Grasp the upper edge of the lower anchor cover and pull upward to unsnap it from the front seat cushion outboard side shield.
3. Remove the screw (2) that secures the lower anchor to the outboard side of the front seat cushion frame and position the seat belt out of the way.

4. Remove the front door sill scuff plate, (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - REMOVAL).
5. Remove the rear passenger door sill scuff plate, (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - REMOVAL).

- Remove the upper B-pillar trim panel, (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - REMOVAL).

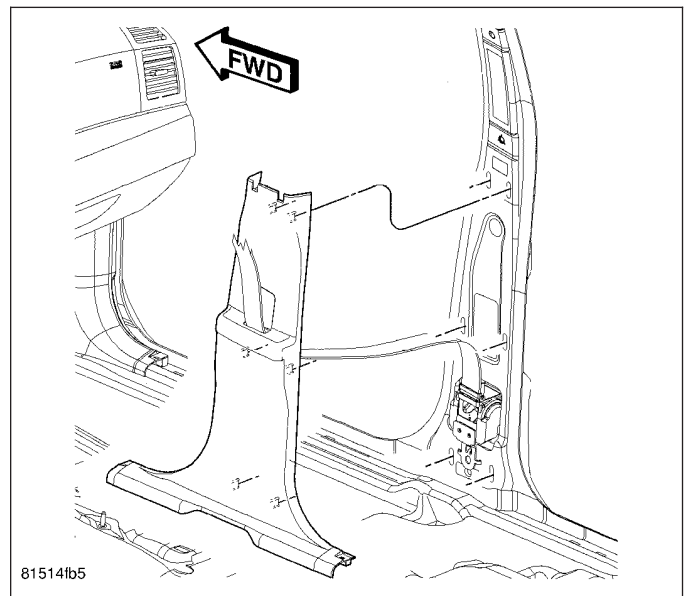

- Open the access door on the lower B-pillar trim panel.
- Using a trim stick C-4755 or equivalent, disengage the retaining tabs that secure the lower B-pillar trim panel to the B-pillar.
- Remove the seat belt from the lower B-pillar trim panel through the access door opening and remove the trim panel.

INSTALLATION

- Route the seat belt through the access door opening in the lower B-pillar trim panel.
- Position the lower B-pillar trim panel to the B-pillar and engage the retaining tabs that secure the trim panel to the B-pillar.

3. Install the upper B-pillar trim panel, (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - INSTALLATION).

4. Position the seat belt lower anchor to the mounting hole on the outboard side of the front seat cushion frame. Be certain that the seat belt webbing between the turning loop and the lower anchor is not twisted.
5. Install the screw (2) that secures the lower anchor to the seat. Tighten the screw to 39 N·m (29 ft. lbs.).
6. Reinstall the lower anchor cover (1) onto the front seat cushion outboard side shield.

8151502e

7. Position the seat belt aside and close the access door on the lower B-pillar trim panel.
8. Install the rear door sill scuff plate, (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - INSTALLATION).
9. Install the front door sill scuff plate, (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - INSTALLATION).

B-PILLAR UPPER TRIM

REMOVAL

1. Firmly grasp the lower end of the turning loop trim cover on the upper B-pillar and pull it straight out to unsnap it from the height adjuster, then lift the bottom of the cover upward and pull outward to disengage the upper tabs from the adjuster.
2. Remove the screw that secures the seat belt turning loop to the height adjuster.
3. Remove the seat belt turning loop from the height adjuster and position the seat belt out of the way.
4. Using a trim stick C-4755 or equivalent, disengage the retaining tabs that secure the upper B-pillar trim panel to the B-pillar and remove the trim panel.

81514fc4

INSTALLATION

1. Position the upper B-pillar trim panel to the B-pillar and engage the retaining tabs that secure the trim panel to the B-pillar.
2. Position the seat belt turning loop onto the height adjuster on the upper B-pillar. Be certain that the seat belt webbing between the retractor and the turning loop is not twisted.
3. Install the screw that secures the turning loop to the height adjuster. Tighten the screw to 39 N·m (29 ft. lbs.).
4. Insert the upper tabs of the turning loop trim cover into the slots of the height adjuster on the upper B-pillar, then lower the bottom of the cover and use hand pressure to press firmly and evenly on the cover until it snaps into place.

C-PILLAR UPPER TRIM

REMOVAL

1. Remove the bolts that secure the rear passenger seat cushion to the floor, (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL).
2. Position the rear passenger seat cushion to gain access to the bolt that secures the rear outboard seat belt lower anchor and the rear seat back bracket to the rear floor panel.
3. Loosen the bolt that secures the rear outboard seat belt lower anchor and the rear seat back bracket to the rear floor panel.
4. Disengage the lower anchor from the loosened bolt.
5. Using a trim stick C-4755 or equivalent, disengage the retaining tabs that secure the upper C-pillar trim panel to the retaining clips in the C-pillar.
6. Remove the seat belt from the upper C-pillar trim panel through the slot provided and remove the upper C-pillar trim panel.

INSTALLATION

1. Route the seat belt through the slot in the upper C-pillar trim panel.
2. Position the locating tabs on the bottom of the upper C-pillar trim panel into the slots in the top of the quarter trim panel.
3. Align the retaining tabs on the upper C-pillar trim panel with the retaining clips in the C-pillar and engage the retaining tabs that secure the trim panel to the C-pillar.
4. Engage the seat belt lower anchor under the loosened bolt that secures the lower anchor and the rear seat back bracket to the rear floor panel. Be certain the seat belt webbing between the turning loop and the lower anchor is not twisted.
5. Tighten the bolt that secures the lower anchor and the rear seat back bracket to the rear floor panel. Tighten the bolt to 50 N·m (37 ft. lbs.).
6. Reinstall the rear seat cushion into the vehicle. (Refer to 23 - BODY/SEATS/REAR SEAT CUSHION - INSTALLATION).

CARPETS AND FLOOR MATS

REMOVAL

1. Remove the front seats, (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).
2. Remove the rear passenger seat cushion, (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL).
3. Remove the floor console, (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).
4. Remove the park assist module, the final drive control module, and the park assist / final drive control module mounting bracket, (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FINAL DRIVE CONTROL MODULE - REMOVAL).
5. Remove the front door sill scuff plates, (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - REMOVAL).
6. Remove the cowl trim panels, (Refer to 23 - BODY/INTERIOR/COWL TRIM - REMOVAL).
7. Remove the rear passenger door sill scuff plates, (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - REMOVAL).
8. Remove the lower B-pillar trim panels, (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL)
9. Remove the carpet from the vehicle.

INSTALLATION

1. Install the carpet in the vehicle.
2. Install the floor console, (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).
3. Install the lower B-pillar trim panels, (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION).
4. Install the rear passenger door sill scuff plates, (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - INSTALLATION).
5. Install the cowl trim panels, (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION).
6. Install the front door sill scuff plates, (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - INSTALLATION).
7. Install the park assist / final drive control module mounting bracket, the park assist module, and the final drive control module, (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FINAL DRIVE CONTROL MODULE - INSTALLATION).
8. Install the rear passenger seat cushion, (Refer to 23 - BODY/SEATS/SEAT CUSHION - INSTALLATION).
9. Install the front seats, (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

COWL TRIM

REMOVAL

1. Remove the front door sill scuff plate, (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - REMOVAL).
2. Remove the hush panel from underneath the instrument panel.
3. Remove the nut that secures the cowl trim panel to the mounting bracket.
4. Remove the cowl trim panel.

INSTALLATION

1. Align the fastener hole in the cowl trim panel with the stud on the mounting bracket and then seat the trim panel onto the mounting bracket.

2. Install the nut that secures the cowl trim panel to the mounting bracket.
3. Install the hush panel.
4. Install the front door sill scuff plate, (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - INSTALLATION).

D-PILLAR TRIM

REMOVAL

1. Remove the upper liftgate trim panel, (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - REMOVAL).

2. Using a trim stick C-4755 or equivalent, disengage the retaining tabs that secure the D-pillar trim panel to the retaining clips in the D-pillar and remove the trim panel.

INSTALLATION

1. Position the locating tabs on the bottom of the D-pillar trim panel into the slots in the top of the quarter trim panel.
2. Align the retaining tabs on the D-pillar trim panel with the retaining clips in the D-pillar and engage the retaining tabs that secure the trim panel to the D-pillar.

3. Install the upper liftgate trim panel, (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - INSTALLATION).

DOOR SILL SCUFF PLATE

REMOVAL

1. Using a trim stick C-4755 or equivalent, disengage the retaining tabs that secure the door sill scuff plate to the retaining clips in the door sill and remove the scuff plate.

INSTALLATION

1. Align the retaining tabs on the door sill scuff plate with the retaining clips in the door sill and engage the retaining tabs that secure the scuff plate to the door sill.

FLOOR CONSOLE

REMOVAL

1. Using a trim stick C-4755 or equivalent, remove the shifter bezel ring.

2. Using a trim stick C-4755 or equivalent, remove the shifter bezel.

3. Remove the center console back cover (2) and disconnect the electrical connector (3).

4. Remove the screws (2) and remove the console (1).

INSTALLATION

1. Position the console (1) into the vehicle and install the screws (2).

2. Connect the electrical connector (3) and install the rear cover (2) onto the console (1).

3. Position the shifter bezel and seat fully.

4. Position the shifter bezel trim ring and seat fully.

HEADLINER

REMOVAL

1. Remove the A-pillar trim panels, (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).
2. Remove the upper B-pillar trim panels, (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - REMOVAL).
3. Remove the upper C-pillar trim panels, (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL).
4. Remove the upper liftgate trim panel, (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - REMOVAL).
5. Remove the D-pillar trim panels, (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - REMOVAL).
6. Pull the top of each door seal downward slightly.
7. Fold the rear passenger seats down.
8. Disconnect the headliner wire harness connector located at the left A-pillar.
9. If equipped, disconnect the headliner wire harness connector(s) from the inside rear view mirror.
10. If equipped, disconnect the headliner wire harness connector from the rain sensor.
11. Remove the overhead console, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).
12. Remove the sun visors, (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL).
13. Remove the sun visor supports, (Refer to 23 - BODY/INTERIOR/SUN VISOR SUPPORT - REMOVAL)
14. Remove the grab handles above each rear passenger door, (Refer to 23 - BODY/INTERIOR/ASSIST HANDLE - REMOVAL).
15. Lower the rear of the headliner downward from the roof panel and disconnect the rear washer hose.
16. Disconnect the headliner wire harness connector located at the left D-pillar.
- 17.

CAUTION: Be careful not to crease the headliner. Lower the front of the headliner downward and remove the headliner through the liftgate door opening.

INSTALLATION

- 1.

CAUTION: Be careful not to crease the headliner. Position the headliner in the vehicle through the liftgate door opening.

2. Connect the headliner wire harness connector located at the left D-pillar.
3. Connect the rear washer hose.
4. Raise the rear of the headliner upward.
5. Raise the front of the headliner upward and install the sun visor supports, (Refer to 23 - BODY/INTERIOR/SUN VISOR SUPPORT - INSTALLATION).
6. Install the sun visors, (Refer to 23 - BODY/INTERIOR/SUN VISOR - INSTALLATION).
7. Install the overhead console, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION).
8. If equipped, connect the headliner wire harness connector(s) to the inside rear view mirror.
9. If equipped, connect the headliner wire harness connector to the rain sensor.
10. Connect the headliner wire harness connector located at the left A-pillar.
11. Install the grab handle above each rear passenger door, (Refer to 23 - BODY/INTERIOR/ASSIST HANDLE - INSTALLATION).
12. Install the A-pillar trim panels, (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).
13. Install the upper B-pillar trim panels, (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - INSTALLATION).
14. Install the upper C-pillar trim panel, (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION).
15. Install the D-pillar trim panels, (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - INSTALLATION).

16. Install the upper liftgate trim panel, (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - INSTALLATION).
17. Seat the top of each of door seal to the door opening.
18. Place the rear passenger seats in the upright position.

LIFTGATE OPENING UPPER TRIM

REMOVAL

1. Using a trim stick C-4755 or equivalent, disengage the retaining tabs that secure the upper liftgate trim panel to the retaining clips in the liftgate opening and remove the trim panel.

INSTALLATION

1. Align the retaining tabs on the upper liftgate trim panel with the retaining clips in the liftgate opening and engage the retaining tabs that secure the trim panel to the liftgate opening.

LIFTGATE SCUFF PLATE

REMOVAL

1. Using a trim stick C-4755 or equivalent, disengage the retaining tabs that secure the liftgate scuff plate to the liftgate door sill and remove the scuff plate.

INSTALLATION

1. Position the liftgate scuff plate to the liftgate door sill and engage the retaining tabs that secure the scuff plate to the door sill.

LOAD FLOOR

REMOVAL

1. Remove the liftgate scuff plate, (Refer to 23 - BODY/INTERIOR/LIFTGATE SCUFF PLATE - REMOVAL).
2. Remove the two nuts that secure the load floor to the floor panel.
3. Remove the load floor.

INSTALLATION

1. Position the load floor in the vehicle.
2. Install the two nuts that secure the load floor to the floor panel.

3. Install the liftgate scuff plate, (Refer to 23 - BODY/INTERIOR/LIFTGATE SCUFF PLATE - INSTALLATION).

QUARTER TRIM PANEL

REMOVAL

1. Remove the rear passenger seat cushion, (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL).
2. Fold the rear passenger seat down.
3. Using a trim stick C-4755 or equivalent, disengage the retaining tabs that secure the upper C-pillar trim panel to the retaining clips in the C-pillar and position the panel and the seat belt out of the way.
4. Remove the rear passenger door sill scuff plate, (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - REMOVAL).
5. If equipped, remove the tonneau cover.
6. Remove the liftgate scuff plate, (Refer to 23 - BODY/INTERIOR/LIFTGATE SCUFF PLATE - REMOVAL).
7. Remove the upper liftgate trim panel, (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - REMOVAL).
8. Remove the D-pillar trim panel, (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - REMOVAL).
9. Remove the load floor, (Refer to 23 - BODY/INTERIOR/LOAD FLOOR - REMOVAL).
10. Remove the two screws that secure the quarter trim panel to the quarter panel.
11. Using a trim stick C-4755 or equivalent, disengage the retaining tabs that secure the quarter trim panel to the quarter panel.
12. Pull the quarter trim panel away from the quarter panel.
13. If equipped, disconnect the power outlet wire harness connector.
14. Remove the quarter trim panel.

INSTALLATION

1. Position the quarter trim panel in the vehicle.
2. If equipped, connect the wire harness connector to the power outlet.
3. Position the flange on the quarter trim panel into the seal ditch and secure the bottom clip first and then the middle clip.
4. Align the two fastener holes in the quarter trim panel with the two fastener holes in the quarter panel and engage the retaining tabs that secure the quarter trim panel to the quarter panel.
5. Install the two screws that secure the quarter trim panel to the quarter panel.
6. Install the load floor, (Refer to 23 - BODY/INTERIOR/LOAD FLOOR - INSTALLATION).
7. Install the D-pillar trim panel, (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - INSTALLATION).

8. Install the upper liftgate trim panel, (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - INSTALLATION).
9. Install the liftgate scuff plate, (Refer to 23 - BODY/INTERIOR/LIFTGATE SCUFF PLATE - INSTALLATION).
10. Position the locating tabs on the bottom of the upper C-pillar trim panel into the slots in the top of the quarter trim panel.
11. Align the retaining tabs on the upper C-pillar trim panel with the retaining clips in the C-pillar and engage the retaining tabs that secure the trim panel to the C-pillar.
12. Place the rear passenger seat in the upright position.
13. Install the rear passenger seat cushion, (Refer to 23 - BODY/SEATS/SEAT CUSHION - INSTALLATION).
14. Install the rear passenger door sill scuff plate, (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - INSTALLATION).
15. If equipped, install the tonneau cover.

REAR VIEW MIRROR

REMOVAL

Without Smartbeam

1. If equipped, disconnect the mirror harness connector (1).
2. Loosen the setscrew (2) that secures the mirror base (3) to the bracket (4) on the windshield (5).
3. Slide the mirror base upward and off of the bracket.

With Smartbeam

1. Disconnect mirror harness connectors (1).
2. Loosen the setscrew (3) that secures the mirror base (2) to the bracket (5) on the windshield (4).
3. Slide the mirror base upward and off of the bracket.

INSTALLATION

INSTALLATION - REAR VIEW MIRROR

Without Smartbeam

1. Position the mirror base (3) on the bracket (4) on the windshield (5) and slide the mirror base downward onto the bracket.
2. Tighten the setscrew (2) to 1 N·m (15 in. lbs.).
3. If equipped, connect mirror harness connector (1).

With Smartbeam

1. Position the mirror base (2) on the bracket (5) on the windshield (4) and slide the mirror base downward onto the bracket.
2. Tighten the setscrew (3) to 1 N·m (15 in. lbs.).
3. Connect mirror harness connectors (1).

NOTE: Failure to calibrate the Smartbeam camera may diminish system performance and cause Diagnostic Trouble Codes (DTCs) to set.

4. Perform the Smartbeam System Calibration Procedure, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/SMARTBEAM - STANDARD PROCEDURE).

INSTALLATION - REAR VIEW MIRROR SUPPORT BRACKET

1. Mark the position for the mirror bracket on the outside of the windshield glass with a wax pencil.
2. Clean the bracket contact area on the glass. Use a mild powdered cleanser on a cloth saturated with isopropyl (rubbing) alcohol. Finally, clean the glass with a paper towel dampened with alcohol.
3. Sand the surface on the support bracket with fine grit-sandpaper. Wipe the bracket surface clean with a paper towel.
4. Apply accelerator to the surface on the bracket according to the following instructions:
 - a. Crush the vial to saturate the felt applicator.
 - b. Remove the paper sleeve.
 - c. Apply accelerator to the contact surface on the bracket.
 - d. Allow the accelerator to dry for five minutes.
 - e. Do not touch the bracket contact surface after the accelerator has been applied.
5. Apply adhesive accelerator to the bracket contact surface on the windshield glass. Allow the accelerator to dry for one minute. Do not touch the glass contact surface after the accelerator has been applied.
6. Install the bracket according to the following instructions:
 - a. Apply one drop of adhesive at the center of the bracket contact-surface on the windshield glass.
 - b. Apply an even coat of adhesive to the contact surface on the bracket.
 - c. Align the bracket with the marked position on the windshield glass.
 - d. Press and hold the bracket in place for at least one minute.

NOTE: Verify that the mirror support bracket is correctly aligned, because the adhesive will cure rapidly.

7. Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.
8. Allow the adhesive to cure for an additional 8-10 minutes before installing the mirror.

NOTE: Failure to calibrate the Smartbeam camera may diminish system performance and cause Diagnostic Trouble Codes (DTCs) to set.

9. If equipped, perform the Smartbeam System Calibration Procedure after installing the mirror, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/SMARTBEAM - STANDARD PROCEDURE).

SUN VISOR

REMOVAL

1. Remove the two screws that secure the sun visor to the roof panel and remove the sun visor from the headliner.
2. If equipped, disconnect the illuminated vanity mirror wire harness connector.

INSTALLATION

1. If equipped, connect the illuminated vanity mirror wire harness connector.
2. Position the sun visor on the headliner and install the two screws that secure the sun visor to the roof panel. Tighten the screws to 2.2 N·m (20 in. lbs.).

SUN VISOR SUPPORT

REMOVAL

1. Remove the screw that secures the sun visor support to the roof panel and remove the support from the headliner.

INSTALLATION

1. Position the sun visor support on the headliner and install the screw that secures the support to the roof panel. Tighten the screw to 2.2 N·m (20 in. lbs.).

LIFTGATE

TABLE OF CONTENTS

	page		page
GLASS		INSTALLATION	138
REMOVAL	130	LATCH-LIFTGATE GLASS

REMOVAL	135	INSTALLATION	142
INSTALLATION	136	SUPPORT-STRUT	
LATCH		REMOVAL	143
REMOVAL	137	INSTALLATION	143

GLASS

REMOVAL

1. Disconnect heated liftgate glass electrical connector (2).

81315f0b

2. Open the liftgate and support.
3. Disconnect liftgate hydraulic cylinders (3) at the lower ball studs.
4. Close liftgate, but not latch in the closed position.
5. Remove hinge covers (1) and remove hinge bolts (2).
6. Remove liftgate.

INSTALLATION

81315f0b

1. Position liftgate on vehicle.
2. Install hinge bolts. Center liftgate. Tighten hinge bolts to 7 N·m (60 in. lbs.).
3. Open and support liftgate.
4. Install support cylinders (3) (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/SUPPORT CYLINDER - INSTALLATION).
5. connect heated glass electrical connector (2).
6. Adjust liftgate as necessary (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/FLIP-UP GLASS - ADJUSTMENTS).

81315f07

ADJUSTMENTS

ADJUSTMENT

1. Verify that the liftgate is correctly centered in its opening.
2. Confirm the liftgate adjustment. Hold a straight edge flush against the glass as indicated, and record the gap/space between the straight edge and the liftgate outer vertical panel.

NOTE: The flush specification for the liftgate glass to the outer panel is 0mm - 2mm over flush.

3. If the liftgate needs to be adjusted, loosen the two hinge bolts and move the liftgate in small increments until desired measurement is achieved.
4. Tighten the liftgate hinge bolts 12 N-m (9 ft. lbs.).
5. Verify correct liftgate closing efforts and operation.

HANDLE

REMOVAL

1. Open the liftgate (4).
2. Disconnect and isolate the battery negative cable.
3. Remove the lower trim panel from the inside of the liftgate. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL/LOWER - REMOVAL).
4. Disconnect the electrical connector of the latch handle (2) on the inside of the liftgate.
5. Reach through the clearance hole in the inside of the liftgate panel on each side of the latch to access and remove the two nuts (1) that secure the handle to the liftgate.

6. Disconnect actuator rod (2) from latch handle.
7. Remove the latch handle from the outside of the liftgate.

INSTALLATION

1. Position the latch handle (2) onto the outside of the liftgate.
2. Working through the clearance hole in the inside of the liftgate panel, install and tighten the two nuts (1) that secure the handle to the liftgate. Tighten the screws to 9 N·m (7 ft. lbs.).

3. Connect actuator rod (2).
4. Connect the electrical connector of the latch handle on the inside of the liftgate.
5. Reinstall the lower trim panel onto the inside of the liftgate. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL/LOWER - INSTALLATION).
6. Reconnect the battery negative cable.
7. Close the liftgate.

HINGE

REMOVAL

1. Open and support the liftgate (2) with a suitable prop or block.
2. Remove the trim plate from the upper liftgate opening header (4). (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - REMOVAL).
3. Mark the hinge (1) liftgate half location on the liftgate inner panel to aid reinstallation.
4. Remove the two screws (2) that secure the hinge to the liftgate.

5. Mark the hinge body half location on the upper liftgate opening header to aid reinstallation.
6. Carefully pull the rear edge of the headliner downward from the header far enough to access and remove the two nuts (5) that secure the hinge studs to the underside of the header.
7. Remove the hinge from the vehicle.

INSTALLATION

1. Position the body half of the liftgate hinge (1) to the upper liftgate opening header (4) on the vehicle.
2. Carefully pull the rear edge of the headliner downward from the header far enough to install and tighten the two nuts (5) that secure the hinge studs to the underside of the header. Tighten the nuts to 28 N·m (21 ft. lbs.).

3. Position the liftgate (1) to the liftgate half of the hinge on the vehicle.
4. Install and tighten the two screws (2) that secure the hinge to the liftgate. Tighten the screws to 28 N·m (21 ft. lbs.).
5. Remove the support from the liftgate.
6. Adjust the liftgate hinge position as necessary to achieve proper spacing and operation.
7. Reinstall the trim plate onto the upper liftgate opening header (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - INSTALLATION).

LATCH

REMOVAL

1. Open the liftgate.
2. Disconnect and isolate the battery negative cable.
3. Remove the lower trim panel from the inside of the liftgate (1). (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - REMOVAL).
4. Disconnect the electrical connectors of the latch (2).

5. Remove the three screws (2) that secure the latch (1) to the liftgate.
6. Remove the liftgate latch (1) from the vehicle.

INSTALLATION

1. Position the latch (1) onto the inside of the liftgate.
2. Install and tighten the three bolts (2) that secure the latch (1) to the studs on the inside of the liftgate. Tighten the nuts to 12 N·m (9 ft. lbs.).

3. Connect electrical connectors (2) to the latch (1).
4. Reinstall the lower trim panel onto the inside of the liftgate. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - INSTALLATION).
5. Reconnect the battery negative cable.
6. Close the liftgate.

LATCH-LIFTGATE GLASS

REMOVAL

1. Open the liftgate.
2. Disconnect and isolate the battery negative cable.
3. Remove the lower trim panel from the inside of the liftgate (1). (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - REMOVAL).
4. Disconnect the electrical connectors (1) from the liftgate glass latch (3).
5. Remove the three nuts (2) that secure the latch (3) to the inside of the liftgate.
6. Remove the liftgate glass latch (3) from the vehicle.

INSTALLATION

1. Position the latch (3) into the inside of the liftgate.
2. Install and tighten the three bolts (2). Tighten the bolts to 12 N·m (9 ft. lbs.).
3. Connect electrical connectors (1) to the latch (3).
4. Install the trim panel onto the inside of the liftgate (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - INSTALLATION).
5. Reconnect the battery negative cable.
6. Close the liftgate.

PANEL-TRIM

REMOVAL

813156a

1. Disconnect and isolate the battery negative cable.
2. Remove the screws (1 and 4) from lower trim panel (2).
3. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the trim panel away from the inside of the liftgate to release the push-in plastic fasteners (3) that secure the panel (2) to the liftgate.
4. Disconnect and remove the lamp (2) from the lower liftgate trim panel.
5. Remove the liftgate lower trim panel (2) from the vehicle.

814aba40

INSTALLATION

1. Check to be certain that the push-in plastic fasteners (3) are properly installed and in good condition on the inside of the trim panel (2).
2. Install the lamp into the liftgate trim panel and connect electrical connector.

3. Using hand pressure, press firmly and evenly on the trim panel (2) over each of the push-in plastic fastener (3) locations until the fasteners are fully engaged in the holes on the inside of the liftgate.
4. Install and tighten the screws (1 and 4) that secure the trim panel (2) to the inside of the liftgate. Tighten the screws to 3 N·m (27 in. lbs.).
5. Reconnect the battery negative cable.

STRIKER-LATCH

REMOVAL

1. Open the liftgate.
2. Remove the scuff plate trim panel from the inside of the liftgate opening lower panel.
3. Mark the latch striker (1) location on the inside of the liftgate opening lower panel to aid reinstallation.
4. Remove the two screws (2) that secure the latch striker to the inside of the liftgate opening lower panel.
5. Remove the latch striker from the vehicle.

INSTALLATION

1. Position the liftgate latch striker (1) to the inside of the liftgate opening lower panel.
2. Install and tighten the two screws (2) that secure the latch striker to the liftgate opening lower panel. Tighten the screws to 28 N·m (21 ft. lbs.).
3. Adjust the latch striker position as necessary to achieve proper liftgate latch operation.
4. Reinstall the scuff plate trim panel to the liftgate opening lower panel.
5. Close the liftgate.

SUPPORT-STRUT

REMOVAL

1. Open and support the liftgate with a suitable prop or block.

WARNING: To avoid personal injury or death, during service lift the ball socket end retaining clip only far enough to release the socket from the ball stud. Excessive prying or removal of the clip may result in improper clip spring tension. Improper clip tension may result in the support cylinder separating from the ball stud causing sudden, unexpected loss of deck lid support.

2. Insert a small flat-bladed tool into the notch on the outer face of one ball socket end (1) of the support cylinder (1) and carefully pry the retaining clip (2) outward while pulling the ball socket away from the ball stud on the liftgate or the liftgate opening trough.

INSTALLATION

1. Position the ball socket (2) on the rod end of the support cylinder (1) to the ball stud on the liftgate.
2. Using hand pressure, press the ball socket onto the ball stud until the retainer clip snaps into place.
3. Inspect to be certain that the retaining clip on each of the support cylinder ball socket ends is fully seated.
4. Remove the service prop or block and close the liftgate.

PAINT CODE

DESCRIPTION

Exterior vehicle body color(s) are identified on the Vehicle Certification Label (Refer to VEHICLE DATA/VEHICLE INFORMATION/VEHICLE CERTIFICATION LABEL - DESCRIPTION) or the Body Code Plate (Refer to VEHICLE DATA/VEHICLE INFORMATION/BODY CODE PLATE - DESCRIPTION).

The first digit of the paint code listed on the vehicle indicates the sequence of application, i.e.: P = primary coat, Q = secondary coat. The color names provided in the Paint and Trim Code Description chart are the same color names used on most repair product containers (Refer to 23 - BODY/PAINT - SPECIFICATIONS).

BASECOAT/CLEARCOAT FINISH

DESCRIPTION

The original equipment paint finish is a multi step process that involves cleaning, applying electro de-position (E-coat), anti-chip primer, basecoat, and clearcoat steps.

CAUTION: Do not use abrasive chemicals, abrasive compounds or harsh alkaline based cleaning solvents on the painted surfaces of a vehicle. Failure to follow this caution can result in damage to vehicle finish.

On most vehicles a two-part paint application (basecoat/clearcoat) is used. Color paint that is applied to primer is called basecoat. A clear coat paint is then applied to protect the basecoat from ultraviolet light and to provide a durable high-gloss finish.

PAINT TOUCH-UP

DESCRIPTION

If the painted metal surface of a vehicle becomes scratched or chipped, it should be touched-up as soon as possible to avoid corrosion.

WARNING: Use an OSHA approved respirator and safety glasses when spraying paint or solvents in a confined area. Failure to follow this warning may result in possible personal injury or death.

When repairing painted metal surfaces, for best results, use MOPAR® Scratch Filler/Primer, Touch-Up Paints and Clear Top Coat (Refer to VEHICLE DATA/VEHICLE INFORMATION/BODY CODE PLATE - DESCRIPTION) for Body Code Plate information.

STANDARD PROCEDURE

PAINT TOUCH-UP

1. Scrape any loose paint and corrosion from inside the scratch or chip.

WARNING: Avoid prolonged skin contact with petroleum or alcohol-based cleaning solvents. Failure to follow this warning can result in possible personal injury or death.

2. Clean affected area with MOPAR® Tar/Road Oil Remover or equivalent, and allow to dry.
3. Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good surface finish. The applicator brush should be wet enough to puddle-fill the scratch or chip without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.
4. Cover the filler/primer with color touch-up paint. Do not overlap touch-up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch-up paint to dry hard.
5. On vehicles without clearcoat, the touch-up color can be lightly finesse sanded (1500 grit) and polished with rubbing compound.

6. On vehicles with clearcoat, apply clear top coat to touch-up paint with the same technique as described in Step 4. Allow clear top coat to dry hard. If desired, the clearcoat can be lightly finesse sanded (1500 grit) and polished with rubbing compound.

FINESSE SANDING/BUFFING & POLISHING

DESCRIPTION

CAUTION: Do not remove more than 0.5 mils of clearcoat finish when sanding, hand buffing or polishing. Basecoat paint must retain clearcoat for durability.

CAUTION: If the finish has been finesse sanded in the past, it cannot be repeated. Failure to follow this caution can result in damage to vehicle finish.

NOTE: Finesse sanding should only be performed by a trained automotive paint technician.

Minor acid etching, orange peel, or smudging in a clearcoat or single-stage finish can be reduced with light finesse sanding, hand buffing and polishing. Use a Paint Thickness Gauge #PR-ETG-2X or equivalent to determine clearcoat or single-stage paint thickness before and after the repair.

SEATS

WARNING

RESTRAINT SYSTEM

During and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar parts catalog. Failure to follow these instructions may result in personal injury or death.

On vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment. Failure to follow these instructions may result in personal injury or death.

On vehicles equipped with airbags, before performing any welding operations disconnect and isolate the battery negative (ground) cable and disconnect all wire harness connectors from the Airbag Control Module (ACM). Failure to take the proper precautions could result in accidental airbag deployment and other possible damage to the supplemental restraint system circuits and components. Failure to follow these instructions may result in personal injury or death.

Replace all restraint system components only with parts specified in the DaimlerChrysler Mopar parts catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection. Failure to follow these instructions may result in personal injury or death.

The fasteners, screws, and bolts originally used for the restraint system components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the restraint system. Any time a new fastener is needed, replace it with the correct fasteners provided in the

service package or specified in the DaimlerChrysler Mopar parts catalog. Failure to follow these instructions may result in personal injury or death.

On vehicles equipped with the Occupant Classification System (OCS), do not hang any after market devices from the front passengers seat back. Do not install a front drivers seat back cover with map pocket onto the passenger seat. Failure to follow these instructions may result in personal injury or death.

The Seat Weight Sensor is a sensitive, calibrated unit and must be handled carefully. Do not drop or handle roughly. If dropped or damaged, replace with another sensor. Failure to follow these instructions may result in personal injury or death.

The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

ADJUSTERS-FRONT

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/ SEATS - WARNING)
2. Remove the seat cushion as necessary. (Refer to 23 - BODY/SEATS/SEAT CUSHION / COVER - FRONT - REMOVAL)

Power

1. Remove the seat risers. (Refer to 23 - BODY/ SEATS/SEAT RISER - FRONT - REMOVAL)
2. Remove the bolts and nuts (2 & 4) and separate the height adjuster assembly from the length adjuster assembly (3).

NOTE: Bolt (4) is a different size from the other three bolts (2). Note the location for proper installation.

81269016

WARNING: A SEAT STRUCTURE THAT HAS SEEN SIGNIFICANT LOAD MAY HAVE THE LOCKING MECHANISM ACTIVATED AND MAY EXHIBIT THE FOLLOWING SYMPTOMS:

- LOCKING PAWL (2) LOOSE
- LOCKING PAWL (2) ENGAGED INTO THE SEAT FRAME SIDEMEMBER (1)
- HEIGHT ADJUSTER ONLY WORKS ON OUT-BOARD SIDE
- BROKEN OR MISSING SHEAR PIN (3)

IF ANY ONE OR MORE OF THESE SYMPTOMS EXIST REPLACE THE HEIGHT ADJUSTER ASSEMBLY. DO NOT ATTEMPT ANY REPAIRS. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY OR DEATH.

Manual

1. Remove the spring clip.

2. Squeeze the towel bar together and pull the towel bar out of the left and right seat tracks.

3. Remove the bolts (1 & 4), nuts (6) and spacers (2) and separate the side member assembly (3) from the length adjuster assembly (5).

INSTALLATION

Power

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)

WARNING: A SEAT STRUCTURE THAT HAS SEEN SIGNIFICANT LOAD MAY HAVE THE LOCKING MECHANISM ACTIVATED AND MAY EXHIBIT THE FOLLOWING SYMPTOMS:

- LOCKING PAWL (2) LOOSE
- LOCKING PAWL (2) ENGAGED INTO THE SEAT FRAME SIDEMEMBER (1)
- HEIGHT ADJUSTER ONLY WORKS ON OUT-BOARD SIDE
- BROKEN OR MISSING SHEAR PIN (3)

IF ANY ONE OR MORE OF THESE SYMPTOMS EXIST REPLACE THE HEIGHT ADJUSTER ASSEMBLY. DO NOT ATTEMPT ANY REPAIRS. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY OR DEATH.

2. Install the seat risers. (Refer to 23 - BODY/SEATS/ SEAT RISER - INSTALLATION)
3. Position the height adjuster assembly (1) onto the length adjuster assembly (3) and install the nuts, bolts and spacers on the inboard side.

NOTE: Bolts (2) and (4) are different and need to be installed into the correct positions.

4. Tighten the bolts to 21 N·m (15 ft. lbs.).
5. Install the seat cushion and install the seat. (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - INSTALLATION)

Manual

1. Install the seat risers. (Refer to 23 - BODY/SEATS/ SEAT RISER - INSTALLATION)
2. Position the side member assembly (3) onto the length adjuster assembly (5) and install the nuts (6), bolts (1 & 4) and spacers (2) on the inboard side.
3. Tighten the bolts to 42 N·m (31 ft. lbs.).

4. Squeeze the towel bar together and insert the ends into the bushings on both tracks.

5. Install the spring clip.
6. Install the seat cushion and install the seat. (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - INSTALLATION)

CUSHION/COVER-SEAT BACK - FRONT

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Remove the front seat. (Refer to 23 - BODY/SEATS/SEAT - FRONT - REMOVAL)
3. Remove the lumbar and recliner handles (1).
4. Remove the screws and remove the side shields (2).

5. Remove the belt buckle.

6. Remove the seat back bolts from both sides.

7. Remove the headrest.
8. Separate the j-straps (1 & 2) and pull cover up over frame and remove cushion.
9. Remove the headrest sleeves and remove the cover.

INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Position the seat back cover over the seat back frame and install the headrest sleeves.
3. Position the seat back cushion on the frame and position the cover over the cushion.
4. Connect the j-straps (1 & 2).

5. Install the seat back bolts and tighten to 40 N-m (30 ft. lbs.).

6. Position the front seat belt buckle lower anchor onto the stud near the rear of the inboard seat cushion frame. Be certain the anti-rotation tab on the anchor is engaged in the clearance hole of the frame.
7. Tighten the nut to 43 N-m (32 ft. lbs.)

8. Install the side shields (2) and install the screws.
9. Install the lumbar and recliner handles (1 & 4).

CUSHION/COVER-CUSHION - FRONT

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Move the seat to the forward position and disconnect and isolate the batter negative cable.
3. Remove the bolts (2) and the clamps (1) and remove the seat cushion.
4. Disconnect the electrical connector, if equipped.

5. Separate the j-straps (1 & 2) and seat cushion cover and foam.

INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Position the cushion cover and foam over the seat pan and connect the j-straps (1 & 2).

3. Position the seat cushion assembly onto the seat frame and install the clamps (1).
4. Connect the wire harness to the seat cushion pan, if equipped.
5. Install the bolts (2) and tighten to 10 N-m (90 in. lbs.).
6. Connect battery negative cable.

CUSHION-REAR SEAT

REMOVAL

1. Remove the two mounting bolts (1), one from each side of the vehicle.
2. Slide the rear seat cushion forward to release the hooks (2) from the body pan.

INSTALLATION

1. Tuck the rear of the seat cushion underneath the seat back and as you are doing so, make sure the hooks are sliding into the slots in the body (2).
2. Install the two bolts to the rear seat cushion. Tighten to 50 N-m (37 ft. lbs.).

RISER-FRONT

REMOVAL

Manual Length Adjuster

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Remove the seat. (Refer to 23 - BODY/SEATS/SEAT - REMOVAL)
3. Move the seat to the forward position on the tracks and remove the seat adjuster bolts/nuts (3).
4. Move the seat to the reward position on the tracks and remove the front seat adjuster bolts/nuts (3).

NOTE: Passenger seat with strain gauges shown, drivers side seat similar.

5. Disconnect strain gauge electrical connectors (1), if equipped.
6. If equipped, remove the strain gauge bolts (2) and remove the strain gauges as necessary.

Power Length Adjuster

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Unbolt the seat from the floor as necessary to gain access to the riser bolts. (Refer to 23 - BODY/SEATS/SEAT - REMOVAL)
3. Move the seat to the forward position on the tracks, tip the seat backwards in vehicle and remove the seat adjuster bolts/nuts (3).
4. Move the seat to the reward position on the tracks and remove the front seat adjuster bolts/nuts (3).

NOTE: Manual seat length adjuster shown, power similar.

5. If the seat cannot be moved forward or backward, remove the seat cushion. (Refer to 23 - BODY/ SEATS/SEAT CUSHION COVER - REMOVAL)
6. Remove the four bolts (1) and remove the motor and cable assembly (2) from the length adjuster assembly.

CAUTION: When the motor and cable assembly are removed from the tracks discard the length adjuster assembly and replace with a new one.

7. Disconnect and isolate battery negative cable.
8. Remove the seat off of the risers and disconnect the electrical connectors.
9. Disconnect strain gauge electrical connectors (1), if equipped.
10. If equipped, remove the strain gauge bolts (2) and remove the strain gauges as necessary.

INSTALLATION

Manual Length Adjuster

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)

NOTE: Passenger seat with strain gauges shown, drivers side seat similar.

2. If equipped, install the strain gauges and install the bolts (2).
3. Tighten the bolts to 40 N·m (30 ft. lbs.).
4. If necessary, connect the electrical connections (1).
5. Move the seat to the forward position on the tracks and install the rear seat adjuster bolts/nuts (3).
6. Tighten the bolts to 45 N·m (33 ft. lbs.).
7. Move the seat to the reward position on the tracks and install the front seat adjuster bolts/nuts (3).
8. Tighten the bolts to 45 N·m (33 ft. lbs.).
9. Install the seat. (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION)

Power Length Adjuster

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. If equipped, install the strain gauges and install the bolts (2).
3. Tighten the bolts to 40 N·m (30 ft. lbs.).
4. Position the seat into the vehicle onto the risers and connect the electrical connectors.
5. Move the seat to the forward position on the tracks and install the seat adjuster bolts/nuts (3).
6. Tighten the bolts attaching the adjuster to the risers/strain gauges to 45 N·m (33 ft. lbs.).
7. Move the seat to the reward position on the tracks and install the front seat adjuster bolts/nuts (3).
8. Tighten the bolts attaching the adjuster to the risers/strain gauges to 45 N·m (33 ft. lbs.).
9. If necessary, connect the strain gauge electrical connections (1).

CAUTION: When the motor and cable assembly are removed from the tracks discard the length adjuster assembly and replace with a new one.

10. Bolt the seat to the floor. (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION)

RISER-REAR

REMOVAL

1. Remove rear seat cushion (Refer to 23 - BODY/ SEATS/SEAT CUSHION - REMOVAL).
2. Remove the two bolt (2) holding the riser (1) to the seat cushion (3).

INSTALLATION

1. Align the riser (1) onto the seat cushion (3) and install the two mounting bolts (2). Tighten bolts to 45 N·m (33 ft. lbs.).
2. Install the seat cushion (Refer to 23 - BODY/ SEATS/SEAT CUSHION - INSTALLATION).

SEAT BACK-REAR

REMOVAL

1. Remove the rear seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL).
2. Loosen outboard lower anchor bolts (1) and slide the rear seat belt anchor (2) off the bolt.

3. Remove the four rear seat back mounting bolts (1) and remove seat back from vehicle.

INSTALLATION

1. Place the rear seat back into position by slipping the hinge bracket onto the two outboard lower bolts.
2. Install the other four mounting bolts (1). Remember to install the three inner seat belt buckles. Torque the bolts to 50 N·m (37 ft. lbs.).

3. Slide the two outboard seat belt anchors (2) onto the outboard lower bolts (1). Tighten bolts to 50 N·m (37 ft. lbs.).
4. Install the rear seat cushion (Refer to 23 - BODY/ SEATS/SEAT CUSHION - INSTALLATION).

SEAT-FRONT

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)

WARNING: The Seat Weight Sensor is a sensitive, calibrated unit and must be handled carefully. Do not drop or handle roughly. If dropped or damaged, replace with another sensor. Failure to follow these instructions may result in personal injury or death.

WARNING: The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

WARNING: When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

2. Move the seat forward to gain access to the rear bolts.
3. Disconnect and isolate battery negative cable.
4. Remove the cover and lower seat belt anchor (1).
5. Remove the two front (4) and three rear (2) bolts.
6. Disconnect the electrical connectors (3), if equipped, and remove the seat from the vehicle.

INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)

WARNING: The Seat Weight Sensor is a sensitive, calibrated unit and must be handled carefully. Do not drop or handle roughly. If dropped or damaged, replace with another sensor. Failure to follow these instructions may result in personal injury or death.

WARNING: The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

WARNING: When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

2. Position the seat into the vehicle and connect the electrical connectors (3), if equipped.
3. Install the two front bolts (4) and three rear bolts (2).
4. Tighten the front inner bolt to 27 N·m (20 ft. lbs.) then tighten the front outer bolt to 27 N·m (20 ft. lbs.).
5. Tighten the rear bolts to 47 N·m (35 ft. lbs.).
6. Install the lower seat belt anchor (1) and install the bolt.
7. Tighten the bolt to 39 N·m (29 ft. lbs.) and install the trim cover (1).
8. Do not reconnect the battery negative cable at this time. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).
9. Following successful completion of the supplemental restraint system verification test procedure, perform the Occupant Classification System Verification Test using a scan tool. (Refer to 8 - ELECTRICAL/RESTRAINTS - *OCS VERIFICATION TEST - VER 1)

SUPPORT-LUMBAR

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Remove the seat back cushion/cover. (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION / COVER - FRONT - REMOVAL)
3. Release the lumbar mat side wires (1) by pulling out on the wire supports and then pulling them in.

4. Squeeze the lower support wires (1) in and release the lower wires.

5. Pull the upper support wires (1) down and release the lumbar mat from the seat back frame.

6. Remove the rivet (1) and remove the lumbar mechanism (2).

INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Install the lumbar mechanism (2) and install a new rivet (1).

3. Place lumbar mat onto seat back frame and insert the upper support wires (1) into the frame.

4. Squeeze the lower support wires (1) together and insert into the lower frame.

5. Squeeze the side support wires together and insert them into the sides of the seat back frame.
6. Install the seat back cushion/cover. (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION / COVER - FRONT - INSTALLATION)

STATIONARY GLASS

STATIONARY GLASS		INSTALLATION	170
WARNING		WINDSHIELD	
WINDSHIELD SAFETY PRECAUTIONS	169	DESCRIPTION	171
QUARTER GLASS		REMOVAL	171
REMOVAL	170	INSTALLATION	171

STATIONARY GLASS

WARNING

WINDSHIELD SAFETY PRECAUTIONS

WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly in an accident.

- Urethane adhesives are applied as a system. Use glass cleaner, glass prep solvent, glass primer, pvc (vinyl) primer and pinch weld (fence) primer provided by the adhesive manufacturer. If not, structural integrity could be compromised.
- Daimlerchrysler does not recommend glass adhesive by brand. Technicians should review product labels and technical data sheets, and use only adhesives that their manufactures warrant will restore a vehicle to the requirements of fmvss 212. Technicians should also insure that primers and cleaners are compatible with the particular adhesive used.
- Be sure to refer to the urethane manufacturer’s directions for curing time specifications, and do not use adhesive after its expiration date.
- Vapors that are emitted from the urethane adhesive or primer could cause personal injury. Use them in a well-ventilated area.
- Skin contact with urethane adhesive should be avoided. Personal injury may result.
- Always wear eye and hand protection when working with glass.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers. Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

QUARTER GLASS

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions (Refer to 23 - BODY/STATIONARY GLASS - WARNING).
2. Remove the quarter panel trim from the side of the vehicle being serviced (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL).
3. Carefully pull down the headliner to access the upper mounting studs that secure the quarter glass (1) to the window fence (2) and, remove the nuts from the studs.
4. Remove the nuts that secure the lower mounting studs to the window fence and, remove the nuts from the studs.
5. Using razor knife, cut butyl sealer between the mounting studs that secure the quarter glass to window fence.
6. Carefully push the quarter window glass from the opening.

INSTALLATION

CAUTION: Roll down the left and right front door glass and open the liftgate glass before installing quarter glass to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.

NOTE: The quarter glass fence should be cleaned of all old butyl sealer. Do not grind sealer off the fence, the paint finish will be adversely affected.

1. Apply 6 mm (0.25 in.) wide butyl tape around perimeter of the quarter glass (1) approximately 5 mm (0.2 in.) from the edge of the glass. Ensure the butyl tape is wrapped around the mounting studs.
2. Place the quarter glass into the window opening (2) and insert mounting studs through the holes in the window fence.
3. Install the nuts that secure the quarter glass to the window fence. Tighten the nuts to 4.5 N·m (40 in. lbs.).
4. Install the headliner.
5. Install the quarter panel trim (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION).

WINDSHIELD

DESCRIPTION

The windshield is attached to the window frame (fence) with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the urethane adhesive to the windshield.

It is difficult to salvage a windshield during the removal operation. The windshield is part of the structural support for the roof. The urethane bonding used to secure the windshield to the fence is difficult to cut or clean from any surface. If the rubber seals are set in urethane, it would also be unlikely they could be salvaged. Before removing the windshield, check the availability of the windshield and seals from the parts supplier.

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions (Refer to 23 - BODY/STATIONARY GLASS - WARNING).
2. Remove the rear view mirror (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - REMOVAL).
3. Remove the rain sensor module from the windshield (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/RAIN SENSOR MODULE - REMOVAL).
4. Remove the cowl grille (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL.)

CAUTION: Be careful not to damage painted surfaces when removing moldings or cutting urethane around the windshield.

5. Remove molding from the top of the windshield.
6. Using an assistant and a wire-type windshield cut-out tool (1, 3 and 4), cut and separate the urethane adhesive (2) securing the windshield to the windshield fence.
7. Carefully remove the windshield from the vehicle.

INSTALLATION

WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly if the vehicle is in an accident.

CAUTION: To help prevent water leaks, partially roll down the left and right door glass before installing the windshield. This avoids pressurizing the passenger compartment if a door is slammed before the urethane is cured.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

1. If the windshield (1) is being reused, remove the as much original urethane (3) as possible from the glass surface using a razor knife (2).

NOTE: To prevent corrosion, do not damage paint on windshield fence when removing original urethane.

NOTE: The windshield fence should be cleaned of most of its old urethane adhesive. A small amount of old urethane, approximately 1 mm in height should remain on the fence. Do not completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected. Support spacers located near the cowl at the bottom of the windshield fence should be replaced with new spacers. Replace any missing or damaged spacers around the perimeter of the windshield fence.

2. Using a razor knife (2), level the original bead of urethane (1) on the windshield fence (3) to a thickness of approximately 1 mm (0.04 in.) and remove any damaged adhesive backed spacers.
3. Install new adhesive backed spacers (4) along the windshield fence as required.
4. Install a new rubber seal (2) along the top of the windshield (1).
5. Using an assistant, position the windshield into the windshield opening and against the windshield fence (3) and spacers.
6. Verify the windshield lays evenly against the fence at the top, bottom and sides of the opening. If not, the fence must be formed to the shape of the windshield.
7. Mark the windshield and the windshield fence with a grease pencil or pieces of masking tape to use as a reference for installation.
8. Using an assistant, remove the windshield from the windshield opening and place it on a suitable padded work surface.

WARNING: Do not use solvent based glass cleaners to clean the windshield before applying glass prep and primer or poor glass adhesion may result.

9. Clean the inside of the windshield with an ammonia based glass cleaner and a lint-free cloth.
10. Apply glass prep adhesion promoter 25 mm (1 in.) wide (1) around the perimeter of the windshield (2) and 5 mm (0.2 in.) from the edge of the glass and wipe dry with a clean lint-free cloth until no streaks are visible.
11. Apply glass primer 25 mm (1 in.) wide (1) around the perimeter of the windshield (2) and 5 mm (0.2 in.) from the edge of the glass. Allow at least three minutes drying time.
12. Using a flashlight, verify that the primer is completely and evenly installed along the perimeter of the windshield.
13. Re-prime any area that is not fully and evenly primed.
14. Clean the windshield fence with an ammonia based glass cleaner and a lint-free cloth.
15. Apply pinch weld primer 15 mm (0.75 in.) wide (1) around the windshield fence (2). Allow at least three minutes drying time.
16. Using a flashlight, verify that the primer is completely and evenly installed along the windshield fence.
17. Re-prime any area that is not fully and evenly primed.

CAUTION: Always apply the bead of adhesive to the windshield. Always install the windshield within 5 minutes after applying the adhesive.

NOTE: If the original urethane adhesive has been exposed for more than 12 hours, the entire adhesive area will need to be re-primed prior to installing new adhesive.

18. Apply approximately a 10 mm (0.4 in.) wide bead of adhesive (1) with a triangular nozzle approximately 6 mm (0.230 in.) from the edge of the glass (2) starting at the bottom center of the windshield.

19. Run the end of the adhesive bead (1) on the windshield (2) parallel to the start of the bead and smooth the ends flush.

20. Using an assistant, position the windshield (1) over the windshield opening.
21. Using the grease pencil marks or tape as reference points, align the windshield to the windshield opening.
22. Carefully lower the windshield into the windshield opening. Guide the windshield and the rubber seal (2) at the top the windshield into its proper location.

CAUTION: It is not possible to move the windshield after installation. The windshield should never be pressed into place by more than one person, because the windshield can break if pressed simultaneously on both sides.

23. Push the windshield inward until the windshield comes into contact with the spacers (4) located on each side and the bottom of the windshield fence (3).
24. Install the cowl grill (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL).
25. Install the rear view mirror onto the windshield (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - INSTALLATION).
26. Install the rain sensor module onto the windshield (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/RAIN SENSOR MODULE - INSTALLATION).

Parts List

1 - MECHANISM COVERS (2)	10 - MOTOR FASTENERS (3)
2 - RIGHT HAND GLASS GUIDE	11 - SUNROOF MOTOR/MODULE ASSEMBLY
3 - GLASS FASTENERS (4)	12 - ALIGNMENT HOLE
4 - GLASS ASSEMBLY	13 - TRIM LACE
5 - DRAIN CHANNEL	14 - ASSEMBLY FASTENERS (10)
6 - SUNSHADE	15 - ALIGNMENT HOLE
7 - LEFT SUNROOF GLASS GUIDE	16 - WIND DEFLECTOR STRAP SCREWS (2)
8 - WIRE HARNESS	17 - GLASS GUIDE FOOT
9 - SUNROOF ASSEMBLY	18 - WIND DEFLECTOR

The power sunroof system allows the sunroof to be opened, closed or placed in the vent position electrically by actuating a switch in the overhead console. The sunroof system receives battery feed through a fuse in the Power Distribution Center (PDC). The sunroof will operate normally with the key in any position while the Accessory Delay system is active.

The sunroof glass panel tilts upward at the rear for ventilation and slides rearward under the roof when open. The panel seals flush with the roof in the closed position to eliminate wind noise. The sunroof includes a manual-sliding sunshade to cover the deep-tinted glass panel.

In addition to the standard power sunroof operation, this vehicle offers several additional features. There is an express (one-touch) opening and closing feature as well as Excessive Force Limitation (EFL). The EFL function detects obstacles trapped between the glass and the vehicle roof during a closing motion. Upon sensing an obstacle the EFL function will reverse direction of the glass to allow removal of the obstacle.

The main components of the power sunroof system are:

- The motor/module assembly
- The power sunroof glass and frame assembly
- The power sunroof switch
- The manual-sliding sunshade

OPERATION

This vehicle has a vent, tilt and slide power sunroof system with express (one-touch) open and closing feature. The sunroof system receives constant battery feed through a fuse in the Power Distribution Center (PDC). The sunroof will operate normally with the key in any position while the Accessory Delay system is active. If the sunroof is moving when the key is turned to the START position (crank engine), all motions stop until the key is released, then the previously requested sunroof motion will resume. The sunroof will also complete a requested motion if the Accessory Delay system goes inactive while the motion is in progress.

A combination push-button and rocker switch module mounted in the overhead console controls sunroof operation. The sunroof switch is a rocker design with a push button in the center of the two halves of the rocker. Pressing the rocker towards the front of the car commands the sunroof closed. Pressing the rocker towards the rear of the car commands the sunroof open. Pressing the center push button commands the sunroof up into the vent position (Rear of sunroof glass raises above the vehicle roof with glass still covering the sunroof opening). All switch commands operate with the glass starting in any position. (Refer to 8 - ELECTRICAL/POWER TOP/SWITCH - OPERATION) for additional information.

An electronic control system, integral to the motor/module assembly, provides the express open and close functions. Pressing the "open" or "close" end of the rocker switch moves the sunroof glass panel to the full open or full closed position, respectively. During express closing, anytime an obstacle is detected in the way of the glass, the motor will stop and reverse travel to avoid pinching an occupant's finger, ice in the track, etc. This function is called Excessive Force Limitation (EFL). There are two methods of overriding the EFL function.

1. When three EFL events occur without the glass being allowed to fully close, the next close attempt will only move while the close switch is continuously actuated. This allows the sunroof to be forced closed if multiple close attempts fail.

2. If the sunroof close switch is continuously actuated during an EFL event, through the reversal, and during a two second wait time, then continuing to hold the close switch will cause the roof to move towards close with the EFL protection disabled. This allows the sunroof to be forced closed if it is known that a reversal will occur.

While in EFL override, the closing motion will cease if the sunroof switch is released at any time.

The motor/module is programmed to learn the speed required to drive the panel based on position and recalibrates itself as needed. If the sunroof becomes uncalibrated, it will only respond to the vent switch. If the vent switch is pressed, the glass will move toward vent; if the switch is released, all motion stops. In the event that the sunroof system becomes uncalibrated perform the sunroof position calibration procedure, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE -SUNROOF POSITION CALIBRATION).

DIAGNOSIS AND TESTING

POWER TOP - SUNROOF

Any diagnosis of the power sunroof system should begin with the use of a scan tool and the proper Diagnostic Procedures Information. The scan tool can provide confirmation that the Controller Area Network (CAN) Data Bus is functional, that all of the electronic modules are sending and receiving the proper messages on the CAN Data Bus, and that the power sunroof motor is being sent the proper hard wired output by the sunroof switch.

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

Refer to the appropriate diagnostic information.

SUNROOF

Refer to SUNROOF DIAGNOSIS CHART for possible causes. Before beginning sunroof diagnostics verify that all other power accessories are in proper operating condition. If not, a common electrical problem may exist. Refer to Wiring Diagrams, in this publication for circuit, splice and component descriptions. Check the condition of the circuit protection (20 amp circuit breaker in the Junction Block). Inspect all wiring connector pins for proper engagement and continuity. Check for battery voltage at the power sunroof controller, refer to Wiring Diagrams, for circuit information. If battery voltage of more than 10 volts is detected at the controller, proceed with the following tests (the controller will not operate at less than 10 volts).

Before beginning diagnosis for wind noise or water leaks, verify that the problem was not caused by releasing the control switch before the sunroof was fully closed. The sunroof module has a water-management system. If however, the sunroof glass is in a partial closed position, high pressure water may be forced beyond the water management system boundaries and onto the headlining.

Every time the sunroof module loses power it must be initialized. This is done by connecting power to the sunroof and moving the sunroof toward the closed position. When initialization occurs a slight "kick" in the sunroof module will be seen and heard. This is the indication that the sunroof module is initialized

SUNROOF DIAGNOSIS CHART

SYMPTOM	POSSIBLE CAUSE
Sunroof motor inoperative.	Faulty control switch. Faulty circuit ground between sunroof module, control switch, and body harness. Faulty power circuit between sunroof module, control switch, and body harness. Faulty sunroof drive motor. Faulty sunroof module.
Audible whine when switch is depressed, sunroof does not operate.	Faulty sunroof drive motor. Binding cable.
Audible clicking or ratcheting when switch is pressed, sunroof does not operate.	Broken or worn drive cable. Worn drive motor gear. Mechanisms not synchronized.
Sunroof vents and opens, but does not close.	Broken or disengaged trough guide Binding cable. Faulty circuit. Faulty control switch. Faulty sunroof module. Faulty drive motor.
Sunroof vents, but does not open.	Binding cable or mechanism. Faulty circuit. Faulty switch. Faulty sunroof module.
Sunroof does not vent	Binding cable or mechanism. Faulty circuit. Faulty control switch. Faulty sunroof module.
Sunroof water leak.	Drain tubes clogged or kinked or disconnected from the sunroof. Glass panel improperly adjusted. Faulty glass panel seal.
Gurgling sound from sunroof	Low spot in drain hose routing, allowing water to stand.
Wind noise from sunroof.	Glass panel compression to the roof opening not consistent. Wind deflector not deploying properly. Glass not installed or adjusted properly. Faulty glass panel seal.

SYMPTOM	POSSIBLE CAUSE
Buzz, Squeak, Rattles from sunroof	Loose or broken attaching hardware. No lubrication in track. Worn or broken mechanism. Cables bunched or kinked.
Sunshade will not function or does not operate smoothly	Sunshade feet are broken. Sunshade feet are in the wrong track. Track obstructions or interference. Trim lace incorrectly installed in track.
Glass movement not consistent or glass does not operate smoothly	Glass and Track timing. Glass and Track alignment. Cables and Guide alignment.
Broken or jammed guide mechanism	Mechanism cover was not installed correctly.

WATER DRAINAGE AND WIND NOISE DIAGNOSIS

The sliding glass panel is designed to seal water entry with a snug fit between the roof and the seal. The fit can be checked by inserting a business card or equivalent, between the roof and the seal. The piece of paper should have some resistance when pulled out when the glass panel is in the closed position. The sunroof housing will drain off a minimum amount of water. Excessive wind noise could result if the gap clearances are exceeded. The sunroof glass panel may need to be adjusted. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS)

Adequate drainage is provided by a drain trough in the sunroof housing which encircles the sliding glass panel and leads to drain hoses. If a wet headliner or other water leak complaints are encountered, before performing any adjustments, first ensure that the drainage system is not plugged or disconnected. Use a pint container to pour water into the sunroof housing drain trough. If water flow is restricted, use compressed air to blow out any material plugging the drain system. Retest system again.

To further check for a disconnected drain hose:

NOTE: Care must be taken not to fold or kink the headliner upon removal.

1. Lower headliner as necessary to gain access to sunroof housing drain tubes. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL)
2. Repair as necessary.

ASSEMBLY-MODULE

REMOVAL

WARNING: The Excessive Force Limitation (EFL) feature must be calibrated any time a sunroof motor/module is replaced with a new component. Failure to perform this procedure could result in vehicle damage and/or personal injury. (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - EXCESSIVE FORCE LIMITATION (EFL) CALIBRATION) for the appropriate procedure.

1. Move glass panel to the fully closed position.
2. Disconnect and isolate the battery negative cable.

3. Remove headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
4. Disconnect the sunroof wire harness electrical connector (2) and separate the harness support clips (1) from the body.
5. Disconnect the front (1) and rear (2) drain tubes from sunroof housing.

6. Remove the fasteners (1) and (2) and remove the DVD support bracket, if equipped.

7. Remove the front (2) and rear (4) fasteners.
8. With the aid of a helper, support the sunroof and remove the fasteners (3) attaching sunroof assembly to roof panel.
9. Remove the sunroof from vehicle.

INSTALLATION

WARNING: The Excessive Force Limitation (EFL) feature must be calibrated any time a sunroof motor/module is replaced with a new component. Failure to perform this procedure could result in vehicle damage and/or personal injury. (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - EXCESSIVE FORCE LIMITATION (EFL) CALIBRATION) for the appropriate procedure.

1. Verify that glass panel is loose and slightly retracted.
2. Raise sunroof module assembly and guide it carefully into position.
3. Hand start the eight screws (2), (3) and (4).
4. Position special tool # 9582 pins through the locating holes and confirm the module assembly is properly aligned.
5. Tighten the eight attaching screws to 9 N·m (80 in. lbs.) and remove the special tool.

6. Install the DVD support bracket (3), if equipped.
7. Install the bolts (2) and tighten to 9 N·m (80 in. lbs.).
8. Install the bolts (1) and tighten to 10 N·m (85 in. lbs.).

9. Connect the electrical connector (2) and seat the three support clips (1) fully.

10. Connect the front (1) and rear (2) drain tubes to the sunroof.
11. Adjust the sunroof glass. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS)
12. Connect battery negative cable.
13. Install the vehicle headliner, (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).
14. Perform the sunroof position calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - SUNROOF POSITION CALIBRATION).
15. Perform the Excessive Force Limitation (EFL) calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - EXCESSIVE FORCE LIMITATION (EFL) CALIBRATION).
16. Verify proper operation of the power sunroof system.

CHANNEL-DRAIN

REMOVAL

1. Remove glass panel (2). (Refer to 23 - BODY/SUNROOF/GLASS PANEL - REMOVAL)
2. Separate the drain channel arms (2) from the guide mechanisms (1) one at a time.

CAUTION: Do not pry the channel arms apart at the same time or you could break the drain channel.

3. Carefully slide the drain channel (1) forward to the notches (2) in the frame and remove from the vehicle.

INSTALLATION

1. Carefully position the drain channel (1) into the notches (2) in the frame and slide rearward.

2. Install the drain channel arms (2) into the mechanism (1) holes one at a time with the reinforcements on the inside of mechanism arms.

CAUTION: Do not pry the channel arms apart at the same time or you could break the drain channel.

3. Install the sunroof glass. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - INSTALLATION)

COVER-GUIDE MECHANISM

REMOVAL

1. Move the glass panel to the full closed position.
2. Slide sunshade rearward to the open position.
3. Separate the mechanism covers (2) from the tabs (1) on the glass panel.

4. Hold both mechanism covers down and open the sunroof fully.
5. Slide the mechanism covers (1) out the front of the guide in the frame (2).

INSTALLATION

1. With the sunroof in the open position, snap the mechanism cover (2) into the lower guide channel.
2. Hold down each cover and close the sunroof.
3. Snap the upper portion of the cover into the retaining clips (1) on the glass panel between the locating features.

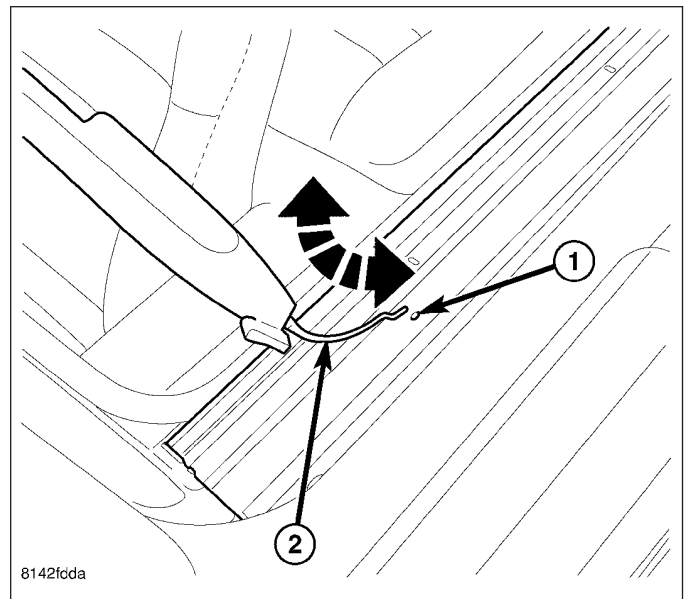

DEFLECTOR-WIND

REMOVAL

1. Open the sunroof fully.
2. Remove the strap screws (2) from the beam area
release the strap (3).

3. Rotate the deflector up and remove springs (2) from the holes in the frame (1).

INSTALLATION

1. Position the deflector spring arms (2) into the holes of the frame (1).

2. Rotate the deflector down, attach the straps (3) and install the strap screws (2) into the front beam.
3. Verify sunroof operation and alignment.

GLASS

REMOVAL

1. Move the glass panel (2) to the full closed position.
2. Slide sunshade rearward to the open position.
3. Separate the mechanism covers (2) from the tabs (1) on the glass panel.

4. Remove the glass panel screws (3).
5. Lift off glass panel and remove from vehicle.

INSTALLATION

1. Position glass panel on to mechanism lift arms.

CAUTION: Verify that the retaining tabs are located on the **INSIDE** of the guide mechanism arms.

2. Start the attaching screws (3).
3. Connect a 12v power supply and verify that the sunroof is in the closed position.
4. Adjust sunroof glass to fit flush with roof line (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS).
5. Tighten the screws (3) to 3.5 N·m (30 in. lbs.).
6. Position the mechanism covers (2) over the glass tabs (1) between the locating features and seat fully.
7. Verify sunroof operation and alignment.

ADJUSTMENTS

ADJUSTMENT

1. Move the sunshade rearward to the open position.
2. Separate the mechanism covers (2) from the tabs (1) on the glass panel.
3. Verify the sunroof glass panel is in the fully closed position.
4. Loosen the forward attaching screws (3) on each side enough to permit the front of the glass to adjust up or down.
5. Adjust the front surface of the sunroof glass panel 0.00 mm to 2 mm (0.00 in. to 0.08 in.) **below** the top surface of the roof.
6. Tighten the front glass panel attaching screws to 3.5 N·m (30 in. lbs.).
7. Loosen the rear screws (3) on each side enough to make the rear adjustment.
8. Adjust the rear surface of the sunroof glass panel 0.00 mm to 2 mm (0.03 in. to 0.08 in.) **above** the top surface of the roof.
9. Tighten the rear glass panel attaching screws to 3.5 N·m (30 in. lbs.).
10. Check for proper fit. If not OK, repeat glass panel adjustment.
11. Position the mechanism covers (2) over the glass tabs (1) between the locating features and seat fully.
12. Verify sunroof operation and alignment.

GUIDE-SUNROOF GLASS

REMOVAL

1. Place the sunroof in the vent position.
2. Remove the sunroof assembly. (Refer to 23 - BODY/SUNROOF/ASSEMBLY-MODULE - REMOVAL)
3. Remove the motor. (Refer to 8 - ELECTRICAL/POWER TOP - SUNROOF SERVICE INFO/MOTOR/MODULE-SUNROOF - REMOVAL)
4. Remove the glass. (Refer to 23 - BODY/SUNROOF/GLASS - REMOVAL)
5. Remove the wind deflector. (Refer to 23 - BODY/SUNROOF/DEFLECTOR-WIND - REMOVAL)
6. Separate the drain channel arms (2) from the guide mechanisms (1) one at a time.

CAUTION: Do not pry the channel arms apart at the same time or you could break the drain channel.

7. Slide the drain channel rearward out of the way.
8. Remove the hard stop screw from the frame.

- push the drive cable and guide plate forward past the hard stop screw location until the glass guide comes loose.

- Rotate the guide (1) up and out of the front beam (3) and release the front foot (2) from the channel guide.

INSTALLATION

- With the drive cable plate aligned insert the front foot (2) into the guide channel and engage the feet with the front beam (3).

2. Rotate the guide plate (1) inboard until the feet of the guide are engaged into the front beam (2).

3. Push the guide assembly (1) and drive cable rearward past the hard stop location.
4. Install the hard stop screw (2) and push the drive cable and guide assembly (1) up against the hard stop screw (2).
5. Verify that the opposite guide assembly is also positioned up against the hard stop screw.
6. Install the wind deflector as necessary. (Refer to 23 - BODY/SUNROOF/DEFLECTOR-WIND - INSTALLATION)
7. Install the motor as necessary. (Refer to 8 - ELECTRICAL/POWER TOP - SUNROOF SERVICE INFO/MOTOR/MODULE-SUNROOF - INSTALLATION)

8. Install the drain channel arms (2) into the mechanism (1) holes one at a time with the reinforcements on the inside of mechanism arms.

CAUTION: Do not pry the channel arms apart at the same time or you could break the drain channel.

9. Install the sunroof assembly into the vehicle. (Refer to 23 - BODY/SUNROOF/ASSEMBLY-MODULE - INSTALLATION)
10. Perform the sunroof position calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - SUNROOF POSITION CALIBRATION).

11. Perform the Excessive Force Limitation (EFL) calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - EXCESSIVE FORCE LIMITATION (EFL) CALIBRATION).
12. Install the glass as necessary. (Refer to 23 - BODY/SUNROOF/GLASS - INSTALLATION)

13. Adjust sunroof glass to fit flush with roof line (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS).
14. Verify proper operation of the power sunroof system.

HOSE-DRAIN

REMOVAL

FRONT HOSES

1. Remove headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
2. Disconnect the drain hose from the sunroof housing (1).
3. Separate the lower tube from the grommet in the body.
4. Drain any liquid from hose connection, if necessary.
5. Release the clips and remove the tube.

REAR HOUSING HOSE

1. Remove headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
2. Disconnect the drain hose from the sunroof housing (2).
3. Drain any liquid from hose connection, if necessary.
4. Release the push pin fasteners and separate the lower tube from the grommet in the body.

INSTALLATION

FRONT HOSES

1. Position the lower portion through the grommet in the body.
2. Connect the new drain hose to the sunroof housing (1) and test drainage.
3. Position the hose into the support clips.
4. Install headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).

REAR HOUSING HOSE

1. Install the rear hose and seat the push pin fasteners fully.
2. Position the lower portion through the grommet in the body.
3. Connect the new drain hose to the sunroof housing (2) and test drainage.
4. Install headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).

MOTOR

DESCRIPTION

For service information refer to (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - DIAGNOSIS AND TESTING).

SUNSHADE

REMOVAL

1. Remove the drain channel. (Refer to 23 - BODY/SUNROOF/CHANNEL-DRAIN - REMOVAL)
2. Push up the front center of the sunshade (1) to pop out the front two feet.

3. Rotate the sunshade (2) so that the other feet (1) are removed from the guide track.

INSTALLATION

1. Verify the sunshade track is free of obstructions like the trim lace/ring.
2. Start with sunshade (2) at an angle with one foot (1) in the track.
3. Rotate the sunshade so the other rear foot is in the track as well as the 2 other feet (3) on the same side as the first foot.

4. To insert the remaining two feet (2) apply force to the middle front of sunshade (3) and guide them into the track.
5. Check that all the feet are in the right track and verify sunshade operation.
6. Install the drain channel. (Refer to 23 - BODY/SUNROOF/CHANNEL-DRAIN - INSTALLATION)

SWITCH-SUNROOF

DESCRIPTION

For service information refer to (Refer to 8 - ELECTRICAL/POWER TOP/SWITCH - DIAGNOSIS AND TESTING).

TRIM LACE

REMOVAL

1. Remove trim lace (2) by holding one end of the trim lace at the butt joint and pulling horizontally into the opening until lace is completely loose from the headliner/sunroof joint.

INSTALLATION

1. Place butt joint of trim lace into position starting at the drivers side middle of the opening at the butt joint notch in the u-frame.
2. Push lace into position.
3. Ensure that the corner radii is fully engage.
4. Once the trim lace is attached to sunroof module using a trim stick C-4755 or equivalent, begin tucking the headliner under the lip on the trim lace working all the way around the opening. When installing a new trim lace, begin tucking the headliner under the lip as the tear cord (1) is removed working all the way around the opening.

HVAC - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

11-MODE POT OPEN (MTC)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With ignition on.
- **Set Condition:**
If the mode pot fails the internal self test.

Possible Causes
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. REPLACE THE A/C HEATER CONTROL

Repair

Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

12-MODE POT SHORTED (MTC)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the mode pot fails the internal self test.

Possible Causes
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. REPLACE THE A/C HEATER CONTROL

Repair

Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

13-TEMP POT OPEN (MTC)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the temp pot fails the internal self test.

Possible Causes
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. REPLACE THE A/C HEATER CONTROL

Repair

Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

14-TEMP POT SHORTED (MTC)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the temp pot fails the internal self test.

Possible Causes
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. REPLACE THE A/C HEATER CONTROL

Repair

Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

18-BLEND DOOR RANGE TOO SMALL (MTC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44) and Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). Diagnose and repair Overcurrent faults (DTC 41, 42, 43, and 44) before diagnosing Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56).

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the A/C Heater Control detects too few commutator pulses when calibrating the left blend door, this DTC will set.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the A/C Heater Control detects too few commutator pulses when calibrating the left blend door.

Possible Causes
ACTUATOR CIRCUIT TEST FAULTS PRESENT
OVERCURRENT FAULTS PRESENT
LEFT BLEND DOOR BINDING, OBSTRUCTED
LEFT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

18-BLEND DOOR RANGE TOO SMALL (MTC) (CONTINUED)**Diagnostic Test****1. VERIFY IF ANY ACTUATOR CIRCUIT TEST FAULTS OR OVERCURRENT FAULTS ARE PRESENT**

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 41, 42, 43, 44, 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, then DTCs 63, 65, 67, or 69, and finally DTCs 41, 42, 43, or 44. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

No >> Go To 2

2. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE LEFT BLEND DOOR TO BIND

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the left blend door to bind.

Are there any physical or mechanical problems with the door, housing, linkage, or actuator?

Yes >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

18-BLEND DOOR RANGE TOO SMALL (MTC) (CONTINUED)**3. CHECK LEFT BLEND DOOR TRAVEL**

Remove the Left Blend Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over the entire span of travel (approximately 90 degrees).

Does the door operate smoothly in both directions over the entire span of travel?

Yes >> Replace the Left Blend Door Actuator in accordance with the Service Information. Then, Go To 4.

No >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. VERIFY THAT THE FAULT IS STILL PRESENT

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 18?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

21-BLEND DOOR RANGE TOO LARGE (MTC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44) and Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). Diagnose and repair Overcurrent faults (DTC 41, 42, 43, and 44) before diagnosing Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56).

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the A/C Heater Control detects too many commutator pulses when calibrating the left blend door, this DTC will set.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the A/C Heater Control detects too many commutator pulses when calibrating the left blend door.

Possible Causes
ACTUATOR CIRCUIT TEST FAULTS PRESENT
OVERCURRENT FAULTS PRESENT
LEFT BLEND DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, BROKEN
LEFT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

21-BLEND DOOR RANGE TOO LARGE (MTC) (CONTINUED)**Diagnostic Test****1. VERIFY IF ANY ACTUATOR CIRCUIT TEST FAULTS OR OVERCURRENT FAULTS ARE PRESENT**

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 41, 42, 43, 44, 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, then DTCs 63, 65, 67, or 69, and finally DTCs 41, 42, 43, or 44. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

No >> Go To 2

2. CHECK FOR A BROKEN LEFT BLEND DOOR ACTUATOR

Turn the ignition off.

Remove the Left Blend Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

Yes >> Replace the Left Blend Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

21-BLEND DOOR RANGE TOO LARGE (MTC) (CONTINUED)**3. CHECK THE LEFT BLEND DOOR & A/C HEATER HOUSING FOR WARPED, WORN, & DAMAGED COMPONENTS**

Inspect for excessively worn door linkage and for a damaged or broken A/C Heater Housing Assembly. Inspect for a warped or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 90 degrees.

Are there any physical or mechanical problems with the door or housing?

Yes >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Left Blend Door Actuator in accordance with the Service Information. Then, Go To 4.

4. VERIFY THAT THE FAULT IS STILL PRESENT

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 21?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

22-FRONT MODE DOOR RANGE TOO SMALL (MTC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44) and Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). Diagnose and repair Overcurrent faults (DTC 41, 42, 43, and 44) before diagnosing Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56).

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the A/C Heater Control detects too few commutator pulses when calibrating the front mode door, this DTC will set.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the A/C Heater Control detects too few commutator pulses when calibrating the front mode door.

Possible Causes
ACTUATOR CIRCUIT TEST FAULTS PRESENT
OVERCURRENT FAULTS PRESENT
FRONT MODE DOOR BINDING, OBSTRUCTED
FRONT MODE DOOR ACTUATOR
A/C HEATER CONTROL

22-FRONT MODE DOOR RANGE TOO SMALL (MTC) (CONTINUED)**Diagnostic Test****1. VERIFY IF ANY ACTUATOR CIRCUIT TEST FAULTS OR OVERCURRENT FAULTS ARE PRESENT**

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 41, 42, 43, 44, 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, then DTCs 63, 65, 67, or 69, and finally DTCs 41, 42, 43, or 44. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

No >> Go To 2

2. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE FRONT MODE DOOR TO BIND

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the front mode door to bind.

Are there any physical or mechanical problems with the door, housing, linkage, or actuator?

Yes >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

22-FRONT MODE DOOR RANGE TOO SMALL (MTC) (CONTINUED)**3. CHECK FRONT MODE DOOR TRAVEL**

Remove the Front Mode Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over the entire span of travel (approximately 350 degrees).

Does the door operate smoothly in both directions over the entire span of travel?

Yes >> Replace the Front Mode Door Actuator in accordance with the Service Information. Then, Go To 4.

No >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. VERIFY THAT THE FAULT IS STILL PRESENT

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 22?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

23–FRONT MODE DOOR RANGE TOO LARGE (MTC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44) and Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). Diagnose and repair Overcurrent faults (DTC 41, 42, 43, and 44) before diagnosing Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56).

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the A/C Heater Control detects too many commutator pulses when calibrating the front mode door, this DTC will set.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the A/C Heater Control detects too many commutator pulses when calibrating the front mode door.

Possible Causes
ACTUATOR CIRCUIT TEST FAULTS PRESENT
OVERCURRENT FAULTS PRESENT
FRONT MODE DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, BROKEN
FRONT MODE DOOR ACTUATOR
A/C HEATER CONTROL

23-FRONT MODE DOOR RANGE TOO LARGE (MTC) (CONTINUED)**Diagnostic Test****1. VERIFY IF ANY ACTUATOR CIRCUIT TEST FAULTS OR OVERCURRENT FAULTS ARE PRESENT**

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 41, 42, 43, 44, 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, then DTCs 63, 65, 67, or 69, and finally DTCs 41, 42, 43, or 44. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

No >> Go To 2

2. CHECK FOR A BROKEN FRONT MODE DOOR ACTUATOR

Turn the ignition off.

Remove the Front Mode Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

Yes >> Replace the Front Mode Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

23-FRONT MODE DOOR RANGE TOO LARGE (MTC) (CONTINUED)**3. CHECK THE FRONT MODE DOOR & A/C HEATER HOUSING FOR WARPED, WORN, & DAMAGED COMPONENTS**

Inspect for excessively worn door linkage and for a damaged or broken A/C Heater Housing Assembly. Inspect for a warped or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 350 degrees.

Are there any physical or mechanical problems with the door or housing?

- Yes** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Front Mode Door Actuator in accordance with the Service Information. Then, Go To 4.

4. VERIFY THAT THE FAULT IS STILL PRESENT

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 23?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

24-REAR MODE DOOR RANGE TOO SMALL (MTC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44) and Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). Diagnose and repair Overcurrent faults (DTC 41, 42, 43, and 44) before diagnosing Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56).

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the A/C Heater Control detects too few commutator pulses when calibrating the rear mode door, this DTC will set.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the A/C Heater Control detects too few commutator pulses when calibrating the rear mode door.

Possible Causes
ACTUATOR CIRCUIT TEST FAULTS PRESENT
OVERCURRENT FAULTS PRESENT
REAR MODE DOOR BINDING, OBSTRUCTED
REAR MODE DOOR ACTUATOR
A/C HEATER CONTROL

24-REAR MODE DOOR RANGE TOO SMALL (MTC) (CONTINUED)**Diagnostic Test****1. VERIFY IF ANY ACTUATOR CIRCUIT TEST FAULTS OR OVERCURRENT FAULTS ARE PRESENT**

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 41, 42, 43, 44, 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, then DTCs 63, 65, 67, or 69, and finally DTCs 41, 42, 43, or 44. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

No >> Go To 2

2. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE REAR MODE DOOR TO BIND

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the rear mode door to bind.

Are there any physical or mechanical problems with the door, housing, linkage, or actuator?

Yes >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

24-REAR MODE DOOR RANGE TOO SMALL (MTC) (CONTINUED)**3. CHECK REAR MODE DOOR TRAVEL**

Remove the Rear Mode Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over the entire span of travel (approximately 155 degrees).

Does the door operate smoothly in both directions over the entire span of travel?

Yes >> Replace the Rear Mode Door Actuator in accordance with the Service Information. Then, Go To 4.

No >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. VERIFY THAT THE FAULT IS STILL PRESENT

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 24?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

25-REAR MODE DOOR RANGE TOO LARGE (MTC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44) and Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). Diagnose and repair Overcurrent faults (DTC 41, 42, 43, and 44) before diagnosing Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56).

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the A/C Heater Control detects too many commutator pulses when calibrating the rear mode door, this DTC will set.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the A/C Heater Control detects too many commutator pulses when calibrating the rear mode door.

Possible Causes
ACTUATOR CIRCUIT TEST FAULTS PRESENT
OVERCURRENT FAULTS PRESENT
REAR MODE DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, BROKEN
REAR MODE DOOR ACTUATOR
A/C HEATER CONTROL

25-REAR MODE DOOR RANGE TOO LARGE (MTC) (CONTINUED)**Diagnostic Test****1. VERIFY IF ANY ACTUATOR CIRCUIT TEST FAULTS OR OVERCURRENT FAULTS ARE PRESENT**

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 41, 42, 43, 44, 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, then DTCs 63, 65, 67, or 69, and finally DTCs 41, 42, 43, or 44. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

No >> Go To 2

2. CHECK FOR A BROKEN REAR MODE DOOR ACTUATOR

Turn the ignition off.

Remove the Rear Mode Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

Yes >> Replace the Rear Mode Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

25-REAR MODE DOOR RANGE TOO LARGE (MTC) (CONTINUED)**3. CHECK THE REAR MODE DOOR & A/C HEATER HOUSING FOR WARPED, WORN, & DAMAGED COMPONENTS**

Inspect for excessively worn door linkage and for a damaged or broken A/C Heater Housing Assembly. Inspect for a warped or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 155 degrees.

Are there any physical or mechanical problems with the door or housing?

- Yes** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Rear Mode Door Actuator in accordance with the Service Information. Then, Go To 4.
-

4. VERIFY THAT THE FAULT IS STILL PRESENT

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 25?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

31-EVAPORATOR SENSOR OPEN (MTC)

31-EVAPORATOR SENSOR OPEN (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the Evaporator Temperature Sensor input is out of range toward the high voltage threshold.

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN
(C121) SENSOR GROUND CIRCUIT OPEN
EVAPORATOR TEMPERATURE SENSOR
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Measure the voltage of the (C21) Evaporator Temperature Sensor Signal circuit.

Is the voltage above 0.2 volts?

- Yes** >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to voltage.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 2

31-EVAPORATOR SENSOR OPEN (MTC) (CONTINUED)

2. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT, (C121) SENSOR GROUND CIRCUIT, & EVAPORATOR TEMPERATURE SENSOR

Turn the ignition off.

Measure the resistance between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit in the A/C Heater Control C2 harness connector. The approximate circuit resistance should be as follows:

- 1468 ohms @ 40°C (104°F)
- 1800 ohms @ 35°C (95°F)
- 2221 ohms @ 30°C (86°F)
- 2757 ohms @ 25°C (77°F)
- 3443 ohms @ 20°C (68°F)
- 4330 ohms @ 15°C (59°F)
- 5485 ohms @ 10°C (50°F)
- 6998 ohms @ 5°C (41°F)
- 7354 ohms @ 4°C (39°F)
- 7731 ohms @ 3°C (37°F)
- 8130 ohms @ 2°C (36°F)
- 8553 ohms @ 1°C (34°F)
- 9000 ohms @ 0°C (32°F)

Is the resistance within the specifications?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 3

3. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Disconnect the Evaporator Temperature Sensor harness connector. Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between the Evaporator Temperature Sensor harness connector and the A/C Heater Control C2 harness connector.

Is the resistance below 5.0 ohms?

- Yes** >> Go To 4
- No** >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

31-EVAPORATOR SENSOR OPEN (MTC) (CONTINUED)

4. CHECK (C121) SENSOR GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the (C121) Sensor Ground circuit between the Evaporator Temperature Sensor harness connector and the A/C Heater Control C2 harness connector.

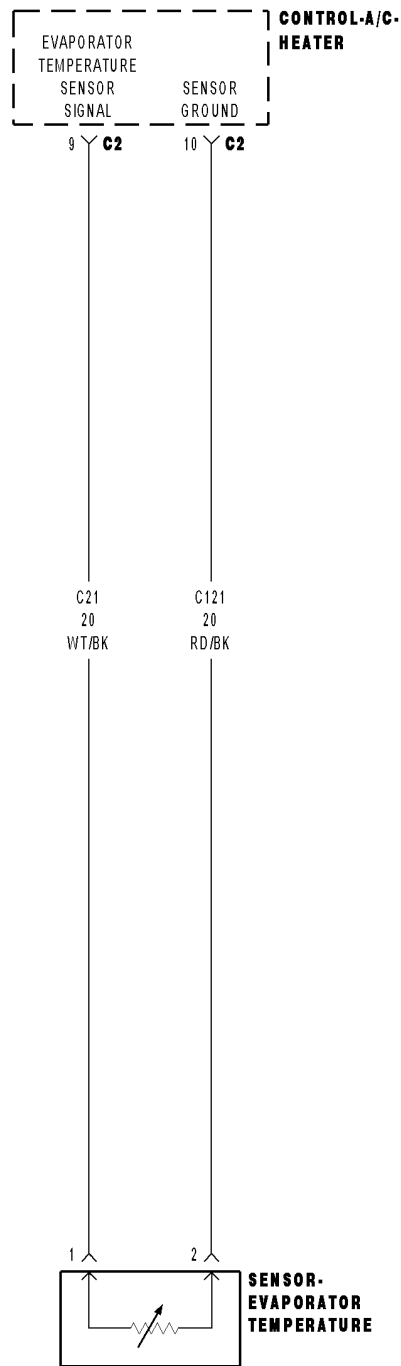

Is the resistance below 5.0 ohms?

Yes >> Replace the Evaporator Temperature Sensor in accordance with the Service Information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (C121) Sensor Ground circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

32-EVAPORATOR SENSOR SHORTED (MTC)

32-EVAPORATOR SENSOR SHORTED (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the Evaporator Temperature Sensor input is out of range toward the low voltage threshold.

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (C121) SENSOR GROUND CIRCUIT
EVAPORATOR TEMPERATURE SENSOR
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. CHECK FOR DTC 32-EVAPORATOR SENSOR SHORTED WITH EVAPORATOR TEMPERATURE SENSOR HARNESS CONNECTOR DISCONNECTED

Turn the ignition off.
Disconnect the Evaporator Temperature Sensor harness connector.
Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 32?

Yes >> Go To 2

No >> Replace the Evaporator Temperature Sensor in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

32-EVAPORATOR SENSOR SHORTED (MTC) (CONTINUED)**2. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between ground and the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

**3. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO (C121) SENSOR GROUND CIRCUIT**

Measure the resistance between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to the (C121) Sensor Ground circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

33-A/C MODE SWITCH STUCK (MTC)

33-A/C MODE SWITCH STUCK (MTC) (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The switch input changes when the switch is pushed down. A stored DTC 33 indicates that the A/C mode switch was stuck in a pushed position for more than 10 minutes, but has since returned to its normal state. An active DTC 33 indicates that the A/C mode switch is stuck in a pushed position. An active DTC 33 will prevent the control from entering diagnostic mode and performing certain diagnostic functions. It will also prevent proper A/C mode switch and status indicator function. For additional information about the A/C Heater Control's on-board diagnostics, refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the A/C mode switch stays in a pushed position for more than 10 minutes.

Possible Causes
OBJECT HOLDING A/C MODE SWITCH IN A PUSHED POSITION SUBSTANCE CAUSING A/C MODE SWITCH TO GET STUCK IN A PUSHED POSITION (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT SHORTED TO VOLTAGE (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT SHORTED TO (C121) SENSOR GROUND CIRCUIT (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT SHORTED TO GROUND (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT OPEN A/C STATUS INDICATOR INOPERATIVE A/C HEATER CONTROL

Diagnostic Test**1. INSPECT THE A/C HEATER CONTROL FOR DAMAGE**

Turn the ignition off.

Inspect the A/C Heater Control for damage.

Is the A/C Heater Control damaged?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 2

2. INSPECT FOR OBJECT OR SUBSTANCE CAUSING THE A/C MODE SWITCH TO STAY OR STICK IN A PUSHED POSITION

Inspect the A/C Heater Control for anything that would cause the A/C mode switch to stay or stick in a pushed position.

Is anything present that would cause the A/C mode switch to stay or stick in a pushed position?

- Yes** >> Repair as necessary.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 3

33-A/C MODE SWITCH STUCK (MTC) (CONTINUED)

3. CHECK THE (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT VOLTAGE

Disconnect the A/C Heater Control C3 harness connector.
 Turn the ignition on.
 Measure the voltage of the (C41) Blower Switch Position Signal circuit.

What is the voltage?

Below 4.8 Volts
 Go To 4

Above 5.2 Volts
 Go To 7

4.8 Volts To 5.2 Volts
 Go To 8

4. CHECK THE (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (C121) SENSOR GROUND CIRCUIT

Turn the ignition off.
 Disconnect the A/C Heater Control C2 harness connector.
 Measure the resistance between the (C41) Blower Switch Position Signal circuit and the (C121) Sensor Ground circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10K ohms?

Yes >> Repair the (C41) Blower Switch Position Signal circuit for a short to the (C121) Sensor Ground circuit.
 Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 5

33-A/C MODE SWITCH STUCK (MTC) (CONTINUED)

5. CHECK THE (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance of the (C41) Blower Switch Position Signal circuit between ground and the A/C Heater Control C3 harness connector.

Is the resistance below 10K ohms?

- Yes** >> Repair the (C41) Blower Switch Position Signal circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 6

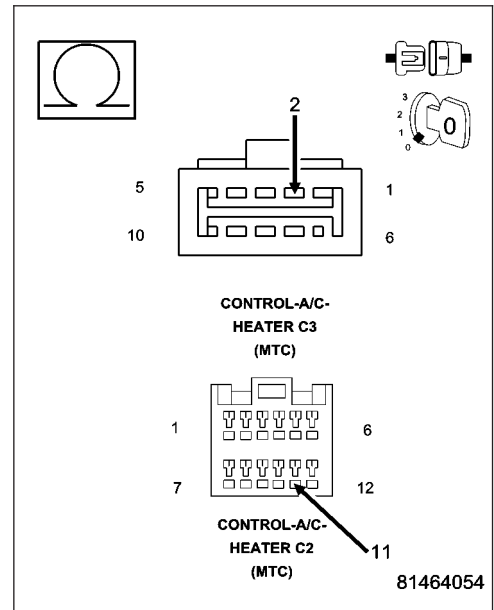

6. CHECK (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT FOR AN OPEN

Measure the resistance of the (C41) Blower Switch Position Signal circuit between the A/C Heater Control C2 harness connector and the A/C Heater Control C3 harness connector.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Repair the (C41) Blower Switch Position Signal circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

33-A/C MODE SWITCH STUCK (MTC) (CONTINUED)

7. CHECK THE (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.
 Disconnect the A/C Heater Control C2 harness connector.
 Turn the ignition on.
 Measure the voltage of the (C41) Blower Switch Position Signal circuit.

Is the voltage above 0.2 volts?

- Yes** >> Repair the (C41) Blower Switch Position Signal circuit for a short to voltage.
 Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the A/C Heater Control in accordance with the Service Information.
 Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

8. CHECK FOR NORMAL A/C MODE SWITCH & STATUS INDICATOR FUNCTION

Turn the ignition off.
 Reconnect the A/C Heater Control C3 harness connector.
 Turn the ignition on.
 Turn the Blower control on.
 Press the A/C mode switch on and off several times while observing the A/C status indicator.

Does the A/C status indicator turn on and off with respect to the switch position?

- Yes** >> Go To 9
- No** >> Replace the A/C Heater Control in accordance with the Service Information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

9. CHECK A/C HEATER CONTROL OPERATION BY ATTEMPTING TO ENTER DIAGNOSTIC MODE

If illuminated, turn off the A/C status indicator and the EBL status indicator.
 Actuate the display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

When entry mode is recognized, the A/C status indicator and the EBL status indicator will illuminate for 5 seconds and then display DTCs, if present. The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated. However, if no DTCs are present, both status indicators will turn off and the system will exit diagnostic mode.

Did the A/C Heater Control enter diagnostic mode?

- Yes** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the A/C Heater Control in accordance with the Service Information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

34-EBL MODE SWITCH STUCK (MTC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The switch input changes when the switch is pushed down. A stored DTC 34 indicates that the EBL mode switch was stuck in a pushed position for more than 10 minutes, but has since returned to its normal state. An active DTC 34 indicates that the EBL mode switch is stuck in a pushed position. An active DTC 34 will prevent the control from performing certain diagnostic functions and it will prevent proper EBL mode switch and status indicator function. For additional information about the A/C Heater Control's on-board diagnostics, refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the EBL mode switch stays in a pushed position for more than 10 minutes.

Possible Causes
A/C HEATER CONTROL DAMAGED OBJECT HOLDING EBL MODE SWITCH IN A PUSHED POSITION SUBSTANCE CAUSING EBL MODE SWITCH TO GET STUCK IN A PUSHED POSITION A/C HEATER CONTROL

Diagnostic Test

1. INSPECT THE A/C HEATER CONTROL FOR DAMAGE

Inspect the A/C Heater Control for damage.

Is the A/C Heater Control damaged?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

2. INSPECT FOR OBJECT OR SUBSTANCE CAUSING THE EBL MODE SWITCH TO STAY OR STICK IN A PUSHED POSITION

Inspect the A/C Heater Control for anything that would cause the EBL mode switch to stay or stick in a pushed position.

Is anything present that would cause the EBL mode switch to stay or stick in a pushed position?

Yes >> Repair as necessary.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

34-EBL MODE SWITCH STUCK (MTC) (CONTINUED)**3. CHECK FOR NORMAL EBL MODE SWITCH & STATUS INDICATOR FUNCTION**

Turn the ignition on.

Press the EBL mode switch on and off several times while observing the EBL status indicator.

Does the EBL status indicator turn on and off with respect to the switch position?

Yes >> Go To 4

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK A/C HEATER CONTROL OPERATION BY ATTEMPTING TO RUN THE ACTUATOR CIRCUIT TEST/ DOOR CALIBRATION FUNCTION

If illuminated, turn off the A/C status indicator and the EBL status indicator.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch.

While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately.

Did the A/C Heater Control run the test / function?

Yes >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

35-FAILED COOL DOWN (MTC)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
When the Cooldown Test is executed.
- **Set Condition:**
If the A/C system is unable to lower the evaporator temperature 11.11°C (20°F).

Possible Causes
PREREQUISITES NOT MET BEFORE RUNNING THE COOLDOWN TEST ANOTHER RELATED SYSTEM NOT FUNCTIONING CORRECTLY POWERTRAIN SYSTEM FAULTS PRESENT

NOTE: This DTC will display as active if the ignition is not cycled after running the Cooldown Test. Otherwise, it will display as stored until cleared.

Diagnostic Test

1. VERIFY THAT ALL OF THE COOLDOWN TEST PREREQUISITES WERE MET

Review the list of Cooldown Test prerequisites.

- **DTC 31 or 32 must not be active.**
- **The refrigerant system must be adequately charged.**
- **The blower motor must operate correctly in all speeds.**
- **The work area ambient temperature must be above 18.3°C (65°F).**
- **The evaporator temperature must be above 18.3°C (65°F).**
- **The A/C compressor must be turned off.**

Were all of the prerequisites met before running the Cooldown Test?

Yes >> Go To 2

No >> Run the Cooldown Test again after all of the prerequisites are met. Then, if DTC 35 is still present, Go To 2. Otherwise, perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR DTCs IN THE PCM

With the scan tool, select PCM.

Are any DTCs present in the PCM?

Yes >> Diagnose and repair the DTC(s). (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) for PCM DTCs. Run the Cooldown Test again after the repair is complete.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Refer to the Service Information for additional Cooldown Test related diagnostic information and testing procedures. Run the Cooldown Test again after the repair is complete.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

36-EEPROM CHECKSUM ERROR (MTC)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the calculated checksum does not match the stored value.

Possible Causes
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. REPLACE THE A/C HEATER CONTROL

Repair

Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

37-ROM CHECKSUM ERROR (MTC)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the calculated checksum does not match the stored value.

Possible Causes
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. REPLACE THE A/C HEATER CONTROL

Repair

Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

41-FRONT MODE OVERCURRENT (MTC)

41-FRONT MODE OVERCURRENT (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

When actuator movement is requested.

- **Set Condition:**

If the A/C Heater Control detects an excessive current draw on any of the door driver circuits while attempting to drive this door actuator. Note that only one overcurrent DTC can set per ignition cycle.

Possible Causes
DOOR DRIVER CIRCUIT(S) SHORTED TO VOLTAGE
DOOR DRIVER CIRCUIT(S) SHORTED TO GROUND
DOOR DRIVER CIRCUITS SHORTED TOGETHER
FRONT MODE DOOR ACTUATOR
REAR MODE DOOR ACTUATOR
LEFT BLEND DOOR ACTUATOR
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

NOTE: This DTC must be active for the result of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

41-FRONT MODE OVERCURRENT (MTC) (CONTINUED)**Diagnostic Test****1. RUN THE ACTUATOR CIRCUIT TEST / DOOR CALIBRATION FUNCTION & THEN CHECK FOR ACTUATOR CIRCUIT TEST FAULTS**

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44).

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the Actuator Circuit Test faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, and finally DTCs 63, 65, 67, or 69. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

41-FRONT MODE OVERCURRENT (MTC) (CONTINUED)

2. CHECK THE (C266) FRONT MODE DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C139) REAR MODE DOOR DRIVER CIRCUIT, (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT, (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Turn the ignition off.

Measure the resistance between the (C266) Front Mode Door Driver circuit and the (C139) Rear Mode Door Driver circuit, (C939) Rear Mode Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C266) Front Mode Door Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C139) REAR MODE DOOR DRIVER CIRCUIT, (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT, (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

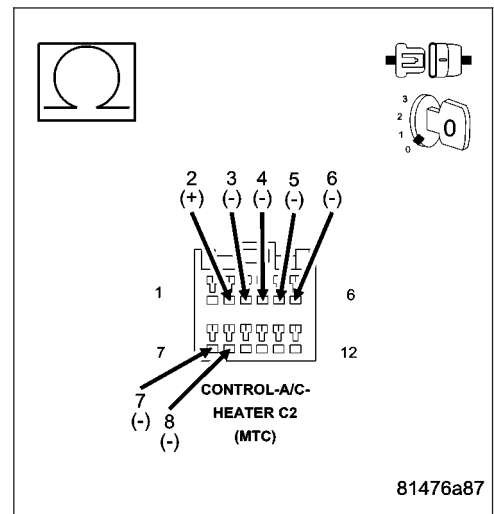

Measure the resistance between the (C66) Front Mode Door Common Driver circuit and the (C139) Rear Mode Door Driver circuit, (C939) Rear Mode Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C66) Front Mode Door Common Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

41-FRONT MODE OVERCURRENT (MTC) (CONTINUED)

4. CHECK THE (C139) REAR MODE DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C139) Rear Mode Door Driver circuit and the (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

- Yes** >> Repair all circuits with a resistance below 10k ohms for a short to the (C139) Rear Mode Door Driver circuit.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 5

5. CHECK THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C939) Rear Mode Door Common Driver circuit and (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

- Yes** >> Repair all circuits with a resistance below 10k ohms for a short to the (C939) Rear Mode Door Common Driver circuit.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 6

41-FRONT MODE OVERCURRENT (MTC) (CONTINUED)

6. CHECK THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C255) Left Blend Door Driver circuit and the (C268) Recirculation Door Driver circuit and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

- Yes** >> Repair all circuits with a resistance below 10k ohms for a short to the (C255) Left Blend Door Driver circuit.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 7

7. CHECK THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C55) Left Blend Door Common Driver circuit and the (C268) Recirculation Door Driver circuit and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

- Yes** >> Repair all circuits with a resistance below 10k ohms for a short to the (C55) Left Blend Door Common Driver circuit.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 8

41-FRONT MODE OVERCURRENT (MTC) (CONTINUED)

8. CHECK THE FRONT MODE DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C66) Front Mode Door Common Driver Circuit and the (C266) Front Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

- Yes** >> Go To 9
- No** >> Go To 10

9. CHECK THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C266) FRONT MODE DOOR DRIVER CIRCUIT

Disconnect the Front Mode Door Actuator harness connector. Measure the resistance between the (C66) Front Mode Door Common Driver Circuit and the (C266) Front Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

- Yes** >> Repair the (C66) Front Mode Door Common Driver Circuit for a short to the (C266) Front Mode Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Front Mode Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

41-FRONT MODE OVERCURRENT (MTC) (CONTINUED)

10. CHECK THE REAR MODE DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C939) Rear Mode Door Common Driver Circuit and the (C139) Rear Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 11

No >> Go To 12

11. CHECK THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C139) REAR MODE DOOR DRIVER CIRCUIT

Disconnect the Rear Mode Door Actuator harness connector.

Measure the resistance between the (C939) Rear Mode Door Common Driver Circuit and the (C139) Rear Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C939) Rear Mode Door Common Driver Circuit for a short to the (C139) Rear Mode Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Rear Mode Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

41-FRONT MODE OVERCURRENT (MTC) (CONTINUED)

12. CHECK THE LEFT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C55) Left Blend Door Common Driver Circuit and the (C255) Left Blend Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 13

No >> Go To 14

13. CHECK THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT

Disconnect the Left Blend Door Actuator harness connector.

Measure the resistance between the (C55) Left Blend Door Common Driver Circuit and the (C255) Left Blend Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C55) Left Blend Door Common Driver Circuit for a short to the (C255) Left Blend Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Left Blend Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

41-FRONT MODE OVERCURRENT (MTC) (CONTINUED)

14. CHECK THE RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C68) Recirculation Door Common Driver Circuit and the (C268) Recirculation Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 15

No >> Go To 16

**15. CHECK THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT**

Disconnect the Recirculation Door Actuator harness connector.

Measure the resistance between the (C68) Recirculation Door Common Driver Circuit and the (C268) Recirculation Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C68) Recirculation Door Common Driver Circuit for a short to the (C268) Recirculation Door Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Recirculation Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

41-FRONT MODE OVERCURRENT (MTC) (CONTINUED)**16. VERIFY THAT THE FAULT IS STILL PRESENT**

Reconnect the A/C Heater Control C2 harness connector.

Reconnect all of the door actuator harness connectors.

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 41?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short that set the original fault. Repair as necessary. Then, if present, diagnose and repair all other DTCs. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

42-REAR MODE OVERCURRENT (MTC)

42-REAR MODE OVERCURRENT (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
When actuator movement is requested.
- **Set Condition:**
If the A/C Heater Control detects an excessive current draw on any of the door driver circuits while attempting to drive this door actuator. Note that only one overcurrent DTC can set per ignition cycle.

Possible Causes
DOOR DRIVER CIRCUIT(S) SHORTED TO VOLTAGE
DOOR DRIVER CIRCUIT(S) SHORTED TO GROUND
DOOR DRIVER CIRCUITS SHORTED TOGETHER
FRONT MODE DOOR ACTUATOR
REAR MODE DOOR ACTUATOR
LEFT BLEND DOOR ACTUATOR
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

NOTE: This DTC must be active for the result of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

42-REAR MODE OVERCURRENT (MTC) (CONTINUED)**Diagnostic Test****1. RUN THE ACTUATOR CIRCUIT TEST / DOOR CALIBRATION FUNCTION & THEN CHECK FOR ACTUATOR CIRCUIT TEST FAULTS**

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44).

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the Actuator Circuit Test faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, and finally DTCs 63, 65, 67, or 69. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

42-REAR MODE OVERCURRENT (MTC) (CONTINUED)

2. CHECK THE (C266) FRONT MODE DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C139) REAR MODE DOOR DRIVER CIRCUIT, (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT, (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Turn the ignition off.

Measure the resistance between the (C266) Front Mode Door Driver circuit and the (C139) Rear Mode Door Driver circuit, (C939) Rear Mode Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C266) Front Mode Door Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C139) REAR MODE DOOR DRIVER CIRCUIT, (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT, (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C66) Front Mode Door Common Driver circuit and the (C139) Rear Mode Door Driver circuit, (C939) Rear Mode Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C66) Front Mode Door Common Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

42-REAR MODE OVERCURRENT (MTC) (CONTINUED)**4. CHECK THE (C139) REAR MODE DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT**

Measure the resistance between the (C139) Rear Mode Door Driver circuit and the (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

- Yes** >> Repair all circuits with a resistance below 10k ohms for a short to the (C139) Rear Mode Door Driver circuit.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 5

**5. CHECK THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT**

Measure the resistance between the (C939) Rear Mode Door Common Driver circuit and (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

- Yes** >> Repair all circuits with a resistance below 10k ohms for a short to the (C939) Rear Mode Door Common Driver circuit.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 6

42-REAR MODE OVERCURRENT (MTC) (CONTINUED)

6. CHECK THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C255) Left Blend Door Driver circuit and the (C268) Recirculation Door Driver circuit and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

- Yes** >> Repair all circuits with a resistance below 10k ohms for a short to the (C255) Left Blend Door Driver circuit.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 7

7. CHECK THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C55) Left Blend Door Common Driver circuit and the (C268) Recirculation Door Driver circuit and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

- Yes** >> Repair all circuits with a resistance below 10k ohms for a short to the (C55) Left Blend Door Common Driver circuit.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 8

42-REAR MODE OVERCURRENT (MTC) (CONTINUED)**8. CHECK THE FRONT MODE DOOR ACTUATOR CIRCUIT RESISTANCE**

Measure the resistance between the (C66) Front Mode Door Common Driver Circuit and the (C266) Front Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 9

No >> Go To 10

**9. CHECK THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C266) FRONT MODE DOOR DRIVER CIRCUIT**

Disconnect the Front Mode Door Actuator harness connector.

Measure the resistance between the (C66) Front Mode Door Common Driver Circuit and the (C266) Front Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C66) Front Mode Door Common Driver Circuit for a short to the (C266) Front Mode Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Front Mode Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

42-REAR MODE OVERCURRENT (MTC) (CONTINUED)

10. CHECK THE REAR MODE DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C939) Rear Mode Door Common Driver Circuit and the (C139) Rear Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 11

No >> Go To 12

11. CHECK THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C139) REAR MODE DOOR DRIVER CIRCUIT

Disconnect the Rear Mode Door Actuator harness connector.

Measure the resistance between the (C939) Rear Mode Door Common Driver Circuit and the (C139) Rear Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C939) Rear Mode Door Common Driver Circuit for a short to the (C139) Rear Mode Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Rear Mode Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

42-REAR MODE OVERCURRENT (MTC) (CONTINUED)**12. CHECK THE LEFT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE**

Measure the resistance between the (C55) Left Blend Door Common Driver Circuit and the (C255) Left Blend Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 13

No >> Go To 14

**13. CHECK THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT**

Disconnect the Left Blend Door Actuator harness connector.

Measure the resistance between the (C55) Left Blend Door Common Driver Circuit and the (C255) Left Blend Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C55) Left Blend Door Common Driver Circuit for a short to the (C255) Left Blend Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Left Blend Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

42-REAR MODE OVERCURRENT (MTC) (CONTINUED)

14. CHECK THE RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C68) Recirculation Door Common Driver Circuit and the (C268) Recirculation Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 15

No >> Go To 16

15. CHECK THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT

Disconnect the Recirculation Door Actuator harness connector. Measure the resistance between the (C68) Recirculation Door Common Driver Circuit and the (C268) Recirculation Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C68) Recirculation Door Common Driver Circuit for a short to the (C268) Recirculation Door Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Recirculation Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

42-REAR MODE OVERCURRENT (MTC) (CONTINUED)**16. VERIFY THAT THE FAULT IS STILL PRESENT**

Reconnect the A/C Heater Control C2 harness connector.

Reconnect all of the door actuator harness connectors.

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

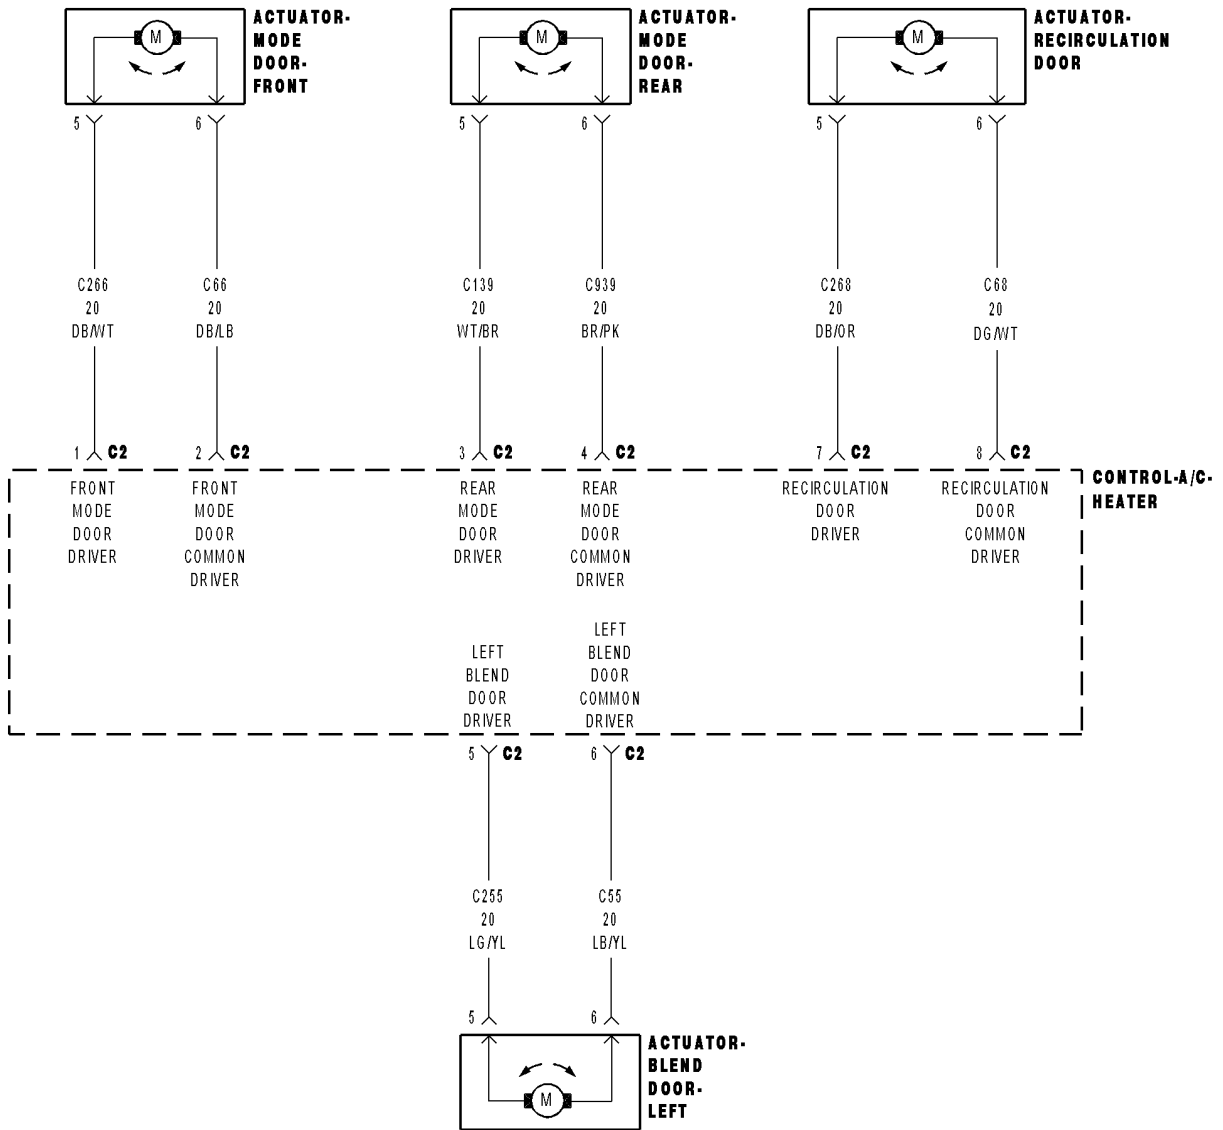

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 42?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short that set the original fault. Repair as necessary. Then, if present, diagnose and repair all other DTCs. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

43-BLEND OVERCURRENT (MTC)

43-BLEND OVERCURRENT (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

When actuator movement is requested.

- **Set Condition:**

If the A/C Heater Control detects an excessive current draw on any of the door driver circuits while attempting to drive this door actuator. Note that only one overcurrent DTC can set per ignition cycle.

Possible Causes
DOOR DRIVER CIRCUIT(S) SHORTED TO VOLTAGE
DOOR DRIVER CIRCUIT(S) SHORTED TO GROUND
DOOR DRIVER CIRCUITS SHORTED TOGETHER
FRONT MODE DOOR ACTUATOR
REAR MODE DOOR ACTUATOR
LEFT BLEND DOOR ACTUATOR
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

NOTE: This DTC must be active for the result of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

43-BLEND OVERCURRENT (MTC) (CONTINUED)**Diagnostic Test****1. RUN THE ACTUATOR CIRCUIT TEST / DOOR CALIBRATION FUNCTION & THEN CHECK FOR ACTUATOR CIRCUIT TEST FAULTS**

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44).

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the Actuator Circuit Test faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, and finally DTCs 63, 65, 67, or 69. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

43-BLEND OVERCURRENT (MTC) (CONTINUED)

2. CHECK THE (C266) FRONT MODE DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C139) REAR MODE DOOR DRIVER CIRCUIT, (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT, (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Turn the ignition off.

Measure the resistance between the (C266) Front Mode Door Driver circuit and the (C139) Rear Mode Door Driver circuit, (C939) Rear Mode Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C266) Front Mode Door Driver circuit.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C139) REAR MODE DOOR DRIVER CIRCUIT, (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT, (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C66) Front Mode Door Common Driver circuit and the (C139) Rear Mode Door Driver circuit, (C939) Rear Mode Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C66) Front Mode Door Common Driver circuit.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

43-BLEND OVERCURRENT (MTC) (CONTINUED)

4. CHECK THE (C139) REAR MODE DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C139) Rear Mode Door Driver circuit and the (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

- Yes** >> Repair all circuits with a resistance below 10k ohms for a short to the (C139) Rear Mode Door Driver circuit.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 5

5. CHECK THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C939) Rear Mode Door Common Driver circuit and (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

- Yes** >> Repair all circuits with a resistance below 10k ohms for a short to the (C939) Rear Mode Door Common Driver circuit.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 6

43-BLEND OVERCURRENT (MTC) (CONTINUED)**6. CHECK THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT**

Measure the resistance between the (C255) Left Blend Door Driver circuit and the (C268) Recirculation Door Driver circuit and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

- Yes** >> Repair all circuits with a resistance below 10k ohms for a short to the (C255) Left Blend Door Driver circuit.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 7

**7. CHECK THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT**

Measure the resistance between the (C55) Left Blend Door Common Driver circuit and the (C268) Recirculation Door Driver circuit and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

- Yes** >> Repair all circuits with a resistance below 10k ohms for a short to the (C55) Left Blend Door Common Driver circuit.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 8

43-BLEND OVERCURRENT (MTC) (CONTINUED)

8. CHECK THE FRONT MODE DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C66) Front Mode Door Common Driver Circuit and the (C266) Front Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

- Yes** >> Go To 9
- No** >> Go To 10

9. CHECK THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C266) FRONT MODE DOOR DRIVER CIRCUIT

Disconnect the Front Mode Door Actuator harness connector. Measure the resistance between the (C66) Front Mode Door Common Driver Circuit and the (C266) Front Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

- Yes** >> Repair the (C66) Front Mode Door Common Driver Circuit for a short to the (C266) Front Mode Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Front Mode Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

43-BLEND OVERCURRENT (MTC) (CONTINUED)**10. CHECK THE REAR MODE DOOR ACTUATOR CIRCUIT RESISTANCE**

Measure the resistance between the (C939) Rear Mode Door Common Driver Circuit and the (C139) Rear Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 11

No >> Go To 12

**11. CHECK THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C139) REAR MODE DOOR DRIVER CIRCUIT**

Disconnect the Rear Mode Door Actuator harness connector.

Measure the resistance between the (C939) Rear Mode Door Common Driver Circuit and the (C139) Rear Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C939) Rear Mode Door Common Driver Circuit for a short to the (C139) Rear Mode Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Rear Mode Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

43-BLEND OVERCURRENT (MTC) (CONTINUED)

12. CHECK THE LEFT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C55) Left Blend Door Common Driver Circuit and the (C255) Left Blend Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 13

No >> Go To 14

13. CHECK THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT

Disconnect the Left Blend Door Actuator harness connector.

Measure the resistance between the (C55) Left Blend Door Common Driver Circuit and the (C255) Left Blend Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C55) Left Blend Door Common Driver Circuit for a short to the (C255) Left Blend Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Left Blend Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

43-BLEND OVERCURRENT (MTC) (CONTINUED)**14. CHECK THE RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE**

Measure the resistance between the (C68) Recirculation Door Common Driver Circuit and the (C268) Recirculation Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 15

No >> Go To 16

**15. CHECK THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT**

Disconnect the Recirculation Door Actuator harness connector.

Measure the resistance between the (C68) Recirculation Door Common Driver Circuit and the (C268) Recirculation Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C68) Recirculation Door Common Driver Circuit for a short to the (C268) Recirculation Door Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Recirculation Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

43-BLEND OVERCURRENT (MTC) (CONTINUED)**16. VERIFY THAT THE FAULT IS STILL PRESENT**

Reconnect the A/C Heater Control C2 harness connector.

Reconnect all of the door actuator harness connectors.

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 43?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short that set the original fault. Repair as necessary. Then, if present, diagnose and repair all other DTCs. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the Actuator Circuit Test faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, and finally DTCs 63, 65, 67, or 69. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

44-RECIRC OVERCURRENT (MTC) (CONTINUED)

2. CHECK THE (C266) FRONT MODE DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C139) REAR MODE DOOR DRIVER CIRCUIT, (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT, (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Turn the ignition off.

Measure the resistance between the (C266) Front Mode Door Driver circuit and the (C139) Rear Mode Door Driver circuit, (C939) Rear Mode Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C266) Front Mode Door Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C139) REAR MODE DOOR DRIVER CIRCUIT, (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT, (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

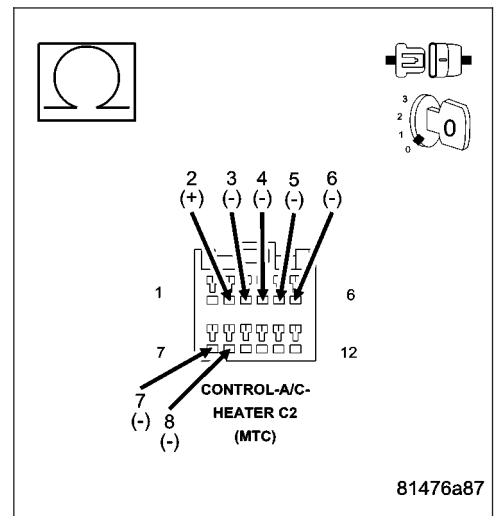

Measure the resistance between the (C66) Front Mode Door Common Driver circuit and the (C139) Rear Mode Door Driver circuit, (C939) Rear Mode Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C66) Front Mode Door Common Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

44-RECIRC OVERCURRENT (MTC) (CONTINUED)

4. CHECK THE (C139) REAR MODE DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C139) Rear Mode Door Driver circuit and the (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

- Yes** >> Repair all circuits with a resistance below 10k ohms for a short to the (C139) Rear Mode Door Driver circuit.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 5

5. CHECK THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C939) Rear Mode Door Common Driver circuit and (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

- Yes** >> Repair all circuits with a resistance below 10k ohms for a short to the (C939) Rear Mode Door Common Driver circuit.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 6

44-RECIRC OVERCURRENT (MTC) (CONTINUED)

6. CHECK THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C255) Left Blend Door Driver circuit and the (C268) Recirculation Door Driver circuit and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C255) Left Blend Door Driver circuit.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 7

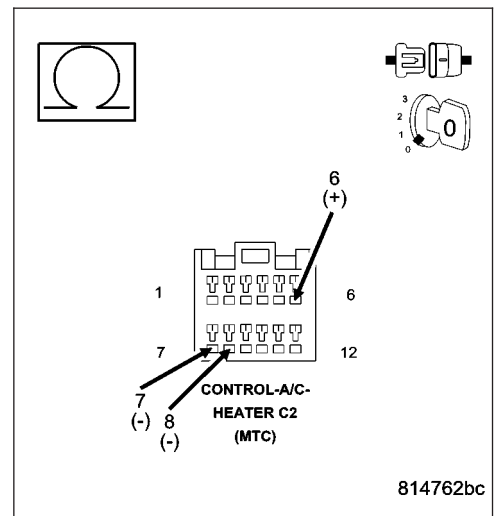

7. CHECK THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C55) Left Blend Door Common Driver circuit and the (C268) Recirculation Door Driver circuit and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C55) Left Blend Door Common Driver circuit.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 8

44-RECIRC OVERCURRENT (MTC) (CONTINUED)**8. CHECK THE FRONT MODE DOOR ACTUATOR CIRCUIT RESISTANCE**

Measure the resistance between the (C66) Front Mode Door Common Driver Circuit and the (C266) Front Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 9

No >> Go To 10

**9. CHECK THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C266) FRONT MODE DOOR DRIVER CIRCUIT**

Disconnect the Front Mode Door Actuator harness connector.

Measure the resistance between the (C66) Front Mode Door Common Driver Circuit and the (C266) Front Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C66) Front Mode Door Common Driver Circuit for a short to the (C266) Front Mode Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Front Mode Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

44-RECIRC OVERCURRENT (MTC) (CONTINUED)

10. CHECK THE REAR MODE DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C939) Rear Mode Door Common Driver Circuit and the (C139) Rear Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 11

No >> Go To 12

11. CHECK THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C139) REAR MODE DOOR DRIVER CIRCUIT

Disconnect the Rear Mode Door Actuator harness connector.

Measure the resistance between the (C939) Rear Mode Door Common Driver Circuit and the (C139) Rear Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C939) Rear Mode Door Common Driver Circuit for a short to the (C139) Rear Mode Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Rear Mode Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

44-RECIRC OVERCURRENT (MTC) (CONTINUED)**12. CHECK THE LEFT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE**

Measure the resistance between the (C55) Left Blend Door Common Driver Circuit and the (C255) Left Blend Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 13

No >> Go To 14

**13. CHECK THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT**

Disconnect the Left Blend Door Actuator harness connector.

Measure the resistance between the (C55) Left Blend Door Common Driver Circuit and the (C255) Left Blend Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C55) Left Blend Door Common Driver Circuit for a short to the (C255) Left Blend Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Left Blend Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

44-RECIRC OVERCURRENT (MTC) (CONTINUED)

14. CHECK THE RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C68) Recirculation Door Common Driver Circuit and the (C268) Recirculation Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 15

No >> Go To 16

15. CHECK THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT

Disconnect the Recirculation Door Actuator harness connector. Measure the resistance between the (C68) Recirculation Door Common Driver Circuit and the (C268) Recirculation Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C68) Recirculation Door Common Driver Circuit for a short to the (C268) Recirculation Door Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Recirculation Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

44-RECIRC OVERCURRENT (MTC) (CONTINUED)**16. VERIFY THAT THE FAULT IS STILL PRESENT**

Reconnect the A/C Heater Control C2 harness connector.

Reconnect all of the door actuator harness connectors.

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 44?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short that set the original fault. Repair as necessary. Then, if present, diagnose and repair all other DTCs. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

45-BLEND DOOR BOUND (MTC)

45-BLEND DOOR BOUND (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44) and Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). Diagnose and repair Overcurrent faults (DTC 41, 42, 43, and 44) before diagnosing Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56).

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the A/C Heater Control detects no commutator pulses when calibrating the left blend door, this DTC will set.

- **When Monitored:**

During actuator calibration.

- **Set Condition:**

If the A/C Heater Control detects no commutator pulses when calibrating the left blend door.

Possible Causes
ACTUATOR CIRCUIT TEST FAULTS PRESENT
OVERCURRENT FAULTS PRESENT
(C255) LEFT BLEND DOOR DRIVER CIRCUIT OPEN
(C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT OPEN
LEFT BLEND DOOR SEIZED, OBSTRUCTED
LEFT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

45-BLEND DOOR BOUND (MTC) (CONTINUED)

Diagnostic Test

1. VERIFY IF ANY ACTUATOR CIRCUIT TEST FAULTS OR OVERCURRENT FAULTS ARE PRESENT

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 41, 42, 43, 44, 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, then DTCs 63, 65, 67, or 69, and finally DTCs 41, 42, 43, or 44. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

No >> Go To 2

2. CHECK THE LEFT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance between the (C255) Left Blend Door Driver circuit and the (C55) Left Blend Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance above 70.0 ohms?

Yes >> Go To 3

No >> Go To 5

45-BLEND DOOR BOUND (MTC) (CONTINUED)

3. CHECK THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT FOR AN OPEN

Disconnect the Left Blend Door Actuator harness connector.
 Measure the resistance of the (C255) Left Blend Door Driver circuit between the A/C Heater Control C2 harness connector and the Left Blend Door Actuator harness connector.

Is the resistance below 5.0 ohms?

- Yes** >> Go To 4
- No** >> Repair the (C255) Left Blend Door Driver circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT FOR AN OPEN

Measure the resistance of the (C55) Left Blend Door Common Driver Circuit between the A/C Heater Control C2 harness connector and the Left Blend Door Actuator harness connector.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Left Blend Door Actuator in accordance with the Service Information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Repair the (C55) Left Blend Door Common Driver circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

45-BLEND DOOR BOUND (MTC) (CONTINUED)**5. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE LEFT BLEND DOOR TO SEIZE**

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the left blend door to seize.

Are there any physical or mechanical problems with the door, housing, linkage, or actuator?

Yes >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 6

6. CHECK LEFT BLEND DOOR TRAVEL

Remove the Left Blend Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over the entire span of travel (approximately 90 degrees).

Does the door operate smoothly in both directions over the entire span of travel?

Yes >> Replace the Left Blend Door Actuator in accordance with the Service Information. Then, Go To 7.

No >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

45-BLEND DOOR BOUND (MTC) (CONTINUED)**7. VERIFY THAT FAULT IS STILL PRESENT**

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 45?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

46-FRONT MODE DOOR BOUND (MTC)

46-FRONT MODE DOOR BOUND (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44) and Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). Diagnose and repair Overcurrent faults (DTC 41, 42, 43, and 44) before diagnosing Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56).

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the A/C Heater Control detects no commutator pulses when calibrating the front mode door, this DTC will set.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the A/C Heater Control detects no commutator pulses when calibrating the front mode door.

Possible Causes
ACTUATOR CIRCUIT TEST FAULTS PRESENT
OVERCURRENT FAULTS PRESENT
(C266) FRONT MODE DOOR DRIVER CIRCUIT OPEN
(C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT OPEN
FRONT MODE DOOR SEIZED, OBSTRUCTED
FRONT MODE DOOR ACTUATOR
A/C HEATER CONTROL

46-FRONT MODE DOOR BOUND (MTC) (CONTINUED)

Diagnostic Test

1. VERIFY IF ANY ACTUATOR CIRCUIT TEST FAULTS OR OVERCURRENT FAULTS ARE PRESENT

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 41, 42, 43, 44, 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, then DTCs 63, 65, 67, or 69, and finally DTCs 41, 42, 43, or 44. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

No >> Go To 2

2. CHECK THE FRONT MODE DOOR ACTUATOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance between the (C266) Front Mode Door Driver circuit and the (C66) Front Mode Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance above 70.0 ohms?

Yes >> Go To 3

No >> Go To 5

46-FRONT MODE DOOR BOUND (MTC) (CONTINUED)

3. CHECK THE (C266) FRONT MODE DOOR DRIVER CIRCUIT FOR AN OPEN

Disconnect the Front Mode Door Actuator harness connector.
 Measure the resistance of the (C266) Front Mode Door Driver circuit between the A/C Heater Control C2 harness connector and the Front Mode Door Actuator harness connector.

Is the resistance below 5.0 ohms?

- Yes** >> Go To 4
- No** >> Repair the (C266) Front Mode Door Driver circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT FOR AN OPEN

Measure the resistance of the (C66) Front Mode Door Common Driver Circuit between the A/C Heater Control C2 harness connector and the Front Mode Door Actuator harness connector.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Front Mode Door Actuator in accordance with the Service Information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Repair the (C66) Front Mode Door Common Driver circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

46-FRONT MODE DOOR BOUND (MTC) (CONTINUED)**5. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE FRONT MODE DOOR TO SEIZE**

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the front mode door to seize.

Are there any physical or mechanical problems with the door, housing, linkage, or actuator?

- Yes** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 6
-

6. CHECK FRONT MODE DOOR TRAVEL

Remove the Front Mode Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over the entire span of travel (approximately 350 degrees).

Does the door operate smoothly in both directions over the entire span of travel?

- Yes** >> Replace the Front Mode Door Actuator in accordance with the Service Information. Then, Go To 7.
- No** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

46-FRONT MODE DOOR BOUND (MTC) (CONTINUED)**7. VERIFY THAT FAULT IS STILL PRESENT**

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 46?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

47-RECIRC DOOR BOUND (MTC)

47-RECIRC DOOR BOUND (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44) and Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). Diagnose and repair Overcurrent faults (DTC 41, 42, 43, and 44) before diagnosing Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56).

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the A/C Heater Control detects no commutator pulses when calibrating the recirculation door, this DTC will set.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the A/C Heater Control detects no commutator pulses when calibrating the recirculation door.

Possible Causes
ACTUATOR CIRCUIT TEST FAULTS PRESENT
OVERCURRENT FAULTS PRESENT
(C268) RECIRCULATION DOOR DRIVER CIRCUIT OPEN
(C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT OPEN
RECIRCULATION DOOR SEIZED, OBSTRUCTED
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

47-RECIRC DOOR BOUND (MTC) (CONTINUED)

Diagnostic Test

1. VERIFY IF ANY ACTUATOR CIRCUIT TEST FAULTS OR OVERCURRENT FAULTS ARE PRESENT

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 41, 42, 43, 44, 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, then DTCs 63, 65, 67, or 69, and finally DTCs 41, 42, 43, or 44. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

No >> Go To 2

2. CHECK THE RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance between the (C268) Recirculation Door Driver circuit and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance above 70.0 ohms?

Yes >> Go To 3

No >> Go To 5

47-RECIRC DOOR BOUND (MTC) (CONTINUED)

3. CHECK THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT FOR AN OPEN

Disconnect the Recirculation Door Actuator harness connector. Measure the resistance of the (C268) Recirculation Door Driver circuit between the A/C Heater Control C2 harness connector and the Recirculation Door Actuator harness connector.

Is the resistance below 5.0 ohms?

- Yes** >> Go To 4
- No** >> Repair the (C268) Recirculation Door Driver circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT FOR AN OPEN

Measure the resistance of the (C68) Recirculation Door Common Driver Circuit between the A/C Heater Control C2 harness connector and the Recirculation Door Actuator harness connector.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Recirculation Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Repair the (C68) Recirculation Door Common Driver circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

47-RECIRC DOOR BOUND (MTC) (CONTINUED)**5. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE RECIRCULATION DOOR TO SEIZE**

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the recirculation door to seize.

Are there any physical or mechanical problems with the door, housing, linkage, or actuator?

Yes >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 6

6. CHECK RECIRCULATION DOOR TRAVEL

Remove the Recirculation Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over the entire span of travel (approximately 85 degrees).

Does the door operate smoothly in both directions over the entire span of travel?

Yes >> Replace the Recirculation Door Actuator in accordance with the Service Information. Then, Go To 7.

No >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

47-RECIRC DOOR BOUND (MTC) (CONTINUED)**7. VERIFY THAT FAULT IS STILL PRESENT**

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

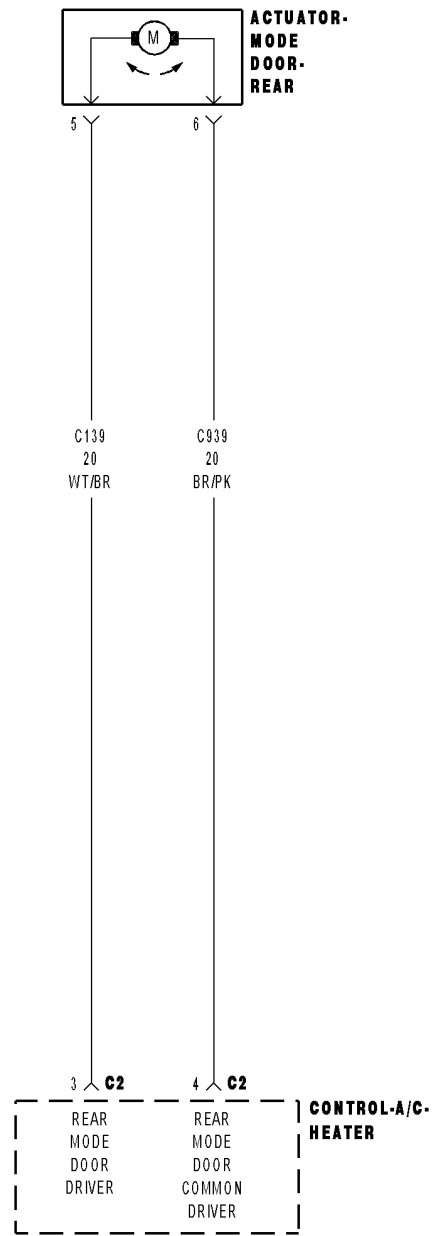

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 47?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

48-REAR MODE DOOR BOUND (MTC)

48-REAR MODE DOOR BOUND (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44) and Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). Diagnose and repair Overcurrent faults (DTC 41, 42, 43, and 44) before diagnosing Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56).

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the A/C Heater Control detects no commutator pulses when calibrating the rear mode door, this DTC will set.

- **When Monitored:**

During actuator calibration.

- **Set Condition:**

If the A/C Heater Control detects no commutator pulses when calibrating the rear mode door.

Possible Causes
ACTUATOR CIRCUIT TEST FAULTS PRESENT
OVERCURRENT FAULTS PRESENT
(C139) REAR MODE DOOR DRIVER CIRCUIT OPEN
(C939) REAR MODE DOOR COMMON DRIVER CIRCUIT OPEN
REAR MODE DOOR SEIZED, OBSTRUCTED
REAR MODE DOOR ACTUATOR
A/C HEATER CONTROL

48-REAR MODE DOOR BOUND (MTC) (CONTINUED)

Diagnostic Test

1. VERIFY IF ANY ACTUATOR CIRCUIT TEST FAULTS OR OVERCURRENT FAULTS ARE PRESENT

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 41, 42, 43, 44, 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, then DTCs 63, 65, 67, or 69, and finally DTCs 41, 42, 43, or 44. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

No >> Go To 2

2. CHECK THE REAR MODE DOOR ACTUATOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance between the (C139) Rear Mode Door Driver circuit and the (C939) Rear Mode Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance above 70.0 ohms?

Yes >> Go To 3

No >> Go To 5

48-REAR MODE DOOR BOUND (MTC) (CONTINUED)**3. CHECK THE (C139) REAR MODE DOOR DRIVER CIRCUIT FOR AN OPEN**

Disconnect the Rear Mode Door Actuator harness connector.

Measure the resistance of the (C139) Rear Mode Door Driver circuit between the A/C Heater Control C2 harness connector and the Rear Mode Door Actuator harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

No >> Repair the (C139) Rear Mode Door Driver circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**4. CHECK THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT FOR AN OPEN**

Measure the resistance of the (C939) Rear Mode Door Common Driver Circuit between the A/C Heater Control C2 harness connector and the Rear Mode Door Actuator harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the Rear Mode Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (C939) Rear Mode Door Common Driver circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

48-REAR MODE DOOR BOUND (MTC) (CONTINUED)**5. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE REAR MODE DOOR TO SEIZE**

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the rear mode door to seize.

Are there any physical or mechanical problems with the door, housing, linkage, or actuator?

Yes >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 6

6. CHECK REAR MODE DOOR TRAVEL

Remove the Rear Mode Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over the entire span of travel (approximately 155 degrees).

Does the door operate smoothly in both directions over the entire span of travel?

Yes >> Replace the Rear Mode Door Actuator in accordance with the Service Information. Then, Go To 7.

No >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

48-REAR MODE DOOR BOUND (MTC) (CONTINUED)**7. VERIFY THAT FAULT IS STILL PRESENT**

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 48?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

51-RECIRC DOOR RANGE TOO SMALL (MTC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44) and Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). Diagnose and repair Overcurrent faults (DTC 41, 42, 43, and 44) before diagnosing Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56).

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the A/C Heater Control detects too few commutator pulses when calibrating the recirculation door, this DTC will set.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the A/C Heater Control detects too few commutator pulses when calibrating the recirculation door.

Possible Causes
ACTUATOR CIRCUIT TEST FAULTS PRESENT
OVERCURRENT FAULTS PRESENT
RECIRCULATION DOOR BINDING, OBSTRUCTED
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

51-RECIRC DOOR RANGE TOO SMALL (MTC) (CONTINUED)**Diagnostic Test****1. VERIFY IF ANY ACTUATOR CIRCUIT TEST FAULTS OR OVERCURRENT FAULTS ARE PRESENT**

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 41, 42, 43, 44, 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, then DTCs 63, 65, 67, or 69, and finally DTCs 41, 42, 43, or 44. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

No >> Go To 2

2. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE RECIRCULATION DOOR TO BIND

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the recirculation door to bind.

Are there any physical or mechanical problems with the door, housing, linkage, or actuator?

Yes >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

51-RECIRC DOOR RANGE TOO SMALL (MTC) (CONTINUED)**3. CHECK RECIRCULATION DOOR TRAVEL**

Remove the Recirculation Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over the entire span of travel (approximately 85 degrees).

Does the door operate smoothly in both directions over the entire span of travel?

Yes >> Replace the Recirculation Door Actuator in accordance with the Service Information. Then, Go To 4.

No >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. VERIFY THAT THE FAULT IS STILL PRESENT

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 51?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

52-RECIRC DOOR RANGE TOO LARGE (MTC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44) and Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). Diagnose and repair Overcurrent faults (DTC 41, 42, 43, and 44) before diagnosing Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56).

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the A/C Heater Control detects too many commutator pulses when calibrating the recirculation door, this DTC will set.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the A/C Heater Control detects too many commutator pulses when calibrating the recirculation door.

Possible Causes
ACTUATOR CIRCUIT TEST FAULTS PRESENT
OVERCURRENT FAULTS PRESENT
RECIRCULATION DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, BROKEN
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

52-RECIRC DOOR RANGE TOO LARGE (MTC) (CONTINUED)**Diagnostic Test****1. VERIFY IF ANY ACTUATOR CIRCUIT TEST FAULTS OR OVERCURRENT FAULTS ARE PRESENT**

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 41, 42, 43, 44, 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, then DTCs 63, 65, 67, or 69, and finally DTCs 41, 42, 43, or 44. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

No >> Go To 2

2. CHECK FOR A BROKEN RECIRCULATION DOOR ACTUATOR

Turn the ignition off.

Remove the Recirculation Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

Yes >> Replace the Recirculation Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

52-RECIRC DOOR RANGE TOO LARGE (MTC) (CONTINUED)**3. CHECK THE RECIRCULATION DOOR & A/C HEATER HOUSING FOR WARPED, WORN, & DAMAGED COMPONENTS**

Inspect for excessively worn door linkage and for a damaged or broken A/C Heater Housing Assembly. Inspect for a warped or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 85 degrees.

Are there any physical or mechanical problems with the door or housing?

- Yes** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Recirculation Door Actuator in accordance with the Service Information. Then, Go To 4.
-

4. VERIFY THAT THE FAULT IS STILL PRESENT

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 52?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

53-FRONT MODE DOOR LINKAGE BROKEN (MTC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44) and Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). Diagnose and repair Overcurrent faults (DTC 41, 42, 43, and 44) before diagnosing Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56).

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the A/C Heater Control detects an excessive amount of commutator pulses when calibrating the front mode door, this DTC will set.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the A/C Heater Control detects an excessive amount of commutator pulses when calibrating the front mode door.

Possible Causes
ACTUATOR CIRCUIT TEST FAULTS PRESENT
OVERCURRENT FAULTS PRESENT
FRONT MODE DOOR OR A/C HEATER HOUSING COMPONENTS DISCONNECTED, MISSING, BROKEN
FRONT MODE DOOR ACTUATOR
A/C HEATER CONTROL

53-FRONT MODE DOOR LINKAGE BROKEN (MTC) (CONTINUED)**Diagnostic Test****1. VERIFY IF ANY ACTUATOR CIRCUIT TEST FAULTS OR OVERCURRENT FAULTS ARE PRESENT**

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 41, 42, 43, 44, 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, then DTCs 63, 65, 67, or 69, and finally DTCs 41, 42, 43, or 44. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

No >> Go To 2

2. CHECK FOR A BROKEN FRONT MODE DOOR ACTUATOR

Turn the ignition off.

Remove the Front Mode Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

Yes >> Replace the Front Mode Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

53-FRONT MODE DOOR LINKAGE BROKEN (MTC) (CONTINUED)**3. CHECK THE FRONT MODE DOOR & A/C HEATER HOUSING FOR DISCONNECTED, MISSING, & BROKEN COMPONENTS**

Inspect for disconnected, missing, or broken door linkage. Inspect for a damaged or broken A/C Heater Housing Assembly and a broken door. Rotate the door from stop to stop. The door should rotate approximately 350 degrees.

Are there any physical or mechanical problems with the door or housing?

- Yes** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Front Mode Door Actuator in accordance with the Service Information. Then, Go To 4.
-

4. VERIFY THAT THE FAULT IS STILL PRESENT

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 53?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

54-REAR MODE DOOR LINKAGE BROKEN (MTC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44) and Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). Diagnose and repair Overcurrent faults (DTC 41, 42, 43, and 44) before diagnosing Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56).

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the A/C Heater Control detects an excessive amount of commutator pulses when calibrating the rear mode door, this DTC will set.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the A/C Heater Control detects an excessive amount of commutator pulses when calibrating the rear mode door.

Possible Causes
ACTUATOR CIRCUIT TEST FAULTS PRESENT
OVERCURRENT FAULTS PRESENT
REAR MODE DOOR OR A/C HEATER HOUSING COMPONENTS DISCONNECTED, MISSING, BROKEN
REAR MODE DOOR ACTUATOR
A/C HEATER CONTROL

54-REAR MODE DOOR LINKAGE BROKEN (MTC) (CONTINUED)**Diagnostic Test****1. VERIFY IF ANY ACTUATOR CIRCUIT TEST FAULTS OR OVERCURRENT FAULTS ARE PRESENT**

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 41, 42, 43, 44, 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, then DTCs 63, 65, 67, or 69, and finally DTCs 41, 42, 43, or 44. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

No >> Go To 2

2. CHECK FOR A BROKEN REAR MODE DOOR ACTUATOR

Turn the ignition off.

Remove the Rear Mode Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

Yes >> Replace the Rear Mode Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

54-REAR MODE DOOR LINKAGE BROKEN (MTC) (CONTINUED)**3. CHECK THE REAR MODE DOOR & A/C HEATER HOUSING FOR DISCONNECTED, MISSING, & BROKEN COMPONENTS**

Inspect for disconnected, missing, or broken door linkage. Inspect for a damaged or broken A/C Heater Housing Assembly and a broken door. Rotate the door from stop to stop. The door should rotate approximately 155 degrees.

Are there any physical or mechanical problems with the door or housing?

- Yes** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Rear Mode Door Actuator in accordance with the Service Information. Then, Go To 4.
-

4. VERIFY THAT THE FAULT IS STILL PRESENT

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 54?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

55-BLEND DOOR LINKAGE BROKEN (MTC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44) and Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). Diagnose and repair Overcurrent faults (DTC 41, 42, 43, and 44) before diagnosing Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56).

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the A/C Heater Control detects an excessive amount of commutator pulses when calibrating the left blend door, this DTC will set.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the A/C Heater Control detects an excessive amount of commutator pulses when calibrating the left blend door.

Possible Causes
ACTUATOR CIRCUIT TEST FAULTS PRESENT
OVERCURRENT FAULTS PRESENT
LEFT BLEND DOOR OR A/C HEATER HOUSING COMPONENTS DISCONNECTED, MISSING, BROKEN
LEFT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

55-BLEND DOOR LINKAGE BROKEN (MTC) (CONTINUED)**Diagnostic Test****1. VERIFY IF ANY ACTUATOR CIRCUIT TEST FAULTS OR OVERCURRENT FAULTS ARE PRESENT**

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 41, 42, 43, 44, 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, then DTCs 63, 65, 67, or 69, and finally DTCs 41, 42, 43, or 44. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

No >> Go To 2

2. CHECK FOR A BROKEN LEFT BLEND DOOR ACTUATOR

Turn the ignition off.

Remove the Left Blend Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

Yes >> Replace the Left Blend Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

55-BLEND DOOR LINKAGE BROKEN (MTC) (CONTINUED)**3. CHECK THE LEFT BLEND DOOR & A/C HEATER HOUSING FOR DISCONNECTED, MISSING, & BROKEN COMPONENTS**

Inspect for disconnected, missing, or broken door linkage. Inspect for a damaged or broken A/C Heater Housing Assembly and a broken door. Rotate the door from stop to stop. The door should rotate approximately 90 degrees.

Are there any physical or mechanical problems with the door or housing?

- Yes** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Left Blend Door Actuator in accordance with the Service Information. Then, Go To 4.
-

4. VERIFY THAT THE FAULT IS STILL PRESENT

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 55?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

56—RECIRC DOOR LINKAGE BROKEN (MTC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44) and Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). Diagnose and repair Overcurrent faults (DTC 41, 42, 43, and 44) before diagnosing Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56).

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the A/C Heater Control detects an excessive amount of commutator pulses when calibrating the recirculation door, this DTC will set.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the A/C Heater Control detects an excessive amount of commutator pulses when calibrating the recirculation door.

Possible Causes
ACTUATOR CIRCUIT TEST FAULTS PRESENT
OVERCURRENT FAULTS PRESENT
RECIRCULATION DOOR OR A/C HEATER HOUSING COMPONENTS DISCONNECTED, MISSING, BROKEN
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

56-RECIRC DOOR LINKAGE BROKEN (MTC) (CONTINUED)**Diagnostic Test****1. VERIFY IF ANY ACTUATOR CIRCUIT TEST FAULTS OR OVERCURRENT FAULTS ARE PRESENT**

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any of the following DTCs: 41, 42, 43, 44, 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, or 72?

Yes >> As present, diagnose and repair the faults in the following order: DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, then DTCs 63, 65, 67, or 69, and finally DTCs 41, 42, 43, or 44. Refer to the Table Of Contents in this section for a complete list of HVAC related symptoms.

No >> Go To 2

2. CHECK FOR A BROKEN RECIRCULATION DOOR ACTUATOR

Turn the ignition off.

Remove the Recirculation Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

Yes >> Replace the Recirculation Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

56-RECIRC DOOR LINKAGE BROKEN (MTC) (CONTINUED)**3. CHECK THE RECIRCULATION DOOR & A/C HEATER HOUSING FOR DISCONNECTED, MISSING, & BROKEN COMPONENTS**

Inspect for disconnected, missing, or broken door linkage. Inspect for a damaged or broken A/C Heater Housing Assembly and a broken door. Rotate the door from stop to stop. The door should rotate approximately 85 degrees.

Are there any physical or mechanical problems with the door or housing?

- Yes** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Recirculation Door Actuator in accordance with the Service Information. Then, Go To 4.

4. VERIFY THAT THE FAULT IS STILL PRESENT

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

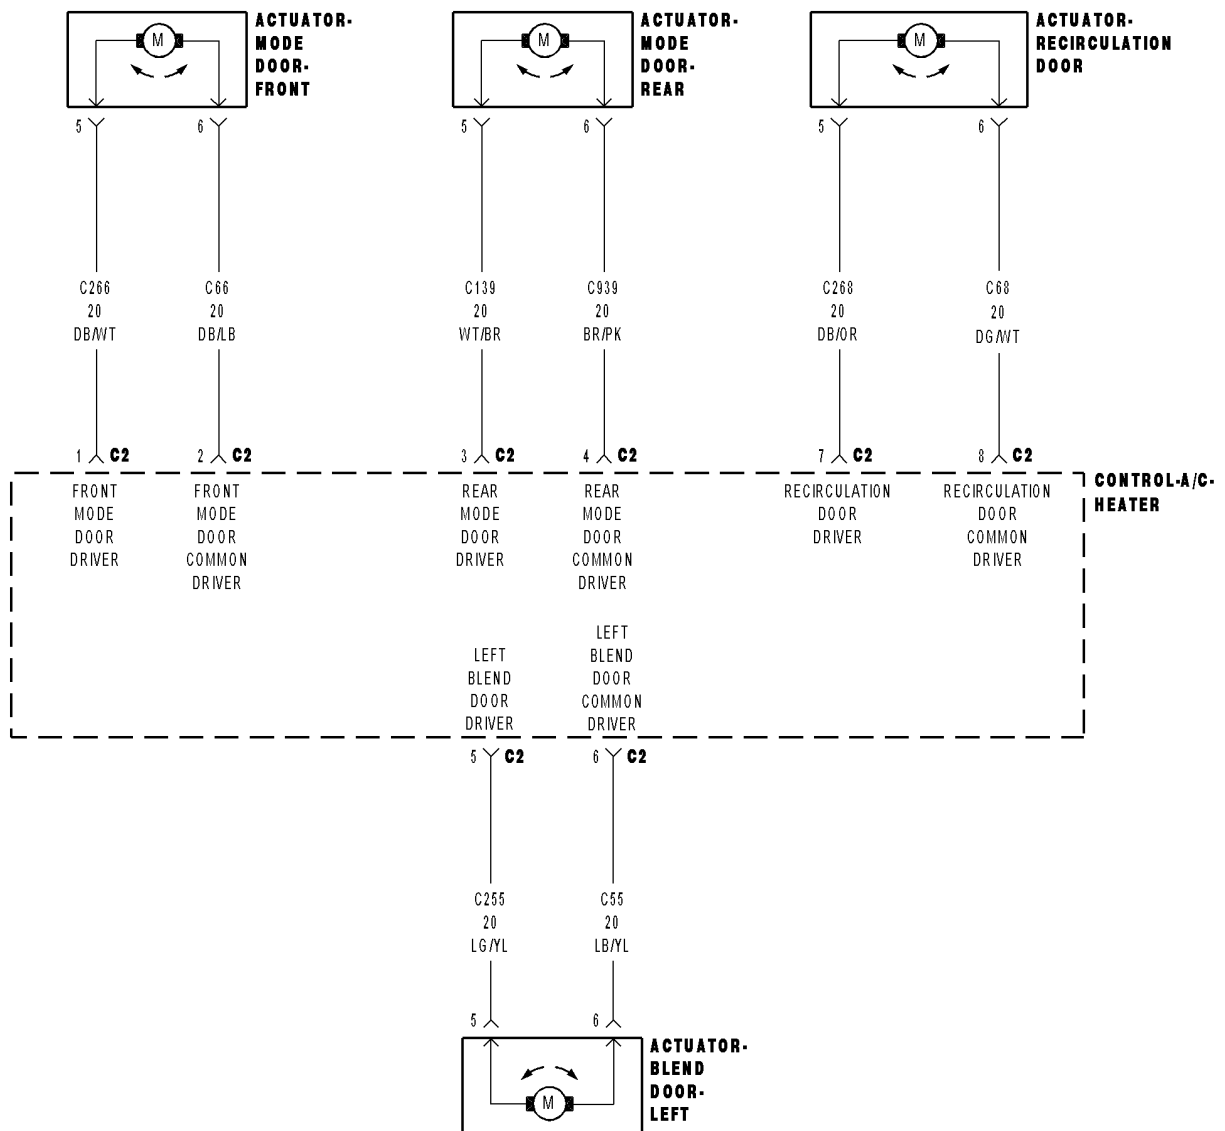

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 56?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

61-COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)

For the Manual Temperature Control circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: This DTC will display as active if the ignition is not cycled after running the Actuator Circuit Test / Door Calibration Function. Otherwise, it will display as stored until cleared. By running the Actuator Circuit Test / Door Calibration Function, the A/C Heater Control can identify up to three door driver circuits shorted simultaneously. A DTC 72 will set if more than three door driver circuits are shorted in the same direction (e.g. four door driver circuits all shorted to ground) or if two or more door driver circuits are shorted with at least one door driver circuit shorted to ignition and one door driver circuit shorted to ground. To ensure a proper diagnosis, diagnose and repair Actuator Circuit Test faults in the following order: If present, diagnose and repair DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, and finally DTCs 63, 65, 67, or 69. In addition, always test the door driver circuits after each repair by clearing DTCs, and then running the Actuator Circuit Test / Door Calibration Function, and then checking for DTCs.

- **When Monitored:**

When running the Actuator Circuit Test / Door Calibration Function.

- **Set Condition:**

If the A/C Heater Control detects a short to ground on the (C66) Front Mode Door Common Driver circuit / (C939) Rear Mode Door Common Driver circuit / (C55) Left Blend Door Common Driver circuit / (C68) Recirculation Door Common Driver circuit.

Possible Causes
(C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT / (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT / (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT / (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT SHORTED TO GROUND
(C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT / (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT / (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT / (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
FRONT MODE DOOR ACTUATOR
REAR MODE DOOR ACTUATOR
LEFT BLEND DOOR ACTUATOR
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

61-COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)

Diagnostic Test

- 1. CHECK THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT, THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT, THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

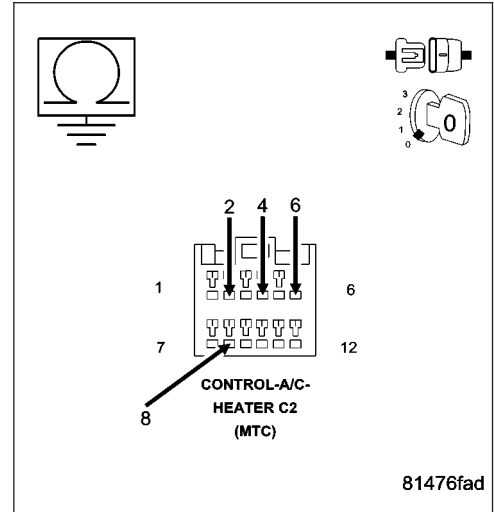

Measure the resistance of the (C66) Front Mode Door Common Driver Circuit, the (C939) Rear Mode Door Common Driver circuit, the (C55) Left Blend Door Common Driver circuit, and the (C68) Recirculation Door Common Driver circuit between ground and the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

- 2. CHECK THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C139) REAR MODE DOOR DRIVER CIRCUIT, (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT, (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT**

Measure the resistance between the (C66) Front Mode Door Common Driver circuit and the (C139) Rear Mode Door Driver circuit, (C939) Rear Mode Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C66) Front Mode Door Common Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

61-COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)

3. CHECK THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C266) FRONT MODE DOOR DRIVER CIRCUIT, (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C939) Rear Mode Door Common Driver circuit and the (C266) Front Mode Door Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C939) Rear Mode Door Common Driver circuit.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

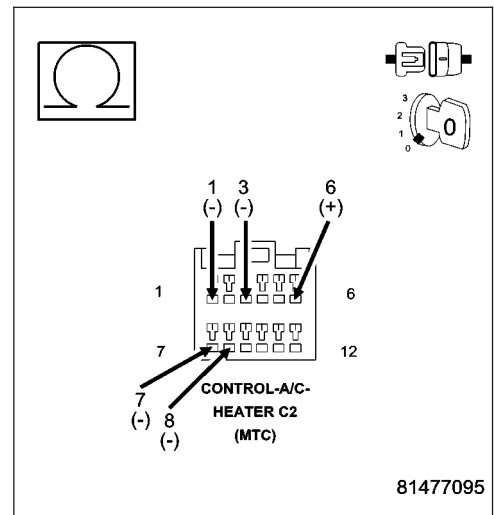

4. CHECK THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C266) FRONT MODE DOOR DRIVER CIRCUIT, (C139) REAR MODE DOOR DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C55) Left Blend Door Common Driver circuit and the (C266) Front Mode Door Driver circuit, (C139) Rear Mode Door Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C55) Left Blend Door Common Driver circuit.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 5

61-COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)

5. CHECK THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C266) FRONT MODE DOOR DRIVER CIRCUIT, (C139) REAR MODE DOOR DRIVER CIRCUIT, & THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT

Measure the resistance between the (C68) Recirculation Door Common Driver circuit and the (C266) Front Mode Door Driver circuit, (C139) Rear Mode Door Driver circuit, and the (C255) Left Blend Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C68) Recirculation Door Common Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 6

6. CHECK THE FRONT MODE DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C66) Front Mode Door Common Driver Circuit and the (C266) Front Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 7

No >> Go To 8

61-COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)**7. CHECK THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C266) FRONT MODE DOOR DRIVER CIRCUIT**

Disconnect the Front Mode Door Actuator harness connector.

Measure the resistance between the (C66) Front Mode Door Common Driver Circuit and the (C266) Front Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

- Yes** >> Repair the (C66) Front Mode Door Common Driver Circuit for a short to the (C266) Front Mode Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Front Mode Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**8. CHECK THE REAR MODE DOOR ACTUATOR CIRCUIT RESISTANCE**

Measure the resistance between the (C939) Rear Mode Door Common Driver Circuit and the (C139) Rear Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

- Yes** >> Go To 9
- No** >> Go To 10

61-COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)

9. CHECK THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C139) REAR MODE DOOR DRIVER CIRCUIT

Disconnect the Rear Mode Door Actuator harness connector.
 Measure the resistance between the (C939) Rear Mode Door Common Driver Circuit and the (C139) Rear Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

- Yes** >> Repair the (C939) Rear Mode Door Common Driver Circuit for a short to the (C139) Rear Mode Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Rear Mode Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

10. CHECK THE LEFT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C55) Left Blend Door Common Driver Circuit and the (C255) Left Blend Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

- Yes** >> Go To 11
- No** >> Go To 12

61-COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)

11. CHECK THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT

Disconnect the Left Blend Door Actuator harness connector.
 Measure the resistance between the (C55) Left Blend Door Common Driver Circuit and the (C255) Left Blend Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

- Yes** >> Repair the (C55) Left Blend Door Common Driver Circuit for a short to the (C255) Left Blend Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Left Blend Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

12. CHECK THE RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C68) Recirculation Door Common Driver Circuit and the (C268) Recirculation Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

- Yes** >> Go To 13
- No** >> Go To 14

61-COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)

13. CHECK THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT

Disconnect the Recirculation Door Actuator harness connector.

Measure the resistance between the (C68) Recirculation Door Common Driver Circuit and the (C268) Recirculation Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C68) Recirculation Door Common Driver Circuit for a short to the (C268) Recirculation Door Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Recirculation Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

81476e49

61-COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)**14. VERIFY THAT THE FAULT IS STILL PRESENT**

Reconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 61?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short that set the original fault. Repair as necessary. Then, if present, diagnose and repair all other DTCs. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

62-COMMON DOOR DRIVER CIRCUIT SHORTED TO IGNITION (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: This DTC will display as active if the ignition is not cycled after running the Actuator Circuit Test / Door Calibration Function. Otherwise, it will display as stored until cleared. By running the Actuator Circuit Test / Door Calibration Function, the A/C Heater Control can identify up to three door driver circuits shorted simultaneously. A DTC 72 will set if more than three door driver circuits are shorted in the same direction (e.g. four door driver circuits all shorted to ground) or if two or more door driver circuits are shorted with at least one door driver circuit shorted to ignition and one door driver circuit shorted to ground. To ensure a proper diagnosis, diagnose and repair Actuator Circuit Test faults in the following order: If present, diagnose and repair DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, and finally DTCs 63, 65, 67, or 69. In addition, always test the door driver circuits after each repair by clearing DTCs, and then running the Actuator Circuit Test / Door Calibration Function, and then checking for DTCs.

- **When Monitored:**

When running the Actuator Circuit Test / Door Calibration Function.

- **Set Condition:**

If the A/C Heater Control detects a short to voltage on the (C66) Front Mode Door Common Driver circuit / (C939) Rear Mode Door Common Driver circuit / (C55) Left Blend Door Common Driver circuit / (C68) Recirculation Door Common Driver circuit.

Possible Causes
(C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT / (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT / (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT / (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT SHORTED TO VOLTAGE
A/C HEATER CONTROL

Diagnostic Test

1. CHECK THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT, (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

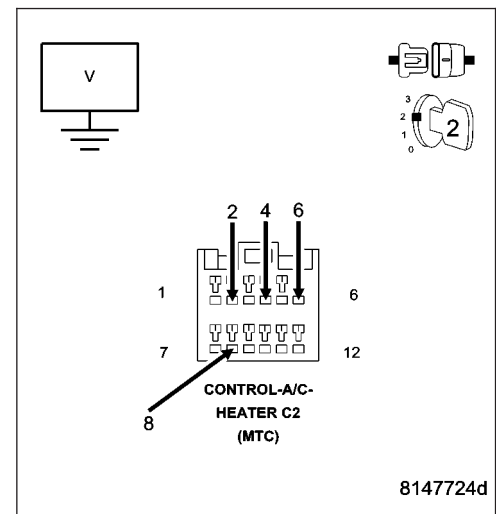

Measure the voltage of the (C66) Front Mode Door Common Driver circuit, (C939) Rear Mode Door Common Driver circuit, (C55) Left Blend Door Common Driver circuit, (C68) Recirculation Door Common Driver circuit.

Is the voltage above 0.2 volts on any of the circuits?

Yes >> Repair all circuits with a voltage above 0.2 volts for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

62-COMMON DOOR DRIVER CIRCUIT SHORTED TO IGNITION (MTC) (CONTINUED)**2. VERIFY THAT THE FAULT IS STILL PRESENT**

Turn the ignition off.

Reconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.

- **When Monitored:**
When running the Actuator Circuit Test / Door Calibration Function.
- **Set Condition:**
If the A/C Heater Control detects a short to ground on the (C266) Front Mode Door Driver circuit.

Possible Causes
(C266) FRONT MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C266) FRONT MODE DOOR DRIVER CIRCUIT SHORTED TO (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT
FRONT MODE DOOR ACTUATOR
A/C HEATER CONTROL

Diagnostic Test

1. CHECK THE (C266) FRONT MODE DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance of the (C266) Front Mode Door Driver circuit between ground and the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C266) Front Mode Door Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

63-FRONT MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)**2. CHECK THE FRONT MODE DOOR ACTUATOR CIRCUIT RESISTANCE**

Measure the resistance between the (C266) Front Mode Door Driver circuit and the (C66) Front Mode Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 3

No >> Go To 4

**3. CHECK THE (C266) FRONT MODE DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT**

Disconnect the Front Mode Door Actuator harness connector.

Measure the resistance between the (C266) Front Mode Door Driver circuit and the (C66) Front Mode Door Common Driver Circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C266) Front Mode Door Driver circuit for a short to the (C66) Front Mode Door Common Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Front Mode Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

63-FRONT MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)**4. VERIFY THAT THE FAULT IS STILL PRESENT**

Reconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 63?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short that set the original fault. Repair as necessary. Then, if present, diagnose and repair all other DTCs. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

64-FRONT MODE DOOR DRIVER CIRCUIT SHORTED TO IGNITION (MTC)

64-FRONT MODE DOOR DRIVER CIRCUIT SHORTED TO IGNITION (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: This DTC will display as active if the ignition is not cycled after running the Actuator Circuit Test / Door Calibration Function. Otherwise, it will display as stored until cleared. By running the Actuator Circuit Test / Door Calibration Function, the A/C Heater Control can identify up to three door driver circuits shorted simultaneously. A DTC 72 will set if more than three door driver circuits are shorted in the same direction (e.g. four door driver circuits all shorted to ground) or if two or more door driver circuits are shorted with at least one door driver circuit shorted to ignition and one door driver circuit shorted to ground. - **When Monitored:**
When running the Actuator Circuit Test / Door Calibration Function.
- **Set Condition:**
If the A/C Heater Control detects a short to voltage on the (C266) Front Mode Door Driver circuit.

Possible Causes
(C266) FRONT MODE DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
A/C HEATER CONTROL

Diagnostic Test

1. CHECK THE (C266) FRONT MODE DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.
 Disconnect the A/C Heater Control C2 harness connector.
 Turn the ignition on.
 Measure the voltage of the (C266) Front Mode Door Driver circuit.

Is the voltage above 0.2 volts?

- Yes** >> Repair the (C266) Front Mode Door Driver circuit for a short to voltage.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 2

64-FRONT MODE DOOR DRIVER CIRCUIT SHORTED TO IGNITION (MTC) (CONTINUED)**2. VERIFY THAT THE FAULT IS STILL PRESENT**

Turn the ignition off.

Reconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

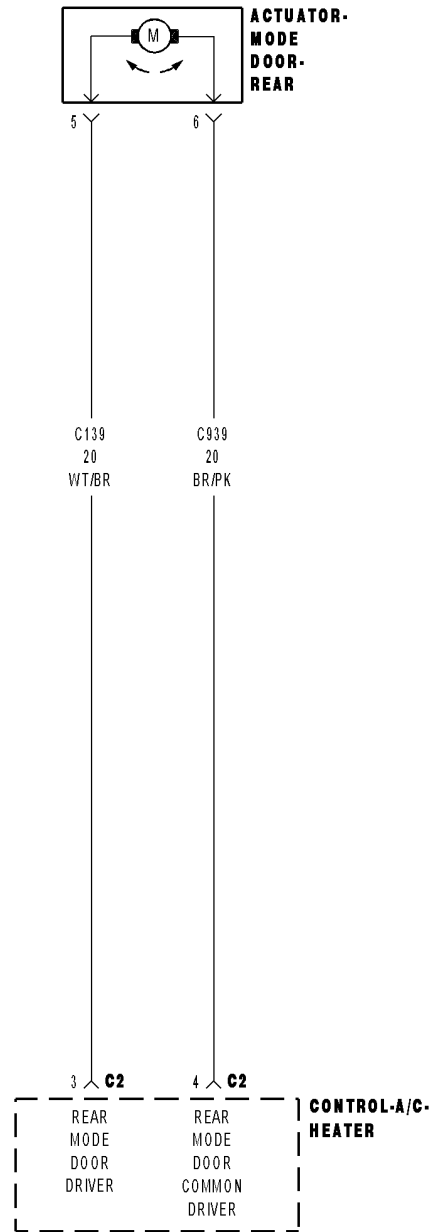

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 64?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short that set the original fault. Repair as necessary. Then, if present, diagnose and repair all other DTCs. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

65-REAR MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC)

ACTUATOR-MODE DOOR-REAR

CONTROL-A/C-HEATER C2 (MTC)

65-REAR MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: This DTC will display as active if the ignition is not cycled after running the Actuator Circuit Test / Door Calibration Function. Otherwise, it will display as stored until cleared. By running the Actuator Circuit Test / Door Calibration Function, the A/C Heater Control can identify up to three door driver circuits shorted simultaneously. A DTC 72 will set if more than three door driver circuits are shorted in the same direction (e.g. four door driver circuits all shorted to ground) or if two or more door driver circuits are shorted with at least one door driver circuit shorted to ignition and one door driver circuit shorted to ground. To ensure a proper diagnosis, diagnose and repair Actuator Circuit Test faults in the following order: If present, diagnose and repair DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, and finally DTCs 63, 65, 67, or 69. In addition, always test the door driver circuits after each repair by clearing DTCs, and then running the Actuator Circuit Test / Door Calibration Function, and then checking for DTCs.

- **When Monitored:**
When running the Actuator Circuit Test / Door Calibration Function.
- **Set Condition:**
If the A/C Heater Control detects a short to ground on the (C139) Rear Mode Door Driver circuit.

Possible Causes

(C139) REAR MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND
 (C139) REAR MODE DOOR DRIVER CIRCUIT SHORTED TO (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT
 REAR MODE DOOR ACTUATOR
 A/C HEATER CONTROL

Diagnostic Test**1. CHECK THE (C139) REAR MODE DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance of the (C139) Rear Mode Door Driver circuit between ground and the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C139) Rear Mode Door Driver circuit for a short to ground.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

65-REAR MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)

2. CHECK THE REAR MODE DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C139) Rear Mode Door Driver circuit and the (C939) Rear Mode Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 3

No >> Go To 4

3. CHECK THE (C139) REAR MODE DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT

Disconnect the Rear Mode Door Actuator harness connector.

Measure the resistance between the (C139) Rear Mode Door Driver circuit and the (C939) Rear Mode Door Common Driver Circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C139) Rear Mode Door Driver circuit for a short to the (C939) Rear Mode Door Common Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Rear Mode Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

65-REAR MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)**4. VERIFY THAT THE FAULT IS STILL PRESENT**

Reconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 65?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short that set the original fault. Repair as necessary. Then, if present, diagnose and repair all other DTCs. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

66-REAR MODE DOOR DRIVER CIRCUIT SHORTED TO IGNITION (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: This DTC will display as active if the ignition is not cycled after running the Actuator Circuit Test / Door Calibration Function. Otherwise, it will display as stored until cleared. By running the Actuator Circuit Test / Door Calibration Function, the A/C Heater Control can identify up to three door driver circuits shorted simultaneously. A DTC 72 will set if more than three door driver circuits are shorted in the same direction (e.g. four door driver circuits all shorted to ground) or if two or more door driver circuits are shorted with at least one door driver circuit shorted to ignition and one door driver circuit shorted to ground. To ensure a proper diagnosis, diagnose and repair Actuator Circuit Test faults in the following order: If present, diagnose and repair DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, and finally DTCs 63, 65, 67, or 69. In addition, always test the door driver circuits after each repair by clearing DTCs, and then running the Actuator Circuit Test / Door Calibration Function, and then checking for DTCs.

- **When Monitored:**
When running the Actuator Circuit Test / Door Calibration Function.
- **Set Condition:**
If the A/C Heater Control detects a short to voltage on the (C139) Rear Mode Door Driver circuit.

Possible Causes

(C139) REAR MODE DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
A/C HEATER CONTROL

Diagnostic Test**1. CHECK THE (C139) REAR MODE DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Measure the voltage of the (C139) Rear Mode Door Driver circuit.

Is the voltage above 0.2 volts?

Yes >> Repair the (C139) Rear Mode Door Driver circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

66-REAR MODE DOOR DRIVER CIRCUIT SHORTED TO IGNITION (MTC) (CONTINUED)**2. VERIFY THAT THE FAULT IS STILL PRESENT**

Turn the ignition off.

Reconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

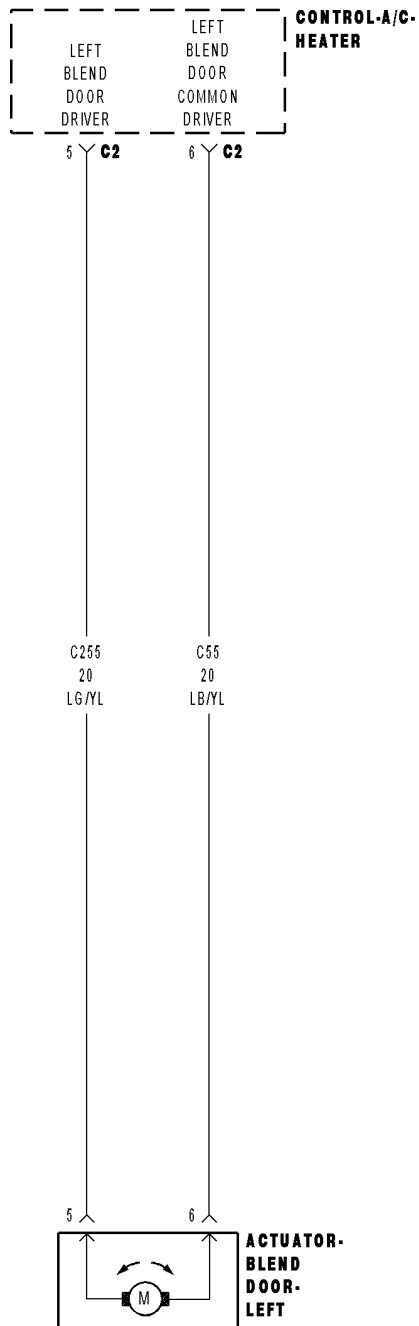

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 66?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short that set the original fault. Repair as necessary. Then, if present, diagnose and repair all other DTCs. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

67-BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC)

67-BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: This DTC will display as active if the ignition is not cycled after running the Actuator Circuit Test / Door Calibration Function. Otherwise, it will display as stored until cleared. By running the Actuator Circuit Test / Door Calibration Function, the A/C Heater Control can identify up to three door driver circuits shorted simultaneously. A DTC 72 will set if more than three door driver circuits are shorted in the same direction (e.g. four door driver circuits all shorted to ground) or if two or more door driver circuits are shorted with at least one door driver circuit shorted to ignition and one door driver circuit shorted to ground. To ensure a proper diagnosis, diagnose and repair Actuator Circuit Test faults in the following order: If present, diagnose and repair DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, and finally DTCs 63, 65, 67, or 69. In addition, always test the door driver circuits after each repair by clearing DTCs, and then running the Actuator Circuit Test / Door Calibration Function, and then checking for DTCs.

- **When Monitored:**
When running the Actuator Circuit Test / Door Calibration Function.
- **Set Condition:**
If the A/C Heater Control detects a short to ground on the (C255) Left Blend Door Driver circuit.

Possible Causes
(C255) LEFT BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C255) LEFT BLEND DOOR DRIVER CIRCUIT SHORTED TO (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT
LEFT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Diagnostic Test

1. CHECK THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance of the (C255) Left Blend Door Driver circuit between ground and the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C255) Left Blend Door Driver circuit for a short to ground.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

67-BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)**2. CHECK THE LEFT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE**

Measure the resistance between the (C255) Left Blend Door Driver circuit and the (C55) Left Blend Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 3

No >> Go To 4

**3. CHECK THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT**

Disconnect the Left Blend Door Actuator harness connector.

Measure the resistance between the (C255) Left Blend Door Driver circuit and the (C55) Left Blend Door Common Driver Circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C255) Left Blend Door Driver circuit for a short to the (C55) Left Blend Door Common Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Left Blend Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

67-BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)**4. VERIFY THAT THE FAULT IS STILL PRESENT**

Reconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 67?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short that set the original fault. Repair as necessary. Then, if present, diagnose and repair all other DTCs. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

69-RECIRC DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC)

69-RECIRC DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: This DTC will display as active if the ignition is not cycled after running the Actuator Circuit Test / Door Calibration Function. Otherwise, it will display as stored until cleared. By running the Actuator Circuit Test / Door Calibration Function, the A/C Heater Control can identify up to three door driver circuits shorted simultaneously. A DTC 72 will set if more than three door driver circuits are shorted in the same direction (e.g. four door driver circuits all shorted to ground) or if two or more door driver circuits are shorted with at least one door driver circuit shorted to ignition and one door driver circuit shorted to ground. To ensure a proper diagnosis, diagnose and repair Actuator Circuit Test faults in the following order: If present, diagnose and repair DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, and finally DTCs 63, 65, 67, or 69. In addition, always test the door driver circuits after each repair by clearing DTCs, and then running the Actuator Circuit Test / Door Calibration Function, and then checking for DTCs.

- **When Monitored:**
When running the Actuator Circuit Test / Door Calibration Function.
- **Set Condition:**
If the A/C Heater Control detects a short to ground on the (C268) Recirculation Door Driver circuit.

Possible Causes

(C268) RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO GROUND
 (C268) RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT
 RECIRCULATION DOOR ACTUATOR
 A/C HEATER CONTROL

Diagnostic Test**1. CHECK THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance of the (C268) Recirculation Door Driver circuit between ground and the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C268) Recirculation Door Driver circuit for a short to ground.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

69-RECIRC DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)

2. CHECK THE RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C268) Recirculation Door Driver circuit and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 3

No >> Go To 4

3. CHECK THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Disconnect the Recirculation Door Actuator harness connector.

Measure the resistance between the (C268) Recirculation Door Driver circuit and the (C68) Recirculation Door Common Driver Circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C268) Recirculation Door Driver circuit for a short to the (C68) Recirculation Door Common Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Recirculation Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

69-RECIRC DOOR DRIVER CIRCUIT SHORTED TO GROUND (MTC) (CONTINUED)**4. VERIFY THAT THE FAULT IS STILL PRESENT**

Reconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 69?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short that set the original fault. Repair as necessary. Then, if present, diagnose and repair all other DTCs. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

71-RECIRC DOOR DRIVER CIRCUIT SHORTED TO IGNITION (MTC)

71-RECIRC DOOR DRIVER CIRCUIT SHORTED TO IGNITION (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: This DTC will display as active if the ignition is not cycled after running the Actuator Circuit Test / Door Calibration Function. Otherwise, it will display as stored until cleared. By running the Actuator Circuit Test / Door Calibration Function, the A/C Heater Control can identify up to three door driver circuits shorted simultaneously. A DTC 72 will set if more than three door driver circuits are shorted in the same direction (e.g. four door driver circuits all shorted to ground) or if two or more door driver circuits are shorted with at least one door driver circuit shorted to ignition and one door driver circuit shorted to ground. To ensure a proper diagnosis, diagnose and repair Actuator Circuit Test faults in the following order: If present, diagnose and repair DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, and finally DTCs 63, 65, 67, or 69. In addition, always test the door driver circuits after each repair by clearing DTCs, and then running the Actuator Circuit Test / Door Calibration Function, and then checking for DTCs.

- **When Monitored:**
When running the Actuator Circuit Test / Door Calibration Function.
- **Set Condition:**
If the A/C Heater Control detects a short to voltage on the (C268) Recirculation Door Driver circuit.

Possible Causes

(C268) RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
A/C HEATER CONTROL

Diagnostic Test**1. CHECK THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Measure the voltage of the (C268) Recirculation Door Driver circuit.

Is the voltage above 0.2 volts?

Yes >> Repair the (C268) Recirculation Door Driver circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

71-RECIRC DOOR DRIVER CIRCUIT SHORTED TO IGNITION (MTC) (CONTINUED)**2. VERIFY THAT THE FAULT IS STILL PRESENT**

Turn the ignition off.

Reconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 71?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short that set the original fault. Repair as necessary. Then, if present, diagnose and repair all other DTCs. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

72-SHORT TOO COMPLEX (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

NOTE: This DTC will display as active if the ignition is not cycled after running the Actuator Circuit Test / Door Calibration Function. Otherwise, it will display as stored until cleared. By running the Actuator Circuit Test / Door Calibration Function, the A/C Heater Control can identify up to three door driver circuits shorted simultaneously. A DTC 72 will set if more than three door driver circuits are shorted in the same direction (e.g. four door driver circuits all shorted to ground) or if two or more door driver circuits are shorted with at least one door driver circuit shorted to ignition and one door driver circuit shorted to ground. To ensure a proper diagnosis, diagnose and repair Actuator Circuit Test faults in the following order: If present, diagnose and repair DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, and finally DTCs 63, 65, 67, or 69. In addition, always test the door driver circuits after each repair by clearing DTCs, and then running the Actuator Circuit Test / Door Calibration Function, and then checking for DTCs.

- **When Monitored:**
When running the Actuator Circuit Test / Door Calibration Function.
- **Set Condition:**
If the A/C Heater Control detects more than three door driver circuits shorted in the same direction (e.g. four door driver circuits all shorted to ground) or if two or more door driver circuits are shorted with at least one door driver circuit shorted to voltage and one door driver circuit shorted to ground.

Possible Causes
MORE THAN THREE DOOR DRIVER CIRCUITS SHORTED TO VOLTAGE
MORE THAN THREE DOOR DRIVER CIRCUITS SHORTED TO GROUND
TWO OR MORE DOOR DRIVER CIRCUITS SHORTED WITH AT LEAST ONE SHORTED TO IGNITION AND ONE SHORTED TO GROUND
FRONT MODE DOOR ACTUATOR
REAR MODE DOOR ACTUATOR
LEFT BLEND DOOR ACTUATOR
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

72-SHORT TOO COMPLEX (MTC) (CONTINUED)

Diagnostic Test

- 1. CHECK THE (C266) FRONT MODE DOOR DRIVER CIRCUIT, (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT, (C139) REAR MODE DOOR DRIVER CIRCUIT, (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT, (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

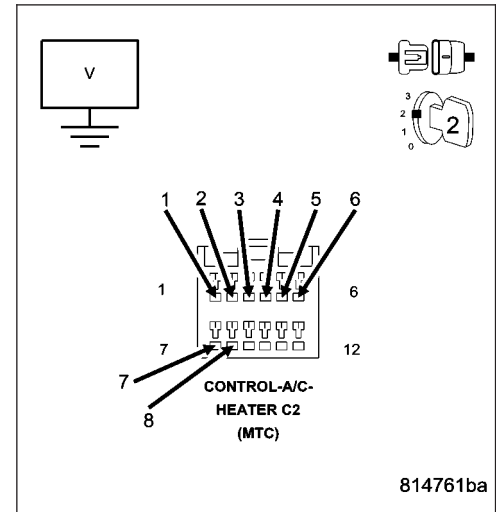

Measure the voltage of the (C266) Front Mode Door Driver circuit, (C66) Front Mode Door Common Driver circuit, (C139) Rear Mode Door Driver circuit, (C939) Rear Mode Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit.

Is the voltage above 0.2 volts on any of the circuits?

Yes >> Repair all circuits with voltage above 0.2 volts for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

- 2. CHECK THE (C266) FRONT MODE DOOR DRIVER CIRCUIT, (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT, (C139) REAR MODE DOOR DRIVER CIRCUIT, (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT, (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Measure the resistance of the (C266) Front Mode Door Driver circuit, (C66) Front Mode Door Common Driver circuit, (C139) Rear Mode Door Driver circuit, (C939) Rear Mode Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit between ground and the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

72-SHORT TOO COMPLEX (MTC) (CONTINUED)

3. CHECK THE (C266) FRONT MODE DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C139) REAR MODE DOOR DRIVER CIRCUIT, (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT, (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C266) Front Mode Door Driver circuit and the (C139) Rear Mode Door Driver circuit, (C939) Rear Mode Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C266) Front Mode Door Driver circuit.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

4. CHECK THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C139) REAR MODE DOOR DRIVER CIRCUIT, (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT, (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C66) Front Mode Door Common Driver circuit and the (C139) Rear Mode Door Driver circuit, (C939) Rear Mode Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C66) Front Mode Door Common Driver circuit.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 5

72-SHORT TOO COMPLEX (MTC) (CONTINUED)

5. CHECK THE (C139) REAR MODE DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C139) Rear Mode Door Driver circuit and the (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C139) Rear Mode Door Driver circuit.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 6

6. CHECK THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT, (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT, (C268) RECIRCULATION DOOR DRIVER CIRCUIT, & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C939) Rear Mode Door Common Driver circuit and (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C268) Recirculation Door Driver circuit, and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C939) Rear Mode Door Common Driver circuit.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 7

72-SHORT TOO COMPLEX (MTC) (CONTINUED)

7. CHECK THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C255) Left Blend Door Driver circuit and the (C268) Recirculation Door Driver circuit and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C255) Left Blend Door Driver circuit.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 8

8. CHECK THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Measure the resistance between the (C55) Left Blend Door Common Driver circuit and the (C268) Recirculation Door Driver circuit and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on any of the circuits?

Yes >> Repair all circuits with a resistance below 10k ohms for a short to the (C55) Left Blend Door Common Driver circuit.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 9

72-SHORT TOO COMPLEX (MTC) (CONTINUED)**9. CHECK THE FRONT MODE DOOR ACTUATOR CIRCUIT RESISTANCE**

Measure the resistance between the (C66) Front Mode Door Common Driver Circuit and the (C266) Front Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 10

No >> Go To 11

**10. CHECK THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C266) FRONT MODE DOOR DRIVER CIRCUIT**

Disconnect the Front Mode Door Actuator harness connector.

Measure the resistance between the (C66) Front Mode Door Common Driver Circuit and the (C266) Front Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C66) Front Mode Door Common Driver Circuit for a short to the (C266) Front Mode Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Front Mode Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

72-SHORT TOO COMPLEX (MTC) (CONTINUED)

11. CHECK THE REAR MODE DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C939) Rear Mode Door Common Driver Circuit and the (C139) Rear Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 12

No >> Go To 13

12. CHECK THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C139) REAR MODE DOOR DRIVER CIRCUIT

Disconnect the Rear Mode Door Actuator harness connector.

Measure the resistance between the (C939) Rear Mode Door Common Driver Circuit and the (C139) Rear Mode Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C939) Rear Mode Door Common Driver Circuit for a short to the (C139) Rear Mode Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Rear Mode Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

72-SHORT TOO COMPLEX (MTC) (CONTINUED)**13. CHECK THE LEFT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE**

Measure the resistance between the (C55) Left Blend Door Common Driver Circuit and the (C255) Left Blend Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 14

No >> Go To 15

**14. CHECK THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT**

Disconnect the Left Blend Door Actuator harness connector.

Measure the resistance between the (C55) Left Blend Door Common Driver Circuit and the (C255) Left Blend Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C55) Left Blend Door Common Driver Circuit for a short to the (C255) Left Blend Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Left Blend Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

72-SHORT TOO COMPLEX (MTC) (CONTINUED)

15. CHECK THE RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C68) Recirculation Door Common Driver Circuit and the (C268) Recirculation Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 16

No >> Go To 17

16. CHECK THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT

Disconnect the Recirculation Door Actuator harness connector. Measure the resistance between the (C68) Recirculation Door Common Driver Circuit and the (C268) Recirculation Door Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C68) Recirculation Door Common Driver Circuit for a short to the (C268) Recirculation Door Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Recirculation Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

72-SHORT TOO COMPLEX (MTC) (CONTINUED)**17. VERIFY THAT THE FAULT IS STILL PRESENT**

Reconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 72?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short that set the original fault. Repair as necessary. Then, if present, diagnose and repair all other DTCs. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

73-AC REQUEST OUTPUT SIGNAL TOO HIGH (MTC)

73-AC REQUEST OUTPUT SIGNAL TOO HIGH (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the A/C Heater Control detects voltage above 4.49 volts on the (C221) A/C Switch Sense circuit.

Possible Causes
(C221) A/C SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE INSTRUMENT CLUSTER (CCN) A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. CHECK (C221) A/C SWITCH SENSE CIRCUIT VOLTAGE AT A/C HEATER CONTROL C1 HARNESS CONNECTOR

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

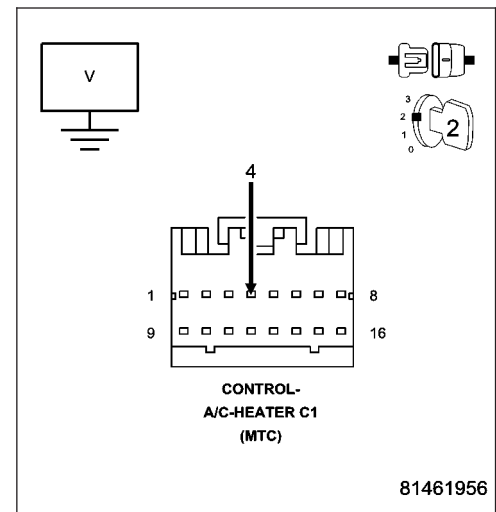

Measure the voltage of the (C221) A/C Switch Sense circuit.

Is the voltage above 5.2 volts?

Yes >> Go To 2

No >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

73-AC REQUEST OUTPUT SIGNAL TOO HIGH (MTC) (CONTINUED)

2. CHECK (C221) A/C SWITCH SENSE CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Instrument Cluster C3 harness connector.

Turn the ignition on.

Measure the voltage of the (C221) A/C Switch Sense circuit.

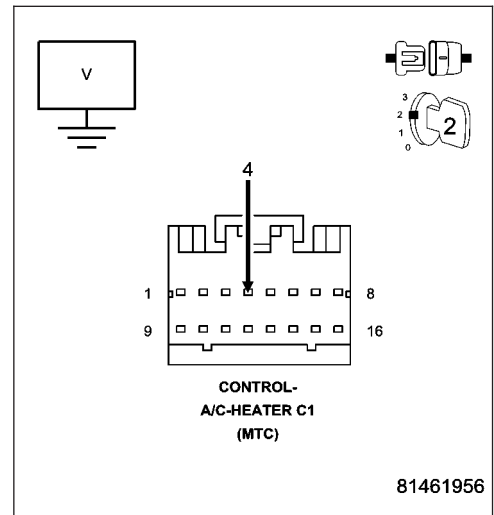

Is the voltage above 0.2 volts?

Yes >> Repair the (C221) A/C Switch Sense circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Instrument Cluster (CCN) in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

74-AC REQUEST OUTPUT SIGNAL TOO LOW (MTC)

74-AC REQUEST OUTPUT SIGNAL TOO LOW (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the A/C Heater Control detects voltage below 1.51 volts on the (C221) A/C Switch Sense circuit.

Possible Causes
(C221) A/C SWITCH SENSE CIRCUIT SHORTED TO GROUND (C221) A/C SWITCH SENSE CIRCUIT OPEN INSTRUMENT CLUSTER (CCN) A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

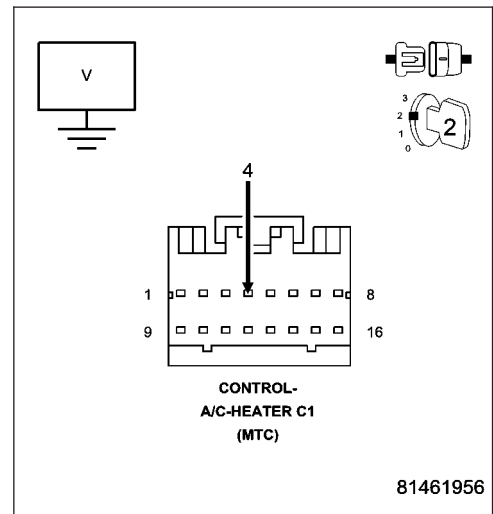

Diagnostic Test

1. CHECK (C221) A/C SWITCH SENSE CIRCUIT VOLTAGE AT A/C HEATER CONTROL C1 HARNESS CONNECTOR

Turn the ignition off.
 Disconnect the A/C Heater Control C1 harness connector.
 Turn the ignition on.
 Measure the voltage of the (C221) A/C Switch Sense circuit.

Is the voltage below 4.8 volts?

- Yes** >> Go To 2
- No** >> Replace the A/C Heater Control in accordance with the Service Information.
 Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

74-AC REQUEST OUTPUT SIGNAL TOO LOW (MTC) (CONTINUED)**2. CHECK (C221) A/C SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Instrument Cluster C3 harness connector.

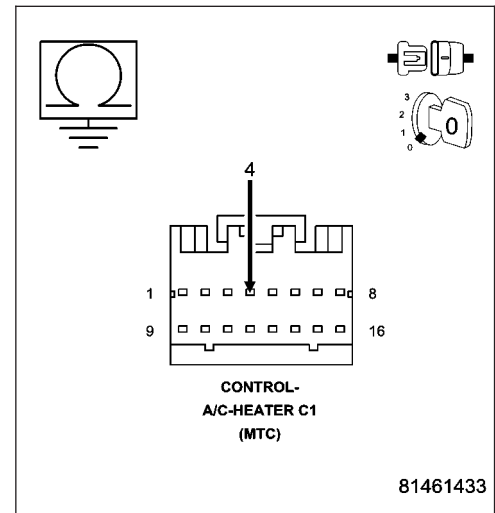

Measure the resistance of the (C221) A/C Switch Sense circuit between ground and the A/C Heater Control C1 harness connector.

Is the resistance below 10K ohms?

Yes >> Repair the (C221) A/C Switch Sense circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

**3. CHECK (C221) A/C SWITCH SENSE CIRCUIT FOR AN OPEN**

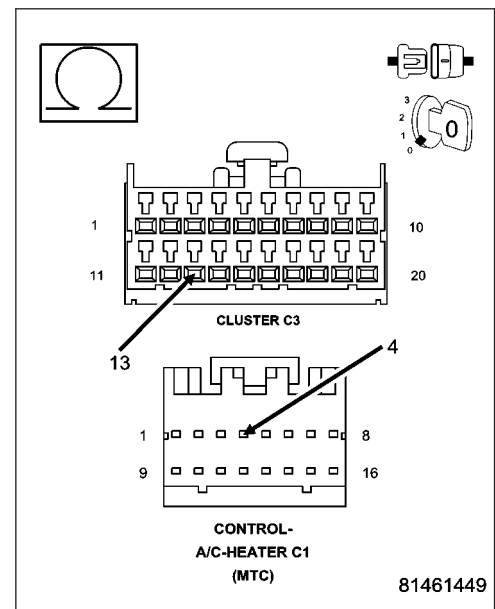

Measure the resistance of the (C221) A/C Switch Sense circuit between the A/C Heater Control C1 harness connector and the Instrument Cluster C3 harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the Instrument Cluster (CCN) in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (C221) A/C Switch Sense circuit for an open. Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

75-AC REQUEST OUTPUT SIGNAL HIGH WHEN DRIVEN LOW (MTC)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the A/C Heater Control detects voltage above 4.49 volts on the (C221) A/C Switch Sense circuit with the A/C switched on.

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Refer to 73-AC REQUEST OUTPUT SIGNAL TOO HIGH for the diagnostic test procedure.

76-AC REQUEST OUTPUT SIGNAL LOW WHEN DRIVEN HIGH (MTC)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the A/C Heater Control detects voltage below 1.51 volts on the (C221) A/C Switch Sense circuit when the A/C is switched off.

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Refer to 74-AC REQUEST OUTPUT SIGNAL TOO LOW for the diagnostic test procedure.

77-EBL OUTPUT SHORTED HIGH

C115
20
DB

77-EBL OUTPUT SHORTED HIGH (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the Ignition on and the EBL mode switch on.
- **Set Condition:**
If the A/C Heater Control senses excessive current on the (C115) Defogger Relay Control circuit.

Possible Causes
EBL RELAY SHORTED TO BATTERY (C115) DEFOGGER RELAY CONTROL CIRCUIT SHORTED TO BATTERY JUNCTION BLOCK A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. CHECK THE EBL RELAY FOR A SHORT TO BATTERY

Turn the ignition off.

Install a known good relay in place of the EBL relay.

Turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Press the EBL mode switch on.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 77?

Yes >> Go To 2

No >> Replace the original EBL Relay in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

77-EBL OUTPUT SHORTED HIGH (CONTINUED)**2. CHECK FOR A SHORTED A/C HEATER CONTROL**

Turn the ignition off.

Remove the replacement EBL relay.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

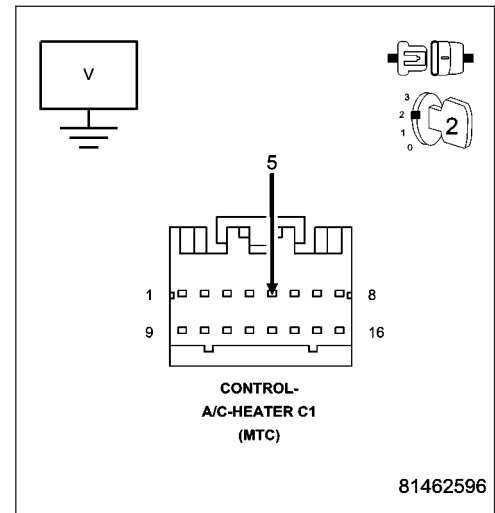

Measure the voltage of the (C115) Defogger Relay Control circuit.

Is the voltage above 0.2 volts?

Yes >> Go To 3

No >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**3. CHECK THE (C115) DEFOGGER RELAY CONTROL CIRCUIT FOR A SHORT TO BATTERY**

Turn the ignition off.

Disconnect the Junction Block C2 harness connector.

Turn the ignition on.

Measure the voltage of the (C115) Defogger Relay Control circuit.

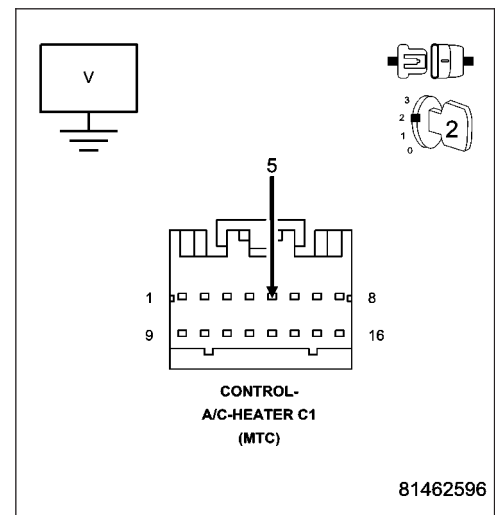

Is the voltage above 0.2 volts?

Yes >> Repair the (C115) Defogger Relay Control circuit for a short to battery.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Junction Block in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

81-BLOWER NOT ON HIGH AT START OF COOLDOWN TEST (MTC)

81-BLOWER NOT ON HIGH AT START OF COOLDOWN TEST (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**

When executing the Cooldown Test.

- **Set Condition:**

If the A/C Heater Control sensed that the blower was not operating at high speed when executing the Cooldown Test.

Possible Causes
BLOWER CONTROL NOT SET TO HIGH SPEED WHEN EXECUTING THE COOLDOWN TEST
BLOWER MOTOR / RELATED CIRCUITS
(C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT SHORTED TO (C121) SENSOR GROUND CIRCUIT
(C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT SHORTED TO GROUND
(C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT OPEN
A/C HEATER CONTROL

NOTE: This DTC will display as active if the ignition is not cycled after running the Cooldown Test. Otherwise, it will display as stored until cleared.

Diagnostic Test

1. CHECK THE BLOWER SPEED SETTING

Was the blower control set to high speed before executing the Cooldown Test?

Yes >> Go To 2

No >> Start the engine, set the blower control to high speed, and then run the Cooldown Test again. Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK THE (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (C121) SENSOR GROUND CIRCUIT

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance between the (C41) Blower Switch Position Signal circuit and the (C121) Sensor Ground circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10K ohms?

Yes >> Repair the (C41) Blower Switch Position Signal circuit for a short to the (C121) Sensor Ground circuit. Run the Cooldown Test again after the repair is complete. Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

81-BLOWER NOT ON HIGH AT START OF COOLDOWN TEST (MTC) (CONTINUED)

3. CHECK THE (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT VOLTAGE

Reconnect the A/C Heater Control C2 harness connector.
 Disconnect the A/C Heater Control C3 harness connector.
 Turn the ignition on.
 Measure the voltage of the (C41) Blower Switch Position Signal circuit.

Is the voltage above 4.8 volts?

Yes >> Check the blower motor and related circuits for the cause of blower operation problems and repair as necessary. Run the Cooldown Test again after the repair is complete. Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

4. CHECK THE (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.
 Disconnect the A/C Heater Control C2 harness connector.
 Measure the resistance of the (C41) Blower Switch Position Signal circuit between ground and the A/C Heater Control C3 harness connector.

Is the resistance below 10K ohms?

Yes >> Repair the (C41) Blower Switch Position Signal circuit for a short to ground. Run the Cooldown Test again after the repair is complete. Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 5

81-BLOWER NOT ON HIGH AT START OF COOLDOWN TEST (MTC) (CONTINUED)

5. CHECK (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT FOR AN OPEN

Measure the resistance of the (C41) Blower Switch Position Signal circuit between the A/C Heater Control C2 harness connector and the A/C Heater Control C3 harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the A/C Heater Control in accordance with the Service Information. Run the Cooldown Test again after the repair is complete.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (C41) Blower Switch Position Signal circuit for an open. Run the Cooldown Test again after the repair is complete.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

82-SENSOR TOO COLD TO START COOLDOWN TEST (MTC)

82-SENSOR TOO COLD TO START COOLDOWN TEST (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

When executing the Cooldown Test.

- **Set Condition:**

If the A/C Heater Control senses that the evaporator temperature is below 18.3°C (65°F) when executing the Cooldown Test.

Possible Causes
FAULTS PRESENT IN THE HVAC SYSTEM EVAPORATOR TEMPERATURE BELOW 18.3°C (65°F) AT START OF COOLDOWN TEST HIGH RESISTANCE ON (C121) SENSOR GROUND CIRCUIT HIGH RESISTANCE ON (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT EVAPORATOR TEMPERATURE SENSOR A/C HEATER CONTROL

NOTE: This DTC will display as active if the ignition is not cycled after running the Cooldown Test. Otherwise, it will display as stored until cleared.

Diagnostic Test

1. CHECK FOR ACTIVE DTC 31, 32, 83, OR 84 IN THE A/C HEATER CONTROL

Turn the ignition on.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 31, 32, 83, or 84?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this section for a complete list of HVAC related symptoms. Run the Cooldown Test again after the repair is complete.

No >> Go To 2

2. ERASE DTCs IN THE A/C HEATER CONTROL

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins displaying DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

Turn the ignition off.

>> Go To 3

82-SENSOR TOO COLD TO START COOLDOWN TEST (MTC) (CONTINUED)**3. VERIFY IF DTC 82 SET DUE TO EVAPORATOR TEMPERATURE BEING BELOW 18.3°C (65°F)**

CAUTION: The work area ambient temperature and the evaporator temperature must be above 18.3°C (65°F) in order to test A/C system performance.

Start the engine.

Set the Mode switch to the panel position.

Press the A/C mode switch off (status indicator not illuminated/compressor not running).

Turn the blower control to high speed. Allow the blower to run for 5 minutes before proceeding.

Turn the blower control off.

Actuate the Cooldown Test by performing the following:

- Press and hold the A/C mode switch down and then turn the blower motor control to high speed. Continue to hold the A/C mode switch down until the A/C status indicator begins flashing. Then, release the mode switch. While the test is running, the A/C status indicator will flash once per second. If the test passes, the A/C status indicator will stop flashing. If the test fails, the A/C and EBL status indicators will flash alternately. Allow the test to run to completion before proceeding.

>> Go To 4

4. CHECK FOR DTCS IN THE A/C HEATER CONTROL

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display DTC 82?

Yes, & No Other DTCs Present

Go To 5

Yes, & Other DTCs Present

Diagnose and repair the other DTC(s). Refer to the Table of Contents in this section for a complete list of HVAC related symptoms. Run the Cooldown Test again after the repair is complete.

No, But Other DTCs Present

Diagnose and repair the DTC(s). Refer to the Table of Contents in this section for a complete list of HVAC related symptoms. Run the Cooldown Test again after the repair is complete.

No, & No Other DTCs Present

Perform additional testing as necessary.

82-SENSOR TOO COLD TO START COOLDOWN TEST (MTC) (CONTINUED)

5. CHECK THE (C121) SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE

NOTE: Ensure that the voltmeter leads are connected for positive polarity and that they meet the terminals in the connector. Also ensure that there is a good terminal to wire connection.

Turn the ignition off.

Back probe the (C121) Sensor Ground circuit between the Evaporator Temperature Sensor harness connector and the A/C Heater Control C2 harness connector.

Turn the ignition on.

Is the voltage below 0.10 volts?

Yes >> Go To 6

No >> Repair the (C121) Sensor Ground circuit for high resistance. Run the Cooldown Test again after the repair is complete.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

6. CHECK THE (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR HIGH RESISTANCE

NOTE: Ensure that the voltmeter leads are connected for positive polarity and that they meet the terminals in the connector. Also ensure that there is a good terminal to wire connection.

Turn the ignition off.

Back probe the (C21) Evaporator Temperature Sensor Signal circuit between the Evaporator Temperature Sensor harness connector and the A/C Heater Control C2 harness connector.

Turn the ignition on.

Is the voltage below 0.10 volts?

Yes >> Replace the A/C Heater Control in accordance with the Service Information. Run the Cooldown Test again after the repair is complete.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for high resistance. Run the Cooldown Test again after the repair is complete.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

83–SENSOR FAILED OPEN DURING COOLDOWN TEST (MTC)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
When executing the Cooldown Test.
- **Set Condition:**
If the Evaporator Temperature Sensor input is out of range toward the high voltage threshold when executing the Cooldown Test.

NOTE: This DTC will display as active if the ignition is not cycled after running the Cooldown Test. Otherwise, it will display as stored until cleared.

Refer to 31–EVAPORATOR SENSOR OPEN for the diagnostic test procedure.

84–SENSOR FAILED SHORTED DURING COOLDOWN TEST (MTC)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
When executing the Cooldown Test.
- **Set Condition:**
If the Evaporator Temperature Sensor input is out of range toward the low voltage threshold when executing the Cooldown Test.

NOTE: This DTC will display as active if the ignition is not cycled after running the Cooldown Test. Otherwise, it will display as stored until cleared.

Refer to 32–EVAPORATOR SENSOR SHORTED for the diagnostic test procedure.

85-BLOWER NOT ON HIGH DURING COOLDOWN TEST (MTC)

85-BLOWER NOT ON HIGH DURING COOLDOWN TEST (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
When executing the Cooldown Test.
- **Set Condition:**
If the A/C Heater Control sensed that the blower was not operating at high speed while the Cooldown Test was running.

Possible Causes
BLOWER CONTROL DID NOT REMAIN ON THE HIGH SPEED SETTING FOR THE ENTIRE COOLDOWN TEST BLOWER MOTOR / RELATED CIRCUITS (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT SHORTED TO (C121) SENSOR GROUND CIRCUIT (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT SHORTED TO GROUND (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT OPEN A/C HEATER CONTROL

NOTE: This DTC will display as active if the ignition is not cycled after running the Cooldown Test. Otherwise, it will display as stored until cleared.

Diagnostic Test

1. CHECK THE BLOWER SPEED SETTING

Was the blower control set to high speed for the entire Cooldown Test?

- Yes** >> Go To 2
- No** >> Start the engine, set the blower control to high speed, and then run the Cooldown Test again. Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK THE (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (C121) SENSOR GROUND CIRCUIT

Turn the ignition off.
 Disconnect the A/C Heater Control C2 harness connector.
 Measure the resistance between the (C41) Blower Switch Position Signal circuit and the (C121) Sensor Ground circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10K ohms?

- Yes** >> Repair the (C41) Blower Switch Position Signal circuit for a short to the (C121) Sensor Ground circuit. Run the Cooldown Test again after the repair is complete. Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 3

85-BLOWER NOT ON HIGH DURING COOLDOWN TEST (MTC) (CONTINUED)**3. CHECK THE (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT VOLTAGE**

Reconnect the A/C Heater Control C2 harness connector.

Disconnect the A/C Heater Control C3 harness connector.

Turn the ignition on.

Measure the voltage of the (C41) Blower Switch Position Signal circuit.

Is the voltage above 4.8 volts?

Yes >> Check the blower motor and related circuits for the cause of blower operation problems and repair as necessary. Run the Cooldown Test again after the repair is complete. Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

**4. CHECK THE (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance of the (C41) Blower Switch Position Signal circuit between ground and the A/C Heater Control C3 harness connector.

Is the resistance below 10K ohms?

Yes >> Repair the (C41) Blower Switch Position Signal circuit for a short to ground. Run the Cooldown Test again after the repair is complete.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 5

85-BLOWER NOT ON HIGH DURING COOLDOWN TEST (MTC) (CONTINUED)

5. CHECK (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT FOR AN OPEN

Measure the resistance of the (C41) Blower Switch Position Signal circuit between the A/C Heater Control C2 harness connector and the A/C Heater Control C3 harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the A/C Heater Control in accordance with the Service Information. Run the Cooldown Test again after the repair is complete.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (C41) Blower Switch Position Signal circuit for an open. Run the Cooldown Test again after the repair is complete.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10AA-RIGHT BLEND DOOR CONTROL CIRCUIT LOW (ATC)

B10AA-RIGHT BLEND DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
When the Actuator DTC Detection Test is executed.
- **Set Condition:**
If the (C61) Right Blend Door Driver circuit or the (C161) Right Blend Door Common Driver circuit is shorted to ground.

Possible Causes
(C61) RIGHT BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C161) RIGHT BLEND DOOR COMMON DRIVER CIRCUIT SHORTED TO GROUND
(C61) RIGHT BLEND DOOR DRIVER CIRCUIT SHORTED TO (C161) RIGHT BLEND DOOR COMMON DRIVER CIRCUIT
(C61) RIGHT BLEND DOOR DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
(C161) RIGHT BLEND DOOR COMMON DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
RIGHT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Diagnostic Test

1. CHECK THE (C61) RIGHT BLEND DOOR DRIVER CIRCUIT & THE (C161) RIGHT BLEND DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance of the (C61) Right Blend Door Driver circuit between ground and the A/C Heater Control C2 harness connector.

Measure the resistance of the (C161) Right Blend Door Common Driver circuit between ground and the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on either circuit?

- Yes** >> Repair the circuit(s) with a resistance below 10k ohms for a short to ground.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

B10AA-RIGHT BLEND DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)**2. CHECK THE RIGHT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE**

Measure the resistance between the (C61) Right Blend Door Driver circuit and the (C161) Right Blend Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 3

No >> Go To 4

**3. CHECK THE (C61) RIGHT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C161) RIGHT BLEND DOOR COMMON DRIVER CIRCUIT**

Disconnect the Right Blend Door Actuator harness connector.

Measure the resistance between the (C61) Right Blend Door Driver circuit and the (C161) Right Blend Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C61) Right Blend Door Driver circuit for a short to the (C161) Right Blend Door Common Driver circuit.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Right Blend Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10AA-RIGHT BLEND DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

4. CHECK THE (C61) RIGHT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C61) Right Blend Door Driver circuit and the (C266) Front Mode Door Driver circuit, (C66) Front Mode Door Common Driver circuit, (C268) Recirculation Door Driver circuit, (C68) Recirculation Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C139) Rear Mode Door Driver circuit, and the (C939) Rear Mode Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms between the (C61) Right Blend Door Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C61) Right Blend Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 5

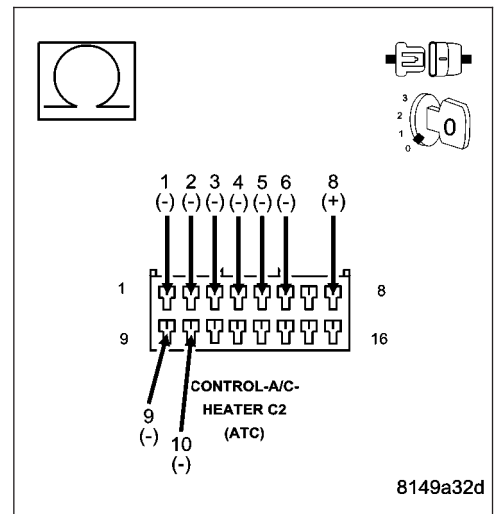

5. CHECK THE (C161) RIGHT BLEND DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C161) Right Blend Door Common Driver circuit and the (C266) Front Mode Door Driver circuit, (C66) Front Mode Door Common Driver circuit, (C268) Recirculation Door Driver circuit, (C68) Recirculation Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C139) Rear Mode Door Driver circuit, and the (C939) Rear Mode Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms between the (C161) Right Blend Door Common Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C161) Right Blend Door Common Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 6

B10AA–RIGHT BLEND DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)**6. RUN THE ACTUATOR DTC DETECTION TEST**

Reconnect the A/C Heater Control C2 harness connector.

Reconnect the Right Blend Door Actuator harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool only display: B10AA–RIGHT BLEND DOOR CONTROL CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No, Other DTC(s) Displayed

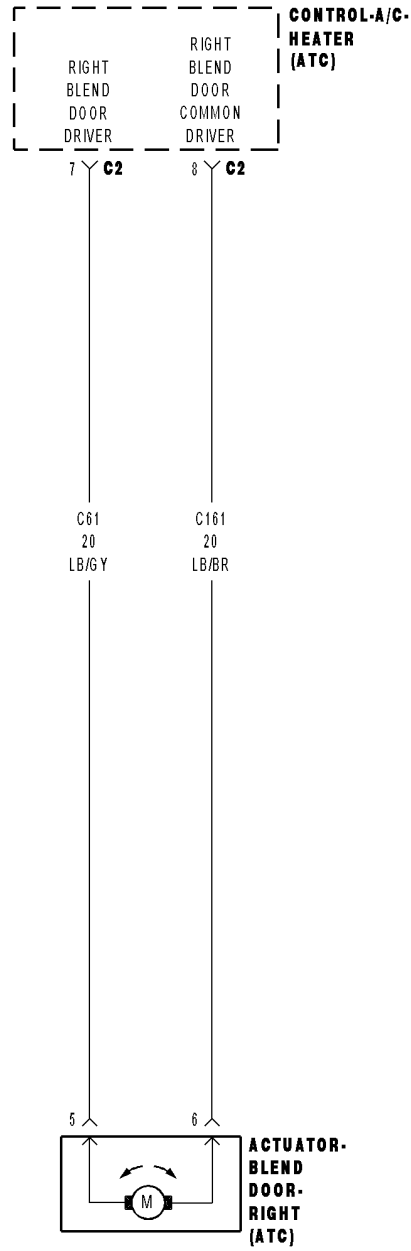

Diagnose and repair the other DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs before diagnosing short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed

Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10AB-RIGHT BLEND DOOR CONTROL CIRCUIT HIGH (ATC)

B10AB-RIGHT BLEND DOOR CONTROL CIRCUIT HIGH (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**

When the Actuator DTC Detection Test is executed.

- **Set Condition:**

If the (C61) Right Blend Door Driver circuit or the (C161) Right Blend Door Common Driver circuit is shorted to voltage.

Possible Causes
(C61) RIGHT BLEND DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C161) RIGHT BLEND DOOR COMMON DRIVER CIRCUIT SHORTED TO VOLTAGE
A/C HEATER CONTROL

Diagnostic Test

1. CHECK THE (C61) RIGHT BLEND DOOR DRIVER CIRCUIT & THE (C161) RIGHT BLEND DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Measure the voltage of the (C61) Right Blend Door Driver circuit.

Measure the voltage of the (C161) Right Blend Door Common Driver circuit.

Is the voltage above 0.2 volts on either circuit?

Yes >> Repair the circuit(s) with voltage above 0.2 volts a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

B10AB–RIGHT BLEND DOOR CONTROL CIRCUIT HIGH (ATC) (CONTINUED)**2. RUN THE ACTUATOR DTC DETECTION TEST**

Turn the ignition off.

Reconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool only display: B10AB–RIGHT BLEND DOOR CONTROL CIRCUIT HIGH?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No, Other DTC(s) Displayed

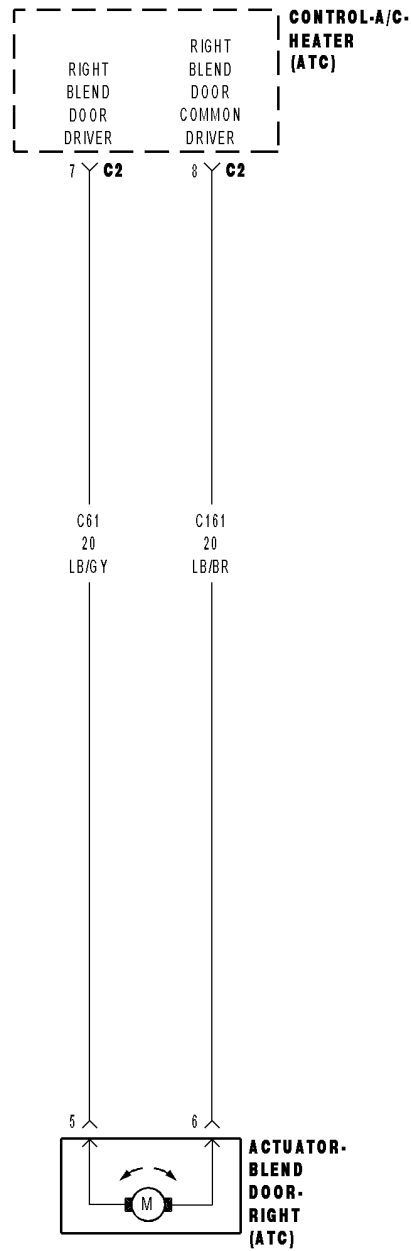

Diagnose and repair the other DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs before diagnosing short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed

Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10AC-RIGHT BLEND DOOR CONTROL CIRCUIT OPEN (ATC)

B10AC–RIGHT BLEND DOOR CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the (C61) Right Blend Door Driver circuit or the (C161) Right Blend Door Common Driver circuit is open.

Possible Causes
(C61) RIGHT BLEND DOOR DRIVER CIRCUIT OPEN
(C161) RIGHT BLEND DOOR COMMON DRIVER CIRCUIT OPEN
RIGHT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE DTCs

Turn the ignition on.
With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE DTCs?

- Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 2

2. CHECK THE RIGHT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

Turn the ignition off.
Disconnect the A/C Heater Control C2 harness connector.
Measure the resistance between the (C61) Right Blend Door Driver circuit and the (C161) Right Blend Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance above 70.0 ohms?

- Yes** >> Go To 3
- No** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10AC-RIGHT BLEND DOOR CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

3. CHECK THE (C61) RIGHT BLEND DOOR DRIVER CIRCUIT FOR AN OPEN

Disconnect the Right Blend Door Actuator harness connector.
 Measure the resistance of the (C61) Right Blend Door Driver circuit between the Right Blend Door Actuator harness connector and the A/C Heater Control C2 harness connector.

Is the resistance below 5.0 ohms?

- Yes** >> Go To 4
- No** >> Repair the (C61) Right Blend Door Driver circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK THE (C161) RIGHT BLEND DOOR COMMON DRIVER CIRCUIT FOR AN OPEN

Measure the resistance of the (C161) Right Blend Door Common Driver circuit between the Right Blend Door Actuator harness connector and the A/C Heater Control C2 harness connector.

Is the resistance below 5.0 ohms?

- No** >> Replace the Right Blend Door Actuator in accordance with the Service Information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- Yes** >> Repair the (C161) Right Blend Door Common Driver circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10AD–RIGHT BLEND DOOR TRAVEL RANGE TOO SMALL (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is less than the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the total span of the Right Blend Door is less than the low range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S) RIGHT BLEND DOOR SEIZED, BINDING, OBSTRUCTED RIGHT BLEND DOOR ACTUATOR A/C HEATER CONTROL

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

- Yes** >> Diagnose and repair the DTC(s). If present, diagnose and repair all Control Circuit/Performance DTCs before diagnosing Control Circuit Open DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 2

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

- Yes** >> Diagnose and repair the DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 3

B10AD–RIGHT BLEND DOOR TRAVEL RANGE TOO SMALL (ATC) (CONTINUED)**3. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE RIGHT BLEND DOOR TO SEIZE OR BIND**

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the right blend door to seize or bind.

Are there any physical or mechanical problems with the door, housing, linkage, or actuator?

- Yes** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 4
-

4. CHECK RIGHT BLEND DOOR TRAVEL

Remove the Right Blend Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over the entire span of travel (approximately 90 degrees).

Does the door operate smoothly in both directions over the entire span of travel?

- Yes** >> Replace the Right Blend Door Actuator in accordance with the Service Information. Then, Go To 5.
- No** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

5. RUN THE ACTUATOR CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B10AD–RIGHT BLEND DOOR TRAVEL RANGE TOO SMALL?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

B10AE–RIGHT BLEND DOOR TRAVEL RANGE TOO LARGE (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value exceeds the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the total span of the Right Blend Door exceeds the high range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S) RIGHT BLEND DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, MISSING, BROKEN RIGHT BLEND DOOR ACTUATOR A/C HEATER CONTROL

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

Yes >> Diagnose and repair the DTC(s). If present, diagnose and repair all Control Circuit/Performance DTCs before diagnosing Control Circuit Open DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 3

B10AE-RIGHT BLEND DOOR TRAVEL RANGE TOO LARGE (ATC) (CONTINUED)**3. CHECK FOR A BROKEN RIGHT BLEND DOOR ACTUATOR**

Turn the ignition off.

Remove the Right Blend Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

- Yes** >> Replace the Right Blend Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 4
-

4. CHECK THE RIGHT BLEND DOOR & A/C HEATER HOUSING FOR WARPED, WORN, DAMAGED, MISSING, & BROKEN COMPONENTS

Inspect for excessively worn, disconnected, missing, or broken door linkage. Inspect for a damaged or broken A/C Heater Housing Assembly. Inspect for a warped or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 90 degrees.

Are there any physical or mechanical problems with the door or housing?

- Yes** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Right Blend Door Actuator in accordance with the Service Information. Then, Go To 5.
-

5. RUN THE ACTUATOR THE CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B10AE-RIGHT BLEND DOOR TRAVEL RANGE TOO LARGE?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

B10AF–RIGHT BLEND DOOR ACTUATOR PERFORMANCE (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The A/C Heater Control monitors the door driver circuits during actuator operation for conditions that prevent proper door operation. If a pulse count error is detected the A/C Heater Control reports the fault as a Actuator Performance DTC. It is important to note that this DTC only indicates that a fault occurred while driving a door actuator and that additional testing is necessary to provide more details about the reported fault.

- **When Monitored:**
When actuator movement is requested.
- **Set Condition:**
If the A/C Heater Control detects a pulse count error while attempting to drive this door actuator.

Possible Causes
DOOR DRIVER CIRCUIT(S) SHORTED HIGH, SHORTED LOW, SHORTED TOGETHER, OPEN
DOOR ACTUATOR(S) BINDING, BROKEN
DOOR ACTUATOR(S) LINKAGE BINDING, DISCONNECTED, MISSING, BROKEN
A/C HEATER CONTROL

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

- Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 2

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool, erase HVAC DTCs.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

- Yes** >> Diagnose and repair the DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 3

B10AF-RIGHT BLEND DOOR ACTUATOR PERFORMANCE (ATC) (CONTINUED)**3. RUN ACTUATOR CALIBRATION TEST**

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 4

4. CHECK MODE, BLEND & RECIRCULATION DOOR OPERATION

Start the engine.

Set the blower to high speed.

Operate each door in all positions in one direction and then in the opposite direction while monitoring the following:

- For the Mode Doors, verify that air flows from each vent accordingly for the position selected on the A/C Heater Control.
- For the Blend Door, verify that the airflow air temperature changes accordingly for the temperature range selected on the A/C Heater Control.
- For the Recirculation Door, verify that the sound of the air flow get louder as the recirculation door opens to bring in recirculated air or gets softer as the recirculation door closes to bring in fresh air.

Does each door operate properly?

Yes >> The condition causing the fault has cleared at this time.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Remove the door actuator of the affected door from the A/C Heater Housing Assembly. By hand, attempt to rotate the actuator in both directions. Inspect the A/C Heater Housing for damage, for disconnected, missing, or broken linkage, and for broken or binding doors. Repair as necessary in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10A0–PANEL MODE DOOR 2 TRAVEL RANGE TOO LARGE (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value exceeds the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the total span of the Rear Mode Door exceeds the high range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S) REAR MODE DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, MISSING, BROKEN REAR MODE DOOR ACTUATOR A/C HEATER CONTROL

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

Yes >> Diagnose and repair the DTC(s). If present, diagnose and repair all Control Circuit/Performance DTCs before diagnosing Control Circuit Open DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 3

B10A0-PANEL MODE DOOR 2 TRAVEL RANGE TOO LARGE (ATC) (CONTINUED)**3. CHECK FOR A BROKEN REAR MODE DOOR ACTUATOR**

Turn the ignition off.

Remove the Rear Mode Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

- Yes** >> Replace the Rear Mode Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 4
-

4. CHECK THE REAR MODE DOOR & A/C HEATER HOUSING FOR WARPED, WORN, DAMAGED, MISSING, & BROKEN COMPONENTS

Inspect for excessively worn, disconnected, missing, or broken door linkage. Inspect for a damaged or broken A/C Heater Housing Assembly. Inspect for a warped or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 155 degrees.

Are there any physical or mechanical problems with the door or housing?

- Yes** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Rear Mode Door Actuator in accordance with the Service Information. Then, Go To 5.
-

5. RUN THE ACTUATOR THE CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B10A0-PANEL MODE DOOR 2 TRAVEL RANGE TOO LARGE?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

B10A1–PANEL MODE DOOR 2 ACTUATOR PERFORMANCE (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The A/C Heater Control monitors the door driver circuits during actuator operation for conditions that prevent proper door operation. If a pulse count error is detected the A/C Heater Control reports the fault as a Actuator Performance DTC. It is important to note that this DTC only indicates that a fault occurred while driving a door actuator and that additional testing is necessary to provide more details about the reported fault.

- **When Monitored:**
When actuator movement is requested.
- **Set Condition:**
If the A/C Heater Control detects a pulse count error while attempting to drive this door actuator.

Possible Causes
DOOR DRIVER CIRCUIT(S) SHORTED HIGH, SHORTED LOW, SHORTED TOGETHER, OPEN
DOOR ACTUATOR(S) BINDING, BROKEN
DOOR ACTUATOR(S) LINKAGE BINDING, DISCONNECTED, MISSING, BROKEN
A/C HEATER CONTROL

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

- Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 2

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool, erase HVAC DTCs.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

- Yes** >> Diagnose and repair the DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 3

B10A1-PANEL MODE DOOR 2 ACTUATOR PERFORMANCE (ATC) (CONTINUED)**3. RUN ACTUATOR CALIBRATION TEST**

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 4

4. CHECK MODE, BLEND & RECIRCULATION DOOR OPERATION

Start the engine.

Set the blower to high speed.

Operate each door in all positions in one direction and then in the opposite direction while monitoring the following:

- For the Mode Doors, verify that air flows from each vent accordingly for the position selected on the A/C Heater Control.
- For the Blend Door, verify that the airflow air temperature changes accordingly for the temperature range selected on the A/C Heater Control.
- For the Recirculation Door, verify that the sound of the air flow get louder as the recirculation door opens to bring in recirculated air or gets softer as the recirculation door closes to bring in fresh air.

Does each door operate properly?

Yes >> The condition causing the fault has cleared at this time.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Remove the door actuator of the affected door from the A/C Heater Housing Assembly. By hand, attempt to rotate the actuator in both directions. Inspect the A/C Heater Housing for damage, for disconnected, missing, or broken linkage, and for broken or binding doors. Repair as necessary in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10A2–LEFT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The A/C Heater Control monitors the door driver circuits during actuator operation for shorts to ground, shorts to battery, and shorts to other door driver circuits. If detected, the A/C Heater Control reports these types of faults as Control Circuit/Performance DTCs. It is important to note that Control Circuit/Performance DTCs do not indicate where or what type of short is present and that additional system testing is necessary to provide more details about the reported fault.

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control detects an excessive current draw on the (C266) Front Mode Door Driver circuit, (C66) Front Mode Door Common Driver circuit, (C268) Recirculation Door Driver circuit, (C68) Recirculation Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C61) Right Blend Door Driver circuit, (C161) Right Blend Door Common Driver circuit, (C139) Rear Mode Door Driver circuit, or the (C939) Rear Mode Door Common Driver circuit while attempting to drive the Left Blend Door Actuator.

Possible Causes
DOOR DRIVER CIRCUIT(S) SHORTED

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool, erase HVAC DTCs.

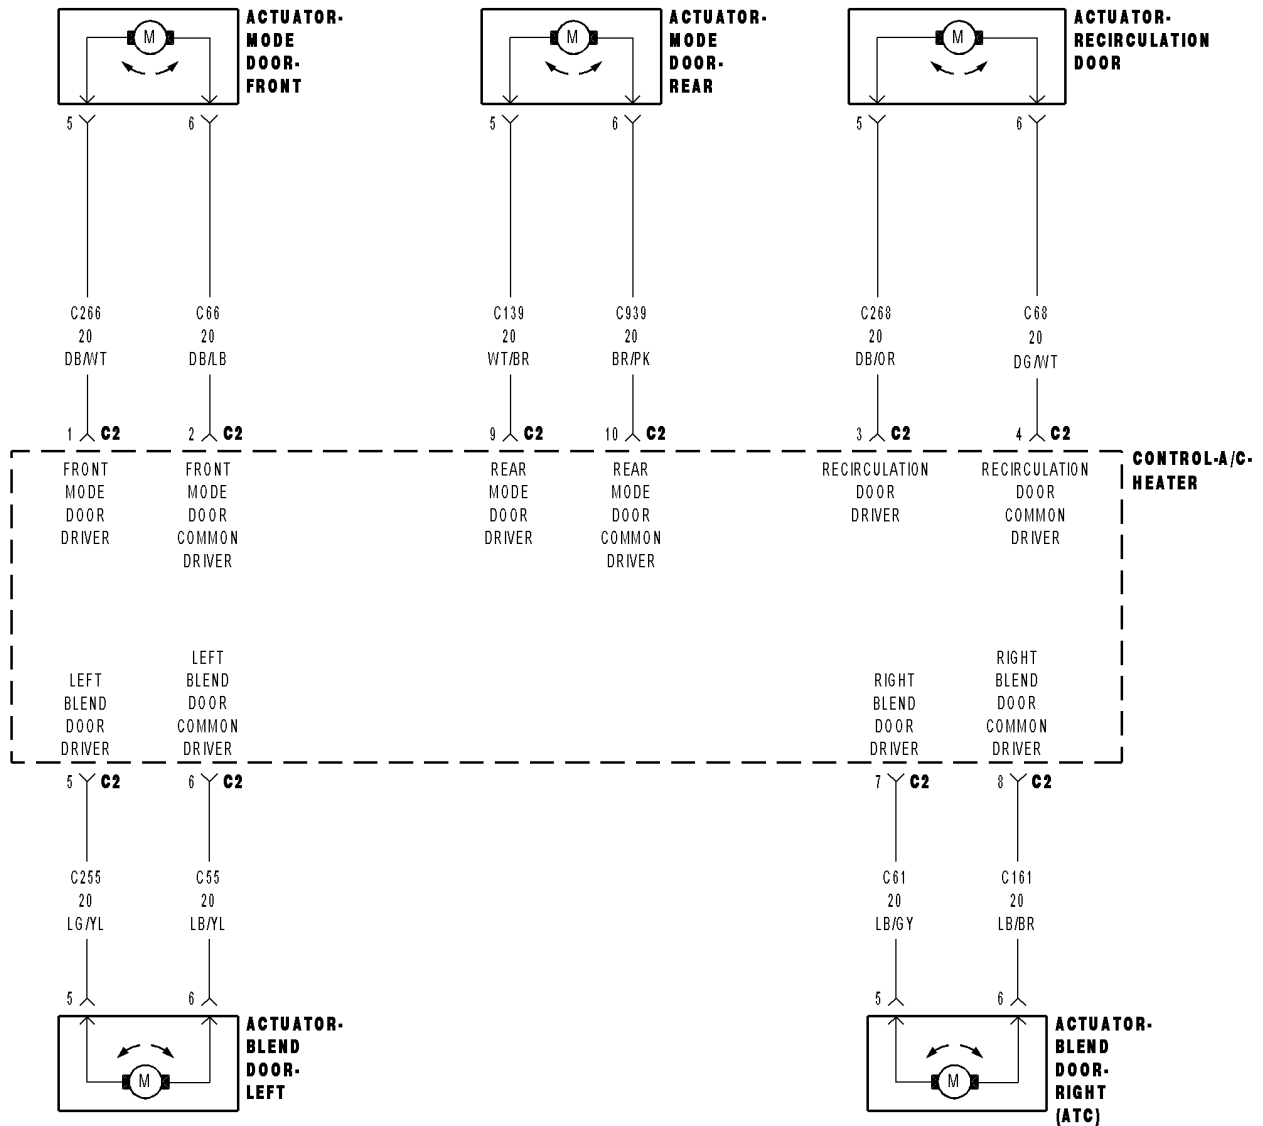

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Repair

Diagnose and repair the DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs before diagnosing short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

B10A3-LEFT BLEND DOOR CONTROL CIRCUIT LOW (ATC)

B10A3-LEFT BLEND DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
When the Actuator DTC Detection Test is executed.
- **Set Condition:**
If the (C255) Left Blend Door Driver circuit or the (C55) Left Blend Door Common Driver circuit is shorted to ground.

Possible Causes
(C255) LEFT BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT SHORTED TO GROUND
(C255) LEFT BLEND DOOR DRIVER CIRCUIT SHORTED TO (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT
(C255) LEFT BLEND DOOR DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
(C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
LEFT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Diagnostic Test

1. CHECK THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT & THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance of the (C255) Left Blend Door Driver circuit between ground and the A/C Heater Control C2 harness connector.

Measure the resistance of the (C55) Left Blend Door Common Driver circuit between ground and the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on either circuit?

- Yes** >> Repair the circuit(s) with a resistance below 10k ohms for a short to ground.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

8149a21c

B10A3-LEFT BLEND DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

2. CHECK THE LEFT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C255) Left Blend Door Driver circuit and the (C55) Left Blend Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 3

No >> Go To 4

3. CHECK THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT

Disconnect the Left Blend Door Actuator harness connector.

Measure the resistance between the (C255) Left Blend Door Driver circuit and the (C55) Left Blend Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C255) Left Blend Door Driver circuit for a short to the (C55) Left Blend Door Common Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Left Blend Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10A3-LEFT BLEND DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

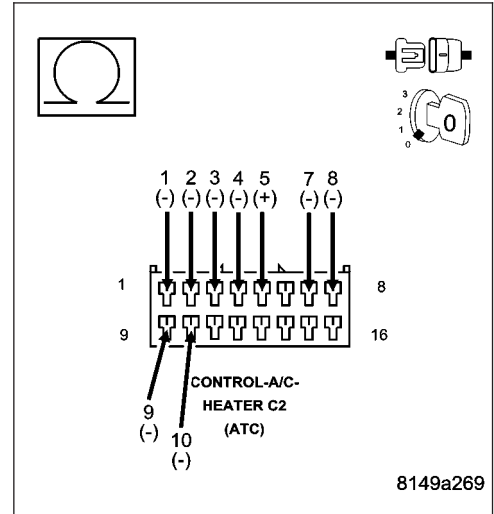

4. CHECK THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C255) Left Blend Door Driver circuit and the (C266) Front Mode Door Driver circuit, (C66) Front Mode Door Common Driver circuit, (C268) Recirculation Door Driver circuit, (C68) Recirculation Door Common Driver circuit, (C61) Right Blend Door Driver circuit, (C161) Right Blend Door Common Driver circuit, (C139) Rear Mode Door Driver circuit, and the (C939) Rear Mode Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms between the (C255) Left Blend Door Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C255) Left Blend Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 5

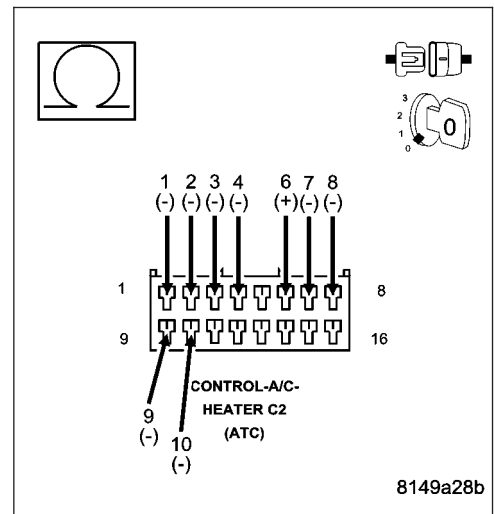

5. CHECK THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C55) Left Blend Door Common Driver circuit and the (C266) Front Mode Door Driver circuit, (C66) Front Mode Door Common Driver circuit, (C268) Recirculation Door Driver circuit, (C68) Recirculation Door Common Driver circuit, (C61) Right Blend Door Driver circuit, (C161) Right Blend Door Common Driver circuit, (C139) Rear Mode Door Driver circuit, and the (C939) Rear Mode Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms between the (C55) Left Blend Door Common Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C55) Left Blend Door Common Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 6

B10A3–LEFT BLEND DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)**6. RUN THE ACTUATOR DTC DETECTION TEST**

Reconnect the A/C Heater Control C2 harness connector.

Reconnect the Left Blend Door Actuator harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool only display: B10A3–LEFT BLEND DOOR CONTROL CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No, Other DTC(s) Displayed

Diagnose and repair the other DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs before diagnosing short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed

Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10A4-LEFT BLEND DOOR CONTROL CIRCUIT HIGH (ATC)

B10A4-LEFT BLEND DOOR CONTROL CIRCUIT HIGH (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
When the Actuator DTC Detection Test is executed.
- **Set Condition:**
If the (C255) Left Blend Door Driver circuit or the (C55) Left Blend Door Common Driver circuit is shorted to voltage.

Possible Causes
(C255) LEFT BLEND DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT SHORTED TO VOLTAGE
A/C HEATER CONTROL

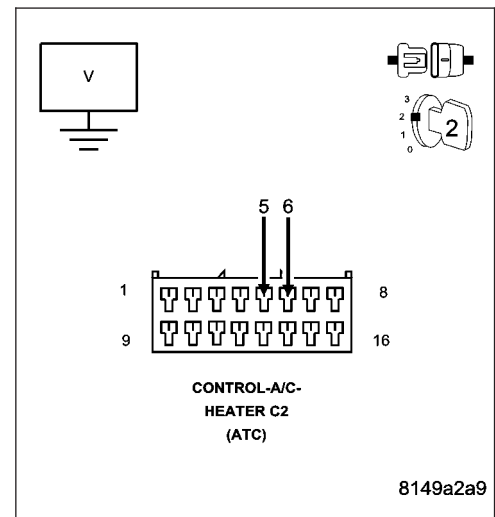

Diagnostic Test

1. CHECK THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT & THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.
 Disconnect the A/C Heater Control C2 harness connector.
 Turn the ignition on.
 Measure the voltage of the (C255) Left Blend Door Driver circuit.
 Measure the voltage of the (C55) Left Blend Door Common Driver circuit.

Is the voltage above 0.2 volts on either circuit?

- Yes** >> Repair the circuit(s) with voltage above 0.2 volts a short to voltage.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 2

B10A4–LEFT BLEND DOOR CONTROL CIRCUIT HIGH (ATC) (CONTINUED)**2. RUN THE ACTUATOR DTC DETECTION TEST**

Turn the ignition off.

Reconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool only display: B10A4–LEFT BLEND DOOR CONTROL CIRCUIT HIGH (ATC)?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No, Other DTC(s) Displayed

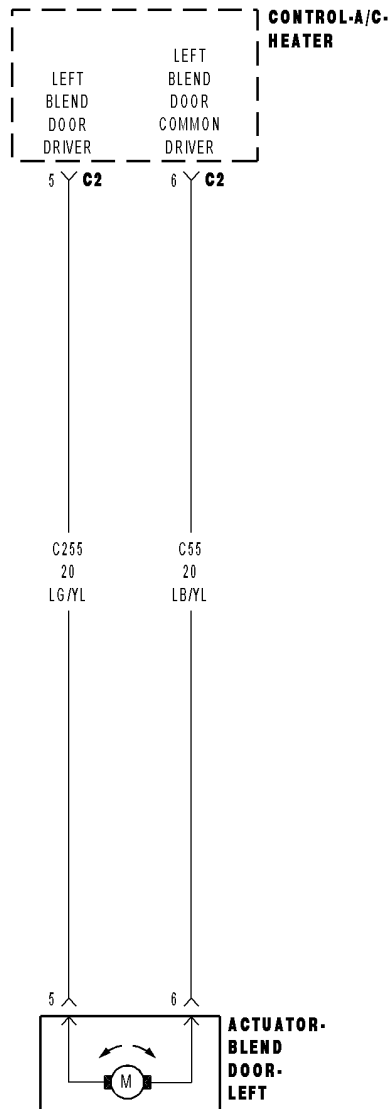

Diagnose and repair the other DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs before diagnosing short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed

Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10A5-LEFT BLEND DOOR CONTROL CIRCUIT OPEN (ATC)

B10A5-LEFT BLEND DOOR CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the (C255) Left Blend Door Driver circuit or the (C55) Left Blend Door Common Driver circuit is open.

Possible Causes
(C255) LEFT BLEND DOOR DRIVER CIRCUIT OPEN (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT OPEN LEFT BLEND DOOR ACTUATOR A/C HEATER CONTROL

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE DTCs

Turn the ignition on.
With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE DTCs?

- Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 2

2. CHECK THE LEFT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE

Turn the ignition off.
Disconnect the A/C Heater Control C2 harness connector.
Measure the resistance between the (C255) Left Blend Door Driver circuit and the (C55) Left Blend Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance above 70.0 ohms?

- Yes** >> Go To 3
- No** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10A5-LEFT BLEND DOOR CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

3. CHECK THE (C255) LEFT BLEND DOOR DRIVER CIRCUIT FOR AN OPEN

Disconnect the Left Blend Door Actuator harness connector.
 Measure the resistance of the (C255) Left Blend Door Driver circuit between the Left Blend Door Actuator harness connector and the A/C Heater Control C2 harness connector.

Is the resistance below 5.0 ohms?

- Yes** >> Go To 4
- No** >> Repair the (C255) Left Blend Door Driver circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK THE (C55) LEFT BLEND DOOR COMMON DRIVER CIRCUIT FOR AN OPEN

Measure the resistance of the (C55) Left Blend Door Common Driver circuit between the Left Blend Door Actuator harness connector and the A/C Heater Control C2 harness connector.

Is the resistance below 5.0 ohms?

- No** >> Replace the Left Blend Door Actuator in accordance with the Service Information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- Yes** >> Repair the (C55) Left Blend Door Common Driver circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10A6–LEFT BLEND DOOR TRAVEL RANGE TOO SMALL (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is less than the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the total span of the Left Blend Door is less than the low range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S) LEFT BLEND DOOR SEIZED, BINDING, OBSTRUCTED LEFT BLEND DOOR ACTUATOR A/C HEATER CONTROL

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

- Yes** >> Diagnose and repair the DTC(s). If present, diagnose and repair all Control Circuit/Performance DTCs before diagnosing Control Circuit Open DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 2

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

- Yes** >> Diagnose and repair the DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 3

B10A6–LEFT BLEND DOOR TRAVEL RANGE TOO SMALL (ATC) (CONTINUED)**3. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE LEFT BLEND DOOR TO SEIZE OR BIND**

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the left blend door to seize or bind.

Are there any physical or mechanical problems with the door, housing, linkage, or actuator?

Yes >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

4. CHECK LEFT BLEND DOOR TRAVEL

Remove the Left Blend Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over the entire span of travel (approximately 90 degrees).

Does the door operate smoothly in both directions over the entire span of travel?

Yes >> Replace the Left Blend Door Actuator in accordance with the Service Information. Then, Go To 5.

No >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

5. RUN THE ACTUATOR CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B10A6–LEFT BLEND DOOR TRAVEL RANGE TOO SMALL?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10A7–LEFT BLEND DOOR TRAVEL RANGE TOO LARGE (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value exceeds the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the total span of the Left Blend Door exceeds the high range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S) LEFT BLEND DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, MISSING, BROKEN LEFT BLEND DOOR ACTUATOR A/C HEATER CONTROL

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

Yes >> Diagnose and repair the DTC(s). If present, diagnose and repair all Control Circuit/Performance DTCs before diagnosing Control Circuit Open DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 3

B10A7-LEFT BLEND DOOR TRAVEL RANGE TOO LARGE (ATC) (CONTINUED)**3. CHECK FOR A BROKEN LEFT BLEND DOOR ACTUATOR**

Turn the ignition off.

Remove the Left Blend Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

- Yes** >> Replace the Left Blend Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 4
-

4. CHECK THE LEFT BLEND DOOR & A/C HEATER HOUSING FOR WARPED, WORN, DAMAGED, MISSING, & BROKEN COMPONENTS

Inspect for excessively worn, disconnected, missing, or broken door linkage. Inspect for a damaged or broken A/C Heater Housing Assembly. Inspect for a warped or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 90 degrees.

Are there any physical or mechanical problems with the door or housing?

- Yes** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Left Blend Door Actuator in accordance with the Service Information. Then, Go To 5.
-

5. RUN THE ACTUATOR THE CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B10A7-LEFT BLEND DOOR TRAVEL RANGE TOO LARGE?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

B10A8–LEFT BLEND DOOR ACTUATOR PERFORMANCE (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The A/C Heater Control monitors the door driver circuits during actuator operation for conditions that prevent proper door operation. If a pulse count error is detected the A/C Heater Control reports the fault as a Actuator Performance DTC. It is important to note that this DTC only indicates that a fault occurred while driving a door actuator and that additional testing is necessary to provide more details about the reported fault.

- **When Monitored:**
When actuator movement is requested.
- **Set Condition:**
If the A/C Heater Control detects a pulse count error while attempting to drive this door actuator.

Possible Causes
DOOR DRIVER CIRCUIT(S) SHORTED HIGH, SHORTED LOW, SHORTED TOGETHER, OPEN
DOOR ACTUATOR(S) BINDING, BROKEN
DOOR ACTUATOR(S) LINKAGE BINDING, DISCONNECTED, MISSING, BROKEN
A/C HEATER CONTROL

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

- Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 2

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool, erase HVAC DTCs.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

- Yes** >> Diagnose and repair the DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 3

B10A8-LEFT BLEND DOOR ACTUATOR PERFORMANCE (ATC) (CONTINUED)**3. RUN ACTUATOR CALIBRATION TEST**

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 4

4. CHECK MODE, BLEND & RECIRCULATION DOOR OPERATION

Start the engine.

Set the blower to high speed.

Operate each door in all positions in one direction and then in the opposite direction while monitoring the following:

- For the Mode Doors, verify that air flows from each vent accordingly for the position selected on the A/C Heater Control.
- For the Blend Door, verify that the airflow air temperature changes accordingly for the temperature range selected on the A/C Heater Control.
- For the Recirculation Door, verify that the sound of the air flow get louder as the recirculation door opens to bring in recirculated air or gets softer as the recirculation door closes to bring in fresh air.

Does each door operate properly?

Yes >> The condition causing the fault has cleared at this time.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Remove the door actuator of the affected door from the A/C Heater Housing Assembly. By hand, attempt to rotate the actuator in both directions. Inspect the A/C Heater Housing for damage, for disconnected, missing, or broken linkage, and for broken or binding doors. Repair as necessary in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10A9–RIGHT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The A/C Heater Control monitors the door driver circuits during actuator operation for shorts to ground, shorts to battery, and shorts to other door driver circuits. If detected, the A/C Heater Control reports these types of faults as Control Circuit/Performance DTCs. It is important to note that Control Circuit/Performance DTCs do not indicate where or what type of short is present and that additional system testing is necessary to provide more details about the reported fault.

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control detects an excessive current draw on the (C266) Front Mode Door Driver circuit, (C66) Front Mode Door Common Driver circuit, (C268) Recirculation Door Driver circuit, (C68) Recirculation Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C61) Right Blend Door Driver circuit, (C161) Right Blend Door Common Driver circuit, (C139) Rear Mode Door Driver circuit, or the (C939) Rear Mode Door Common Driver circuit while attempting to drive the Right Blend Door Actuator.

Possible Causes
DOOR DRIVER CIRCUIT(S) SHORTED

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Repair

Diagnose and repair the DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs before diagnosing short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

B10B0–INFRARED SENSOR THERMISTOR CIRCUIT LOW (ATC)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the IR Sensor fails the internal self test.

Possible Causes
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test**1. REPLACE THE A/C HEATER CONTROL****Repair**

Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10B1–INFRARED SENSOR THERMISTOR CIRCUIT HIGH (ATC)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With ignition on.
- **Set Condition:**
If the IR Sensor fails the internal self test.

Possible Causes
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. REPLACE THE A/C HEATER CONTROL

Repair

Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10B2–A/C COOL DOWN TEST PERFORMANCE (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
When the Cooldown Test is executed.
- **Set Condition:**
If the A/C system is unable to lower the evaporator temperature 11.11°C (20°F) within two minutes.

Possible Causes
PREREQUISITES NOT MET BEFORE RUNNING THE TEST
ANOTHER RELATED SYSTEM NOT FUNCTIONING CORRECTLY
POWERTRAIN SYSTEM FAULTS PRESENT

Diagnostic Test

1. VERIFY THAT ALL OF THE COOLDOWN TEST PREREQUISITES WERE MET

Review the list of Cooldown Test prerequisites.

- **DTCs B1031 and B1032 must not be active.**
- **The refrigerant system must be adequately charged.**
- **The blower motor must operate correctly in all speeds.**
- **The work area ambient temperature must be above 18.3°C (65°F).**
- **The evaporator temperature must be above 18.3°C (65°F).**
- **The A/C compressor must be turned off.**

Were all of the prerequisites met before running the Cooldown Test?

Yes >> Go To 2

No >> Run the Cooldown Test again after all of the prerequisites are met. Then, if DTC B10B2 is still active, Go To 2. Otherwise, Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR DTCs IN THE PCM

With the scan tool, select PCM.

Are any DTCs present in the PCM?

Yes >> Diagnose and repair the DTC(s). (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) for PCM DTCs. Run the Cooldown Test again after the repair is complete.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Refer to the Service Information for additional Cooldown Test related diagnostic information and testing procedures. Run the Cooldown Test again after the repair is complete.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B100A–RECIRCULATION SWITCH REQUEST INPUT CIRCUIT LOW (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The switch input changes when the switch is pushed down. A stored DTC B100A indicates that the Recirculation mode switch was stuck in a pushed position for more than 10 minutes, but has since returned to its normal state. An active DTC B100A indicates that the Recirculation mode switch is stuck in a pushed position. An active DTC B100A will prevent proper Recirculation mode switch and status indicator function.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the Recirculation mode switch stays in a pushed position for more than 10 minutes.

Possible Causes
A/C HEATER CONTROL DAMAGED
OBJECT HOLDING RECIRCULATION MODE SWITCH IN A PUSHED POSITION
SUBSTANCE CAUSING RECIRCULATION MODE SWITCH TO GET STUCK IN A PUSHED POSITION
A/C HEATER CONTROL

Diagnostic Test

1. INSPECT THE A/C HEATER CONTROL FOR DAMAGE

Inspect the A/C Heater Control for damage.

Is the A/C Heater Control damaged?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 2

2. INSPECT FOR OBJECT OR SUBSTANCE CAUSING THE RECIRCULATION MODE SWITCH TO STAY OR STICK IN A PUSHED POSITION

Inspect the A/C Heater Control for anything that would cause the Recirculation mode switch to stay or stick in a pushed position.

Is anything present that would cause the Recirculation mode switch to stay or stick in a pushed position?

- Yes** >> Repair as necessary.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 3

B100A-RECIRCULATION SWITCH REQUEST INPUT CIRCUIT LOW (ATC) (CONTINUED)**3. CHECK FOR NORMAL RECIRCULATION MODE SWITCH & STATUS INDICATOR FUNCTION**

Turn the ignition on.

Press the Recirculation mode switch on and off several times while observing the Recirculation status indicator.

Does the Recirculation status indicator turn on and off?

Yes >> Go To 4

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. VERIFY THAT DTC B100A-RECIRCULATION SWITCH REQUEST INPUT CIRCUIT LOW IS STILL ACTIVE

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on. Wait 10 minutes before proceeding.

With the scan tool, read HVAC DTCs.

Does the scan tool display active: B100A-RECIRCULATION SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B105A-RECIRCULATION DOOR CONTROL CIRCUIT HIGH (ATC)

B105A-RECIRCULATION DOOR CONTROL CIRCUIT HIGH (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
When the Actuator DTC Detection Test is executed.
- **Set Condition:**
If the (C268) Recirculation Door Driver circuit or the (C68) Recirculation Door Common Driver circuit is shorted to voltage.

Possible Causes
(C268) RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT SHORTED TO VOLTAGE
A/C HEATER CONTROL

Diagnostic Test

1. CHECK THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Measure the voltage of the (C268) Recirculation Door Driver circuit.

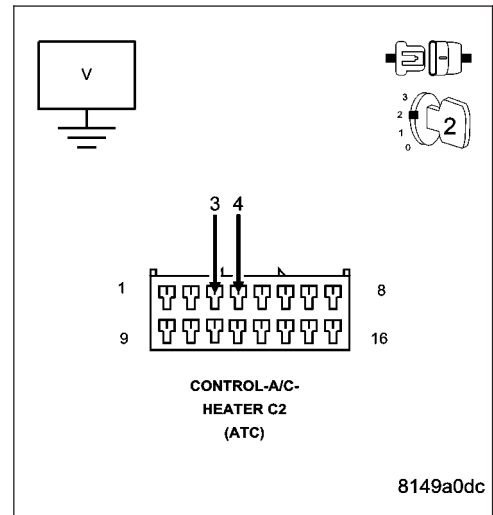

Measure the voltage of the (C68) Recirculation Door Common Driver circuit.

Is the voltage above 0.2 volts on either circuit?

Yes >> Repair the circuit(s) with voltage above 0.2 volts a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

B105A-RECIRCULATION DOOR CONTROL CIRCUIT HIGH (ATC) (CONTINUED)**2. RUN THE ACTUATOR DTC DETECTION TEST**

Turn the ignition off.

Reconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool only display: B105A-RECIRCULATION DOOR CONTROL CIRCUIT HIGH?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No, Other DTC(s) Displayed

Diagnose and repair the other DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs before diagnosing short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed

Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B105B-RECIRCULATION DOOR CONTROL CIRCUIT OPEN (ATC)

B105B-RECIRCULATION DOOR CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the (C268) Recirculation Door Driver circuit or the (C68) Recirculation Door Common Driver circuit is open.

Possible Causes
(C268) RECIRCULATION DOOR DRIVER CIRCUIT OPEN
(C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT OPEN
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE DTCs

Turn the ignition on.
With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE DTCs?

- Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 2

2. CHECK THE RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE

Turn the ignition off.
Disconnect the A/C Heater Control C2 harness connector.
Measure the resistance between the (C268) Recirculation Door Driver circuit and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance above 70.0 ohms?

- Yes** >> Go To 3
- No** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B105B-RECIRCULATION DOOR CONTROL CIRCUIT OPEN (ATC) (CONTINUED)**3. CHECK THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT FOR AN OPEN**

Disconnect the Recirculation Door Actuator harness connector.

Measure the resistance of the (C268) Recirculation Door Driver circuit between the Recirculation Door Actuator harness connector and the A/C Heater Control C2 harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

No >> Repair the (C268) Recirculation Door Driver circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**4. CHECK THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT FOR AN OPEN**

Measure the resistance of the (C68) Recirculation Door Common Driver circuit between the Recirculation Door Actuator harness connector and the A/C Heater Control C2 harness connector.

Is the resistance below 5.0 ohms?

No >> Replace the Recirculation Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

Yes >> Repair the (C68) Recirculation Door Common Driver circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B105C–RECIRCULATION DOOR TRAVEL RANGE TOO SMALL (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is less than the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the total span of the Recirculation Door is less than the low range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S) RECIRCULATION DOOR SEIZED, BINDING, OBSTRUCTED RECIRCULATION DOOR ACTUATOR A/C HEATER CONTROL

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

- Yes** >> Diagnose and repair the DTC(s). If present, diagnose and repair all Control Circuit/Performance DTCs before diagnosing Control Circuit Open DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 2

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

- Yes** >> Diagnose and repair the DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 3

B105C-RECIRCULATION DOOR TRAVEL RANGE TOO SMALL (ATC) (CONTINUED)**3. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE RECIRCULATION DOOR TO SEIZE OR BIND**

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the recirculation door to seize or bind.

Are there any physical or mechanical problems with the door, housing, linkage, or actuator?

- Yes** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 4
-

4. CHECK RECIRCULATION DOOR TRAVEL

Remove the Recirculation Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over the entire span of travel (approximately 85 degrees).

Does the door operate smoothly in both directions over the entire span of travel?

- Yes** >> Replace the Recirculation Door Actuator in accordance with the Service Information. Then, Go To 5.
- No** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

5. RUN THE ACTUATOR CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B105C-RECIRCULATION DOOR TRAVEL RANGE TOO SMALL?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

B105D–RECIRCULATION DOOR TRAVEL RANGE TOO LARGE (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value exceeds the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the total span of the Recirculation Door exceeds the high range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S) RECIRCULATION DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, MISSING, BROKEN RECIRCULATION DOOR ACTUATOR A/C HEATER CONTROL

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

Yes >> Diagnose and repair the DTC(s). If present, diagnose and repair all Control Circuit/Performance DTCs before diagnosing Control Circuit Open DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 3

B105D-RECIRCULATION DOOR TRAVEL RANGE TOO LARGE (ATC) (CONTINUED)**3. CHECK FOR A BROKEN RECIRCULATION DOOR ACTUATOR**

Turn the ignition off.

Remove the Recirculation Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

- Yes** >> Replace the Recirculation Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 4
-

4. CHECK THE RECIRCULATION DOOR & A/C HEATER HOUSING FOR WARPED, WORN, DAMAGED, MISSING, & BROKEN COMPONENTS

Inspect for excessively worn, disconnected, missing, or broken door linkage. Inspect for a damaged or broken A/C Heater Housing Assembly. Inspect for a warped or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 85 degrees.

Are there any physical or mechanical problems with the door or housing?

- Yes** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Recirculation Door Actuator in accordance with the Service Information. Then, Go To 5.
-

5. RUN THE ACTUATOR CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B105D-RECIRCULATION DOOR TRAVEL RANGE TOO LARGE?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

B106B-REAR DEFROST CONTROL CIRCUIT LOW (ATC)

CONTROL-A/C-HEATER C1 (ATC)

B106B-REAR DEFROST CONTROL CIRCUIT LOW (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**

With ignition on and the EBL output turned off.

- **Set Condition:**

If the (C115) Rear Window Defogger Relay Control circuit is shorted to ground.

Possible Causes
(C115) REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT SHORTED TO GROUND
(C115) REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT OPEN
REAR WINDOW DEFOGGER RELAY
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. INSTALL A SUBSTITUTE REAR WINDOW DEFOGGER RELAY & THEN CHECK FOR DTC B106B-REAR DEFROST CONTROL CIRCUIT LOW

Turn the ignition on.

Verify that the EBL mode switch is off.

Turn the ignition off.

Install a substitute Rear Window Defogger Relay.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, read HVAC DTCs.

Does the scan tool display: B106B-REAR DEFROST CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> Replace the original Rear Window Defogger Relay in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B106B-REAR DEFROST CONTROL CIRCUIT LOW (ATC) (CONTINUED)

2. CHECK (C115) REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Remove the substitute Rear Window Defogger Relay.

Disconnect the A/C Heater Control C1 harness connector.

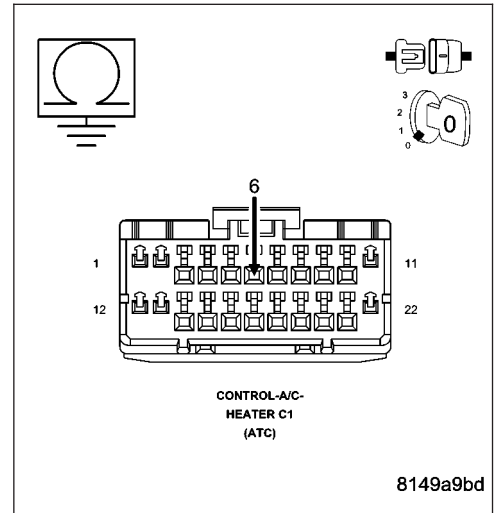

Measure the resistance of the (C115) Rear Window Defogger Relay Control circuit between ground and the A/C Heater Control C1 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C115) Rear Window Defogger Relay Control circuit for a short to ground. Reinstall the original Rear Window Defogger Relay.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK (C115) REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT FOR AN OPEN

Measure the resistance of the (C115) Rear Window Defogger Relay Control circuit between the Rear Window Defogger Relay connector terminal 85 in the JB and the A/C Heater Control C1 harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the A/C Heater Control in accordance with the Service Information. Reinstall the original Rear Window Defogger Relay.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (C115) Rear Window Defogger Relay Control circuit for an open. Reinstall the original Rear Window Defogger Relay.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B106C-REAR DEFROST CONTROL CIRCUIT HIGH (ATC)

C115
20
DB

CONTROL-A/C-HEATER C1 (ATC)

B106C-REAR DEFROST CONTROL CIRCUIT HIGH (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With ignition on.
- **Set Condition:**
If the EBL output is turned on and the (C115) Rear Window Defogger Relay Control circuit is either shorted to voltage or open.

Possible Causes
(C115) REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
(C115) REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT OPEN
REAR WINDOW DEFOGGER RELAY
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. INSTALL A SUBSTITUTE REAR WINDOW DEFOGGER RELAY & THEN CHECK FOR DTC B106C-REAR DEFROST CONTROL CIRCUIT HIGH

- Turn the ignition on.
- Verify that the EBL mode switch is off.
- Turn the ignition off.
- Install a substitute Rear Window Defogger Relay.
- Turn the ignition on.
- With the scan tool, erase HVAC DTCs.
- Turn the ignition off, wait 10 seconds, and turn the ignition on.
- Press the EBL mode switch is on.
- With the scan tool, read HVAC DTCs.

Does the scan tool display: B106C-REAR DEFROST CONTROL CIRCUIT HIGH?

- Yes** >> Go To 2
- No** >> Replace the original Rear Window Defogger Relay in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B106C-REAR DEFROST CONTROL CIRCUIT HIGH (ATC) (CONTINUED)

2. CHECK (C115) REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition on.
 Verify that the EBL mode switch is off.
 Turn the ignition off.
 Remove the substitute Rear Window Defogger Relay.
 Disconnect the A/C Heater Control C1 harness connector.
 Turn the ignition on.
 Measure the voltage of the (C115) Rear Window Defogger Relay Control circuit.

Is the voltage above 0.2 volts?

- Yes** >> Repair the (C115) Rear Window Defogger Relay Control circuit for a short to voltage. Reinstall the original Rear Window Defogger Relay.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 3

3. CHECK (C115) REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off.
 Measure the resistance of the (C115) Rear Window Defogger Relay Control circuit between the Rear Window Defogger Relay connector terminal 85 in the JB and the A/C Heater Control C1 harness connector.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information. Reinstall the original Rear Window Defogger Relay.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Repair the (C115) Rear Window Defogger Relay Control circuit for an open. Reinstall the original Rear Window Defogger Relay.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B109B–PANEL MODE DOOR 2 CONTROL CIRCUIT/PERFORMANCE (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The A/C Heater Control monitors the door driver circuits during actuator operation for shorts to ground, shorts to battery, and shorts to other door driver circuits. If detected, the A/C Heater Control reports these types of faults as Control Circuit/Performance DTCs. It is important to note that Control Circuit/Performance DTCs do not indicate where or what type of short is present and that additional system testing is necessary to provide more details about the reported fault.

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control detects an excessive current draw on the (C266) Front Mode Door Driver circuit, (C66) Front Mode Door Common Driver circuit, (C268) Recirculation Door Driver circuit, (C68) Recirculation Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C61) Right Blend Door Driver circuit, (C161) Right Blend Door Common Driver circuit, (C139) Rear Mode Door Driver circuit, or the (C939) Rear Mode Door Common Driver circuit while attempting to drive the Rear Mode Door Actuator.

Possible Causes
DOOR DRIVER CIRCUIT(S) SHORTED

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool, erase HVAC DTCs.

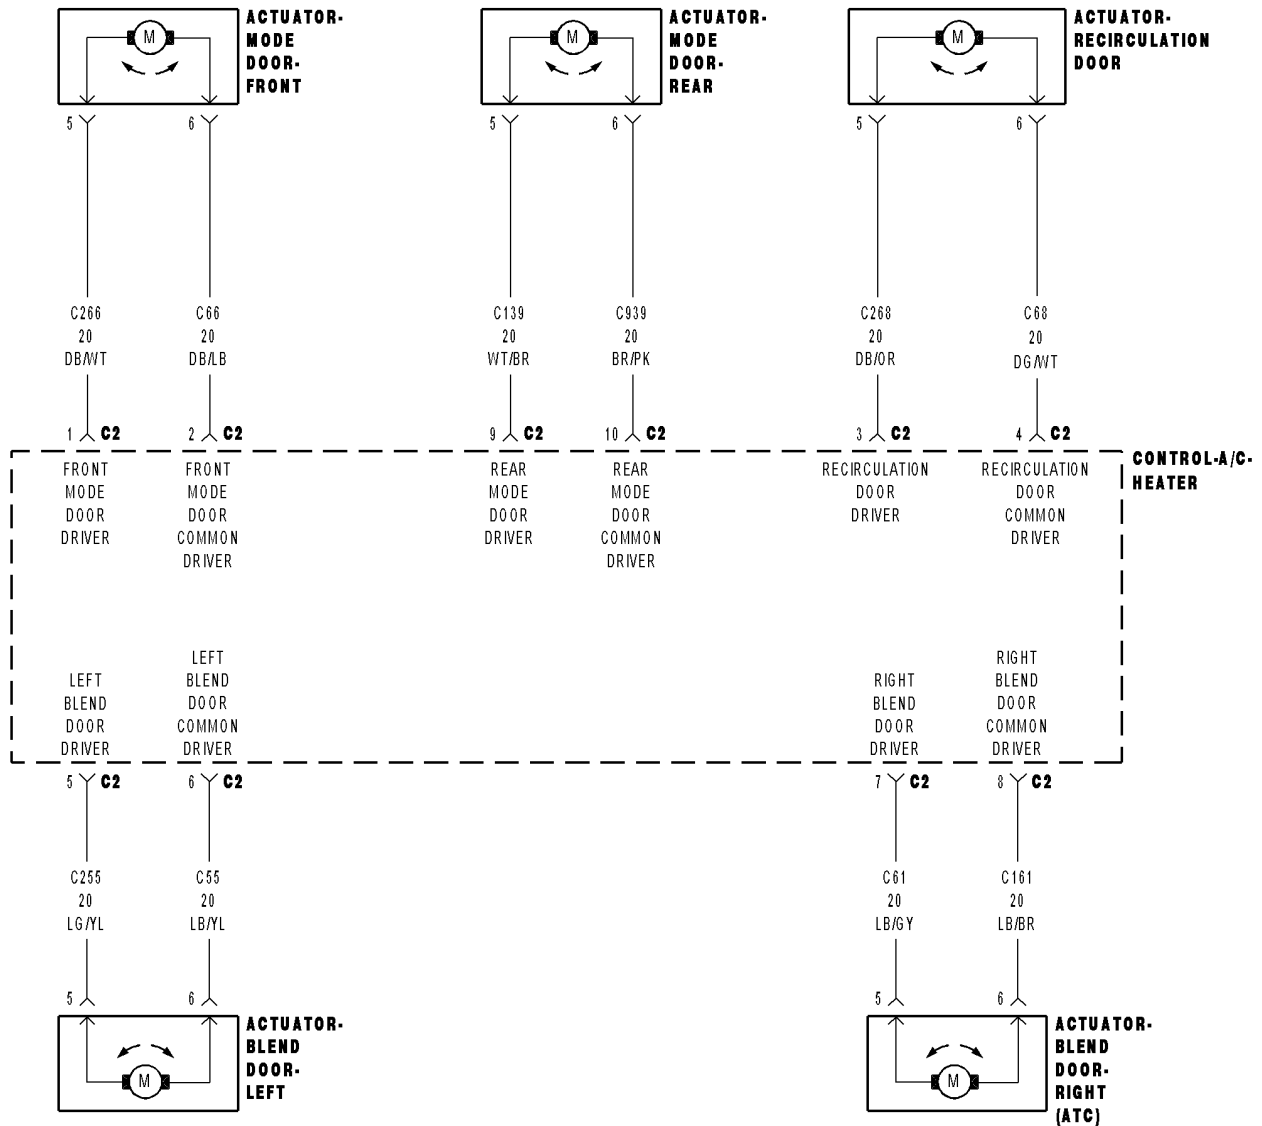

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Repair

Diagnose and repair the DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs before diagnosing short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

B109C-PANEL MODE DOOR 2 CONTROL CIRCUIT LOW (ATC)

B109C-PANEL MODE DOOR 2 CONTROL CIRCUIT LOW (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
When the Actuator DTC Detection Test is executed.
- **Set Condition:**
If the (C139) Rear Mode Door Driver circuit or the (C939) Rear Mode Door Common Driver circuit is shorted to ground.

Possible Causes
(C139) REAR MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C939) REAR MODE DOOR COMMON DRIVER CIRCUIT SHORTED TO GROUND
(C139) REAR MODE DOOR DRIVER CIRCUIT SHORTED TO (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT
(C139) REAR MODE DOOR DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
(C939) REAR MODE DOOR COMMON DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
REAR MODE DOOR ACTUATOR
A/C HEATER CONTROL

Diagnostic Test

1. CHECK THE (C139) REAR MODE DOOR DRIVER CIRCUIT & THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance of the (C139) Rear Mode Door Driver circuit between ground and the A/C Heater Control C2 harness connector.

Measure the resistance of the (C939) Rear Mode Door Common Driver circuit between ground and the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on either circuit?

- Yes** >> Repair the circuit(s) with a resistance below 10k ohms for a short to ground.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

8149a143

B109C-PANEL MODE DOOR 2 CONTROL CIRCUIT LOW (ATC) (CONTINUED)**2. CHECK THE REAR MODE DOOR ACTUATOR CIRCUIT RESISTANCE**

Measure the resistance between the (C139) Rear Mode Door Driver circuit and the (C939) Rear Mode Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 3

No >> Go To 4

**3. CHECK THE (C139) REAR MODE DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT**

Disconnect the Rear Mode Door Actuator harness connector.

Measure the resistance between the (C139) Rear Mode Door Driver circuit and the (C939) Rear Mode Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C139) Rear Mode Door Driver circuit for a short to the (C939) Rear Mode Door Common Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Rear Mode Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B109C-PANEL MODE DOOR 2 CONTROL CIRCUIT LOW (ATC) (CONTINUED)

4. CHECK THE (C139) REAR MODE DOOR DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C139) Rear Mode Door Driver circuit and the (C266) Front Mode Door Driver circuit, (C66) Front Mode Door Common Driver circuit, the (C268) Recirculation Door Driver circuit, (C68) Recirculation Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C61) Right Blend Door Driver circuit, and the (C161) Right Blend Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms between the (C139) Rear Mode Door Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C139) Rear Mode Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 5

5. CHECK THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C939) Rear Mode Door Common Driver circuit and the (C266) Front Mode Door Driver circuit, (C66) Front Mode Door Common Driver circuit, the (C268) Recirculation Door Driver circuit, (C68) Recirculation Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C61) Right Blend Door Driver circuit, and the (C161) Right Blend Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms between the (C939) Rear Mode Door Common Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C939) Rear Mode Door Common Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 6

B109C–PANEL MODE DOOR 2 CONTROL CIRCUIT LOW (ATC) (CONTINUED)**6. RUN THE ACTUATOR DTC DETECTION TEST**

Reconnect the A/C Heater Control C2 harness connector.

Reconnect the Rear Mode Door Actuator harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool only display: B109C–PANEL MODE DOOR 2 CONTROL CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No, Other DTC(s) Displayed

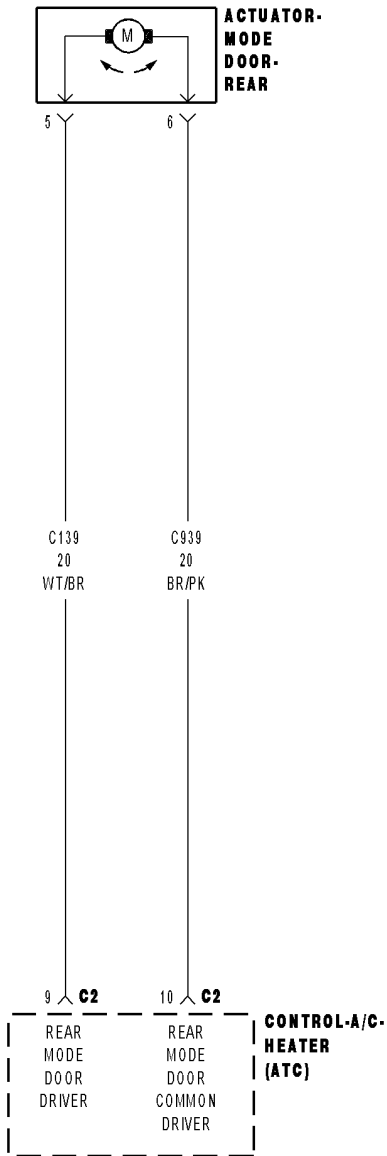

Diagnose and repair the other DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs before diagnosing short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed

Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B109D-PANEL MODE DOOR 2 CONTROL CIRCUIT HIGH (ATC)

B109D-PANEL MODE DOOR 2 CONTROL CIRCUIT HIGH (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**

When the Actuator DTC Detection Test is executed.

- **Set Condition:**

If the (C139) Rear Mode Door Driver circuit or the (C939) Rear Mode Door Common Driver circuit is shorted to voltage.

Possible Causes
(C139) REAR MODE DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C939) REAR MODE DOOR COMMON DRIVER CIRCUIT SHORTED TO VOLTAGE
A/C HEATER CONTROL

Diagnostic Test

1. CHECK THE (C139) REAR MODE DOOR DRIVER CIRCUIT & THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Measure the voltage of the (C139) Rear Mode Door Driver circuit.

Measure the voltage of the (C939) Rear Mode Door Common Driver circuit.

Is the voltage above 0.2 volts on either circuit?

Yes >> Repair the circuit(s) with voltage above 0.2 volts a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

B109D–PANEL MODE DOOR 2 CONTROL CIRCUIT HIGH (ATC) (CONTINUED)**2. RUN THE ACTUATOR DTC DETECTION TEST**

Turn the ignition off.

Reconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool only display: B109D–PANEL MODE DOOR 2 CONTROL CIRCUIT HIGH?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No, Other DTC(s) Displayed

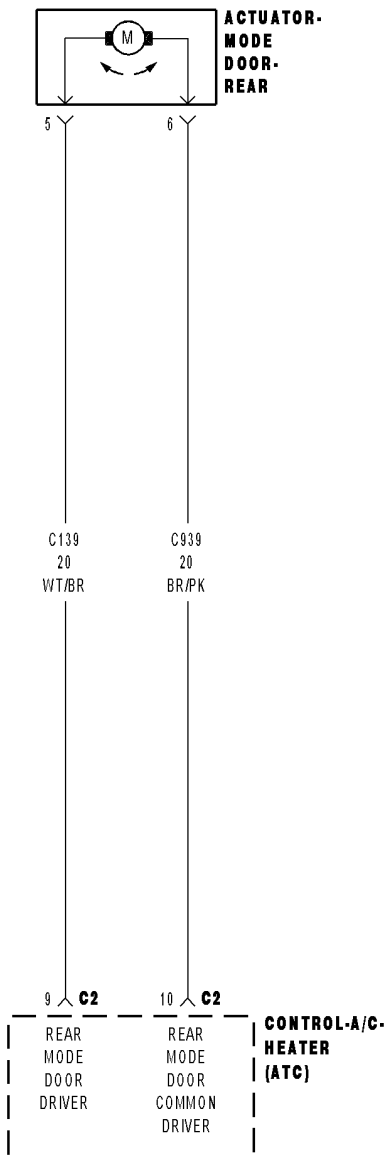

Diagnose and repair the other DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs before diagnosing short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed

Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B109E-PANEL MODE DOOR 2 CONTROL CIRCUIT OPEN (ATC)

B109E-PANEL MODE DOOR 2 CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the (C139) Rear Mode Door Driver circuit or the (C939) Rear Mode Door Common Driver circuit is open.

Possible Causes
(C139) REAR MODE DOOR DRIVER CIRCUIT OPEN
(C939) REAR MODE DOOR COMMON DRIVER CIRCUIT OPEN
REAR MODE DOOR ACTUATOR
A/C HEATER CONTROL

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE DTCs

Turn the ignition on.
With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE DTCs?

- Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 2

2. CHECK THE REAR MODE DOOR ACTUATOR CIRCUIT RESISTANCE

Turn the ignition off.
Disconnect the A/C Heater Control C2 harness connector.
Measure the resistance between the (C139) Rear Mode Door Driver circuit and the (C939) Rear Mode Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance above 70.0 ohms?

- Yes** >> Go To 3
- No** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B109E-PANEL MODE DOOR 2 CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

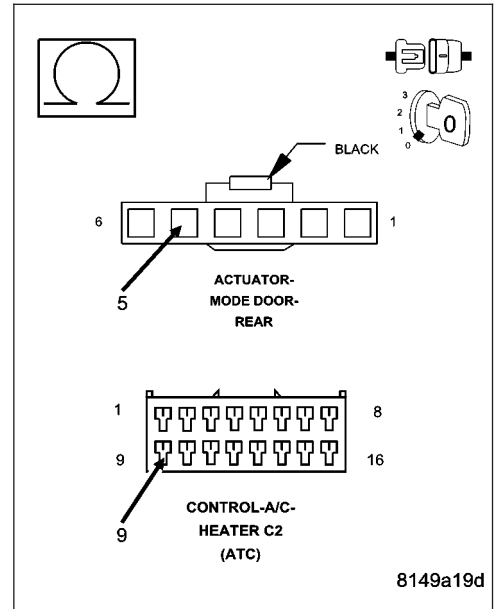

3. CHECK THE (C139) REAR MODE DOOR DRIVER CIRCUIT FOR AN OPEN

Disconnect the Rear Mode Door Actuator harness connector.

Measure the resistance of the (C139) Rear Mode Door Driver circuit between the Rear Mode Door Actuator harness connector and the A/C Heater Control C2 harness connector.

Is the resistance below 5.0 ohms?

- Yes** >> Go To 4
- No** >> Repair the (C139) Rear Mode Door Driver circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK THE (C939) REAR MODE DOOR COMMON DRIVER CIRCUIT FOR AN OPEN

Measure the resistance of the (C939) Rear Mode Door Common Driver circuit between the Rear Mode Door Actuator harness connector and the A/C Heater Control C2 harness connector.

Is the resistance below 5.0 ohms?

- No** >> Replace the Rear Mode Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- Yes** >> Repair the (C939) Rear Mode Door Common Driver circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B109F–PANEL MODE DOOR 2 TRAVEL RANGE TOO SMALL (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is less than the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the total span of the Rear Mode Door is less than the low range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S) REAR MODE DOOR SEIZED, BINDING, OBSTRUCTED REAR MODE DOOR ACTUATOR A/C HEATER CONTROL

Diagnostic Test**1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs**

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

- Yes** >> Diagnose and repair the DTC(s). If present, diagnose and repair all Control Circuit/Performance DTCs before diagnosing Control Circuit Open DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 2

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

- Yes** >> Diagnose and repair the DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 3

B109F-PANEL MODE DOOR 2 TRAVEL RANGE TOO SMALL (ATC) (CONTINUED)**3. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE REAR MODE DOOR TO SEIZE OR BIND**

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the rear mode door to seize or bind.

Are there any physical or mechanical problems with the door, housing, linkage, or actuator?

- Yes** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 4
-

4. CHECK REAR MODE DOOR TRAVEL

Remove the Rear Mode Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over the entire span of travel (approximately 155 degrees).

Does the door operate smoothly in both directions over the entire span of travel?

- Yes** >> Replace the Rear Mode Door Actuator in accordance with the Service Information. Then, Go To 5.
- No** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

5. RUN THE ACTUATOR CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B109F-PANEL MODE DOOR 2 TRAVEL RANGE TOO SMALL?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

B222A-VEHICLE LINE MISMATCH (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The EBL and AC status indicators will flash when this DTC is active. The status indicators will continue to flash across ignition cycles and battery disconnects. The vehicle line and country code data transmitted on the CAN B Bus must correspond with data stored in the A/C Heater Control to stop the status indicators from flashing.

- **When Monitored:**
With ignition on.
- **Set Condition:**
If vehicle line and country code data transmitted on the CAN B Bus doesn't correspond with data stored in the A/C Heater Control.

Possible Causes
INCORRECT PCM
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK VEHICLE LINE IN PCM

With the scan tool compare the vehicle line that is programmed into the PCM to the vehicle line of the vehicle.

Does the vehicle line programmed into the PCM match the vehicle?

- Yes** >> Replace the A/C Heater Control in accordance with the service information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace and program the Powertrain Control Module in accordance with the service information. Ensure the PCM is replaced with the correct vehicle line PCM.
Perform POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).
-

B1001–A/C SWITCH REQUEST INPUT CIRCUIT LOW (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The switch input changes when the switch is pushed down. A stored DTC B1001 indicates that the A/C mode switch was stuck in a pushed position for more than 10 minutes, but has since returned to its normal state. An active DTC B1001 indicates that the A/C mode switch is stuck in a pushed position. An active DTC B1001 will prevent proper A/C mode switch and status indicator function.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the A/C mode switch stays in a pushed position for more than 10 minutes.

Possible Causes
A/C HEATER CONTROL DAMAGED OBJECT HOLDING A/C MODE SWITCH IN A PUSHED POSITION SUBSTANCE CAUSING A/C MODE SWITCH TO GET STUCK IN A PUSHED POSITION A/C HEATER CONTROL

Diagnostic Test

1. INSPECT THE A/C HEATER CONTROL FOR DAMAGE

Inspect the A/C Heater Control for damage.

Is the A/C Heater Control damaged?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 2

2. INSPECT FOR OBJECT OR SUBSTANCE CAUSING THE A/C MODE SWITCH TO STAY OR STICK IN A PUSHED POSITION

Inspect the A/C Heater Control for anything that would cause the A/C mode switch to stay or stick in a pushed position.

Is anything present that would cause the A/C mode switch to stay or stick in a pushed position?

- Yes** >> Repair as necessary.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 3
-

B1001-A/C SWITCH REQUEST INPUT CIRCUIT LOW (ATC) (CONTINUED)**3. CHECK FOR NORMAL A/C MODE SWITCH & STATUS INDICATOR FUNCTION**

Turn the ignition on.

Press the A/C mode switch on and off several times while observing the A/C status indicator.

Does the A/C status indicator turn on and off?

Yes >> Go To 4

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. VERIFY THAT DTC B1001-A/C SWITCH REQUEST INPUT CIRCUIT LOW IS STILL ACTIVE

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on. Wait 10 minutes before proceeding.

With the scan tool, read HVAC DTCs.

Does the scan tool display active: B1001-A/C SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1016–REAR DEFROST SWITCH REQUEST INPUT CIRCUIT LOW (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The switch input changes when the switch is pushed down. A stored DTC B1016 indicates that the EBL mode switch was stuck in a pushed position for more than 10 minutes, but has since returned to its normal state. An active DTC B1016 indicates that the EBL mode switch is stuck in a pushed position. An active DTC B1016 will prevent proper EBL mode switch and status indicator function.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the EBL mode switch stays in a pushed position for more than 10 minutes.

Possible Causes
A/C HEATER CONTROL DAMAGED OBJECT HOLDING EBL MODE SWITCH IN A PUSHED POSITION SUBSTANCE CAUSING EBL MODE SWITCH TO GET STUCK IN A PUSHED POSITION A/C HEATER CONTROL

Diagnostic Test

1. INSPECT THE A/C HEATER CONTROL FOR DAMAGE

Inspect the A/C Heater Control for damage.

Is the A/C Heater Control damaged?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

2. INSPECT FOR OBJECT OR SUBSTANCE CAUSING THE EBL MODE SWITCH TO STAY OR STICK IN A PUSHED POSITION

Inspect the A/C Heater Control for anything that would cause the EBL mode switch to stay or stick in a pushed position.

Is anything present that would cause the EBL mode switch to stay or stick in a pushed position?

Yes >> Repair as necessary.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

B1016-REAR DEFROST SWITCH REQUEST INPUT CIRCUIT LOW (ATC) (CONTINUED)**3. CHECK FOR NORMAL EBL MODE SWITCH & STATUS INDICATOR FUNCTION**

Turn the ignition on.

Press the EBL mode switch on and off several times while observing the EBL status indicator.

Does the EBL status indicator turn on and off?

Yes >> Go To 4

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. VERIFY THAT DTC B1016-REAR DEFROST SWITCH REQUEST INPUT CIRCUIT LOW IS STILL ACTIVE

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on. Wait 10 minutes before proceeding.

With the scan tool, read HVAC DTCs.

Does the scan tool display active: B1016-REAR DEFROST SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1031-EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW (ATC)

CONTROL-A/C-HEATER C2 (ATC)

SENSOR-EVAPORATOR TEMPERATURE

B1031-EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the Evaporator Temperature Sensor input is out of range toward the low voltage threshold.

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (C121) SENSOR GROUND CIRCUIT
EVAPORATOR TEMPERATURE SENSOR
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK FOR DTC B1031-EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW WITH EVAPORATOR TEMPERATURE SENSOR HARNESS CONNECTOR DISCONNECTED

Turn the ignition off.
 Disconnect the Evaporator Temperature Sensor harness connector.
 Turn the ignition on.
 With the scan tool, erase HVAC DTCs.
 Turn the ignition off, wait 10 seconds, and then turn the ignition on.
 With the scan tool, read HVAC DTCs.

Does the scan tool display active: B1031-EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW?

- Yes** >> Go To 2
- No** >> Replace the Evaporator Temperature Sensor in accordance with the Service Information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1031-EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW (ATC) (CONTINUED)

2. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between ground and the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to ground.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO (C121) SENSOR GROUND CIRCUIT

Measure the resistance between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to the (C121) Sensor Ground circuit.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the A/C Heater Control in accordance with the Service Information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1032-EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH (ATC)

**CONTROL-A/C-
HEATER C2
(ATC)**

**SENSOR-
EVAPORATOR
TEMPERATURE**

B1032-EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the Evaporator Temperature Sensor input is out of range toward the high voltage threshold.

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN
(C121) SENSOR GROUND CIRCUIT OPEN
EVAPORATOR TEMPERATURE SENSOR
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Measure the voltage of the (C21) Evaporator Temperature Sensor Signal circuit.

Is the voltage above 0.2 volts?

Yes >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to voltage.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

B1032-EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH (ATC) (CONTINUED)

2. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT, (C121) SENSOR GROUND CIRCUIT, & EVAPORATOR TEMPERATURE SENSOR

Turn the ignition off.

Measure the resistance between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit in the A/C Heater Control C2 harness connector. The approximate circuit resistance should be as follows:

- 1468 ohms @ 40°C (104°F)
- 1800 ohms @ 35°C (95°F)
- 2221 ohms @ 30°C (86°F)
- 2757 ohms @ 25°C (77°F)
- 3443 ohms @ 20°C (68°F)
- 4330 ohms @ 15°C (59°F)
- 5485 ohms @ 10°C (50°F)
- 6998 ohms @ 5°C (41°F)
- 7354 ohms @ 4°C (39°F)
- 7731 ohms @ 3°C (37°F)
- 8130 ohms @ 2°C (36°F)
- 8553 ohms @ 1°C (34°F)
- 9000 ohms @ 0°C (32°F)

Is the resistance within the specifications?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Disconnect the Evaporator Temperature Sensor harness connector.

Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between the Evaporator Temperature Sensor harness connector and the A/C Heater Control C2 harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

No >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1032-EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH (ATC) (CONTINUED)**4. CHECK (C121) SENSOR GROUND CIRCUIT FOR AN OPEN**

Measure the resistance of the (C121) Sensor Ground circuit between the Evaporator Temperature Sensor harness connector and the A/C Heater Control C2 harness connector.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the Evaporator Temperature Sensor in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Repair the (C121) Sensor Ground circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1034–INFRARED TEMPERATURE SENSOR INPUT CIRCUIT LOW (ATC)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the IR Sensor fails the internal self test.

Possible Causes
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test**1. REPLACE THE A/C HEATER CONTROL****Repair**

Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1035–INFRARED TEMPERATURE SENSOR INPUT CIRCUIT HIGH (ATC)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With ignition on.
- **Set Condition:**
If the IR Sensor fails the internal self test.

Possible Causes
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test**1. REPLACE THE A/C HEATER CONTROL****Repair**

Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1036–INFRARED SENSOR PERIOD TOO LONG OR TOO SHORT (ATC)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With ignition on.
- **Set Condition:**
If the IR Sensor fails the internal self test.

Possible Causes
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test**1. REPLACE THE A/C HEATER CONTROL****Repair**

Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1040—PANEL MODE DOOR 1 CONTROL CIRCUIT/PERFORMANCE (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The A/C Heater Control monitors the door driver circuits during actuator operation for shorts to ground, shorts to battery, and shorts to other door driver circuits. If detected, the A/C Heater Control reports these types of faults as Control Circuit/Performance DTCs. It is important to note that Control Circuit/Performance DTCs do not indicate where or what type of short is present and that additional system testing is necessary to provide more details about the reported fault.

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control detects an excessive current draw on the (C266) Front Mode Door Driver circuit, (C66) Front Mode Door Common Driver circuit, (C268) Recirculation Door Driver circuit, (C68) Recirculation Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C61) Right Blend Door Driver circuit, (C161) Right Blend Door Common Driver circuit, (C139) Rear Mode Door Driver circuit, or the (C939) Rear Mode Door Common Driver circuit while attempting to drive the Front Mode Door Actuator.

Possible Causes
DOOR DRIVER CIRCUIT(S) SHORTED

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool, erase HVAC DTCs.

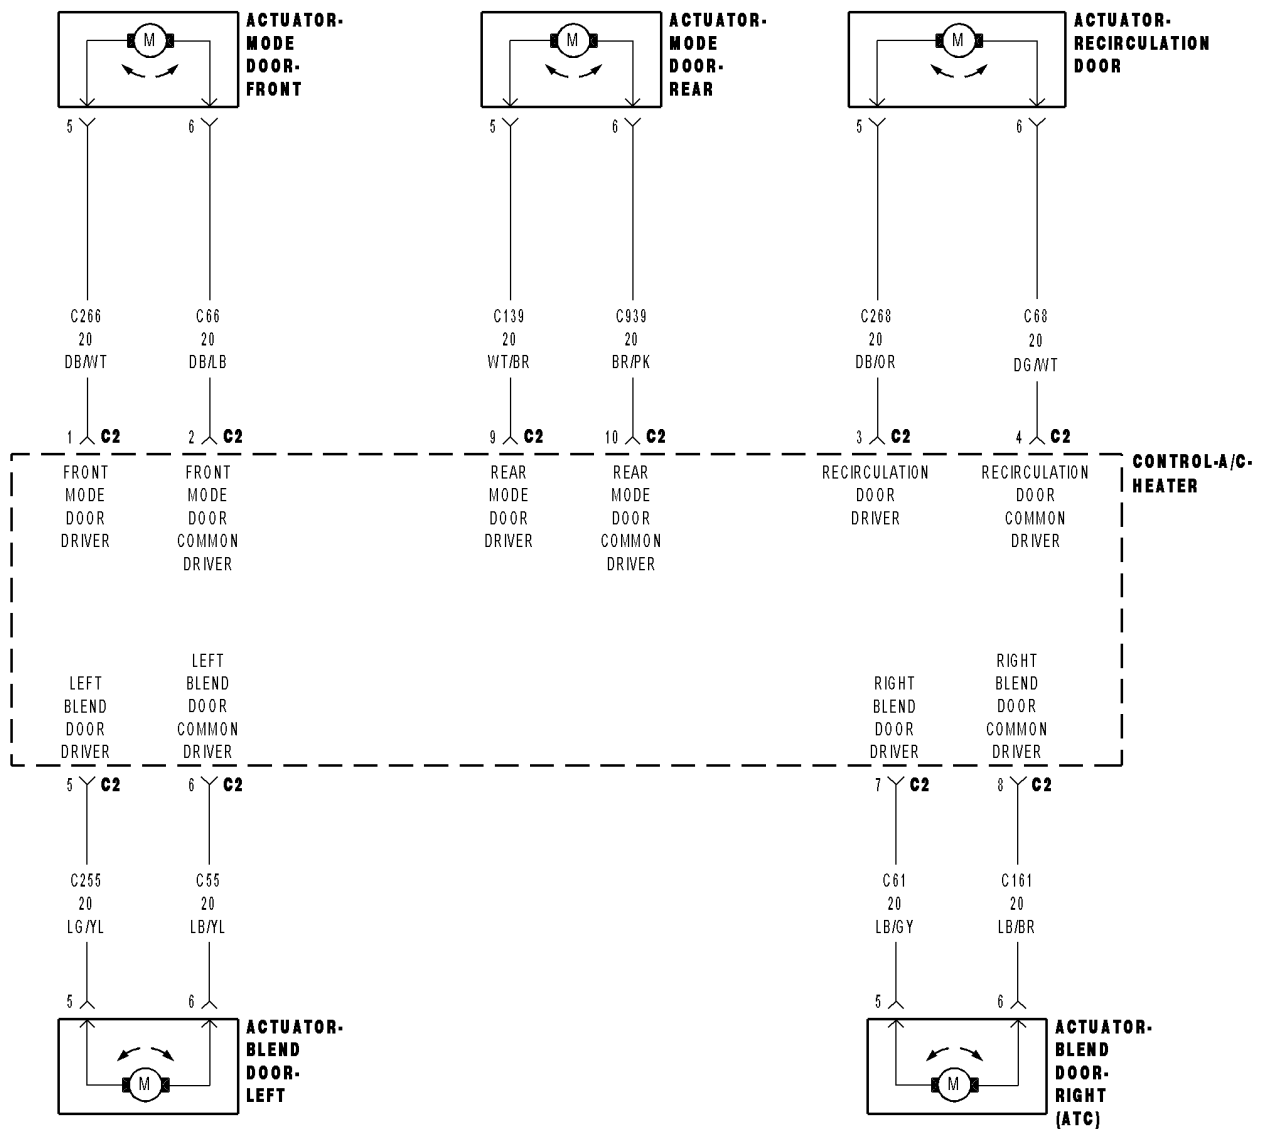

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Repair

Diagnose and repair the DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs before diagnosing short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

B1041-PANEL MODE DOOR 1 CONTROL CIRCUIT LOW (ATC)

B1041-PANEL MODE DOOR 1 CONTROL CIRCUIT LOW (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
When the Actuator DTC Detection Test is executed.
- **Set Condition:**
If the (C266) Front Mode Door Driver circuit or the (C66) Front Mode Door Common Driver circuit is shorted to ground.

Possible Causes
(C266) FRONT MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT SHORTED TO GROUND
(C266) FRONT MODE DOOR DRIVER CIRCUIT SHORTED TO (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT
(C266) FRONT MODE DOOR DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
(C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
FRONT MODE DOOR ACTUATOR
A/C HEATER CONTROL

Diagnostic Test

1. CHECK THE (C266) FRONT MODE DOOR DRIVER CIRCUIT & THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance of the (C266) Front Mode Door Driver circuit between ground and the A/C Heater Control C2 harness connector.

Measure the resistance of the (C66) Front Mode Door Common Driver circuit between ground and the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on either circuit?

- Yes** >> Repair the circuit(s) with a resistance below 10k ohms for a short to ground.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

B1041-PANEL MODE DOOR 1 CONTROL CIRCUIT LOW (ATC) (CONTINUED)

2. CHECK THE FRONT MODE DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C266) Front Mode Door Driver circuit and the (C66) Front Mode Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 3

No >> Go To 4

3. CHECK THE (C266) FRONT MODE DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT

Disconnect the Front Mode Door Actuator harness connector.

Measure the resistance between the (C266) Front Mode Door Driver circuit and the (C66) Front Mode Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C266) Front Mode Door Driver circuit for a short to the (C66) Front Mode Door Common Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Front Mode Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1041-PANEL MODE DOOR 1 CONTROL CIRCUIT LOW (ATC) (CONTINUED)

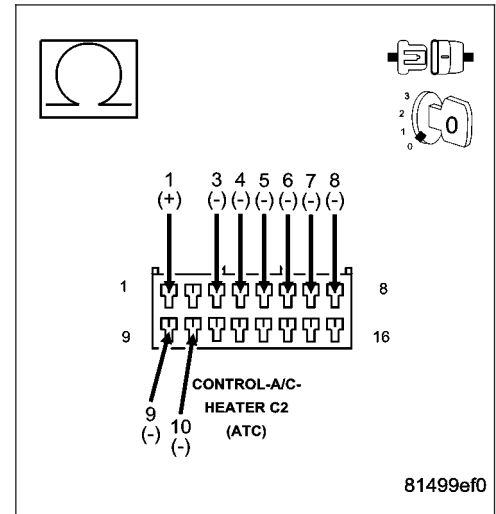

4. CHECK THE (C266) FRONT MODE DOOR DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C266) Front Mode Door Driver circuit and the (C268) Recirculation Door Driver circuit, (C68) Recirculation Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C61) Right Blend Door Driver circuit, (C161) Right Blend Door Common Driver circuit, (C139) Rear Mode Door Driver circuit, and the (C939) Rear Mode Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms between the (C266) Front Mode Door Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C266) Front Mode Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 5

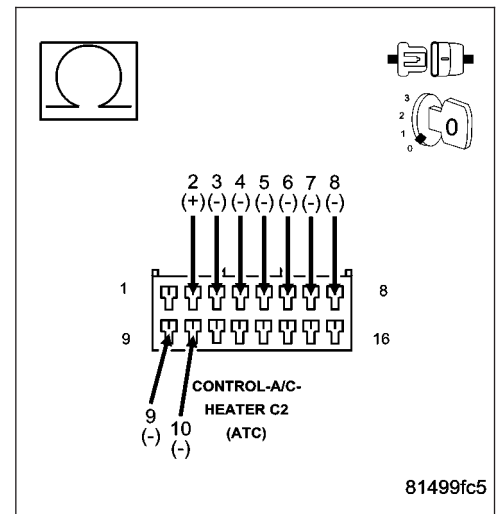

5. CHECK THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C66) Front Mode Door Common Driver circuit and the (C268) Recirculation Door Driver circuit, (C68) Recirculation Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C61) Right Blend Door Driver circuit, (C161) Right Blend Door Common Driver circuit, (C139) Rear Mode Door Driver circuit, and the (C939) Rear Mode Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms between the (C66) Front Mode Door Common Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C66) Front Mode Door Common Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 6

B1041–PANEL MODE DOOR 1 CONTROL CIRCUIT LOW (ATC) (CONTINUED)**6. RUN THE ACTUATOR DTC DETECTION TEST**

Reconnect the A/C Heater Control C2 harness connector.

Reconnect the Front Mode Door Actuator harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool only display: B1041–PANEL MODE DOOR 1 CONTROL CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No, Other DTC(s) Displayed

Diagnose and repair the other DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs before diagnosing short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed

Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1042-PANEL MODE DOOR 1 CONTROL CIRCUIT HIGH (ATC)

B1042-PANEL MODE DOOR 1 CONTROL CIRCUIT HIGH (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
When the Actuator DTC Detection Test is executed.
- **Set Condition:**
If the (C266) Front Mode Door Driver circuit or the (C66) Front Mode Door Common Driver circuit is shorted to voltage.

Possible Causes
(C266) FRONT MODE DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
(C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT SHORTED TO VOLTAGE
A/C HEATER CONTROL

Diagnostic Test

1. CHECK THE (C266) FRONT MODE DOOR DRIVER CIRCUIT & THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Measure the voltage of the (C266) Front Mode Door Driver circuit.

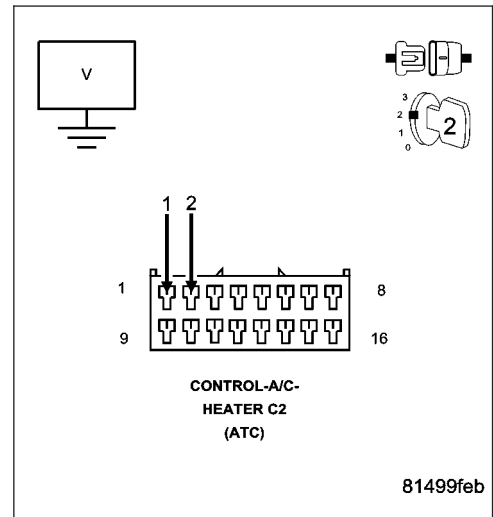

Measure the voltage of the (C66) Front Mode Door Common Driver circuit.

Is the voltage above 0.2 volts on either circuit?

Yes >> Repair the circuit(s) with voltage above 0.2 volts a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

B1042–PANEL MODE DOOR 1 CONTROL CIRCUIT HIGH (ATC) (CONTINUED)**2. RUN THE ACTUATOR DTC DETECTION TEST**

Turn the ignition off.

Reconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool only display: B1042–PANEL MODE DOOR 1 CONTROL CIRCUIT HIGH?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No, Other DTC(s) Displayed

Diagnose and repair the other DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs before diagnosing short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed

Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1043-PANEL MODE DOOR 1 CONTROL CIRCUIT OPEN (ATC)

B1043-PANEL MODE DOOR 1 CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the (C266) Front Mode Door Driver circuit or the (C66) Front Mode Door Common Driver circuit is open.

Possible Causes
(C266) FRONT MODE DOOR DRIVER CIRCUIT OPEN
(C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT OPEN
FRONT MODE DOOR ACTUATOR
A/C HEATER CONTROL

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE DTCs

Turn the ignition on.
With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE DTCs?

- Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 2

2. CHECK THE FRONT MODE DOOR ACTUATOR CIRCUIT RESISTANCE

Turn the ignition off.
Disconnect the A/C Heater Control C2 harness connector.
Measure the resistance between the (C266) Front Mode Door Driver circuit and the (C66) Front Mode Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance above 70.0 ohms?

- Yes** >> Go To 3
- No** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1043-PANEL MODE DOOR 1 CONTROL CIRCUIT OPEN (ATC) (CONTINUED)

3. CHECK THE (C266) FRONT MODE DOOR DRIVER CIRCUIT FOR AN OPEN

Disconnect the Front Mode Door Actuator harness connector.
 Measure the resistance of the (C266) Front Mode Door Driver circuit between the Front Mode Door Actuator harness connector and the A/C Heater Control C2 harness connector.

Is the resistance below 5.0 ohms?

- Yes** >> Go To 4
- No** >> Repair the (C266) Front Mode Door Driver circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK THE (C66) FRONT MODE DOOR COMMON DRIVER CIRCUIT FOR AN OPEN

Measure the resistance of the (C66) Front Mode Door Common Driver circuit between the Front Mode Door Actuator harness connector and the A/C Heater Control C2 harness connector.

Is the resistance below 5.0 ohms?

- No** >> Replace the Front Mode Door Actuator in accordance with the Service Information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- Yes** >> Repair the (C66) Front Mode Door Common Driver circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1044–PANEL MODE DOOR 1 TRAVEL RANGE TOO SMALL (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is less than the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the total span of the Front Mode Door is less than the low range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S) FRONT MODE DOOR SEIZED, BINDING, OBSTRUCTED FRONT MODE DOOR ACTUATOR A/C HEATER CONTROL

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

- Yes** >> Diagnose and repair the DTC(s). If present, diagnose and repair all Control Circuit/Performance DTCs before diagnosing Control Circuit Open DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 2

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

- Yes** >> Diagnose and repair the DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> Go To 3
-

B1044-PANEL MODE DOOR 1 TRAVEL RANGE TOO SMALL (ATC) (CONTINUED)**3. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE FRONT MODE DOOR TO SEIZE OR BIND**

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the front mode door to seize or bind.

Are there any physical or mechanical problems with the door, housing, linkage, or actuator?

- Yes** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 4
-

4. CHECK FRONT MODE DOOR TRAVEL

Remove the Front Mode Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over the entire span of travel (approximately 350 degrees).

Does the door operate smoothly in both directions over the entire span of travel?

- Yes** >> Replace the Front Mode Door Actuator in accordance with the Service Information. Then, Go To 5.
- No** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

5. RUN THE ACTUATOR CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B1044-PANEL MODE DOOR 1 TRAVEL RANGE TOO SMALL?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

B1045–PANEL MODE DOOR 1 TRAVEL RANGE TOO LARGE (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The A/C Heater Control calibrates each actuator individually. Automatic calibration occurs upon power up after installing a new A/C Heater Control. Manual calibration occurs by sending a command with the scan tool. The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value exceeds the expected range for this actuator, this DTC will set. Note that the control clears all stored calibration faults at the beginning of the calibration procedure.

- **When Monitored:**
During actuator calibration.
- **Set Condition:**
If the total span of the Front Mode Door exceeds the high range limit.

Possible Causes
DOOR DRIVER ELECTRICAL CIRCUIT(S) FRONT MODE DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, MISSING, BROKEN FRONT MODE DOOR ACTUATOR A/C HEATER CONTROL

Diagnostic Test

1. CHECK FOR ACTIVE CONTROL CIRCUIT/PERFORMANCE & CONTROL CIRCUIT OPEN DTCs

Turn the ignition on.

With the scan tool, read active HVAC DTCs.

Does the scan tool display any active: XXXX CONTROL CIRCUIT/PERFORMANCE or XXXX CONTROL CIRCUIT OPEN DTCs?

Yes >> Diagnose and repair the DTC(s). If present, diagnose and repair all Control Circuit/Performance DTCs before diagnosing Control Circuit Open DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 2

2. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool in HVAC, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs first, all short low DTCs second, and all open DTCs last. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> Go To 3

B1045–PANEL MODE DOOR 1 TRAVEL RANGE TOO LARGE (ATC) (CONTINUED)**3. CHECK FOR A BROKEN FRONT MODE DOOR ACTUATOR**

Turn the ignition off.

Remove the Front Mode Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

Does the actuator turn in either direction?

- Yes** >> Replace the Front Mode Door Actuator in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 4
-

4. CHECK THE FRONT MODE DOOR & A/C HEATER HOUSING FOR WARPED, WORN, DAMAGED, MISSING, & BROKEN COMPONENTS

Inspect for excessively worn, disconnected, missing, or broken door linkage. Inspect for a damaged or broken A/C Heater Housing Assembly. Inspect for a warped or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 350 degrees.

Are there any physical or mechanical problems with the door or housing?

- Yes** >> Repair as necessary in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Front Mode Door Actuator in accordance with the Service Information. Then, Go To 5.
-

5. RUN THE ACTUATOR THE CALIBRATION TEST

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display: B1045–PANEL MODE DOOR 1 TRAVEL RANGE TOO LARGE?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

B1058–RECIRCULATION DOOR CONTROL CIRCUIT/PERFORMANCE (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The A/C Heater Control monitors the door driver circuits during actuator operation for shorts to ground, shorts to battery, and shorts to other door driver circuits. If detected, the A/C Heater Control reports these types of faults as Control Circuit/Performance DTCs. It is important to note that Control Circuit/Performance DTCs do not indicate where or what type of short is present and that additional system testing is necessary to provide more details about the reported fault.

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control detects an excessive current draw on the (C266) Front Mode Door Driver circuit, (C66) Front Mode Door Common Driver circuit, (C268) Recirculation Door Driver circuit, (C68) Recirculation Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C61) Right Blend Door Driver circuit, (C161) Right Blend Door Common Driver circuit, (C139) Rear Mode Door Driver circuit, or the (C939) Rear Mode Door Common Driver circuit while attempting to drive the Recirculation Door Actuator.

Possible Causes
DOOR DRIVER CIRCUIT(S) SHORTED

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. RUN THE ACTUATOR DTC DETECTION TEST

With the scan tool, erase HVAC DTCs.

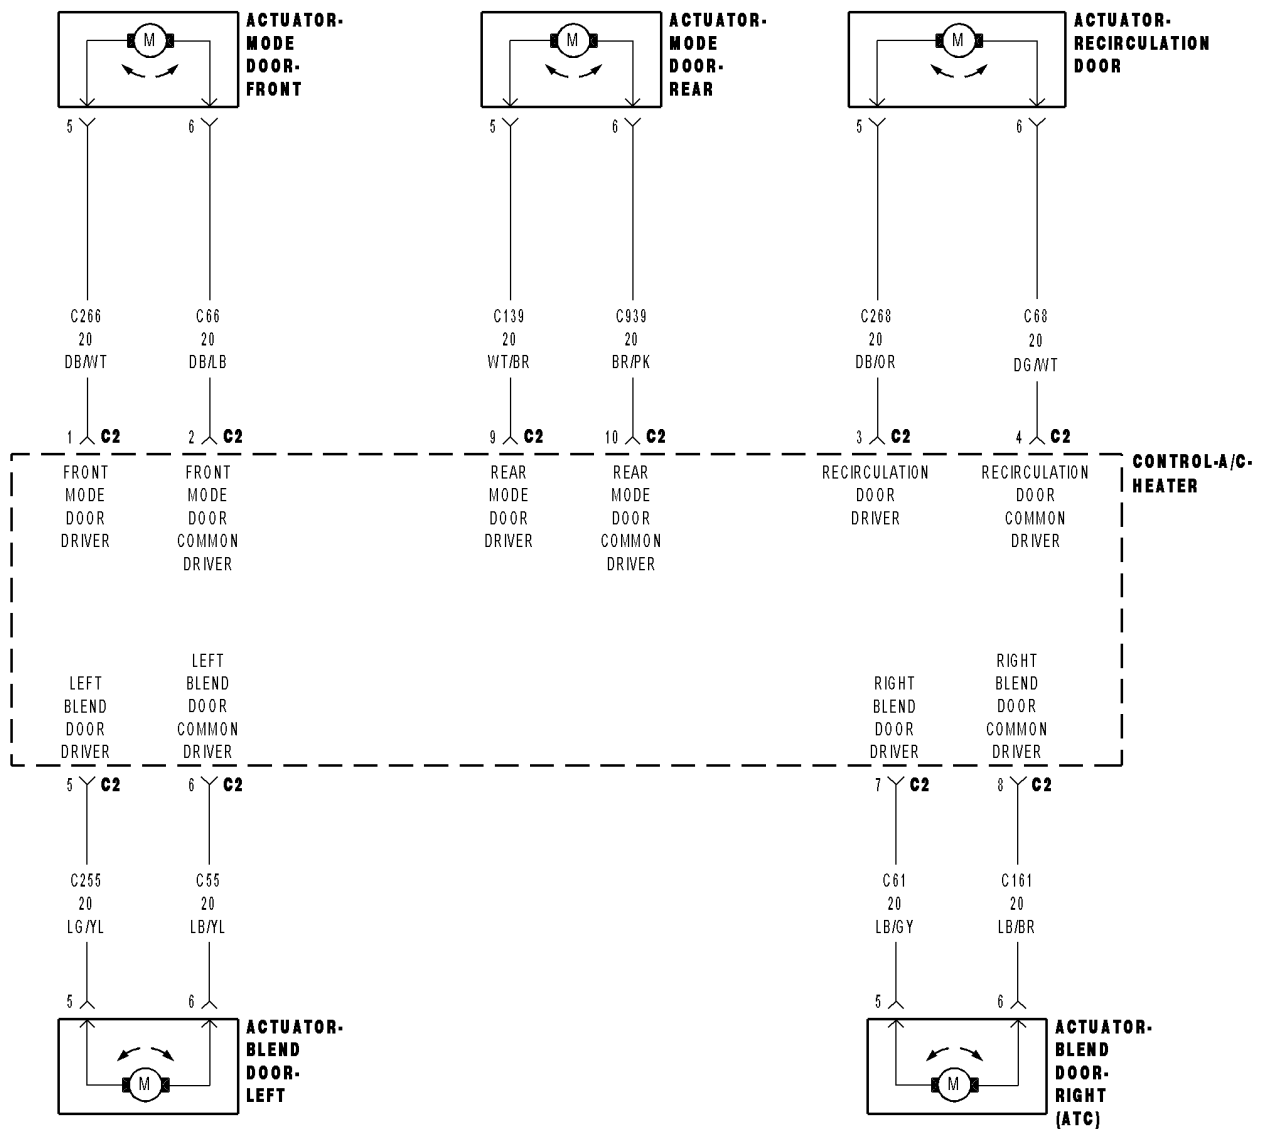

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Repair

Diagnose and repair the DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs before diagnosing short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

B1059-RECIRCULATION DOOR CONTROL CIRCUIT LOW (ATC)

B1059-RECIRCULATION DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
When the Actuator DTC Detection Test is executed.
- **Set Condition:**
If the (C268) Recirculation Door Driver circuit or the (C68) Recirculation Door Common Driver circuit is shorted to ground.

Possible Causes
(C268) RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO GROUND
(C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT SHORTED TO GROUND
(C268) RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT
(C268) RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
(C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

Diagnostic Test

1. CHECK THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT & THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance of the (C268) Recirculation Door Driver circuit between ground and the A/C Heater Control C2 harness connector.

Measure the resistance of the (C68) Recirculation Door Common Driver circuit between ground and the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms on either circuit?

- Yes** >> Repair the circuit(s) with a resistance below 10k ohms for a short to ground.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 2

B1059-RECIRCULATION DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

2. CHECK THE RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE

Measure the resistance between the (C268) Recirculation Door Driver circuit and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 30.0 ohms?

Yes >> Go To 3

No >> Go To 4

3. CHECK THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT

Disconnect the Recirculation Door Actuator harness connector.

Measure the resistance between the (C268) Recirculation Door Driver circuit and the (C68) Recirculation Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (C268) Recirculation Door Driver circuit for a short to the (C68) Recirculation Door Common Driver circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Recirculation Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1059-RECIRCULATION DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)

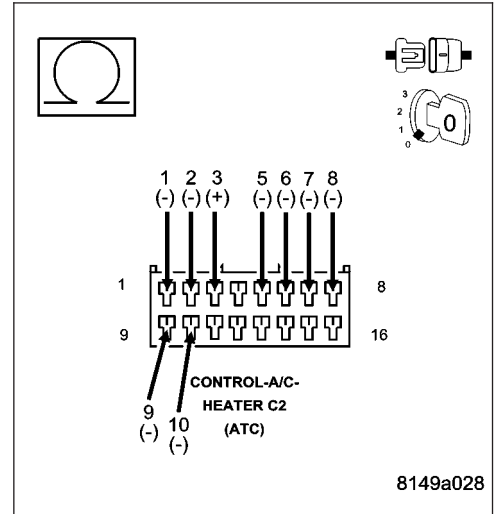

4. CHECK THE (C268) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C268) Recirculation Door Driver circuit and the (C266) Front Mode Door Driver circuit, (C66) Front Mode Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C61) Right Blend Door Driver circuit, (C161) Right Blend Door Common Driver circuit, (C139) Rear Mode Door Driver circuit, and the (C939) Rear Mode Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms between the (C268) Recirculation Door Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C268) Recirculation Door Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 5

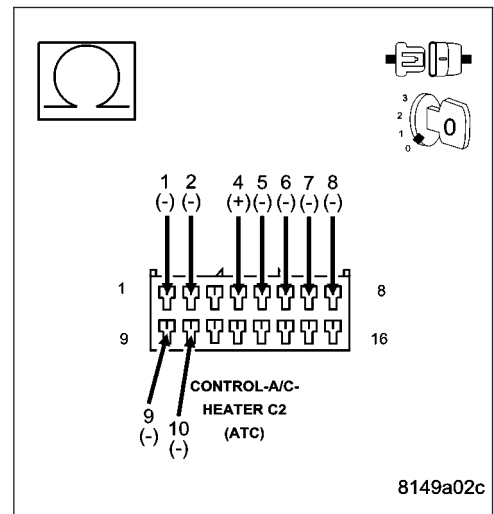

5. CHECK THE (C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUITS

Measure the resistance between the (C68) Recirculation Door Common Driver circuit and the (C266) Front Mode Door Driver circuit, (C66) Front Mode Door Common Driver circuit, (C255) Left Blend Door Driver circuit, (C55) Left Blend Door Common Driver circuit, (C61) Right Blend Door Driver circuit, (C161) Right Blend Door Common Driver circuit, (C139) Rear Mode Door Driver circuit, and the (C939) Rear Mode Door Common Driver circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10k ohms between the (C68) Recirculation Door Common Driver circuit and any of the other door driver circuits?

Yes >> Repair the circuit(s) with a resistance below 10k ohms for a short to the (C68) Recirculation Door Common Driver circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 6

B1059–RECIRCULATION DOOR CONTROL CIRCUIT LOW (ATC) (CONTINUED)**6. RUN THE ACTUATOR DTC DETECTION TEST**

Reconnect the A/C Heater Control C2 harness connector.

Reconnect the Recirculation Door Actuator harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool only display: B1059–RECIRCULATION DOOR CONTROL CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No, Other DTC(s) Displayed

Diagnose and repair the other DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs before diagnosing short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No, And No Other DTCs Displayed

Using the wiring diagram as a guide, inspect the wiring and connectors for conditions causing an intermittent short. Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1082-HVAC MUX CIRCUIT LOW

B1082–HVAC MUX CIRCUIT LOW (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the Instrument Cluster (CCN) detects voltage below 0.55 volts for 10 seconds on the (C221) A/C Switch Sense circuit.

Possible Causes
(C221) A/C SWITCH SENSE CIRCUIT SHORTED TO GROUND INSTRUMENT CLUSTER (CCN) A/C HEATER CONTROL

Diagnostic Test

1. VERIFY DTC B1082–HVAC MUX CIRCUIT LOW IS ACTIVE

Turn the ignition on.
With the scan tool, erase CCN DTCs.
Turn the ignition off, wait 10 seconds, and turn the ignition on.
With the scan tool, read CCN DTCs.

Does the scan tool display active: B1082–HVAC MUX CIRCUIT LOW?

- Yes** >> Go To 2
- No** >> Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR DTC B1082–HVAC MUX CIRCUIT LOW WITH A/C HEATER CONTROL C1 HARNESS CONNECTOR DISCONNECTED

Turn the ignition off.
Disconnect the A/C Heater Control C1 harness connector.
Turn the ignition on.
With the scan tool, erase CCN DTCs.
Turn the ignition off, wait 10 seconds, and turn the ignition on.
With the scan tool, read CCN DTCs.

Does the scan tool display: B1082–HVAC MUX CIRCUIT LOW?

- Yes** >> Go To 3
- No** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1082-HVAC MUX CIRCUIT LOW (CONTINUED)**3. CHECK (C221) A/C SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Instrument Cluster C3 harness connector.

Measure the resistance of the (C221) A/C Switch Sense circuit between ground and the A/C Heater Control C1 harness connector.

Is the resistance below 10k ohms?

- Yes** >> Repair the (C221) A/C Switch Sense circuit for a short to ground.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Replace the Instrument Cluster (CCN) in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1083-HVAC MUX CIRCUIT HIGH

B1083–HVAC MUX CIRCUIT HIGH (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the Instrument Cluster (CCN) detects voltage above 4.5 volts for 10 seconds on the (C221) A/C Switch Sense circuit.

Possible Causes
(C221) A/C SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE (C221) A/C SWITCH SENSE CIRCUIT OPEN INSTRUMENT CLUSTER (CCN) A/C HEATER CONTROL

Diagnostic Test**1. VERIFY DTC B1083–HVAC MUX CIRCUIT HIGH IS ACTIVE**

Turn the ignition on.

With the scan tool, erase CCN DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, read CCN DTCs.

Does the scan tool display active: B1083–HVAC MUX CIRCUIT HIGH?

Yes >> Go To 2

No >> Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1083-HVAC MUX CIRCUIT HIGH (CONTINUED)

2. CHECK (C221) A/C SWITCH SENSE CIRCUIT VOLTAGE AT A/C HEATER CONTROL C1 HARNESS CONNECTOR

Turn the ignition off.
 Disconnect the A/C Heater Control C1 harness connector.
 Turn the ignition on.
 Measure the voltage of the (C221) A/C Switch Sense circuit.

What is the voltage?

Below 4.8 Volts

Go To 3

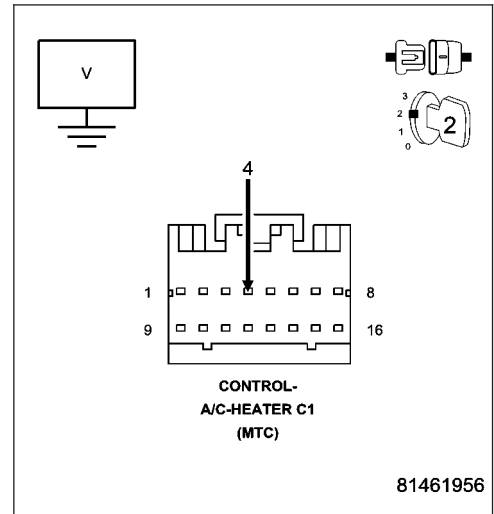

4.8 to 5.2 Volts

Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

Above 5.2 Volts

Go To 4

3. CHECK (C221) A/C SWITCH SENSE CIRCUIT FOR AN OPEN

Turn the ignition off.
 Disconnect the Instrument Cluster C3 harness connector.
 Measure the resistance of the (C221) A/C Switch Sense circuit between the A/C Heater Control C1 harness connector and the Instrument Cluster C3 harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace the Instrument Cluster (CCN) in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (C221) A/C Switch Sense circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1083-HVAC MUX CIRCUIT HIGH (CONTINUED)**4. CHECK (C221) A/C SWITCH SENSE CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Instrument Cluster C3 harness connector.

Turn the ignition on.

Measure the voltage of the (C221) A/C Switch Sense circuit.

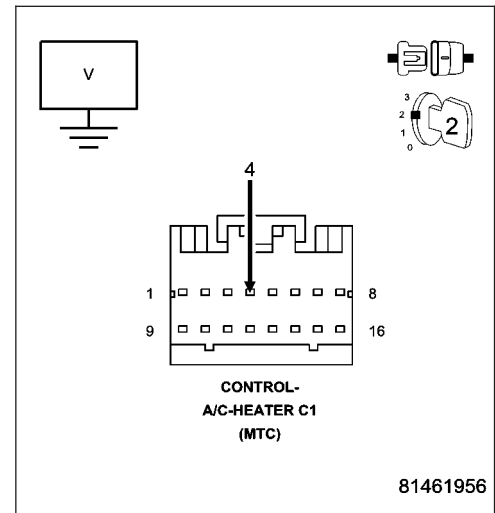

Is the voltage above 0.2 volts?

Yes >> Repair the (C221) A/C Switch Sense circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Instrument Cluster (CCN) in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1601-LEFT SOLAR SENSOR CIRCUIT LOW (ATC)

B1601–LEFT SOLAR SENSOR CIRCUIT LOW (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With ignition on.
- **Set Condition:**
If the Left Sunload Sensor input is out of range toward the low voltage threshold.

Possible Causes
(G39) SUN SENSOR NO. 1 SIGNAL CIRCUIT SHORTED TO GROUND (G39) SUN SENSOR NO. 1 SIGNAL CIRCUIT SHORTED TO (G939) SUN SENSOR RETURN CIRCUIT SUN SENSOR A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK FOR DTC B1601–LEFT SOLAR SENSOR CIRCUIT LOW WITH SUN SENSOR HARNESS CONNECTOR DISCONNECTED

Turn the ignition off.

Disconnect the Sun Sensor harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, read HVAC DTCs.

Does the scan tool display: B1601–LEFT SOLAR SENSOR CIRCUIT LOW?

Yes >> Go To 2

No >> Replace the Sun Sensor in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1601-LEFT SOLAR SENSOR CIRCUIT LOW (ATC) (CONTINUED)

2. CHECK (G39) SUN SENSOR NO. 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

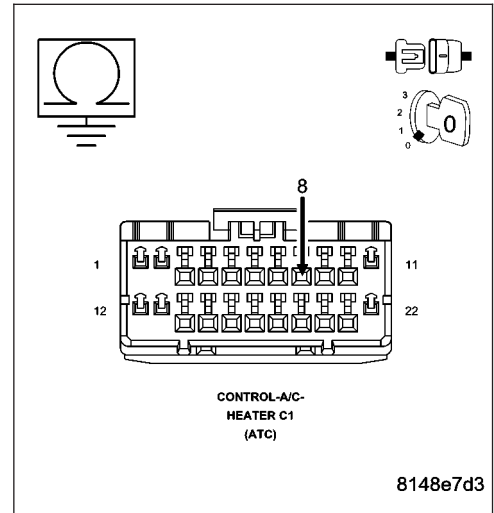

Measure the resistance of the (G39) Sun Sensor No. 1 Signal circuit between ground and the A/C Heater Control C1 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (G39) Sun Sensor No. 1 Signal circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK (G39) SUN SENSOR NO. 1 SIGNAL CIRCUIT FOR A SHORT TO (G939) SUN SENSOR RETURN CIRCUIT

Measure the resistance between the (G39) Sun Sensor No. 1 Signal circuit and the (G939) Sun Sensor Return circuit in the A/C Heater Control C1 harness connector.

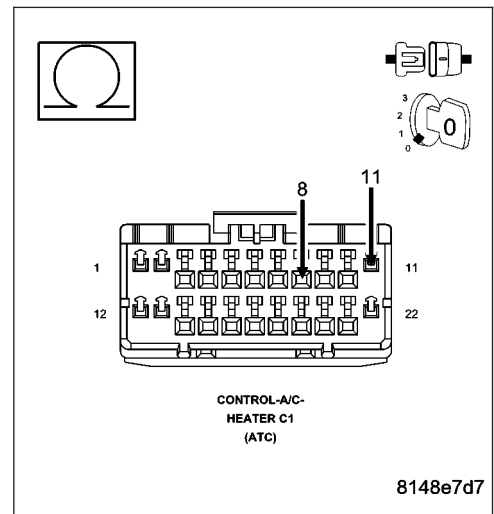

Is the resistance below 10k ohms?

Yes >> Repair the (G39) Sun Sensor No. 1 Signal circuit for a short to the (G939) Sun Sensor Return circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1602-LEFT SOLAR SENSOR CIRCUIT HIGH (ATC)

B1602-LEFT SOLAR SENSOR CIRCUIT HIGH (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With ignition on.
- **Set Condition:**
If the Left Sunload Sensor input is out of range toward the high voltage threshold.

Possible Causes
(G39) SUN SENSOR NO. 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE (G39) SUN SENSOR NO. 1 SIGNAL CIRCUIT OPEN (G939) SUN SENSOR RETURN CIRCUIT OPEN SUN SENSOR A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK (G39) SUN SENSOR NO. 1 SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.
 Disconnect the Sun Sensor harness connector.
 Turn the ignition on.
 Measure the voltage of the (G39) Sun Sensor No. 1 Signal circuit.

What voltage is present?

- Above 5.2 Volts**
Go To 2
- 4.8 Volts to 5.2 Volts**
Go To 3
- Below 4.8 Volts**
Go To 5

B1602-LEFT SOLAR SENSOR CIRCUIT HIGH (ATC) (CONTINUED)**2. CHECK (G39) SUN SENSOR NO. 1 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Measure the voltage of the (G39) Sun Sensor No. 1 Signal circuit.

Is the voltage above 0.2 volts?

Yes >> Repair the (G39) Sun Sensor No. 1 Signal circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**3. CHECK (G939) SUN SENSOR RETURN CIRCUIT FUNCTION**

Turn the ignition off.

Connect a jumper wire between the (G39) Sun Sensor No. 1 Signal circuit and the (G939) Sun Sensor Return circuit in the Sun Sensor harness connector.

Turn the ignition on.

With the scan tool in HVAC, select Data Display and read the Left Solar Sensor voltage.

Is the voltage below 0.2 volts?

Yes >> Replace the Sun Sensor in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

B1602-LEFT SOLAR SENSOR CIRCUIT HIGH (ATC) (CONTINUED)

4. CHECK (G939) SUN SENSOR RETURN CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (G939) Sun Sensor Return circuit between the Sun Sensor harness connector and the A/C Heater Control C1 harness connector.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Repair the (G939) Sun Sensor Return circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

5. CHECK (G39) SUN SENSOR NO. 1 SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (G39) Sun Sensor No. 1 Signal circuit between the Sun Sensor harness connector and the A/C Heater Control C1 harness connector.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Repair the (G39) Sun Sensor No. 1 Signal circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1604-RIGHT SOLAR SENSOR CIRCUIT LOW (ATC)

B1604–RIGHT SOLAR SENSOR CIRCUIT LOW (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With ignition on.
- **Set Condition:**
If the Right Sunload Sensor input is out of range toward the low voltage threshold.

Possible Causes
(G139) SUN SENSOR NO. 2 SIGNAL CIRCUIT SHORTED TO GROUND (G139) SUN SENSOR NO. 2 SIGNAL CIRCUIT SHORTED TO (G939) SUN SENSOR RETURN CIRCUIT SUN SENSOR A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK FOR DTC B1604–RIGHT SOLAR SENSOR CIRCUIT LOW WITH SUN SENSOR HARNESS CONNECTOR DISCONNECTED

- Turn the ignition off.
- Disconnect the Sun Sensor harness connector.
- Turn the ignition on.
- With the scan tool, erase HVAC DTCs.
- Turn the ignition off, wait 10 seconds, and turn the ignition on.
- With the scan tool, read HVAC DTCs.

Does the scan tool display: B1604–RIGHT SOLAR SENSOR CIRCUIT LOW?

- Yes** >> Go To 2
- No** >> Replace the Sun Sensor in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1604-RIGHT SOLAR SENSOR CIRCUIT LOW (ATC) (CONTINUED)**2. CHECK (G139) SUN SENSOR NO. 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (G139) Sun Sensor No. 2 Signal circuit between ground and the A/C Heater Control C1 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (G139) Sun Sensor No. 2 Signal circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

**3. CHECK (G139) SUN SENSOR NO. 2 SIGNAL CIRCUIT FOR A SHORT TO (G939) SUN SENSOR RETURN CIRCUIT**

Measure the resistance between the (G139) Sun Sensor No. 2 Signal circuit and the (G939) Sun Sensor Return circuit in the A/C Heater Control C1 harness connector.

Is the resistance below 10k ohms?

Yes >> Repair the (G139) Sun Sensor No. 2 Signal circuit for a short to the (G939) Sun Sensor Return circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1605-RIGHT SOLAR SENSOR CIRCUIT HIGH (ATC)

B1605–RIGHT SOLAR SENSOR CIRCUIT HIGH (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With ignition on.
- **Set Condition:**
If the Right Sunload Sensor input is out of range toward the high voltage threshold.

Possible Causes
(G139) SUN SENSOR NO. 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE (G139) SUN SENSOR NO. 2 SIGNAL CIRCUIT OPEN (G939) SUN SENSOR RETURN CIRCUIT OPEN SUN SENSOR A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK (G139) SUN SENSOR NO. 2 SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Sun Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (G139) Sun Sensor No. 2 Signal circuit.

What voltage is present?

Above 5.2 Volts

Go To 2

4.8 Volts to 5.2 Volts

Go To 3

Below 4.8 Volts

Go To 5

B1605–RIGHT SOLAR SENSOR CIRCUIT HIGH (ATC) (CONTINUED)

2. CHECK (G139) SUN SENSOR NO. 2 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Measure the voltage of the (G139) Sun Sensor No. 2 Signal circuit.

Is the voltage above 0.2 volts?

Yes >> Repair the (G139) Sun Sensor No. 2 Signal circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. CHECK (G939) SUN SENSOR RETURN CIRCUIT FUNCTION

Turn the ignition off.

Connect a jumper wire between the (G139) Sun Sensor No. 2 Signal circuit and the (G939) Sun Sensor Return circuit in the Sun Sensor harness connector.

Turn the ignition on.

With the scan tool in HVAC, select Data Display and read the Right Solar Sensor voltage.

Is the voltage below 0.2 volts?

Yes >> Replace the Sun Sensor in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

B1605-RIGHT SOLAR SENSOR CIRCUIT HIGH (ATC) (CONTINUED)**4. CHECK (G939) SUN SENSOR RETURN CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (G939) Sun Sensor Return circuit between the Sun Sensor harness connector and the A/C Heater Control C1 harness connector.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Repair the (G939) Sun Sensor Return circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

**5. CHECK (G139) SUN SENSOR NO. 2 SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (G139) Sun Sensor No. 2 Signal circuit between the Sun Sensor harness connector and the A/C Heater Control C1 harness connector.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Repair the (G139) Sun Sensor No. 2 Signal circuit for an open.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B2214--(HVAC) CLIMATE CONTROL INTERNAL (ATC)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the A/C Heater Control has an internal fault.

Possible Causes
A/C HEATER CONTROL

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

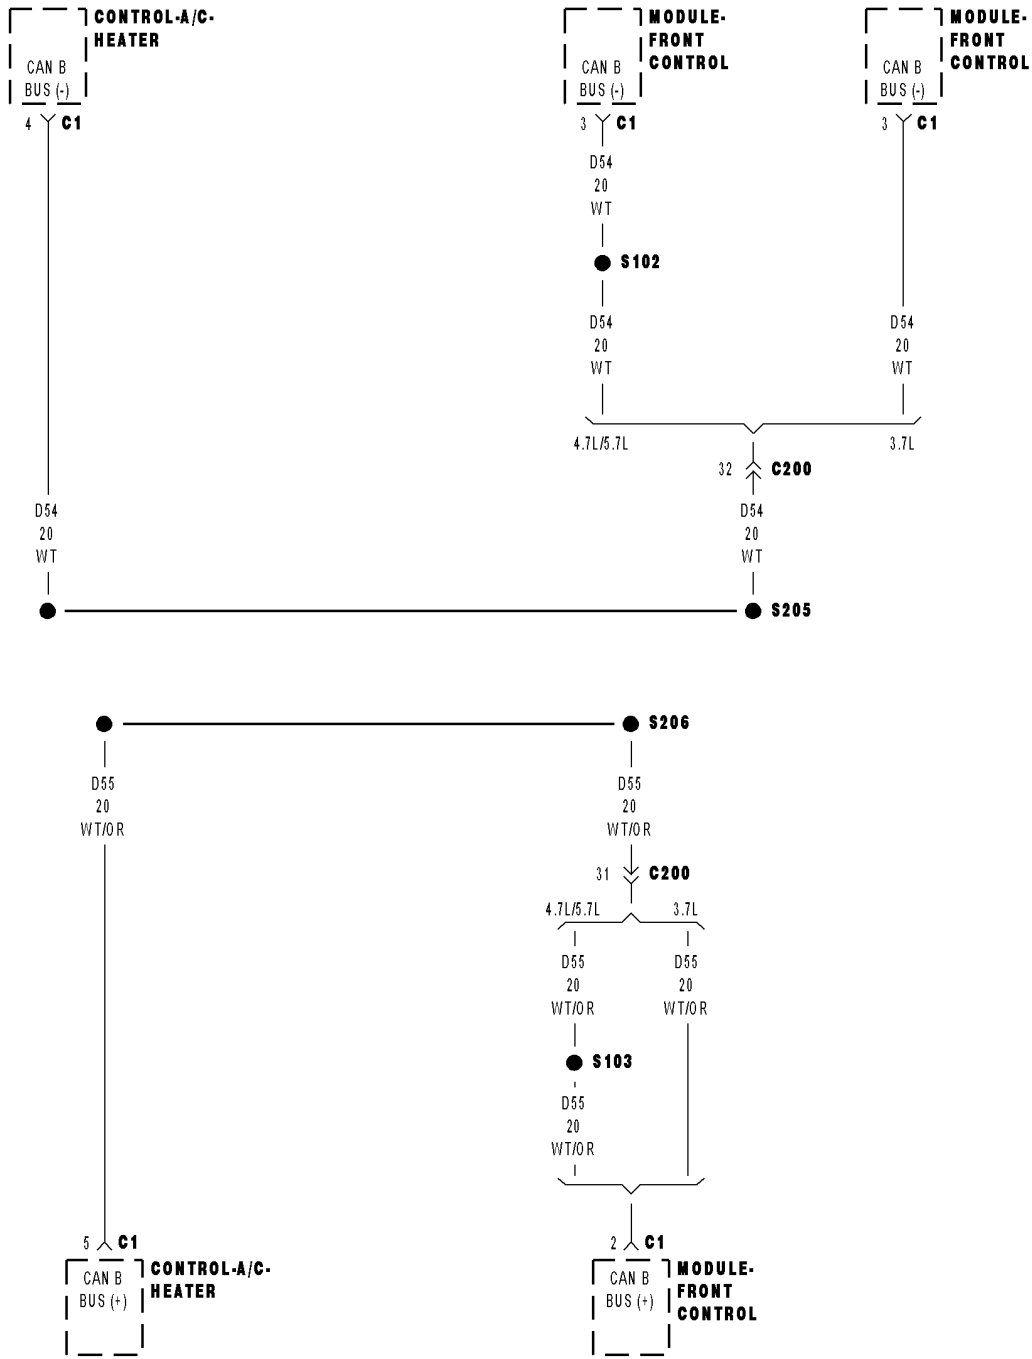

Diagnostic Test

1. REPLACE THE A/C HEATER CONTROL

Repair

Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0019-CAN B BUS (ATC)

U0019–CAN B BUS (ATC) (CONTINUED)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
Continuously
- **Set Condition:**
If the CAN B Bus (+) or CAN B Bus (-) circuit is open, shorted to voltage, or shorted to ground.

Possible Causes
ACTIVE U0019 CAN B BUS DTC IN FRONT CONTROL MODULE (D55) CAN B BUS (+) CIRCUIT OPEN (D54) CAN B BUS (-) CIRCUIT OPEN A/C HEATER CONTROL

Diagnostic Test

1. VERIFY DTC U0019–CAN B BUS IS ACTIVE

Turn the ignition on.
With the scan tool, read HVAC DTCs.

Does the scan tool display active: U0019–CAN B BUS?

- Yes** >> Go To 2
- No** >> If the DTC is stored, check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR ACTIVE CAN B BUS RELATED DTCS IN THE FRONT CONTROL MODULE (FCM)

With the scan tool, read Front Control Module (FCM) DTCs

Does the scan tool display any active CAN B BUS related DTCs?

- Yes** >> Diagnose and repair the DTC(s). (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).
- No** >> Go To 3

U0019-CAN B BUS (ATC) (CONTINUED)

3. CHECK (D55) CAN B BUS (+) CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the negative battery cable.

Disconnect the A/C Heater Control C1 harness connector.

Disconnect the Front Control Module (FCM) C1 harness connector.

Measure the resistance of the (D55) CAN B Bus (+) circuit between the Front Control Module C1 harness connector and the A/C Heater Control C1 harness connector.

Is the resistance below 2.0 ohms?

Yes >> Go To 4

No >> Repair the (D55) CAN B Bus (+) circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK (D54) CAN B BUS (-) CIRCUIT FOR AN OPEN

Measure the resistance of the (D54) CAN B Bus (-) circuit between the Front Control Module C1 connector and the A/C Heater Control C1 harness connector.

Is the resistance below 2.0 ohms?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (D54) CAN B Bus (-) circuit for an open.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

U0141–LOST COMMUNICATION WITH FRONT CONTROL MODULE (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Front Control Module (FCM).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0151–LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC) (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Occupant Restraint Controller (ORC).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0154–LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Occupant Classification Module (OCM).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0155–LOST COMMUNICATION WITH CLUSTER/CCN (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Cluster (CCN).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0156—LOST COMMUNICATION WITH EOM (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the A/C Heater Control loses communication with the Compass Temperature Module (EOM).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0159—LOST COMMUNICATION WITH PARKING ASSIST CONTROL MODULE (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the A/C Heater Control loses communication with the Parktronics (PTS).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0167—LOST COMMUNICATION WITH INTRUSION TRANSCIEVER CONTROL MODULE (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the A/C Heater Control loses communication with the Intrusion Transceiver Control Module (ITM).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0168—LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM) (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the A/C Heater Control loses communication with the Vehicle Security Control Module (SKREEM/WCM).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0169—LOST COMMUNICATION WITH SUNROOF CONTROL MODULE (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the A/C Heater Control loses communication with the Sunroof Control Module (SCM).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0184—LOST COMMUNICATION WITH RADIO (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the A/C Heater Control loses communication with the Radio.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0186—LOST COMMUNICATION WITH AUDIO AMPLIFIER (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the A/C Heater Control loses communication with the Amplifier (AMP).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0195—LOST COMMUNICATION WITH SDARS (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the A/C Heater Control loses communication with the Satellite Audio Receiver (SDARS).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0196—LOST COMMUNICATION WITH VEHICLE ENTERTAINMENT CONTROL MODULE (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the A/C Heater Control loses communication with the Vehicle Entertainment System (VES).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0197—LOST COMMUNICATION WITH HANDS FREE PHONE MODULE (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the A/C Heater Control loses communication with the Hands Free Phone Module (HFM).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0199—LOST COMMUNICATION WITH DRIVER DOOR MODULE (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the A/C Heater Control loses communication with the Driver Door Module (DDM).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0200—LOST COMMUNICATION WITH PASSENGER DOOR MODULE (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
With the ignition on.
- **Set Condition:**
If the A/C Heater Control loses communication with the Passenger Door Module (PDM).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0208—LOST COMMUNICATION WITH HEATED SEAT CONTROL MODULE (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Heated Seat Module (HSM).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0209—LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Memory Seat Module (MSM).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0212—LOST COMMUNICATION WITH SCCM - CAN-B (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Steering Column Control Module (SCCM).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0231—LOST COMMUNICATION WITH RAIN SENSING MODULE (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Rain Sensing Module (RSM).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

U0241—LOST COMMUNICATION WITH AUTO HIGHBEAM HEADLAMP CONTROL MODULE (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Auto High Beam Module (AHBM).

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

***HVAC SYSTEM TEST (ATC)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The HVAC System Test provides a starting point in the diagnostic process by identifying the appropriate diagnostic procedure or system test to perform when diagnosing a given symptom, condition, or DTC. It also provides a means for testing the entire HVAC system by utilizing the A/C Heater Control's On-Board System Tests. The On-Board System Tests can also assist in diagnosing stored DTCs. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING) for additional information about on-board diagnostics.

Diagnostic Test

1. HVAC SYSTEM TEST

NOTE: Diagnose and repair all active DTCs before diagnosing and repairing stored DTCs.

Make a selection based on the symptom, condition, or DTC that you want to diagnose.

For Any Active DTC

Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

Scan Tool Indicates HVAC Not Active On Bus

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

Complete HVAC System Test

Go To 2

A/C System Performance Test

Go To 2

General System Operation & Function Test

Go To 3

Actuator DTC Detection Test

Go To 4

Actuator Calibration Test

Go To 5

HVAC SYSTEM TEST (ATC) (CONTINUED)*2. A/C SYSTEM PERFORMANCE TEST**

NOTE: The following are prerequisites of the Cooldown Test. Verify each of the following before running the test:

- If active, diagnose and repair DTC B1031 or B1032 before proceeding. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.
- Verify that the refrigerant system has an adequate charge. Check and repair as necessary before proceeding. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS).
- Verify that the blower motor operates correctly in all speeds. Diagnose and repair all blower related faults before proceeding.
- Verify that the work area ambient temperature is above 18.3°C (65°F) before proceeding. Move the vehicle to a warmer work area if necessary.
- Verify that the evaporator temperature is above 18.3°C (65°F) before proceeding.
- Verify that the A/C compressor is not running. If the A/C compressor is running, turn the A/C off and allow the evaporator to warm up before proceeding.

Once all of the prerequisites have been met, actuate the Cooldown Test by performing the following:

Start the engine.

With the scan tool in HVAC, select System Tests and then select Cooldown test.

NOTE: The Cooldown Test can take up to two minutes to run. While the test is running, the A/C status indicator will flash. If the test passes, the A/C status indicator will stop flashing. However, if the test fails, both the A/C and EBL status indicators will flash alternately and an active DTC B10B2 will set. The status indicators will continue to flash until either a successful Cooldown Test is executed or until the vehicle is driven a specified number of miles. In addition, DTC B10B2 will remain active until a successful Cooldown Test is executed. The test will stop running if any of the following occurs:

- The ignition is turned off.
- The A/C compressor is requested off.
- The blower control is moved to the off position, unless the control was in the off position when the test was started. In this case, moving the blower control out of the off position and then returning it to the off position will stop the test
- DTC B1031 or B1032 sets during the test.
- the control receives a bus message to stop the test.

Allow the test to run to completion before proceeding.

With the scan tool, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and Repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms. Run the Cooldown Test again after the repair is complete.

No >> As necessary, either Go To 3, or 4, or 5, or Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

HVAC SYSTEM TEST (ATC) (CONTINUED)*3. GENERAL SYSTEM OPERATION & FUNCTION TEST**

NOTE: If at anytime a DTC becomes active during this test, proceed to the conclusion question.

NOTE: If multiple DTCs become active, diagnose those that relate to a short circuit first.

If not done so previously, start the engine.

Turn the blower control to manual low.

Turn the Left and Right Blend controls to full cold.

Turn the Mode control to panel.

Monitor the scan tool for active HVAC DTCs while performing the following test steps.

Press the A/C mode switch on, wait 30 seconds, press it off, and then proceed to the next step.

Press the Rear Defrost mode switch on, wait 30 seconds, press it off, and then proceed to the next step.

Press the Recirculation mode switch on, wait 30 seconds, press it off, and then proceed to the next step.

Turn the Left Blend control to full hot, wait 30 seconds, turn it to full cold, and then proceed to the next step.

Turn the Right Blend control to full hot, wait 30 seconds, turn it to full cold, and then proceed to the next step.

Turn the Mode control to every door position. Leave it in each position for 30 seconds.

Does the scan tool display any active DTCs?

- Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.
- No** >> If you are here due to a stored DTC, it is possible that a technician may not have erased the DTC following a repair. If possible, verify if the vehicle was recently in for this type of service. Otherwise, Go To either 4 or 5, or visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals, and repair as necessary.
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. ACTUATOR DTC DETECTION TEST

If not done so previously, start the engine.

With the scan tool, select System Tests and then select Actuator DTC Detection. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

- Yes** >> Diagnose and repair the DTC(s). If multiple DTCs are present, diagnose and repair all short high DTCs and then all short low DTCs. Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> If you are here due to a stored DTC, it is possible that a technician may not have erased the DTC following a repair. If possible, verify if the vehicle was recently in for this type of service. Otherwise, either Go To 5 or visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals, and repair as necessary.
- Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
-

HVAC SYSTEM TEST (ATC) (CONTINUED)*5. ACTUATOR CALIBRATION TEST**

If not done so previously, start the engine.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

Does the scan tool display any DTCs?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> No problem found. However, if you are here due to a stored DTC, it is possible that a technician may not have erased the DTC following a repair. If possible, verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals, and repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***HVAC SYSTEM TEST (MTC)**

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

Theory of Operation

The HVAC System Test provides a starting point in the diagnostic process by identifying the appropriate diagnostic procedure or system test to perform when diagnosing a given symptom, condition, or DTC. It also provides a means for testing the entire HVAC system by utilizing the A/C Heater Control's On-Board System Tests. The On-Board System Tests can also assist in diagnosing stored DTCs. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING) for additional information about on-board diagnostics.

Diagnostic Test

1. HVAC SYSTEM TEST

NOTE: Diagnose and repair all active DTCs before diagnosing and repairing stored DTCs.

Make a selection based on the symptom, condition, or DTC that you want to diagnose.

For Any Active DTC

Control Won't Run System Tests

Refer to *A/C Heater Control Will Not Enter Diagnostic Mode for the diagnostic test procedure.

HVAC SYSTEM TEST (MTC) (CONTINUED)*2. A/C SYSTEM PERFORMANCE TEST**

NOTE: The following are prerequisites of the Cooldown Test. Verify each of the following before running the test:

- If active, diagnose and repair DTC 31 or 32 before proceeding. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.
- Verify that the refrigerant system has an adequate charge. Check and repair as necessary before proceeding (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS).
- Verify that the blower motor operates correctly in all speeds. Diagnose and repair all blower related faults before proceeding.
- Verify that the work area ambient temperature is above 18.3°C (65°F) before proceeding. Move the vehicle to a warmer work area if necessary.
- Verify that the evaporator temperature is above 18.3°C (65°F) before proceeding.
- Verify that the A/C compressor is not running. If the compressor is running, turn the A/C off and allow the evaporator to warm up before proceeding.

Once all of the prerequisites have been met, actuate the Cooldown Test by performing the following:

- If not done so previously, start the engine.
- Press and hold the A/C mode switch down and then turn the blower motor control to high speed. Continue to hold the A/C mode switch down until the A/C status indicator begins flashing. Then, release the mode switch.
-

NOTE: The Cooldown Test can take up to two minutes to run. While the test is running, the A/C status indicator will flash once per second. If the test passes, the A/C status indicator will stop flashing. If the test fails, the A/C and EBL status indicators will flash alternately. The test will stop running if the either ignition is turned off, or the blower control is turned to any position other than high, or if DTC 31 or 32 sets during the test.

- Allow the test to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any DTCs?

Yes >> Diagnose and Repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms. Run the Cooldown Test again after the repair is complete.

No >> As necessary, either Go To 3 or 4, or Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

HVAC SYSTEM TEST (MTC) (CONTINUED)*3. GENERAL SYSTEM OPERATION & FUNCTION TEST**

If not done so previously, start the engine.

Turn the blower control on.

Turn the Blend control to full cold.

Turn the Mode control to panel.

Press the A/C mode switch on, wait 30 seconds, press it off, and then proceed to the next step.

Press the EBL mode switch on, wait 30 seconds, press it off, and then proceed to the next step.

Turn the Blend control to full hot, wait 30 seconds, turn it to full cold, and then proceed to the next step.

Turn the Mode control to every door position. Leave it in each position for 30 seconds. When complete, proceed to the next step.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

NOTE: If multiple DTCs are active, diagnose those that relate to a short circuit first.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any DTCs?

Yes >> Diagnose and repair the DTC(s). Go To 4 if Overcurrent faults (DTC 41, 42, 43, and 44) are present and run the Actuator Circuit Test / Door Calibration Function. Otherwise, refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.

No >> If you are here due to a stored DTC, it is possible that a technician may not have erased the DTC following a repair. If possible, verify if the vehicle was recently in for this type of service. Otherwise, either Go To 4 or visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals, and repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

HVAC SYSTEM TEST (MTC) (CONTINUED)*4. ACTUATOR CIRCUIT TEST / DOOR CALIBRATION FUNCTION**

NOTE: By running the Actuator Circuit Test / Door Calibration Function, the A/C Heater Control can identify up to three door driver circuits shorted simultaneously. A DTC 72 will set if more than three door driver circuits are shorted in the same direction (e.g. four door driver circuits all shorted to ground) or if two or more door driver circuits are shorted with at least one door driver circuit shorted to ignition and one door driver circuit shorted to ground. To ensure a proper diagnosis, diagnose and repair Actuator Circuit Test faults in the following order: If present, diagnose and repair DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, and finally DTCs 63, 65, 67, or 69. In addition, always test the door driver circuits after each repair by clearing DTCs, and then running the Actuator Circuit Test / Door Calibration Function, and then checking for DTCs.

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44) and Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). Diagnose and repair Overcurrent faults (DTC 41, 42, 43, and 44) before diagnosing Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). If not done so previously, turn the ignition on.

Actuate the Clear DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.
- When the A/C status indicator begins flashing DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds. However, if no DTCs were present, both status indicators will turn off and the system will exit diagnostic mode.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately. Allow the test / function to run to completion before proceeding.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

NOTE: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the A/C status indicator.

Does the A/C status indicator display any DTCs?

Yes >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

No >> No problem found. However, if you are here due to a stored DTC, it is possible that a technician may not have erased the DTC following a repair. If possible, verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals, and repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***A/C HEATER CONTROL WILL NOT ENTER DIAGNOSTIC MODE (MTC)**

***A/C HEATER CONTROL WILL NOT ENTER DIAGNOSTIC MODE (MTC) (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

An active DTC 33 will prevent the control from entering diagnostic mode and performing certain diagnostic functions, it will also prevent proper A/C mode switch and status indicator function. An active DTC 34 will prevent the control from performing certain diagnostic functions and it will prevent proper EBL mode switch and status indicator function. In addition, a short or an open (C41) Blower Switch Position Signal circuit will also prevent the control from entering diagnostic mode. For additional information about the A/C Heater Control's on-board diagnostics, refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING.

Possible Causes
OBJECT HOLDING A/C MODE SWITCH / EBL MODE SWITCH IN A PUSHED POSITION SUBSTANCE CAUSING A/C MODE SWITCH / EBL MODE SWITCH TO GET STUCK IN A PUSHED POSITION (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT SHORTED TO VOLTAGE (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT SHORTED TO (C121) SENSOR GROUND CIRCUIT (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT SHORTED TO GROUND (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT OPEN A/C STATUS INDICATOR / EBL STATUS INDICATOR INOPERATIVE A/C HEATER CONTROL

Diagnostic Test**1. INSPECT THE A/C HEATER CONTROL FOR DAMAGE**

Turn the ignition off.

Inspect the A/C Heater Control for damage.

Is the A/C Heater Control damaged?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 2

2. INSPECT FOR OBJECT OR SUBSTANCE CAUSING THE A/C MODE SWITCH OR EBL MODE SWITCH TO STAY OR STICK IN A PUSHED POSITION

Inspect the A/C Heater Control for anything that would cause the A/C mode switch or the EBL mode switch to stay or stick in a pushed position.

Is anything present that would cause the A/C mode switch or EBL mode switch to stay or stick in a pushed position?

- Yes** >> Repair as necessary.
 Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 3

***A/C HEATER CONTROL WILL NOT ENTER DIAGNOSTIC MODE (MTC) (CONTINUED)**

3. CHECK THE (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT VOLTAGE

Disconnect the A/C Heater Control C3 harness connector.
 Turn the ignition on.
 Measure the voltage of the (C41) Blower Switch Position Signal circuit.

What is the voltage?

Below 4.8 Volts
 Go To 4

Above 5.2 Volts
 Go To 7

4.8 Volts To 5.2 Volts
 Go To 8

4. CHECK THE (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT FOR A SHORT TO THE (C121) SENSOR GROUND CIRCUIT

Turn the ignition off.
 Disconnect the A/C Heater Control C2 harness connector.
 Measure the resistance between the (C41) Blower Switch Position Signal circuit and the (C121) Sensor Ground circuit in the A/C Heater Control C2 harness connector.

Is the resistance below 10K ohms?

Yes >> Repair the (C41) Blower Switch Position Signal circuit for a short to the (C121) Sensor Ground circuit.
 Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 5

***A/C HEATER CONTROL WILL NOT ENTER DIAGNOSTIC MODE (MTC) (CONTINUED)**

5. CHECK THE (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance of the (C41) Blower Switch Position Signal circuit between ground and the A/C Heater Control C3 harness connector.

Is the resistance below 10K ohms?

- Yes** >> Repair the (C41) Blower Switch Position Signal circuit for a short to ground.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Go To 6

6. CHECK (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT FOR AN OPEN

Measure the resistance of the (C41) Blower Switch Position Signal circuit between the A/C Heater Control C2 harness connector and the A/C Heater Control C3 harness connector.

Is the resistance below 5.0 ohms?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).
- No** >> Repair the (C41) Blower Switch Position Signal circuit for an open.
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

***A/C HEATER CONTROL WILL NOT ENTER DIAGNOSTIC MODE (MTC) (CONTINUED)**

7. CHECK THE (C41) BLOWER SWITCH POSITION SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Measure the voltage of the (C41) Blower Switch Position Signal circuit.

Is the voltage above 0.2 volts?

Yes >> Repair the (C41) Blower Switch Position Signal circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

8. CHECK FOR NORMAL A/C MODE SWITCH & STATUS INDICATOR FUNCTION

Turn the ignition off.

Reconnect the A/C Heater Control C3 harness connector.

Turn the ignition on.

Turn the blower control on.

Press the A/C mode switch on and off several times while observing the A/C status indicator.

Does the A/C status indicator turn on and off with respect to the switch position?

Yes >> Go To 9

No >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

9. CHECK FOR NORMAL EBL MODE SWITCH & STATUS INDICATOR FUNCTION

Turn the blower control off.

Press the EBL mode switch on and off several times while observing the EBL status indicator.

Does the EBL status indicator turn on and off with respect to the switch position?

Yes >> Go To 10

No >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

A/C HEATER CONTROL WILL NOT ENTER DIAGNOSTIC MODE (MTC) (CONTINUED)*10. CHECK THE A/C HEATER CONTROL BY ATTEMPTING TO ENTER DIAGNOSTIC MODE**

If illuminated, turn off the A/C status indicator and the EBL status indicator.

Actuate the display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 5 seconds and then release the A/C mode switch.

When entry mode is recognized, the A/C status indicator and the EBL status indicator will illuminate for 5 seconds and then, if present, will begin displaying DTCs. The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated. However, if no DTCs are present, both status indicators will turn off and the system will exit diagnostic mode.

Did the A/C Heater Control enter diagnostic mode?

Yes >> Go To 11

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

11. CHECK THE A/C HEATER CONTROL BY ATTEMPTING TO RUN THE ACTUATOR CIRCUIT TEST/ DOOR CALIBRATION FUNCTION

Turn the ignition off, wait 10 seconds, then turn the ignition on.

If illuminated, turn off the A/C status indicator and the EBL status indicator.

Actuate the Actuator Circuit Test / Door Calibration Function by performing the following:

- Turn the blower control off.
- Press and hold the EBL mode switch down and then turn the blower control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the EBL mode switch.

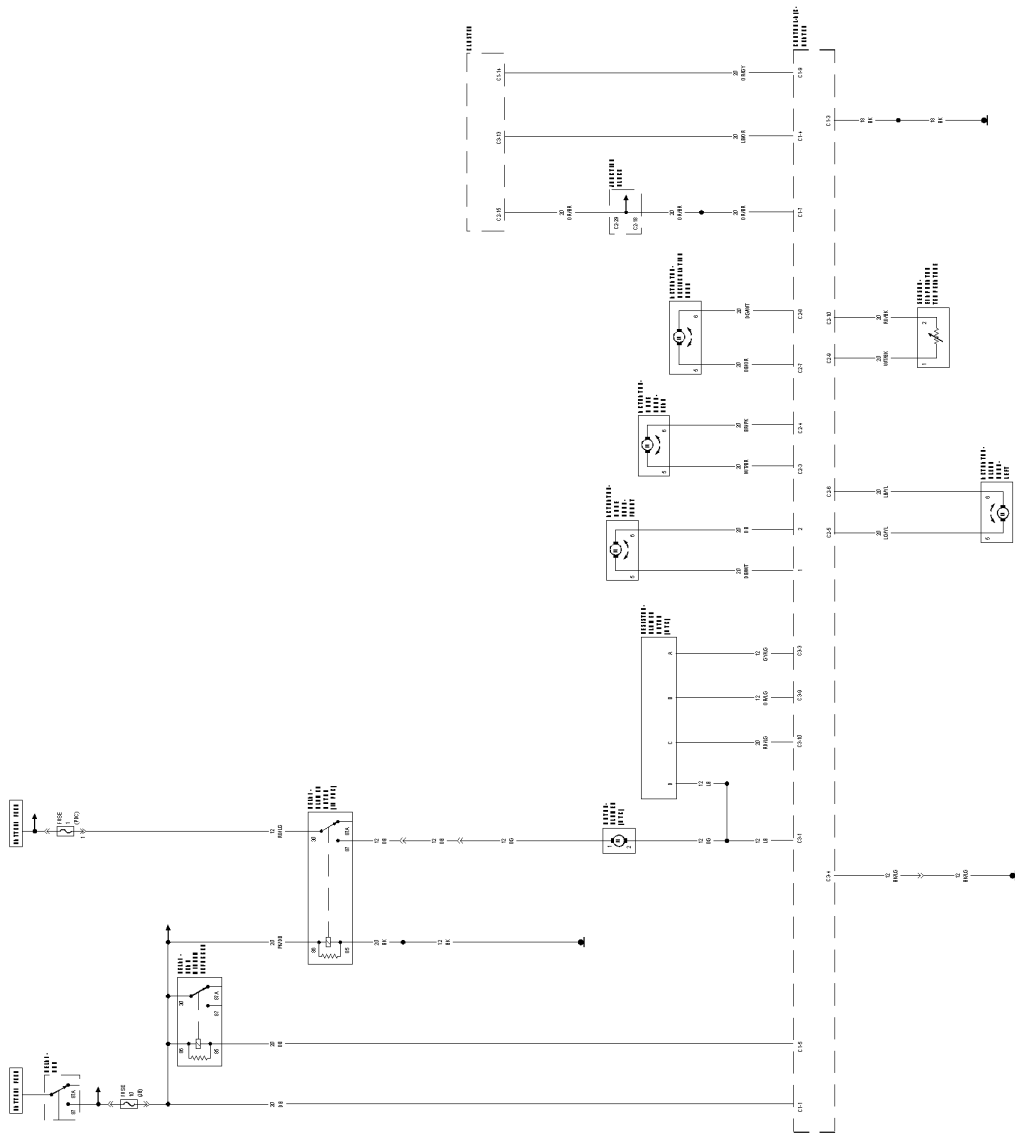

While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. If the test / function fails, the A/C and EBL status indicators will flash alternately.

Did the A/C Heater Control run the test / function?

Yes >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

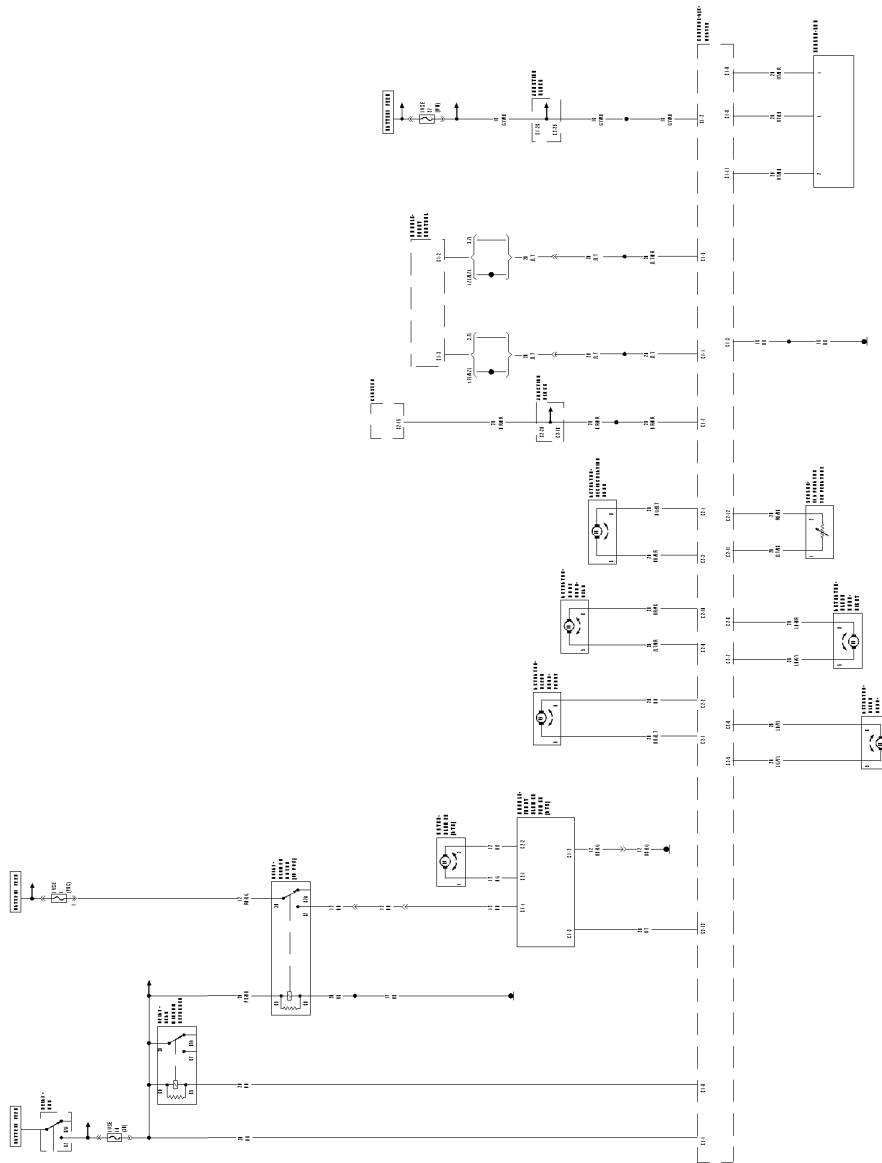

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

HVAC - SERVICE INFORMATION

DESCRIPTION

A manual temperature control (MTC) single zone type heating-A/C system or a fully adjustable automatic temperature control (ATC) dual zone type heating-A/C system is available on this vehicle.

To maintain the performance level of the heating, ventilation and air conditioning (HVAC) system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or A/C condenser will reduce the performance of the A/C and engine cooling systems.

The engine cooling system includes the radiator, thermostat, radiator hoses and the engine coolant pump. Refer to 7 - Cooling for more information before opening or attempting any service to the engine cooling system.

All vehicles are equipped with a common heater, ventilation and air conditioning (HVAC) housing (1). The heating-A/C system combines A/C, heating, and ventilating capabilities in a single HVAC housing mounted within the passenger compartment beneath the instrument panel. The HVAC housing includes:

- Recirculation-air door and actuator (2)
- Blower motor (3)
- Blower motor resistor (MTC) or blower motor power module (ATC) (4)
- Blend-air door(s) and actuator(s) (5)
- Heater core (6)
- Mode-air doors and actuator (7)
- Evaporator temperature sensor (8)
- A/C evaporator (9)

Based upon the system and selected mode, conditioned air can exit the HVAC housing through one or a combination of the three main housing outlets: defrost, panel or floor. The defrost and panel outlets are located on the top of the HVAC housing and the floor outlets are located at the rear of the HVAC housing. Once the conditioned air exits the HVAC housing, it is further directed through molded plastic ducts to the outlets within the vehicle interior. These outlets and their locations are as follows:

- **Defroster Outlets** - Two large defroster outlets are located near the center of the instrument panel top cover, near the base of the windshield.
- **Side Window Demister Outlets** - There are two side window demister outlets, one is located at each out-board end of the instrument panel top cover, near the belt line at the A-pillars.

- **Panel Outlets** - There are four panel outlets in the instrument panel, one located near each outboard end of the instrument panel facing the rear of the vehicle and one located on each side of the instrument panel center bezel.
- **Floor Outlets** - There is one floor outlet located above each side of the floor panel center tunnel near the dash panel. There is also one outlet located under each front seat.
- **Console Outlets** - There are two console outlets located at the back of the center floor console facing the rear of the vehicle.

OPERATION

Both the manual temperature control (MTC) and the automatic temperature control (ATC) heating-A/C system are blend-air type systems. In a blend-air system, a blend-air door controls the amount of conditioned air that is allowed to flow through, or around, the heater core. In the available dual zone system, two blend-air doors are used to provide completely independent side-to-side temperature control of the discharge air. The temperature control(s) determines the discharge air temperature(s) by operating the blend door actuator(s), which move the blend-air door(s). This design allows almost immediate control of output air temperature(s).

The heating-A/C system pulls outside (ambient) air through the cowl opening at the base of the windshield, then into the air inlet housing and through the A/C evaporator (3). Air flow can be directed either through or around the heater core (1). This is done by adjusting the blend-air door(s) (2) with the temperature control(s) located on the A/C-heater control in the instrument panel. The air flow can then be directed from the panel, floor and defrost outlets in various combinations using the mode control located on the A/C-heater control. Air flow velocity can be adjusted with the blower speed control located on the A/C-heater control.

The outside (fresh) air intake can be shut off by selecting the Recirculation Mode with the mode control. This will operate an electrically actuated recirculation-air door (4) that closes off the fresh air intake and recirculates the air that is already inside the vehicle.

The A/C compressor can be engaged in any mode by pressing the snowflake, A/C on/off button. It can also be engaged by placing the mode control in the mix to defrost positions. This will remove heat and humidity from the air before it is directed through or around the heater core. The mode control on the A/C-heater control is used to also direct the conditioned air to the selected system outlets. The mode control uses an electric actuator to control the mode-air doors (5 and 6).

The two slot-type defroster outlets receive airflow from the HVAC housing through the molded plastic defroster ducts, which connect to the HVAC housing defroster outlets. The airflow from the defroster outlets is directed by fixed vanes in the defroster outlet grilles and cannot be adjusted. The defroster outlet grilles are serviceable from the instrument panel top cover.

The side window demister outlets receive airflow from the HVAC housing through the molded plastic demister ducts. The demisters direct air from the HVAC housing through the outlets located on the top corners of the instrument panel. The airflow from the side window demister outlets is directed by fixed vanes in the demister outlet grilles and cannot be adjusted. The side window demister outlet grilles are not serviceable from the instrument panel. The demisters operate when the controls are set in Heat, Bi-level, Mix and Defrost modes.

The four instrument panel outlets receive airflow from the HVAC housing through two molded plastic main panel ducts. One duct directs air flow out of the right side instrument panel outlets, while the other duct delivers air flow to the left side outlets. Each of these outlets can be individually adjusted to direct the flow of air.

The floor outlets receive airflow from the HVAC housing through the floor distribution ducts which are connected to the rear of the HVAC air distribution housing. Two plastic rear distribution ducts and one center console duct attach to the rear of the air distribution housing and provide conditioned air to the rear seating positions. The two console outlets can be individually adjusted to direct the flow of air, but the floor outlets cannot be adjusted.

NOTE: It is important to keep the HVAC air intake opening clear of debris. Leaf particles and other debris that is small enough to pass through the cowl opening screen can accumulate within the HVAC housing. The closed, warm, damp and dark environment created within the housing is ideal for the growth of certain molds, mildews and other fungi. Any accumulation of decaying plant matter provides an additional food source for fungal spores, which enter the housing with the fresh intake-air. Excess debris, as well as objectionable odors created by decaying plant matter and growing fungi can be discharged into the passenger compartment during heater-A/C operation if the air intake opening is not kept clear of debris.

The A/C system is designed for the use of non-CFC, R-134a refrigerant and uses an A/C expansion valve to meter the flow of refrigerant to the A/C evaporator. The A/C evaporator cools and dehumidifies the incoming air prior to blending it with the heated air. To maintain minimum evaporator temperatures and prevent evaporator freezing, an evaporator temperature sensor is used. The sensor is located downstream of the evaporator and supplies an evaporator temperature signal to the A/C-heater control. For the ATC system, the A/C-heater control broadcasts the A/C request on the controller area network (CAN) B bus, where it is read and processed by the front control module (FCM), which in turn broadcasts it on the CAN C bus, where it is read and processed by the powertrain control module (PCM). For the MTC system, the A/C-heater control sends the request for A/C to the CCN via a dedicated mux circuit. The CCN then broadcasts the A/C request on the CAN B bus, where it is read and processed by the FCM, which in turn broadcasts it on the CAN C bus, where it is read and processed by the PCM.

DIAGNOSIS AND TESTING

HEATING AND A/C SYSTEMS

ON-BOARD DIAGNOSTICS

CAUTION: Do not exchange A/C-Heater Controls from vehicle to vehicle. Software versions differ between models and model years. Installing an A/C-Heater Control with software that is incompatible for a given vehicle can result in either improper or failed HVAC system operation.

SETTING FAULTS - ATC AND MTC SYSTEMS

Both the automatic temperature control (ATC) and the manual temperature control (MTC) systems are controlled by the A/C-heater control located on the center bezel of the instrument panel. The ATC system communicates on the controller area network (CAN) B bus and is fully addressable with a scan tool. The MTC system is NOT connected to the CAN bus and is NOT addressable with a scan tool. The A/C-heater control's primary means of fault detection for both heating-A/C systems is through active and stored diagnostic trouble codes (DTCs). The control continuously monitors various internal parameters during normal system operation. If it detects a fault, both an active and a stored diagnostic trouble code (DTC) will set for that parameter. When the offending parameter returns to an acceptable value, the control automatically clears the active DTC. However, the stored DTC remains until cleared (either manually or automatically). Note that DTCs will not set or clear if supply voltage is low.

The A/C-heater control's secondary means of fault detection for both heating-A/C systems is through system tests. For ATC systems, these tests include the HVAC System Test, the Cooldown Test, Actuator Calibration, and the Actuator DTC Detection Test. For MTC systems, these tests include the HVAC System Test, the Cooldown Test, Actuator Calibration (new MTC installation only), and the Actuator Circuit Test / Door Calibration Function. Refer to System Tests in this Section for a detailed description of each test.

DISPLAYING FAULTS AND READING FAULTS - ATC SYSTEM

Use a scan tool to display DTCs stored in the A/C-heater control of the ATC system (Refer to 24 - HVAC - Electrical Diagnostics for more information).

DISPLAYING FAULTS AND READING FAULTS - MTC SYSTEM

Use the A/C-heater control to display DTCs stored in the A/C-heater control of the MTC system. Refer to Entering Display DTC Mode - MTC System; Display Sequencing - MTC System; Reading Diagnostic Trouble Codes - MTC System; Active DTCs - ATC and MTC Systems; Stored DTCs - ATC and MTC Systems; and Clearing Faults - MTC System in this section for additional information.

ENTERING DISPLAY DTC MODE - MTC SYSTEM

To enter the MTC system's Display DTC Mode, perform the following:

NOTE: An active DTC 33 will prevent the control from entering diagnostic mode and performing certain diagnostic functions. It will also prevent proper A/C mode switch and status indicator function. If this occurs, refer to *A/C HEATER CONTROL WILL NOT ENTER DIAGNOSTIC MODE (MTC) in 24 - HVAC - Electrical Diagnostics for the diagnostic test procedure.

1. Turn the ignition to the On position.
2. Turn the blower motor control (1) to the On position.
3. Press the A/C mode switch (2) down, turn the blower motor control to the Off position, wait 5 seconds and then release the A/C switch. If there are active or stored DTCs to display, the A/C status indicator (3) will begin to flash. If there are no active or stored DTCs to display, the LEDs on the A/C-heater control (4) will turn off and the system will automatically exit the mode of operation.
4. To manually exit Display DTC Mode, either turn the ignition off or disconnect the negative battery cable from the battery.

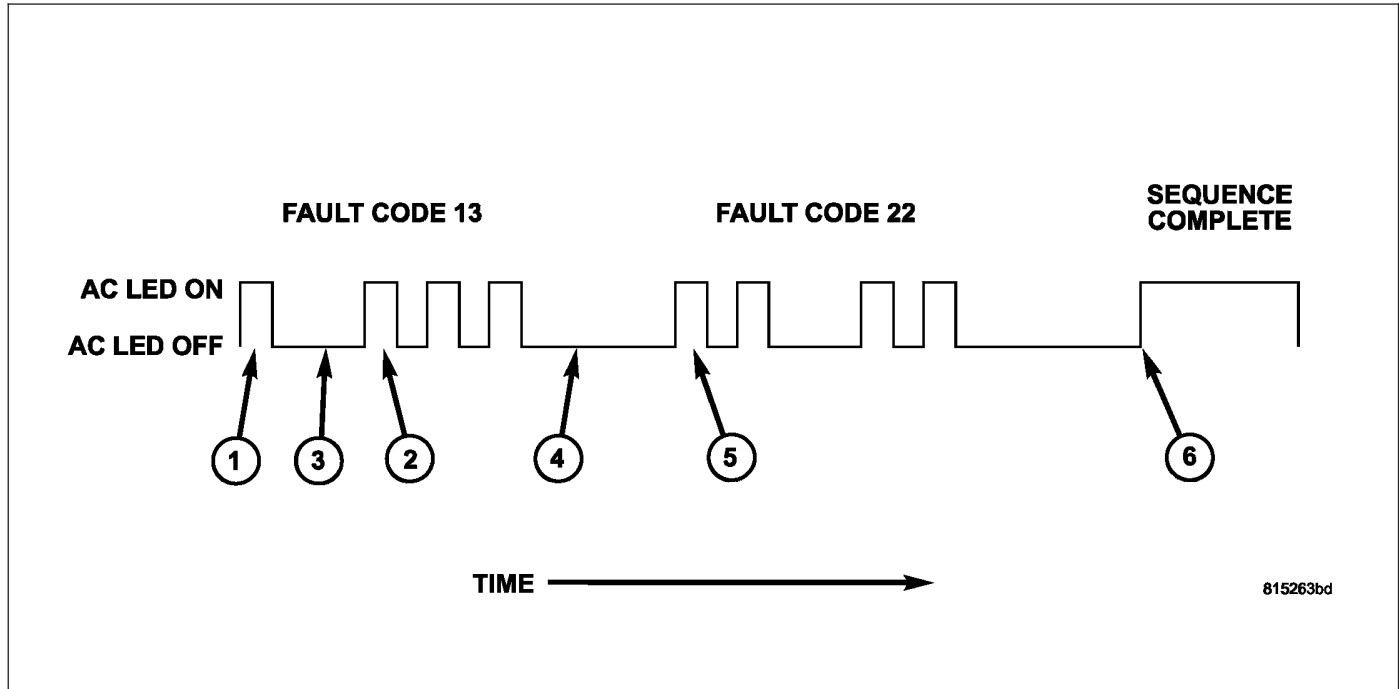

8134aceb

DISPLAY SEQUENCING - MTC SYSTEM

MTC system DTCs will display in ascending numerical order but not in chronological order. Active DTCs will display before stored DTCs. If there are active and stored DTCs for the same parameter, the A/C-heater control will NOT display the stored DTC for that parameter. The EBL status indicator will illuminate and remain illuminated while the A/C-heater control is displaying stored DTCs. After displaying all active and stored DTCs, the A/C-heater control restarts at the beginning, displaying all DTCs again. To restart the sequence from the beginning while the A/C-heater control is displaying DTCs, press the EBL mode switch down, and then release it. This will cause the A/C-heater control to quit displaying the present code, turn off all LEDs for 2.0 seconds, and then it will begin flashing all DTCs again from the beginning.

READING DIAGNOSTIC TROUBLE CODES - MTC SYSTEM

All active and stored DTCs for the MTC system have an assigned code number. The A/C status indicator flashes in a series of pulses to display the code numbers. Each pulse has an indicator on time of 1.5 seconds. The tens unit value (1) is flashed first followed by the ones unit value (2). A 2.0 second indicator off-time (3) separates the unit values. When displaying multiple DTCs, the A/C status indicator will go off for five seconds (4) before displaying the next DTC (5). To indicate that the A/C-heater control has completed displaying all DTCs, the A/C status indicator will illuminate for two seconds (6) and then go off for two seconds before beginning to flash the DTCs over again.

ACTIVE DTCs - ATC AND MTC SYSTEMS

Refer to 24 - HVAC - Electrical Diagnostics to diagnose HVAC system DTCs.

STORED DTCs - ATC AND MTC SYSTEMS

The HVAC System Test, found in 24 - HVAC - Electrical Diagnostics, provides a means for diagnosing stored DTCs. The HVAC System Test consists of multiple diagnostic procedures which cover:

- A/C System Performance
- System Controls
- Air-door Functionality

Either perform the entire diagnostic procedure for a complete system test or perform an individual procedure if diagnosing a specific symptom, condition, or DTC.

CLEARING FAULTS - ATC SYSTEM

For every fault that sets, the A/C-heater control maintains an independent count of the number of key cycles since the active DTC cleared, the odometer reading when the DTC set, and the elapsed ignition on time that the DTC was active. When the number of key cycles (by parameter) reaches a global number, the system automatically clears all of the information associated with that DTC. A loss of battery voltage will also clear all active DTCs and associated data from memory. However, upon reconnecting the battery and activating the A/C-heater control ("Ignition" line going "HIGH"), the system will again evaluate all parameters and will set active DTCs for parameters outside of acceptable limits.

DTCs can also be cleared manually from the A/C-heater control (which also resets key cycle counters). Use a scan tool to clear DTCs stored in the A/C-heater control of the ATC system (Refer to 24 - HVAC - Electrical Diagnostics for more information).

CLEARING FAULTS - MTC SYSTEM

To clear DTCs stored in the A/C-heater control of the MTC system, perform the following:

NOTE: An active DTC 33 will prevent the control from entering diagnostic mode and performing certain diagnostic functions. It will also prevent proper A/C mode switch and status indicator function. If this occurs, refer to *A/C HEATER CONTROL WILL NOT ENTER DIAGNOSTIC MODE (MTC) in 24 - HVAC - Electrical Diagnostics for the diagnostic test procedure.

NOTE: An active DTC 34 will prevent the control from performing certain diagnostic functions and it will prevent proper EBL mode switch and status indicator function. If active, diagnose and repair DTC 34 before proceeding. Refer to 24 - HVAC - Electrical Diagnostics for the diagnostic test procedure.

1. Turn the ignition to the On position.
2. Turn the blower motor control (1) to the On position.
3. Press the A/C mode switch (2) down, turn the blower motor control to the Off position, wait 5 seconds and then release the A/C mode switch.
4. When the A/C status indicator begins flashing DTCs, set the Mode switch to the floor position, simultaneously press the A/C mode switch and the EBL mode switch down for 5 seconds and then release the mode switches. Stored DTCs will clear from memory in approximately two seconds.

SYSTEM TESTS

HVAC SYSTEM TEST - ATC AND MTC SYSTEMS

The HVAC System Test, found in 24 - HVAC - Electrical Diagnostics, provides a starting point in the diagnostic process by identifying the appropriate diagnostic procedure or system test to perform when diagnosing a given symptom, condition, or DTC. It also provides a means for testing the entire HVAC system by utilizing the A/C-heater control's On-Board System Tests. The On-Board System Tests can also assist in diagnosing stored DTCs.

ACTUATOR CALIBRATION - ATC SYSTEM

The Actuator Calibration function homes and repositions the air-door actuators, removes accumulated positioning errors, and checks for air-door span faults. Once actuated, the entire process takes approximately 90 seconds. Upon completion, all air-door actuators should return to the position that the system is currently requesting. Running the Actuator Calibration function is the only way to detect air-door travel too large faults and air-door travel too small faults. These faults, if present, will display on the scan tool after running the Actuator Calibration function.

STARTING ACTUATOR CALIBRATION - ATC SYSTEM

Use a scan tool to start the Actuator Calibration function.

ACTUATOR CALIBRATION - MTC SYSTEM

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44) and Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). Diagnose and repair Overcurrent faults (DTC 41, 42, 43, and 44) before diagnosing Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56).

The A/C-Heater Control automatically runs the Actuator Calibration function upon ignition on after installing a new A/C-Heater Control. The Actuator Calibration function homes and repositions the air-door actuators, removes accumulated positioning errors, and checks for air-door span faults. Once actuated, the entire process takes approximately 90 seconds. Upon completion, all air-door actuators should return to the position that the system is currently requesting. Running the Actuator Calibration function is the only way to detect air-door travel too large faults, air-door travel too small faults, air-door bound faults, and air-door broken linkage faults. These faults, if present, will display when checking for DTCs in the A/C-heater control.

STARTING ACTUATOR CALIBRATION MANUALLY - MTC SYSTEM

Refer to Starting The Actuator Circuit Test / Door Calibration Function - MTC System in this section.

ACTUATOR DTC DETECTION TEST - ATC SYSTEM

The Actuator DTC Detection Test tests the air-door electrical circuits for shorts. This test supplements the continuous actuator drive system diagnostics and can provide greater detail about shorted air-door electrical circuits by identifying up to three door driver circuits shorted simultaneously. Running the Actuator DTC Detection Test is the only way to detect air-door actuator control circuit low and air-door actuator control circuit high faults. These faults, if present, will display on the scan tool after running the Actuator DTC Detection Test.

STARTING ACTUATOR DTC DETECTION TEST - ATC SYSTEM

Use a scan tool to start the Actuator DTC Detection Test.

ACTUATOR CIRCUIT TEST / DOOR CALIBRATION FUNCTION - MTC SYSTEM

NOTE: Diagnose and repair Actuator Circuit Test faults (DTC 61, 62, 63, 64, 65, 66, 67, 68, 69, 71, and 72) before diagnosing Overcurrent faults (DTC 41, 42, 43, and 44) and Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56). Diagnose and repair Overcurrent faults (DTC 41, 42, 43, and 44) before diagnosing Calibration faults (DTC 18, 21, 22, 23, 24, 25, 45, 46, 47, 48, 51, 52, 53, 54, 55, and 56).

The Actuator Circuit Test / Door Calibration function first tests the air-door electrical circuits for shorts and then it homes and repositions the air-doors to remove accumulated positioning errors and to check for air-door span faults. This test / function supplements the continuous actuator drive system diagnostics and can provide greater detail about shorted air-door electrical circuits by identifying up to three door driver circuits shorted simultaneously. This test will also detect air-door travel too large faults, air-door travel too small faults, air-door bound faults, and air-door broken linkage faults. The Actuator Circuit Test / Door Calibration function must be manually actuated. Faults detected will display when checking for DTCs in the A/C-heater control.

STARTING THE ACTUATOR CIRCUIT TEST / DOOR CALIBRATION FUNCTION - MTC SYSTEM

NOTE: By running the Actuator Circuit Test / Door Calibration Function, the A/C-Heater Control can identify up to three door driver circuits shorted simultaneously. A DTC 72 will set if more than three door driver circuits are shorted in the same direction (e.g. four door driver circuits all shorted to ground) or if two or more door driver circuits are shorted with at least one door driver circuit shorted to ignition and one door driver circuit shorted to ground. To ensure a proper diagnosis, diagnose and repair Actuator Circuit Test faults in the following order: If present, diagnose and repair DTC 72 first, then DTC 62, then DTC 61, then DTCs 64, 66, 68, or 71, and finally DTCs 63, 65, 67, or 69. In addition, always test the door driver circuits after each repair by clearing DTCs, and then running the Actuator Circuit Test / Door Calibration Function, and then checking for DTCs.

To start the Actuator Circuit Test / Door Calibration function for the MTC system, perform the following:

NOTE: An active DTC 34 will prevent the control from performing certain diagnostic functions and it will prevent proper EBL mode switch and status indicator function. If this occurs, diagnose and repair DTC 34 before running the Actuator Circuit Test / Door Calibration function. Refer to 24 - HVAC - Electrical Diagnostics for the diagnostic test procedure.

1. Turn the ignition to the On position.
2. Turn the blower motor control (1) to the Off position.
3. Press and hold the EBL mode switch (2) down and then turn the blower motor control on. Continue to hold the EBL mode switch down until the EBL status indicator begins flashing. Then, release the mode switch. While the test / function is running, the EBL status indicator will flash once per second. If the test / function passes, the EBL status indicator will stop flashing. However, if the test / function fails, the A/C and EBL status indicators will flash alternately. Faults detected will display when checking for DTCs in the A/C-heater control.

COOLDOWN TEST - ATC AND MTC SYSTEMS

The Cooldown Test checks A/C system performance by measuring the system's ability to lower the evaporator temperature 11.11° C (20° F) as measured by the evaporator temperature sensor. The following are prerequisites of the Cooldown Test. Verify each of the following before running the Cooldown Test:

- For the ATC system, the Cooldown Test will NOT start if DTC B1031 or B1032 is active. If active, diagnose and repair either DTC before proceeding (Refer to 24 - HVAC - Electrical Diagnostics for a complete list of HVAC related symptoms).
- For the MTC system, the Cooldown Test will NOT start if DTC 31 or 32 is active. If active, diagnose and repair either DTC before proceeding (Refer to 24 - HVAC - Electrical Diagnostics for a complete list of HVAC related symptoms).
- For both systems, verify that the refrigerant system has an adequate charge. Check and repair as necessary before proceeding (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS).
- For both systems, verify that the blower motor operates correctly in all speeds. Diagnose and repair all blower motor related faults before proceeding.
- For both systems, verify that the ambient temperature of the work area is above 18.3° C (65° F) before proceeding. Move the vehicle to a warmer work area if necessary.
- For both systems, verify that the evaporator temperature is above 18.3° C (65° F) before proceeding.
- For both systems, verify that the A/C compressor is NOT running. If the A/C compressor is running, turn the A/C off and allow the evaporator to warm up before proceeding.

STARTING THE COOLDOWN TEST - ATC SYSTEM

Once all of the prerequisites have been met, the Cooldown Test for the ATC system can be actuated by sending a command with a scan tool. Once started, the ATC A/C-heater control automatically sets the blower speed and positions the air-doors for optimal A/C performance. It also sends a request for A/C operation on the CAN B bus. The Cooldown Test can take up to two minutes to run and, will stop running if any of the following occurs:

- The ignition is turned off.
- The A/C compressor is requested off.
- The blower motor control is moved to the Off position, unless the control was in the Off position when the Cooldown Test was started. In this case, moving the blower motor control out of the Off position and then returning it to the Off position will stop the test.

- DTC B1031 or B1032 sets during the Cooldown Test.
- The A/C-heater control receives a bus message to stop the Cooldown Test.

While the Cooldown Test is running, the A/C status indicator will flash. During this time the A/C-heater control will ignore most of its inputs. If the ATC system passes the test, the A/C status indicator will stop flashing. However, if the ATC system fails the test, both the A/C and EBL status indicators will flash alternately and an active DTC B10B2 will set. The status indicators will continue to flash until either a successful Cooldown Test is executed or until the vehicle is driven a specified number of miles. In addition, DTC B10B2 will remain active until a successful Cooldown Test is executed. Always check for DTCs in the A/C-heater control after running the Cooldown Test.

STARTING THE COOLDOWN TEST - MTC SYSTEM

Once all of the prerequisites have been met, the Cooldown Test for the MTC system can be actuated by performing the following:

NOTE: An active DTC 33 will prevent the control from entering diagnostic mode and performing certain diagnostic functions. It will also prevent proper A/C mode switch and status indicator function. If this occurs, refer to *A/C HEATER CONTROL WILL NOT ENTER DIAGNOSTIC MODE (MTC) in 24 - HVAC - Electrical Diagnostics for the diagnostic test procedure.

1. Verify that the ignition is in the Off position.
2. Turn the blower motor control (1) to the Off position.
3. Start the engine.
4. Press and hold the A/C mode switch (2) down and then turn the blower motor control to high speed. Continue to hold the A/C mode switch down until the A/C status indicator begins flashing. Then, release the mode switch.

Once actuated, the MTC A/C-heater control automatically positions the air-doors for optimal A/C performance and sends a request for A/C operation to the cluster (CCN) via hardwired circuits. The Cooldown Test can take up to two minutes to run. The test will stop running if any of the following occurs:

- The ignition is turned to the Off position.
- The blower motor control is turned to the any position other than high speed.
- DTC 31 or 32 sets during the Cooldown Test.

While the Cooldown Test is running, the A/C status indicator will flash. During this time the A/C-heater control will ignore most of its inputs. If the MTC system passes the test, the A/C status indicator will stop flashing. However, if the MTC system fails the test, both the A/C and EBL status indicators will flash alternately and an active DTC 35 will set. The status indicators will continue to flash until either a successful Cooldown Test is executed or until the vehicle's ignition on time has exceeded a specified value. In addition, DTC 35 will remain active until a successful Cooldown Test is executed. Always check for and diagnose DTCs present in the A/C-heater control after running the Cooldown Test. If the Cooldown Test fails, service the heating-A/C system as required.

A/C PERFORMANCE

The A/C system is designed to provide the passenger compartment with low temperature and low humidity air. The A/C evaporator, located in the HVAC housing is cooled to temperatures near the freezing point. As warm damp air passes over the fins of the A/C evaporator, the air transfers its heat to the refrigerant in the evaporator coils and the moisture in the air condenses on the evaporator fins. During periods of high heat and humidity, an A/C system will be more effective in the Recirculation mode (max-A/C). With the system in the Recirculation mode, only air from the passenger compartment passes through the A/C evaporator. As the passenger compartment air dehumidifies, the A/C system performance levels rise.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the A/C system. When humidity is high, the A/C evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and coils. This reduces the amount of heat the A/C evaporator can absorb from the air. High humidity greatly reduces the ability of the A/C evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their A/C system on humid days. A performance test is the best way to determine whether the system is performing up to design standards. This test also provides valuable clues as to the possible cause of trouble with the A/C system. The ambient air temperature in the location where the vehicle will be tested must be a minimum of 21° C (70° F) for this test.

A/C PERFORMANCE TEST

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

1. Perform the A/C System Performance Test found within the HVAC System Test (refer to 24 - HVAC Electrical Diagnostics). If no diagnostic trouble codes (DTCs) are found in the A/C-heater control or the powertrain control module (PCM), go to Step 2. If any DTCs are found, repair as required, then proceed to Step 2.
2. Connect a tachometer and a manifold gauge set.
3. Set the A/C-heater control to the Recirculation mode (max-A/C) position, the temperature control to the full cool position, and the blower motor control to the highest speed position.
4. Start the engine and hold the idle at 1,000 rpm with the compressor clutch engaged. If the A/C compressor does not engage, see the A/C Diagnosis chart.
5. The engine should be at operating temperature, the doors should be closed and the windows opened.
6. Insert a thermometer in the driver side center panel outlet. Operate the A/C system until it stabilizes.
7. With the A/C compressor clutch engaged, compare the air temperature at the center panel outlet and the A/C compressor discharge pressure (high side) to the A/C Performance and Pressure chart. The compressor clutch may cycle, depending upon the ambient temperature and humidity. If the clutch cycles, use the readings obtained before the clutch disengaged.

A/C PERFORMANCE TEMPERATURE AND PRESSURE

Ambient Air Temperature	21°C (70°F)	27°C (80°F)	32°C (90°F)	38°C (100°F)	43°C (110°F)
Maximum Allowable Air Temperature at Center Panel Outlet	9°C (48°F)	9°C (48°F)	12°C (54°F)	15°C (59°F)	18°C (65°F)
Suction Pressure at Service Port (Low Side)	138 to 207 kPa (20 to 30 psi)	138 to 207 kPa (20 to 30 psi)	207 to 276 kPa (30 to 40 psi)	207 to 276 kPa (30 to 40 psi)	241 to 310 kPa (35 to 45 psi)
Discharge Pressure at Service Port (High Side)	1034 to 1724 kPa (150 to 250 psi)	1379 to 2068 kPa (200 to 300 psi)	1551 to 2241 kPa (225 to 325 psi)	1724 to 2413 kPa (250 to 350 psi)	2068 to 2758 kPa (300 to 400 psi)

8. If the air outlet temperature fails to meet the specifications in the A/C Performance Temperature and Pressure chart, or if the A/C compressor discharge pressure is high, refer to the A/C Pressure Diagnosis chart.

A/C PRESSURE DIAGNOSIS

Condition	Possible Causes	Correction
Rapid A/C compressor clutch cycling (ten or more cycles per minute).	Very low refrigerant system charge.	See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
Equal pressures, but the compressor clutch does not engage.	1. No refrigerant in the refrigerant system.	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Faulty fuse.	2. Check the fuses in the Integrated Power Module. Repair the shorted circuit or component and replace the fuses, if required. Refer to Group 8.
	3. Faulty A/C compressor clutch coil.	3. See A/C Compressor Clutch Coil in this group. Test the compressor clutch coil and replace, if required.
	4. Faulty A/C compressor clutch relay.	4. See A/C Compressor Clutch Relay in this group. Test the compressor clutch relay and relay circuits. Repair the circuits or replace the relay, if required.
	5. Improperly installed or faulty evaporator temperature sensor.	5. See Evaporator Temperature Sensor in this group. Test the sensor and replace, if required.
	6. Faulty A/C pressure transducer.	6. See A/C Pressure Transducer in this group. Test the sensor and replace, if required.
	7. Faulty Powertrain Control Module (PCM).	7. Refer to Group 9 - Engine Electrical Diagnostics for testing of the PCM. Test the PCM and replace, if required.
Normal pressures, but A/C Performance Test air temperatures at center panel outlet are too high.	1. Excessive refrigerant oil in system.	1. See Refrigerant Oil Level in this group. Recover the refrigerant from the refrigerant system and inspect the refrigerant oil content. Restore the refrigerant oil to the proper level, if required.
	2. Blend door actuator (s) improperly installed or faulty.	2. See Blend Door Actuator in this group. Inspect the actuator(s) for proper operation and replace, if required.
	3. Blend-air door(s) inoperative or sealing improperly.	3. See HVAC Housing in this group. Inspect the blend-air door(s) for proper operation and sealing. Repair if required.
The low side pressure is normal or slightly low, and the high side pressure is too low.	1. Low refrigerant system charge.	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Refrigerant flow through the A/C evaporator is restricted.	2. See A/C Evaporator in this group. Replace the restricted A/C evaporator, if required.
	3. Faulty A/C compressor.	3. See A/C Compressor in this group. Replace the A/C compressor, if required.

Condition	Possible Causes	Correction
The low side pressure is normal or slightly high, and the high side pressure is too high.	1. A/C condenser air flow restricted.	1. Check the A/C condenser for damaged fins, foreign objects obstructing air flow through the condenser fins, and missing or improperly installed air seals. Clean, repair, or replace components as required.
	2. Refrigerant flow through the receiver/drier is restricted.	2. See Receiver/Drier in this group. Replace the restricted receiver/drier, if required.
	3. Inoperative radiator cooling fan.	3. Test the radiator cooling fan and replace, if required. Refer to Group 7 - Cooling.
	4. Refrigerant system overcharged.	4. See Refrigerant System Charge in this group. Recover the refrigerant from the refrigerant system. Charge the refrigerant system to the proper level, if required.
	5. Air in the refrigerant system.	5. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	6. Engine overheating.	6. Test the engine cooling system and repair, if required. Refer to Group 7 - Cooling.
The low side pressure is too high, and the high side pressure is too low.	1. Accessory drive belt slipping.	1. Inspect the accessory drive belt condition and tension. Repair as required. Refer to Group 7 - Cooling.
	2. Faulty A/C orifice valve.	2. See A/C Orifice Valve in this group. Replace the valve, if required.
	3. Faulty A/C compressor.	3. See A/C Compressor in this group. Replace the A/C compressor, if required.
The low side pressure is too low, and the high side pressure is too high.	1. Restricted refrigerant flow through the refrigerant lines.	1. See Liquid Line, Suction Line and Discharge Line in this group. Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line, if required.
	2. Restricted refrigerant flow through the A/C orifice valve.	2. See A/C Orifice Valve in this group. Replace the valve, if required.
	3. Restricted refrigerant flow through the A/C condenser.	3. See A/C Condenser in this group. Replace the restricted A/C condenser, if required.

HEATER PERFORMANCE

Before performing the following tests, refer to Group 7 - Cooling for the procedures to check the engine coolant level and flow, engine coolant reserve/recovery system operation, accessory drive belt condition and tension, radiator air flow and the fan drive operation. Perform the A/C System Performance Test, which is found within the HVAC System Test (refer to 24 - HVAC Electrical Diagnostics). If any diagnostic trouble codes (DTCs) are found in the A/C-heater control or the powertrain control module (PCM), repair as necessary.

MAXIMUM HEATER OUTPUT

Engine coolant is delivered to the heater core through two heater hoses. With the engine idling at normal operating temperature, set the temperature control to the full hot position, the mode control to the floor position, and the blower motor control to the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the front floor outlets. Compare the test thermometer reading to the Heater Temperature Reference chart.

HEATER TEMPERATURE REFERENCE

Ambient Air Temperature	15.5° C (60° F)	21.1° C (70° F)	26.6° C (80° F)	32.2° C (90° F)
Minimum Heater System Air Outlet Temperature	52.2° C (126° F)	56.1° C (133° F)	59.4° C (139° F)	62.2° C (144° F)

If the heater outlet air temperature is below the minimum specification, refer to Group 7 - Cooling. Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system. Refer to Group 7 - Cooling for more information.

OBSTRUCTED COOLANT FLOW

Possible locations or causes of obstructed coolant flow are as follows:

- Faulty water pump.
- Faulty thermostat.
- Pinched or kinked heater hoses.
- Improper heater hose routing.
- Plugged heater hoses or supply and return ports at the cooling system connections.
- Plugged heater core.

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is low, a mechanical problem may exist.

MECHANICAL PROBLEMS

Possible locations or causes of insufficient heat due to mechanical problems are as follows:

- Obstructed cowl air intake.
- Obstructed heater system outlets.
- Blend-air door(s) or actuator(s) not functioning properly.
- Faulty blower motor system
- Faulty A/C-heater control

TEMPERATURE CONTROL

If the heater outlet air temperature cannot be adjusted with the temperature control on the A/C-heater control, the following could require service:

- Faulty A/C-heater control.
- Faulty blend door actuator(s).
- Faulty, obstructed or improperly installed blend-air door.
- Faulty related wiring harness or connectors.
- Improper engine coolant temperature.

SPECIFICATIONS**A/C SYSTEM**

Item	Description	Notes
A/C Compressor	Denso 10S17	ND-8 PAG oil
Freeze-up Control	Evaporator Temperature Sensor	HVAC housing mounted
Low psi Control	A/C Pressure Transducer	Discharge line mounted - opens below 110 kPa (16 psi), closes above 220 kPa (32 psi)
High psi Control	A/C Pressure Transducer	Discharge line mounted - opens above 3219 kPa (476 psi), closed below 2937 kPa (426 psi)
Refrigerant Charge Capacity	Refer to the A/C Underhood Specification Label located in the engine compartment	R-134a refrigerant
A/C Clutch Coil Draw	3.3 amps	@ 12V \pm 0.5V @ 21° C (70° F)
A/C Clutch Coil Resistance	3.6 \pm 0.2 ohms	When measured across coil lead connector
A/C Clutch Air Gap	0.35 - 0.60 mm (0.014 - 0.024 in.)	

SPECIAL TOOLS

HEATING-A/C SYSTEM

Snap Ring Pliers C-4574 are required to service the A/C clutch and field coil.

ACTUATOR-BLEND DOOR

DESCRIPTION

The blend door actuators (1) are reversible, 12 volt direct current (DC), servo motors. Models equipped with the MTC single zone heating-A/C system have a single blend-air door, which is controlled by a single blend door actuator. Models with the ATC dual zone heating-A/C system have two blend-air doors, which are controlled by two blend door actuators.

The blend door actuator for the single zone heating-A/C system is located on the driver side end of the HVAC air distribution housing, close to the dash panel.

For the dual zone heating-A/C system, the same blend door actuator used for the single zone system becomes the driver side blend door actuator, which is mechanically connected to only the driver side blend-air door. A second separate blend door actuator is also located on the passenger side of the HVAC air distribution housing which is mechanically connected to only the passenger side blend-air door.

The blend door actuators are interchangeable with each other, as well as with the actuators for the mode-air door and the recirculation-air door. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle (2). Each actuator also has an identical output shaft with splines (3) that connects it to its respective door linkage and three integral mounting tabs (4) that allow the actuator to be secured to the HVAC housing. The blend door actuators do not require mechanical indexing to the blend-air doors, as they are electronically calibrated by the A/C-heater control.

OPERATION

The blend door actuators are connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness. The blend door actuator(s) can move the blend-air door(s) in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the blend-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the blend-air door moves in the opposite direction.

When the A/C-heater control makes the voltage to both connections high or both connections low, the blend-air door(s) stops and will not move. The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the blend door actuators and the blend-air doors. The A/C-heater control learns the blend-air doors stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the blend door actuator circuits.

Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - HEATING AND A/C SYSTEMS and to 24 - HVAC Electrical Diagnostics for more information.

The blend door actuator(s) cannot be adjusted or repaired and, if faulty or damaged, they must be replaced.

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: The single zone heater-A/C system is equipped with a single blend door actuator. The dual zone system has two blend door actuators, one for the driver side blend-air door and one for the passenger side blend-air door.

SINGLE ZONE/DUAL ZONE DRIVER SIDE

1. Disconnect and isolate the negative battery cable.
2. Remove the instrument panel silencer from the driver side of the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - REMOVAL).
3. Remove the three screws (1) that secure the blend door actuator (2) to the driver side of the HVAC air distribution housing (3).
4. Remove the blend door actuator from the air distribution housing and disconnect the HVAC wire harness connector (4) from the actuator.
5. Remove the blend door actuator from the vehicle.

DUAL ZONE PASSENGER SIDE

1. Disconnect and isolate the negative battery cable.
2. Remove the glove box from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).
3. Remove the three screws (1) that secure the blend door actuator (2) to the passenger side of the HVAC air distribution housing (3).
4. Remove the blend door actuator from the air distribution housing and disconnect the HVAC wire harness connector (4) from the actuator.
5. Remove the blend door actuator from the vehicle.

INSTALLATION

NOTE: The single zone heater-A/C system is equipped with a single blend door actuator. The dual zone system has two blend door actuators, one for the driver side blend-air door and one for the passenger side blend-air door.

SINGLE ZONE/DUAL ZONE DRIVER SIDE

1. Position the blend door actuator (1) into the vehicle.
2. Install the blend door actuator onto the driver side of the HVAC air distribution housing (2). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft (3) with those on the blend door cam (4).

3. Install the screws (1) that secure the blend door actuator (2) to the driver side of the air distribution housing (3). Tighten the screws to 2 N·m (17 in. lbs.).
4. Connect the HVAC wire harness connector (4) to the blend door actuator.
5. Install the instrument panel silencer onto the driver side of the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - INSTALLATION).
6. Reconnect the negative battery cable.

DUAL ZONE PASSENGER SIDE

1. Position the blend door actuator (1) into the vehicle.
2. Install the blend door actuator onto the passenger side of the HVAC air distribution housing (2). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft (3) with those on the blend door cam (4).

3. Install the screws (1) that secure the blend door actuator (2) to the passenger side of the air distribution housing (3). Tighten the screws to 2 N-m (17 in. lbs.).
4. Connect the HVAC wire harness connector (4) to the blend door actuator.
5. Install the glove box into the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).
6. Reconnect the negative battery cable.

ACTUATOR-MODE DOOR

DESCRIPTION

This vehicle uses two mode door actuators (1) which are reversible, 12-volt direct current (DC), servo motors. The mode door actuator for the panel/defrost/demist/floor air doors is located on the driver side end of the HVAC air distribution housing. The mode door actuator for the rear floor/console air door is located on the rear of the air distribution housing near the front of the floor console area. The mode door actuators are mechanically connected to the mode-air doors.

The mode door actuator is interchangeable with the actuators for the blend-air door(s) and the recirculation-air door. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle (2). Each actuator also has an identical output shaft with splines (3) that connects it to its door linkage and three integral mounting tabs (4) that allow the actuator to be secured to the HVAC housing. The mode door actuator does not require mechanical indexing to the mode-air doors, as it is electronically calibrated by the A/C-heater control.

OPERATION

The two mode door actuators are connected to the A/C-heater control through the vehicle electrical system by dedicated two-wire leads and connectors of the HVAC wire harness. The mode door actuators can move the panel/defrost/demist/floor air doors in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the mode-air doors will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the mode-air doors moves in the opposite direction.

When the A/C-heater control makes the voltage to both connections high or both connections low, the mode-air door stops and will not move. The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the mode door actuators and the mode-air doors. The A/C-heater control learns the mode-air doors stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the mode door actuator circuits.

Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING and to 24 - HVAC Electrical Diagnostics for more information.

The mode door actuators cannot be adjusted or repaired and, if faulty or damaged, they must be replaced.

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: The heater-A/C system is equipped with two mode door actuators. One for the air doors for the outlets in the instrument panel and one for the air door for the rear seat/console outlets.

PANEL/DEFROST/DEMIST/FLOOR

1. Disconnect and isolate the negative battery cable.
2. Remove the instrument panel silencer from the driver side of the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - REMOVAL).
3. Remove the three screws (1) that secure the mode door actuator (2) to the driver side of the HVAC air distribution housing (3).
4. Remove the mode door actuator from the air distribution housing and disconnect the HVAC wire harness connector (4) from the actuator.
5. Remove the mode door actuator from the vehicle.

**REAR FLOOR/CONSOLE**

1. Disconnect and isolate the negative battery cable.
2. Remove the instrument panel from the vehicle (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
3. Remove the two screws (1) that secure the mode door actuator (2) to the rear of the HVAC air distribution housing (3).
4. Remove the mode door actuator from the air distribution housing and disconnect the HVAC wire harness connector (4) from the actuator.
5. Remove the mode door actuator from the vehicle.

INSTALLATION

PANEL/DEFROST/DEMIST/FLOOR

1. Position the mode door actuator (1) into the vehicle.
2. Install the mode door actuator onto the driver side of the HVAC air distribution housing (2). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft (3) with those on the mode door cam (4).

3. Install the screws (1) that secure the mode door actuator (2) to the driver side of the air distribution housing (3). Tighten the screws to 2 N·m (17 in. lbs.).
4. Connect the HVAC wire harness connector (4) to the mode door actuator.
5. Install the instrument panel silencer onto the driver side of the instrument panel (Refer to 23 - BODY/ INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - INSTALLATION).
6. Reconnect the negative battery cable.

REAR FLOOR/CONSOLE

1. Position the mode door actuator (1) into the vehicle.
2. Install the mode door actuator onto the rear of the HVAC air distribution housing (2). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft (3) with those on the pivot shaft of the rear floor/console air door (4).

3. Install the two screws (1) that secure the mode door actuator (2) to the rear of the air distribution housing (3). Tighten the screws to 2 N-m (17 in. lbs.).
4. Connect the HVAC wire harness connector (4) to the mode door actuator.
5. Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).
6. Reconnect the negative battery cable.

ACTUATOR-RECIRCULATION DOOR

DESCRIPTION

The recirculation door actuator (1) is a reversible, 12 volt direct current (DC), servo motor. The recirculation door actuator is located on the left side of the HVAC air inlet housing and is directly connected to the pivot shaft of the recirculation-air door.

The recirculation door actuator is interchangeable with the actuators for the blend-air door(s) and the mode-air doors. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle (2). Each actuator also has an identical output shaft with splines (3) that connects it to its door linkage and three integral mounting tabs (4) that allow the actuator to be secured to the air inlet housing. The recirculation door actuator does not require mechanical indexing to the recirculation-air door, as it is electronically calibrated by the A/C-heater control.

OPERATION

The recirculation door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness. The recirculation door actuator can move the recirculation-air door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the recirculation-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the recirculation-air door moves in the opposite direction.

When the A/C-heater control makes the voltage to both connections high or both connections low, the recirculation-air door stops and will not move. The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the recirculation door actuator and the recirculation-air door. The A/C-heater control learns the recirculation-air door stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the recirculation door actuator circuits.

Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - HEATING AND A/C SYSTEMS and to 24 - HVAC Electrical Diagnostics for more information.

The recirculation door actuator cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

1. Disconnect and isolate the negative battery cable.
2. Remove the glove box from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - REMOVAL).
3. Remove the two screws (1) that secure the recirculation door actuator (2) to the left side of the HVAC air inlet housing (3).
4. Remove the recirculation door actuator from the air inlet housing and disconnect the HVAC wire harness connector (4) from the actuator.
5. Remove the recirculation door actuator from the vehicle.

INSTALLATION

1. Position the recirculation door actuator (1) into the vehicle.
2. Install the recirculation door actuator onto the left side of the HVAC air inlet housing (2). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft (3) with those on the recirculation door pivot shaft (4).

3. Install the three screws (1) that secure the recirculation door actuator (2) to the left side of the HVAC air inlet housing (3). Tighten the screws to 2 N·m (17 in. lbs.).
4. Connect the HVAC wire harness connector (4) to the recirculation door actuator.
5. Install the glove box into the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - INSTALLATION).
6. Reconnect the negative battery cable.

CLUTCH-A/C COMPRESSOR

DESCRIPTION

The A/C compressor clutch assembly consists of a stationary electromagnetic A/C clutch field coil (4), pulley bearing and pulley assembly (3), clutch plate (2) and shims (7). These components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt.

The A/C clutch field coil and the pulley bearing and pulley assembly are both retained on the nose of the A/C compressor with snap rings (5 and 6). The clutch plate is splined to the compressor shaft and secured with a bolt (1).

OPERATION

The A/C compressor clutch components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt. When the electromagnetic A/C clutch field coil is energized, it magnetically draws the clutch plate into contact with the clutch pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley assembly.

A/C compressor clutch engagement is controlled by the powertrain control module (PCM) or the engine control module (ECM), depending on engine application.

The A/C compressor clutch components cannot be repaired and, if faulty or damaged, they must be replaced.

DIAGNOSIS AND TESTING

A/C COMPRESSOR CLUTCH COIL

The A/C compressor clutch coil electrical circuit is controlled by the powertrain control module (PCM) through the A/C clutch relay. The A/C clutch coil can be tested by either measuring clutch field coil resistance or by measuring current draw. Begin testing of a suspected compressor clutch coil problem by performing the preliminary checks.

PRELIMINARY CHECKS

1. If the A/C compressor clutch will not engage, refer to 24 - HVAC Electrical Diagnostics to perform the A/C System Performance Test, which is found within the HVAC System Test. If no diagnostic trouble codes (DTCs) are found in the A/C-heater control or the powertrain control module (PCM), go to Step 2. If any DTCs are found, repair as required.
2. If the A/C compressor clutch still will not engage, verify the refrigerant charge level (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS). If the refrigerant charge level is OK, go to COIL RESISTANCE TEST and/or COIL CURRENT DRAW TEST . If the refrigerant charge level is not OK, adjust the refrigerant charge as required.

COIL RESISTANCE TEST

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the A/C clutch field coil lead connector.
3. Use an ohm meter and measure the resistance of the clutch coil at the coil lead connector terminals.
4. Refer to the A/C Clutch Coil Specifications chart for the acceptable A/C clutch coil resistance. Specifications apply for a work area temperature of 21° C (70° F).
 - a. If the A/C clutch coil reading is below specifications, the coil is shorted and must be replaced.
 - b. If the A/C clutch coil reading is above specifications, the coil is open and must be replaced.

COIL CURRENT DRAW TEST

1. Verify the battery state of charge (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - DIAGNOSIS AND TESTING).
2. Connect an ammeter (0 to 10 ampere scale selected) in series with the clutch coil feed terminal. Connect a voltmeter (0 to 20 volt scale selected) to measure voltage across the battery and the clutch coil.
3. With the A/C-heater control in the A/C mode and the blower motor at low speed, start the engine and allow it to run at a normal idle speed.
4. The A/C compressor clutch should engage immediately, and the clutch coil supply voltage should be within two volts of the battery voltage. If the coil supply voltage is OK, go to Step 5. If the coil supply voltage is not within two volts of battery voltage, test the clutch coil feed circuit for excessive voltage drop and repair as necessary.
5. Refer to the A/C Clutch Coil Specifications chart for the acceptable A/C clutch coil current draw. Specifications apply for a work area temperature of 21° C (70° F). If voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until voltage reads below 12.5 volts.
 - a. If the A/C clutch coil current reading is zero, the coil is open and must be replaced.
 - b. If the A/C clutch coil current reading is above specifications, the coil is shorted and must be replaced.

A/C CLUTCH COIL SPECIFICATIONS

Compressor	Current Draw	Coil Resistance
Denso 10S17	3.3 amps @ 11.5 - 12.5 volts	3.6 ± 0.2 ohms

STANDARD PROCEDURE

A/C CLUTCH PLATE INSPECTION

NOTE: The A/C clutch can be serviced in the vehicle. The refrigerant system can remain fully-charged during compressor clutch, pulley and bearing assembly, or coil replacement.

Examine the friction surfaces of the pulley and the clutch plate (2) for wear. The pulley and clutch plate should be replaced if there is excessive wear or scoring.

If the friction surfaces are oily, inspect the shaft and nose area of the A/C compressor (1) for refrigerant oil. If refrigerant oil is found, the compressor shaft seal is leaking and the A/C compressor must be replaced.

Check the pulley bearing for roughness or excessive leakage of grease. Replace the pulley and bearing assembly, if required.

A/C CLUTCH BREAK-IN

After a new A/C compressor clutch has been installed, cycle the compressor clutch approximately twenty times (five seconds on, then five seconds off). During this procedure, set the A/C-heater controls to the A/C Recirculation Mode, the blower motor in the highest speed position, and the engine speed at 1500 to 2000 rpm. This procedure (burnishing) will seat the opposing friction surfaces and provide a higher compressor clutch torque capability.

REMOVAL

NOTE: The A/C compressor clutch can be serviced in the vehicle. The refrigerant system can remain fully-charged during compressor clutch, pulley and bearing assembly, or coil replacement.

1. Disconnect and isolate the negative battery cable.
2. Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - REMOVAL).
3. Disconnect the engine wire harness connector for the A/C compressor clutch coil from the clutch field coil wire harness connector on the top of the A/C compressor.
4. Remove the bolts that secure the A/C compressor to the engine and support the A/C compressor.
5. Remove the compressor shaft bolt (1). A band-type oil filter wrench or a strap wrench may be used to secure the clutch plate (2) during bolt removal.

CAUTION: Do not pry between the clutch plate and the pulley and bearing assembly to remove the clutch plate from the compressor shaft as this may damage the clutch plate.

NOTE: Use care not to lose any clutch shim(s) during removal of the clutch plate, as they may be reused during the clutch plate installation process.

6. Tap the clutch plate (2) lightly with a plastic mallet to release it from the splines on the compressor shaft (1). Remove the clutch plate and shim(s) (3) from the compressor shaft.

7. Using snap ring pliers (Special Tool C-4574 or equivalent) (2), remove the external snap ring (1) that secures the pulley and bearing assembly (3) to the front cover of the A/C compressor, then slide the pulley and bearing assembly off of the A/C compressor.

8. Remove the screw that secures the clutch coil pigtail wire connector bracket and ground clip to the top of the compressor housing (3).
9. Using snap ring pliers (Special Tool C-4574 or equivalent) (1), remove the external snap ring (4) that secures the clutch field coil (2) to the front cover of the compressor housing, then slide the clutch field coil off of the A/C compressor.

INSTALLATION

1. Align the dowel pin on the back of the clutch field coil (2) with the hole in the compressor front cover (3) and position the clutch field coil onto the A/C compressor. Be certain that the clutch coil wire harness is properly oriented and routed so that it is not pinched between the compressor front cover and the clutch field coil.

CAUTION: The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.

NOTE: A new snap ring must be used to secure the clutch field coil to the A/C compressor. The bevel side of the snap ring must face outward and both snap ring eyelets must be oriented to the right or to the left of the clutch field coil dowel pin location on the A/C compressor.

2. Using snap ring pliers (Special Tool C-4574 or equivalent) (1), install the external snap ring (4) that secures the clutch field coil to the front cover of the A/C compressor. Be certain that the snap ring is fully and properly seated in the groove and oriented correctly.
3. Install the screw that secures the clutch field coil wire harness connector bracket and ground clip to the top of the compressor housing. Tighten the screw securely.

CAUTION: When installing the pulley and bearing assembly, **DO NOT** mar the friction surfaces of the pulley or premature failure of the clutch will result.

4. Install the pulley and bearing assembly (1) onto the front cover of the A/C compressor. If necessary, tap the pulley gently with a block of wood (2) placed on the pulley friction surface.

CAUTION: The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.

NOTE: A new snap ring must be used to secure the pulley and bearing assembly to the A/C compressor. The bevel side of the snap ring must face outward.

- Using snap ring pliers (Special Tool C-4574 or equivalent) (2), install the external snap ring (1) that secures the pulley and bearing assembly (3) to the front cover of the A/C compressor. Be certain that the snap ring is fully and properly seated in the groove.

- If the original clutch plate (2) and pulley and bearing assembly are to be reused, reinstall the original shim(s) (3) on the compressor shaft (1) against the shoulder. If a new clutch plate and/or pulley and bearing assembly are being used, install a trial stack of shims 2.54 mm (0.010 in.) thick on the compressor shaft against the shoulder.

7. Install the clutch plate (2) onto the compressor shaft.
8. Install the compressor shaft bolt (1). Tighten the bolt to 19 N·m (168 in. lbs.).

NOTE: The shims may compress after tightening the shaft bolt. Check the air gap in four or more places to verify the air gap is correct. Spin the pulley before performing a final check of the air gap.

9. With the clutch plate assembled tight against the shim(s), measure the air gap between the clutch plate and the pulley and bearing assembly faces with a feeler gauge. The air gap should be between specifications (Refer to 24 - HEATING & AIR CONDITIONING - SPECIFICATIONS). If the proper air gap is not obtained, add or subtract shims as needed until the desired air gap is obtained.
10. Install the bolts that secure the A/C compressor to the engine (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR-A/C - INSTALLATION).

11. Connect the engine wire harness connector to the A/C compressor clutch coil.
12. Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - INSTALLATION).
13. Reconnect the negative battery cable.

CONTROL-A/C-HEATER

DESCRIPTION

MANUAL SINGLE ZONE

The A/C-heater control (1) for the manual temperature control (MTC) single zone heating-A/C system allows one temperature setting for the entire vehicle. All controls are identified by ISO graphic symbols.

The A/C-heater control and integral computer is located in the instrument panel and contains:

- a rotary control knob for temperature control of the discharged air (2).
- a rotary control knob for recirculation and mode control of the discharged air (3).
- a push button rear window defogger on/off control (4). The defogger button contains an LED that illuminates when the rear window defogger system is in operation.
- a push button A/C on/off control (5). The Snowflake button contains an LED that illuminates when the A/C system is in operation.
- a rotary control knob for fan speed selection and turning the heating-A/C system off (6).

Prior to replacing an A/C-heater control, check for any diagnostic trouble codes (DTCs) related to the heating-A/C system and run the calibration procedure to verify that the concern is not a system issue. Refer to 24 - HEATING

& AIR CONDITIONING - DIAGNOSIS AND TESTING - HEATING AND A/C SYSTEMS and to 24 - HVAC Electrical Diagnostics for more information.

The A/C-heater control cannot be repaired and, if faulty or damaged, it must be replaced.

AUTOMATIC DUAL ZONE

The A/C-heater control (1) for the automatic temperature control (ATC) dual zone heating-A/C system allows both the driver and the front seat passenger the ability to individually regulate air temperature for their side of the vehicle. All controls are identified by ISO graphic symbols.

The ATC A/C-heater control and integral computer is located in the instrument panel and contains:

- a push button A/C on/off control (2). The Snowflake button contains an LED that illuminates when the A/C system is in operation.
- a push button rear window defogger on/off control (3). The defogger button contains an LED that illuminates when the rear window defogger system is in operation.
- an infrared sensor (4) that detects thermal radiation emitted by the front seat occupants and their surroundings
- a push button air recirculation control (5). The Recirculation button contains an LED that illuminates when the recirculation function is manually activated.
- a rotary control knob for mode control of the discharged air (6).
- two rotary control knobs for individual driver and front seat passenger temperature control of the discharged air (7).
- a rotary control knob for manual and automatic fan speed selection and turning the heating-A/C system off (8).
- Auto mode provides variable air recirculation under high temperature and humidity conditions. Because recirculation is generally accompanied by increased fan noise, the proportion of recirculated to outside air gradually approaches full recirculation over a broad temperature range.

812b3774

The A/C-heater control for the ATC dual zone heating-A/C system is diagnosed using a scan tool. Prior to replacing an A/C-heater control, check for any diagnostic trouble codes (DTCs) related to the heating-A/C system and run the calibration procedure to verify that the concern is not a system issue. Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - HEATING AND A/C SYSTEMS and to 24 - HVAC Electrical Diagnostics for more information.

The A/C-heater control cannot be repaired and, if faulty or damaged, it must be replaced.

The ATC A/C-heater control utilizes integrated circuitry and information carried on the controller area network (CAN) B bus to monitor many sensors and switch inputs throughout the vehicle. In response to those inputs, the internal circuitry and programming of the ATC A/C-heater control allows it to control electronic functions and features of the ATC heating-A/C system.

Some of the inputs received by the A/C-heater control of the ATC heating-A/C system on the CAN B bus are as follows:

- Controlhead backlight dimming
- Refrigerant Pressure
- A/C Clutch Engage
- Vehicle Identification Number
- Vehicle Odometer
- Engine Coolant Temperature
- Ambient Air Temperature
- System Voltage

- Vehicle Speed
- Engine Speed

Some of the messages broadcasted by the A/C-heater control of the ATC heating-A/C system on the CAN B bus are as follows:

- A/C Request
- A/C Select
- EBL Status

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

1. Disconnect and isolate the negative battery cable.
2. Remove the center bezel (1) from the instrument panel and place it on a workbench (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).
3. Remove the screws (2) that secure the electronic vehicle information center (EVIC) control (3) and the A/C-heater control (4) to the center bezel and remove the controls.

INSTALLATION

1. Position the A/C-heater control (4) and the electronic vehicle information center (EVIC) control (3) into the instrument panel center bezel (1).
2. Install the screws (2) that secure the A/C-heater control and the EVIC control to the center bezel. Tighten the screws to 2 N·m (17 in. lbs.).
3. Install the center bezel onto the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).
4. Reconnect the negative battery cable.

MODULE-POWER-BLOWER MOTOR

DESCRIPTION

A blower motor power module is used on this model when it is equipped with the automatic temperature control (ATC) heating-A/C system. Models equipped with the manual temperature control (MTC) heating-A/C system use a blower motor resistor, instead of the blower motor power module (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/RESISTOR-BLOWER MOTOR - DESCRIPTION).

The blower motor power module is mounted to the rear of the HVAC housing, directly behind the glove box. The blower motor power module consists of a molded plastic mounting plate with two integral connector receptacles (1). Concealed behind the mounting plate is the power module electronic circuitry and a large finned heat sink (2). The blower motor power module is accessed for service by removing the glove box.

OPERATION

The blower motor power module is connected to the vehicle electrical system through a dedicated lead and connector of the HVAC wire harness. A second connector receptacle receives the wire harness connector from the blower motor. The blower motor power module allows the microprocessor-based automatic temperature control (ATC) A/C-heater control to calculate and provide infinitely variable blower motor speeds based upon either manual blower switch input or the ATC programming using a pulse width modulated (PWM) circuit strategy.

The PWM voltage is applied to a comparator circuit which compares the PWM signal voltage to the blower motor feedback voltage. The resulting output drives the power module circuitry, which provides a linear output voltage to change or maintain the desired blower speed.

The blower motor power module can be diagnosed using a scan tool.

The blower motor power module cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

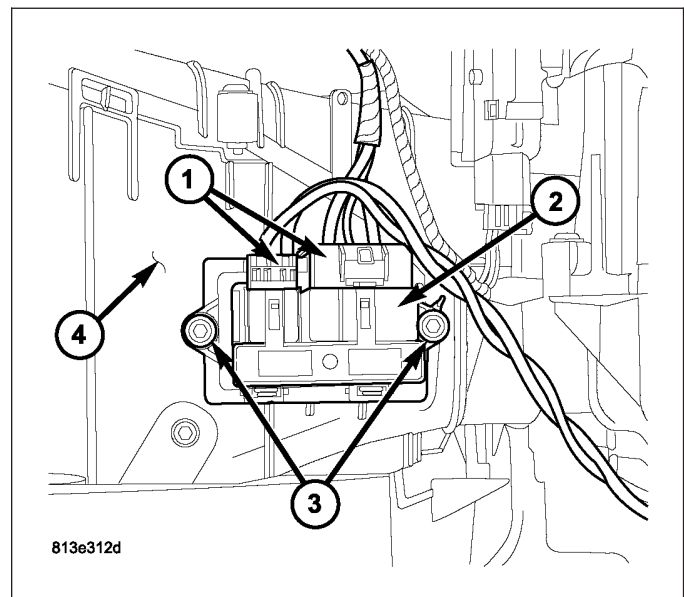

WARNING: The heat sink for the blower motor power module may get very hot during normal operation. If the blower motor was turned on prior to servicing the blower motor power module, wait five minutes to allow the heat sink to cool before performing diagnosis or service. Failure to take this precaution can result in possible personal injury.

1. Disconnect and isolate the negative battery cable.
2. Remove the glove box from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - REMOVAL).
3. Disconnect the two wire harness connectors (1) from the blower motor power module (2).
4. Remove the two screws (3) that secure the blower motor power module to the HVAC housing (4).
5. Remove the blower motor power module from the HVAC housing.

INSTALLATION

1. Position the blower motor power module (2) into the HVAC housing (4).
2. Install the two screws (3) that secure the blower motor power module to the HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).
3. Connect the two wire harness connectors (1) to the blower motor power module.
4. Install the glove box into the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - INSTALLATION).
5. Reconnect the negative battery cable.

RELAY-A/C CLUTCH

DESCRIPTION

The A/C clutch relay (1) is a International Standards Organization (ISO) micro-relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns (2). The ISO micro-relay terminal functions are the same as a conventional ISO relay. However, the ISO micro-relay terminal pattern (or footprint) is different, the current capacity is lower, and the physical dimensions are smaller than those of the conventional ISO relay.

The A/C clutch relay is located in the power distribution center (PDC) in the engine compartment.

OPERATION

The ISO-standard A/C clutch micro-relay is an electromechanical switch that uses a low current input controlled by the powertrain control module (PCM) to control the high current output to the A/C clutch field coil. The movable, common feed relay contact is held against the fixed, normally closed relay contact by spring pressure. When the electromagnetic relay coil is energized, it draws the movable common feed relay contact away from the fixed, normally closed relay contact and, holds it against the fixed, normally open relay contact. This action allows high current to flow to the A/C clutch field coil.

When the relay coil is de-energized, spring pressure returns the movable relay contact back against the fixed, normally closed contact point. The resistor or diode is connected in parallel with the relay coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The A/C clutch relay terminals are connected to the vehicle electrical system through a receptacle in the power distribution center (PDC). The inputs and outputs of the A/C clutch relay include:

- Terminal (30) receives fused battery current at all times.
- Terminal (85) receives a ground through the A/C clutch relay control circuit only when the PCM electronically pulls the circuit to ground.
- Terminal (86) receives fused battery current through a ignition switch output circuit only when the ignition switch is in the Run or Start positions.
- Terminal (87) provides battery current to the A/C clutch coil through the A/C clutch relay output circuit only when the A/C clutch relay coil is energized.
- Terminal (87A) is not connected to any circuit in this application, but provides a battery current output only when the A/C clutch relay coil is de-energized.

The A/C clutch relay cannot be repaired and, if faulty or damaged, it must be replaced. Refer to the appropriate wiring information for diagnosis and testing of the ISO-standard micro-relay and for complete HVAC wiring diagrams.

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Open the cover of the power distribution center (PDC) (1) located in the engine compartment.

NOTE: Refer to the fuse and relay layout map on the inside of the PDC cover for A/C clutch relay location.

3. Remove the A/C clutch relay (2) from the PDC.

INSTALLATION

NOTE: Refer to the fuse and relay layout map on the inside of the power distribution center (PDC) cover for A/C clutch relay location.

1. Position the A/C clutch relay (2) into the receptacle of the PDC (1).
2. Align the A/C clutch relay terminals with the terminal cavities in the PDC receptacle and push down firmly on the relay until the terminals are fully seated.
3. Close the cover of the PDC.
4. Reconnect the negative battery cable.

RELAY-BLOWER MOTOR

DESCRIPTION

The blower motor relay (1) for the heating-A/C system is a International Standards Organization (ISO)-type relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns. The blower motor relay is a electromechanical device that switches battery current through a fuse in the power distribution center (PDC) directly to the blower motor when equipped with the manual temperature control (MTC) system, or to the blower motor power module when equipped with the automatic temperature control (ATC) system. The blower motor relay is energized when the relay coil is provided battery current by the ignition switch.

The blower motor relay is located in the PDC in the engine compartment.

OPERATION

The ISO-standard blower motor relay is an electromechanical switch that uses a low current input from the ignition switch to control the high current output to the blower motor. The movable, common feed relay contact is held against the fixed, normally closed relay contact by spring pressure. When the electromagnetic relay coil is energized, it draws the movable common feed relay contact away from the fixed, normally closed relay contact and, holds it against the fixed, normally open relay contact. This action allows high current to flow to the blower motor.

When the relay coil is de-energized, spring pressure returns the movable relay contact back against the fixed, normally closed contact point. The resistor or diode is connected in parallel with the relay coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The blower motor relay terminals are connected to the vehicle electrical system through a receptacle in the power distribution center (PDC). The inputs and outputs of the blower motor relay include:

- Terminal (30) receives fused battery current at all times.
- Terminal (85) is connected to a ground circuit at all times.
- Terminal (86) receives fused battery current through the run relay only when the run relay coil is energized.
- Terminal (87) provides fused battery current to the blower motor through the blower motor relay only when the blower motor relay coil is energized.
- Terminal (87A) is not connected to any circuit in this application, but provides a battery current output only when the blower motor relay coil is de-energized.

The blower motor relay cannot be repaired and, if faulty or damaged, it must be replaced. Refer to the appropriate wiring information for diagnosis and testing of the ISO-standard relay and for complete HVAC wiring diagrams.

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Open the cover of the power distribution center (PDC) (1) located in the engine compartment.

NOTE: Refer to the fuse and relay layout map on the PDC cover for blower motor relay location.

3. Remove the blower motor relay (2) from the PDC.

INSTALLATION

NOTE: Refer to the fuse and relay map on the cover of the power distribution center (PDC) for blower motor relay location.

1. Position the blower motor relay (2) into the proper receptacle of the PDC (1).
2. Align the blower motor relay terminals with the terminal cavities in the PDC receptacle and push down firmly on the relay until the terminals are fully seated.
3. Close the cover of the PDC.
4. Reconnect the negative battery cable.

RESISTOR-BLOWER MOTOR

DESCRIPTION

A blower motor resistor is used on vehicles equipped with the manual temperature control (MTC) heating-A/C system. Vehicles equipped with the automatic temperature control (ATC) heating-A/C system use a blower motor power module, instead of the blower motor resistor (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/MODULE-POWER-BLOWER MOTOR - DESCRIPTION).

The blower motor resistor is mounted to the rear of the HVAC housing, directly behind the glove box. The blower motor resistor consists of a molded plastic mounting plate (1) with an integral wire connector receptacle (2). Concealed behind the mounting plate are coiled resistor wires contained within a ceramic heat sink (3).

The blower motor resistor is accessed for service by removing the glove box.

OPERATION

The blower motor resistor is connected to the vehicle electrical system through a dedicated wire lead and connector of the HVAC wire harness. The blower motor resistor has multiple resistor wires, each of which will reduce the current flow through the blower motor to change the blower motor speed.

The blower motor control in the MTC heating-A/C system directs the ground path for the blower motor through the correct resistor wire to obtain the selected speed. With the blower motor control in the lowest speed position, the ground path for the blower motor is applied through all of the resistor wires. Each higher speed selected with the blower motor control applies the blower motor ground path through fewer of the resistor wires, increasing the blower motor speed.

The blower motor resistor cannot be adjusted or repaired and, if faulty or damaged (such as a cracked ceramic heat sink), it must be replaced.

DIAGNOSIS AND TESTING

BLOWER MOTOR RESISTOR

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the blower motor resistor (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/RESISTOR-BLOWER MOTOR - REMOVAL).

- Using an ohmmeter, check for continuity between all of the blower motor resistor terminals. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor switch and the blower motor resistor or blower motor as required. If not OK, replace the faulty blower motor resistor.

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

WARNING: The blower motor resistor may get very hot during normal operation. If the blower motor was turned on prior to servicing the blower motor resistor, wait five minutes to allow the blower motor resistors to cool before performing diagnosis or service. Failure to take this precaution can result in possible personal injury.

CAUTION: Do not operate the blower motor with the blower motor resistor removed from the circuit. Failure to take this precaution can result in vehicle damage.

- Disconnect and isolate the negative battery cable.
- Remove the glove box from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - REMOVAL).
- Disengage the wire harness connector locking tab (1) and disconnect the wire harness connector (2) from the blower motor resistor (3).
- Remove the two screws (4) that secure the blower motor resistor to the HVAC housing (5).
- Remove the blower motor resistor from the HVAC housing.

INSTALLATION

1. Position the blower motor resistor (3) into the HVAC housing (5).
2. Install the two screws (4) that secure the blower motor resistor to the HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).
3. Connect the wire harness connector (2) to the blower motor resistor and engage the wire harness connector locking tab (1).
4. Install the glove box into the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - INSTALLATION).
5. Reconnect the negative battery cable.

SENSOR-AMBIENT AIR TEMPERATURE

DESCRIPTION

The ambient air temperature sensor is a variable resistor that monitors the air temperature outside of the vehicle. The ATC system uses the sensor data to maintain optimum cabin temperature levels. The ambient air temperature sensor is mounted onto the top of the front bumper beam.

OPERATION

The ambient air temperature sensor is a variable resistor that operates on a 5-volt reference signal sent by the front control module (FCM). The ambient air temperature sensor is connected to the FCM through a two-wire lead and connector of the vehicle wire harness. The ambient air temperature sensor changes its internal resistance in response to changes in the outside air temperature, which either increases or decreases the reference signal voltage read by the FCM. The FCM converts and broadcasts the sensor data over the controller area network (CAN) B bus, where it is read by the ATC A/C-heater control and other vehicle control modules.

The ambient air temperature sensor is diagnosed using the scan tool. Refer to 9 - Engine Electrical Diagnostics for more information.

The ambient air temperature sensor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the grille (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
3. Disconnect the wire harness connector (1) from the ambient air temperature sensor (2) located at the top of the front bumper beam (3).
4. Disengage the ambient air temperature sensor from the retaining tabs (4) and remove the sensor.

INSTALLATION

1. Install the ambient air temperature sensor (2) onto the top of the front bumper beam (3). Make sure that the retaining tabs (4) are fully engaged.
2. Connect the wire harness connector (1) to the ambient air temperature sensor.
3. Install the grille (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).
4. Reconnect the negative battery cable.

SENSOR-EVAPORATOR TEMPERATURE

DESCRIPTION

The evaporator temperature sensor (1) measures the temperature of the conditioned air downstream of the A/C evaporator (2). The evaporator temperature sensor is an electrical thermistor within a molded plastic case that is inserted into the HVAC housing (3) near the coldest point of the A/C evaporator. Two terminals within the connector receptacle (4) connect the sensor to the vehicle electrical system through a wire lead and connector of the HVAC wire harness.

The external location of the evaporator temperature sensor allows the sensor to be removed or installed without disturbing the refrigerant in the A/C system.

OPERATION

The evaporator temperature sensor is a thermistor that operates on a 5-volt reference signal sent out by the A/C-heater control. The sensor connects to the A/C-heater control through a two-wire lead and connector of the HVAC wire harness. The sensor monitors the temperature of the conditioned air downstream of the A/C evaporator and changes its internal resistance in response to changes in the air temperature. As the temperature increases, the sensor's resistance decreases which increases the reference signal voltage read by the A/C-heater control. As the temperature decreases, the sensor's resistance increases which decreases the reference signal voltage read by the A/C-heater control.

The A/C-heater control also uses the reference signal voltage as an indication that conditions are correct to request A/C operation, should the operator (manually) or the A/C-heater control (automatically) so desire this function. For the ATC system, the A/C-heater control broadcasts the A/C request on the controller area network (CAN) B bus, where it is read and processed by the front control module (FCM), which in turn broadcasts it on the CAN C bus, where it is read and processed by the powertrain control module (PCM). For the MTC system, the A/C-heater control sends the request for A/C to the CCN via a dedicated mux circuit. The CCN then broadcasts the A/C request on the CAN B bus, where it is read and processed by the FCM, which in turn broadcasts it on the CAN C bus, where it is read and processed by the PCM.

The evaporator temperature sensor is diagnosed using a scan tool (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - HEATING AND A/C SYSTEMS and to 24 - HVAC Electrical Diagnostics for more information).

The evaporator temperature sensor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

REMOVAL

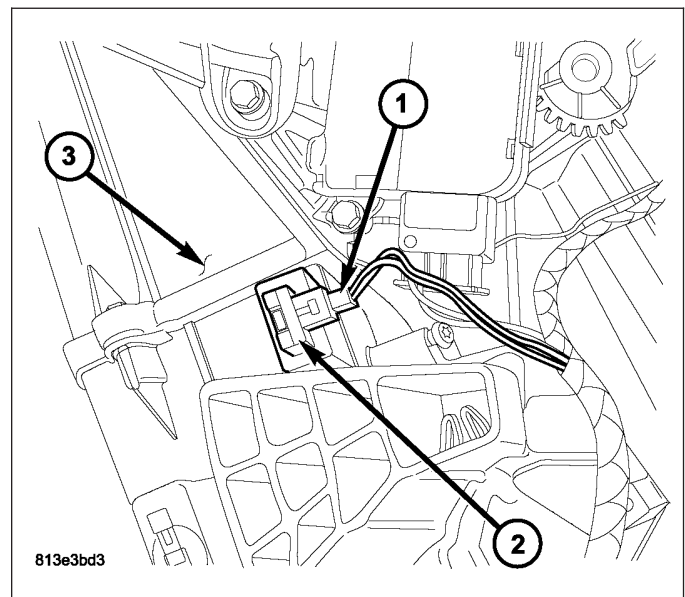

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

1. Disconnect and isolate the negative battery cable.
2. Remove the instrument panel silencer from the driver side of the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - REMOVAL).
3. Disconnect the HVAC wire harness connector (1) from the evaporator temperature sensor (2) located on the side of the HVAC housing (3).
4. Remove the evaporator temperature sensor from the HVAC housing.

INSTALLATION

1. Install the evaporator temperature sensor (2) into side of the HVAC housing (3). Make sure that the sensor retaining clips are fully engaged in the housing.
2. Connect the HVAC wire harness connector (1) to the evaporator temperature sensor.
3. Install the instrument panel silencer onto the driver side of the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - INSTALLATION).
4. Reconnect the negative battery cable.

SENSOR-INFRA-RED

DESCRIPTION

The infrared sensor is used only on models equipped with the automatic temperature control (ATC) heating-A/C system. The infrared temperature sensor consists of an infrared transducer concealed behind a clear lens (1) located within the instrument panel mounted A/C-heater control (2).

OPERATION

The infrared sensor detects thermal radiation emitted by the driver and front passenger seat occupants and their surroundings and converts its data into a linear pulse width modulated (PWM) output signal which is read by the automatic temperature control (ATC) A/C-heater control. The ATC A/C-heater control uses the infrared sensor data as one of the inputs necessary to automatically control the interior cabin temperature level. By using thermal radiation (surface temperature) measurement, rather than an air temperature measurement, the ATC heating-A/C system is able to adjust itself to the comfort level as perceived by the occupant. This allows the ATC system to compensate for other ambient conditions affecting comfort levels, such as solar heat gain or evaporative heat loss.

The ATC system logic responds to the infrared sensor message by calculating and adjusting the air flow temperature and air flow rate needed to properly obtain and maintain the selected comfort level temperature of the occupants. The A/C-heater control continually monitors the infrared sensor circuits, and will store diagnostic trouble codes (DTCs) for any problem it detects.

The infrared sensor is diagnosed using a scan tool (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - HEATING AND A/C SYSTEMS and to 24 - HVAC Electrical Diagnostics for more information).

The infrared sensor cannot be adjusted or repaired and, if faulty or damaged, the entire ATC A/C-heater control must be replaced.

SENSOR-SUN

DESCRIPTION

The automatic temperature control (ATC) heating-A/C system uses a sun sensor assembly (1) to measure sun light intensity. The sun sensor assembly incorporates two sun sensors (2) within a molded plastic case which is mounted to the instrument panel and a clear lens (3) that protrudes through the defroster grille. The wire harness receptacle (4) connects the sun sensors to the vehicle electrical system through a wire lead and connector of the instrument panel wire harness.

OPERATION

The ATC heating-A/C system uses two sun sensors to balance the system in response to side-to-side variations in sun light intensity. Passengers in sun and shadow require different functional settings because they experience very different temperatures. The sun sensor assembly provides data to the A/C heater control to help determine proper mode and blend-air door positions and blower motor speeds. The sun sensors are not thermistor type sensors, but rather photo diodes. For this reason the sun sensors responds to sun light intensity rather than temperature. The sun sensor assembly is also used to sense day and night conditions for automatic headlight control on MTC equipped vehicles.

The sun sensor is diagnosed using a scan tool (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - HEATING AND A/C SYSTEMS and to 24 - HVAC Electrical Diagnostics for more information).

The sun sensor assembly cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING

SUN SENSOR

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.

The sun sensor assembly is located so that the sun rays will hit the sensors in the same way that it will hit the driver and the passenger. It is important that the area in front of the sun sensor assembly be unobstructed. Check for the following:

- Windshield wipers are properly adjusted.
- Defroster grille or sun sensor is properly installed. The sun sensor lens should protrude above the defroster grille.
- Any stickers on the windshield are not directly in front of the sun sensor.
- Any items laying on top of the instrument panel are not covering the sun sensor.

If the vehicle exhibits a lack of passenger comfort in sunny weather such as in the early afternoon, inspect the position of the sun sensor assembly. The sun sensor lens should protrude above the defroster grille to insure proper operation. If the sun sensor is not properly positioned, perform the following procedure:

1. Confirm that the defroster grille is properly installed. If not, repair as required.
2. Remove the defroster grille (Refer to 23 - BODY/INSTRUMENT PANEL/DEFROSTER GRILLE - REMOVAL).
3. Verify that the sun sensor is properly installed to the instrument panel (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/SENSOR-SUN - INSTALLATION).
4. Install the defroster grille (Refer to 23 - BODY/INSTRUMENT PANEL/DEFROSTER GRILLE - INSTALLATION).

The A/C-heater control continually monitors the sun sensor circuits and will store diagnostic trouble codes (DTCs) for any problem it detects. The sun sensor can be tested in the vehicle with a scan tool (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - HEATING AND A/C SYSTEMS and to 24 - HVAC Electrical Diagnostics for more information).

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.

1. Disconnect and isolate the negative battery cable.
2. Using a trim stick or another suitable wide flat-blade tool (1), gently pry between both sides of the sun sensor (2) and the instrument panel (3) to release the snap clip retainers located at the front of the sensor near the windshield.

3. Carefully pull the sun sensor (1) partially out of the instrument panel (2) and disconnect the wire harness connector (3) from the sensor.
4. Remove the sun sensor from the vehicle.

INSTALLATION

1. Position the sun sensor (2) near the instrument panel (3).
2. Connect the wiring harness connector (1) to the sun sensor.
3. Align the tab on the sun sensor with the opening in the instrument panel and install the sensor onto the instrument panel. Make sure that the sensor's retaining clips located at the front of the sensor near the windshield are fully engaged to the instrument panel.
4. Reconnect the negative battery cable.

TRANSDUCER-A/C PRESSURE

DESCRIPTION

The A/C pressure transducer (1) is a switch that is installed on a fitting located on the A/C discharge line. An internally threaded fitting on the A/C pressure transducer connects it to the externally threaded Schrader-type fitting on the A/C discharge line. A rubber O-ring seals the connection between the A/C pressure transducer and the discharge line fitting. The A/C pressure transducer is connected to the vehicle electrical system by a molded plastic connector with three terminals.

OPERATION

The A/C pressure transducer monitors the pressures in the high side of the refrigerant system through its connection to a fitting on the A/C discharge line. The A/C pressure transducer will change its internal resistance in response to the pressures it monitors. A Schrader-type valve in the discharge line fitting permits the A/C pressure transducer to be removed or installed without disturbing the refrigerant in the A/C system.

The powertrain control module (PCM) provides a five volt reference signal and a sensor ground to the A/C pressure transducer, then monitors the output voltage of the A/C pressure transducer on a sensor return circuit to determine refrigerant pressure. The PCM is programmed to respond to the A/C pressure transducer and other sensor inputs by controlling the operation of the A/C compressor clutch and the radiator cooling fan to help optimize A/C system performance and to protect the system components from damage. The PCM will disengage the A/C compressor clutch when high side pressure rises above 3082 kPa (447 psi) and re-engage the clutch when high side pressure drops below 2937 kPa (426 psi). The A/C pressure transducer will also disengage the A/C compressor clutch if the high side pressure drops below 110 kPa (16 psi) and will re-engage the clutch when the high side pressure rises above 221 kPa (32 psi). If the refrigerant pressure rises above 1655 kPa (240 psi), the PCM will actuate the cooling fan. The A/C pressure transducer input to the PCM will also prevent the A/C compressor clutch from engaging when ambient temperatures are below about 4.5° C (40° F) due to the pressure/temperature relationship of the refrigerant.

The A/C pressure transducer is diagnosed using a scan tool. Refer to 9 - Engine Electrical Diagnostics for more information.

The A/C pressure transducer cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

REMOVAL

NOTE: It is not necessary to discharge the refrigerant system to replace the A/C pressure transducer.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (1) from the A/C pressure transducer (2) located on the A/C discharge line (3).
3. Remove the A/C pressure transducer from the fitting on the A/C discharge line and remove and discard the O-ring seal.

INSTALLATION

NOTE: Use only the specified O-ring as it is made of special material for R-134a. Use only refrigerant oil of the type required for the A/C compressor.

1. Lubricate a new rubber O-ring seal (4) with clean refrigerant oil and install it onto the discharge line fitting (3).
2. Install the A/C pressure transducer (2) onto the A/C discharge line. Tighten the A/C pressure transducer securely.
3. Connect the wire harness connector (1) to the A/C pressure transducer.
4. Reconnect the negative battery cable.

DUCT-DEFROSTER

DESCRIPTION

The two slot-type defroster outlets located near the center of the instrument panel receive airflow from the HVAC housing through the molded plastic main distribution duct (1) and defroster ducts (2), which are attached to the bottom of the instrument panel top cover (3).

The defroster ducts are integral to the instrument panel top cover and are not serviced separately (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).

813e57d4

DUCT-FLOOR CONSOLE

REMOVAL

NOTE: Shown with instrument panel removed for clarity.

1. Remove the floor console from the passenger compartment (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).
2. Disengage the push-pin retainer (1) that secures the front console duct (2) to the gear selector (3).
3. Disconnect the front console duct from the air distribution housing (4) and remove the console duct.

INSTALLATION

NOTE: Shown with instrument panel removed for clarity.

1. Position the floor console duct (2) into the vehicle.
2. Connect the front console duct to the air distribution housing (4) and engage the push-pin retainer (1) to the gear selector (3).
3. Install the floor console (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION).

DUCTS-FLOOR DISTRIBUTION

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: Take the proper precautions to protect the front face of the instrument panel from cosmetic damage while performing these procedures.

FRONT FLOOR DUCTS

NOTE: Shown with the instrument panel, gear selector and console duct removed for clarity.

1. Remove the instrument panel from the passenger compartment (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
2. Disconnect the right front floor duct (5) and the left front floor duct (6) from the rear of the air distribution housing (4) and remove the front floor ducts from the vehicle.

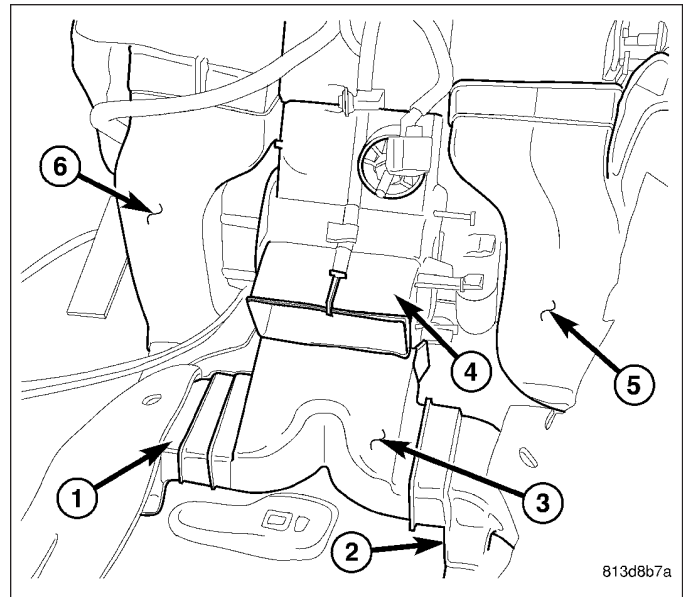

REAR FLOOR DUCTS

1. Remove the floor console from the passenger compartment (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).
2. Remove the front seats (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).
3. Disengage the push-pin retainer (1) that secures the front console duct (2) to the gear selector (3).
4. Disconnect the front console duct from the air distribution housing (4) and remove the console duct.
5. Remove the screws (5) that secure the gear selector to the floor panel (6) and position the gear selector out of the way.

6. Roll back the front floor carpet from under the instrument panel toward the rear of the vehicle (Refer to 23 - BODY/INTERIOR/CARPETS AND FLOOR MATS - REMOVAL).
7. Disconnect the left rear floor duct (1) and the right rear floor duct (2) from the rear floor distribution duct (3).
8. Disengage the retainer that secures the rear floor ducts to the floor support and remove the floor ducts.
9. Disconnect the rear floor distribution duct from the air distribution housing (4) and remove the distribution duct.

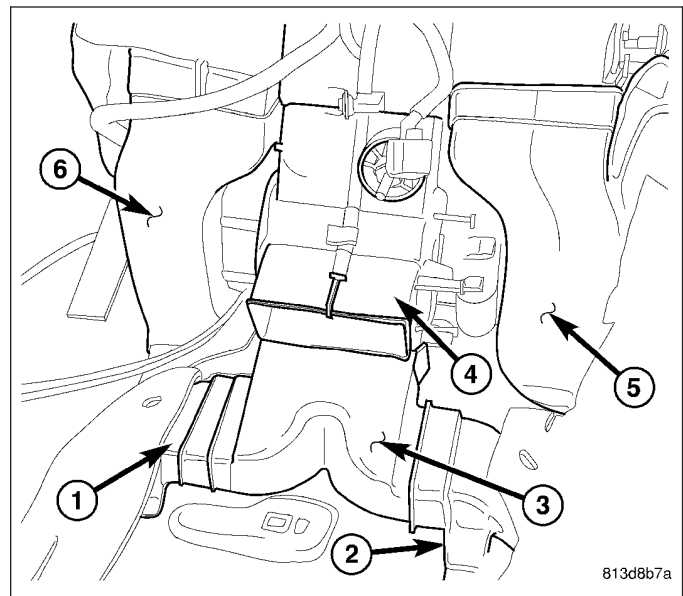

INSTALLATION

FRONT FLOOR DUCTS

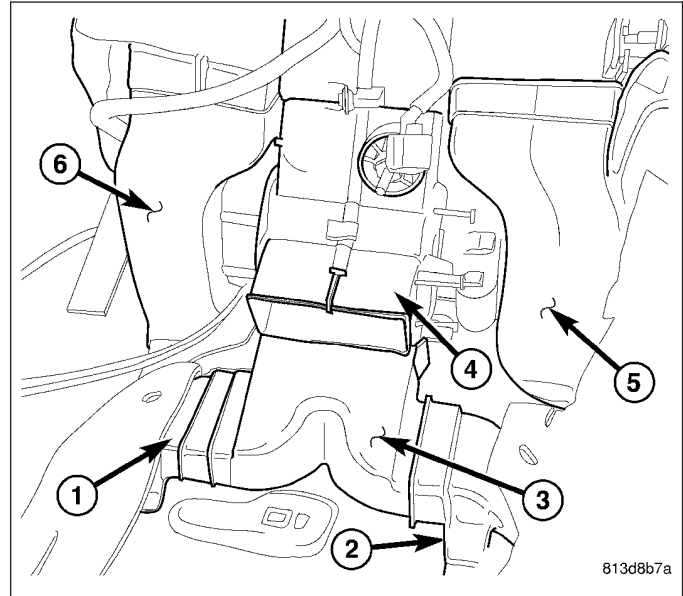

NOTE: Shown with the instrument panel, gear selector and console duct removed for clarity.

1. Position the right front floor duct (5) and left front floor duct (6) into the vehicle
2. Connect the front floor ducts to the rear of the air distribution housing (4).
3. Install the instrument panel (Refer to 23 - BODY/ INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

REAR FLOOR DUCTS

1. Position the rear floor distribution duct (3) into the vehicle and connect it to the rear of the HVAC air distribution housing (4).
2. Position the left rear floor duct (1) and right rear floor duct (2) into the vehicle and engage the retainers that secure the floor ducts to the floor support.
3. Connect the rear floor ducts to the rear floor distribution duct.
4. Install the carpet onto the front floor panel and under the instrument panel (Refer to 23 - BODY/ INTERIOR/CARPETS AND FLOOR MATS - INSTALLATION).

5. Position the gear selector (3) to its installed location on the floor panel (6) and securely install the retaining screws (5).
6. Connect the front console duct (2) to the air distribution housing (4) and engage the push-pin retainer (1) to the gear selector.
7. Install the front seats (Refer to 23 - BODY/SEATS/ SEAT - INSTALLATION).
8. Install the floor console (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCT-FLOOR CONSOLE - INSTALLATION)
9. Install the floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).

DUCT-INSTRUMENT PANEL

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: The air ducts for the instrument panel and demisters outlets are integral to each other and cannot be serviced separately.

NOTE: Take the proper precautions to protect the front face of the instrument panel from cosmetic damage while performing this procedure.

OUTBOARD DUCTS

1. Remove the instrument panel and place it on a workbench (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
2. Remove the instrument panel top cover (1) from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).
3. Remove the screws that secure the passenger side instrument panel duct and demister duct assembly (2) and the driver side instrument panel duct and demister duct assembly (3) to the instrument panel top cover.
4. Disconnect the instrument panel ducts from the main distribution duct (4) and the end outlets (5) and remove the ducts from the instrument panel top cover.

CENTER DUCTS

1. Remove the radio from the instrument panel (Refer to 8 - ELECTRICAL/AUDIO/RADIO - REMOVAL).
2. Remove the screws (1) that secure the center instrument panel duct(s) (2) to the instrument panel (3).
3. Disconnect the center instrument panel duct(s) from the main distribution duct (4) and remove the duct(s) through the opening for the radio in the instrument panel.

INSTALLATION

OUTBOARD DUCTS

1. Position the passenger side instrument panel duct and demister duct assembly (2) and the driver side instrument panel duct and demister duct assembly (3) into the instrument panel top cover (1).
2. Connect the instrument panel ducts to the air outlets (5) and the main distribution duct (4). Make sure that the ducts are correctly installed over the instrument panel and demister outlet seals.
3. Install the screws that secure the instrument panel ducts the instrument panel top cover. Tighten the screws to 2 N·m (17 in. lbs.).
4. Install the instrument panel top cover onto the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).
5. Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

CENTER DUCTS

1. Position the center instrument panel duct(s) (2) into the instrument panel (3) through the opening for the radio.
2. Connect the center instrument panel duct(s) to the main distribution duct (4).
3. Install the screws (1) that secure the center instrument panel duct(s) to the instrument panel. Tighten the screws to 2 N·m (17 in. lbs.).
4. Install the radio into the instrument panel (Refer to 8 - ELECTRICAL/AUDIO/RADIO - INSTALLATION).

MOTOR-BLOWER

DESCRIPTION

The blower motor (1) is a 12-volt, direct current (DC) motor mounted within a plastic housing with an integral wire lead and connector (2) and squirrel cage-type blower wheel (3) that is secured to the blower motor shaft (4). The blower motor wheel is located in the HVAC air inlet housing which is mounted to the passenger side end of the HVAC housing.

The blower motor can be accessed for service from underneath the instrument panel.

OPERATION

The blower motor is used to control the velocity of air moving through the HVAC housing by spinning the blower wheel within the HVAC air inlet housing at the selected speed or, in the ATC system, at the selected or programmed speed.

On models equipped with the manual temperature control (MTC) heating-A/C system, the blower motor will operate whenever the ignition switch is in the On position and the blower motor control in any position except Off. On models equipped with the automatic temperature control (ATC) system, the blower motor will operate whenever the ignition switch is in the On position and the A/C-heater control power is turned on.

For the MTC system, blower motor speed is controlled by directing the ground path for the blower motor through the correct resistor wire to obtain the selected speed.

For the ATC system, blower motor speed is controlled by the blower motor power module which provides the blower motor with power and a path to ground. The blower motor power module also sends a blower control signal to the A/C-heater control. Using input from the blower motor control (manual mode) or sensor data (automatic mode), the A/C-heater control processes the blower control signal from the power module and sets the speed at which the blower motor will run.

The blower motor and blower motor wheel are factory balanced and cannot be adjusted or repaired. If faulty or damaged, the blower motor and blower wheel must be replaced as an assembly.

DIAGNOSIS AND TESTING

BLOWER MOTOR

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: For circuit descriptions and diagrams, refer to Air Conditioning/Heater in Group 8W - Wiring Diagrams.

OPERATION

Possible causes of an inoperative blower motor include:

- Faulty fuse
- Faulty blower motor resistor or power module (depending on application)
- Faulty blower motor switch
- Faulty mode control switch
- Faulty blower motor
- Faulty blower motor circuit wiring or wire harness connectors

Possible causes of the blower motor not operating in all speeds include:

- Faulty fuse
- Faulty blower motor resistor or power module (depending on application)
- Faulty blower motor switch
- Faulty blower motor
- Faulty blower motor circuit wiring or wire harness connectors

VIBRATION

Possible causes of blower motor vibration include:

- Improper blower motor mounting
- Improper blower wheel mounting
- Deformed blower wheel
- Out of balance blower wheel due to foreign material in the wheel
- Faulty blower motor

NOISE

To determine if the blower motor is the source of the noise, simply switch the blower motor from Off to On. To verify that the blower motor is the source of the noise, unplug the blower motor wire harness connector and operate the heater-A/C system. If the noise goes away, possible causes include:

- Foreign material in the HVAC air inlet housing
- Improper blower motor mounting
- Improper blower wheel mounting
- Faulty blower motor

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

1. Disconnect and isolate the negative battery cable.
2. Remove the instrument panel silencer from the passenger side of the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - REMOVAL)
3. Remove the glove box from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).
4. Disconnect the blower motor wire harness connector (1) from the blower motor power module or resistor (2), depending on how equipped.
5. Remove the three screws (3) that secure the blower motor (4) to the HVAC housing (5).
6. Remove the blower motor from the HVAC housing.

INSTALLATION

1. Position the blower motor (4) into the HVAC housing (5).
2. Install the three screws (3) that secure the blower motor to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).
3. Connect the wire harness connector (1) to the blower motor power module or resistor (2), depending on how equipped.
4. Install the glove box into the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).
5. Install the instrument panel silencer onto the passenger side of the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - INSTALLATION)
6. Reconnect the negative battery cable.

OUTLETS-AIR

DESCRIPTION

There are two defroster air outlets (1) located on the top of the instrument panel (2). The airflow from the defroster outlets is directed by fixed vanes in the defroster grilles and cannot be adjusted. The defroster grilles are serviced individually, however, the defroster outlets are not serviceable from the instrument panel top cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).

There are two side window demister air outlets (3). One located on each end of the instrument panel top cover. The airflow from the side window demister air outlets is directed by fixed vanes in the outlets and cannot be adjusted. The side window demister air outlets are not serviceable from the instrument panel top cover (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).

There are four instrument panel air outlets (4). One air outlet is located near each outboard end of the instrument panel facing the rear of the vehicle and one outlet is located on each side of the radio bezel. Each of the instrument panel air outlets contain a non-serviceable grille with movable vanes that are used to direct or shut off the flow of the conditioned air leaving the instrument panel outlets. Only the outboard instrument panel air outlets can be serviced separately. For service of the center instrument panel air outlets, the radio bezel must be replaced.

REMOVAL

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: Only the outboard instrument panel air outlets can be serviced separately.

NOTE: Take the proper precautions to protect the front face of the instrument panel from cosmetic damage while performing this procedure.

1. Remove the instrument panel and place it on a workbench (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
2. Remove the instrument panel ducts from the instrument panel (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-INSTRUMENT PANEL - REMOVAL).
3. Remove the three screws (1) that secure the outboard instrument panel air outlet(s) (2) to the instrument panel top cover (3) and remove the outlets.

INSTALLATION

1. Position the outboard instrument panel air outlet(s) (2) into the instrument panel top cover (3).

NOTE: Make sure that the air outlet is properly aligned to the instrument panel opening and that the foam seal on the outlet is properly installed.

2. Install the three screws (1) that secure the instrument panel air outlets to the top cover. Tighten the screws to 2 N·m (17 in. lbs.).
3. Install the instrument panel ducts into the instrument panel (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-INSTRUMENT PANEL - INSTALLATION).
4. Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

HVAC HOUSING

DESCRIPTION

All models are equipped with a common HVAC housing assembly that combines A/C and heating capabilities into a single unit mounted within the passenger compartment. The HVAC housing assembly consists of three separate housings:

- **HVAC housing** — The HVAC housing (1) is mounted to the dash panel behind the instrument panel and contains the evaporator core and the blower motor resistor block or power model, depending on application. The HVAC housing consists of a upper and a lower housing that are attached together and has mounting provisions for the air inlet housing, blower motor, air distribution housing and the HVAC wire harness.
- **Air inlet housing** — The air inlet housing (2) is mounted to the right end of the HVAC housing and contains the recirculation-air door and actuator.
- **Air distribution housing** — The air distribution housing (3) is mounted to the rear of the HVAC housing and contains the heater core, blend-air door(s) and actuator(s), mode-air doors and actuators and door linkages.

The heating-A/C system is a blend-air type system. The blend-air doors control the amount of conditioned air that is allowed to flow through, or around, the heater core. The dual zone heating A/C system uses two blend door actuators while the single zone system uses only one blend door actuator.

The A/C system is designed for the use of a non-CFC, R-134a refrigerant and uses an A/C evaporator to cool and dehumidify the incoming air prior to blending it with the heated air. A temperature control determines the discharge air temperature by operating the blend door actuator(s), which moves the blend-air door(s). This allows an almost immediate control of the output air temperature of the system. The two mode door actuators operate the mode-air doors which direct the flow of the conditioned air out the various air outlets, depending on the mode selected. The recirculation door actuator operates the recirculation-air door which closes off the fresh air intake and recirculates the air already inside the vehicle. The electric door actuators are connected to the vehicle electrical system by the HVAC wire harness. The blower motor controls the velocity of air flowing through the HVAC housing assembly by spinning the blower wheel within the HVAC housings at the selected speed by use of the blower motor resistor block or power model, depending on application.

The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator. The air distribution housing must be removed from the HVAC housing and disassembled for service of the mode-air and blend-air doors. The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.

REMOVAL

AIR DISTRIBUTION HOUSING

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the mode-air and blend-air doors.

1. Remove the HVAC housing assembly and place it on a workbench (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HVAC HOUSING ASSEMBLY - REMOVAL).
2. Disengage the HVAC wire harness retainer (1) from the rear of the air distribution housing (2).
3. Disconnect the HVAC wire harness (3) from the blend door actuator (4) and the mode door actuator (5) located on the driver side of the air distribution housing.

4. Disconnect the HVAC wire harness (1) from the mode door actuator (2) located near the bottom of the air distribution housing (3).
5. If equipped with dual zone heating-A/C, disconnect the HVAC wire harness from the blend door actuator (4) located on the passenger side of the air distribution housing.

6. Remove the five screws (1) that secure the heater core and tube cover (2) to the HVAC housing (3).
7. Remove the heater core and tube cover from the HVAC housing.

NOTE: Take proper precautions to protect the carpeting from spilled engine coolant. Have absorbent toweling readily available to clean up any spills.

8. Remove the screw (1) that secures the heater core tubes (2) to the HVAC housing (3).
9. Remove the bolt (4) that secures the heater core tubes to the heater core (5).
10. Disconnect the heater core tubes from the heater core and remove and discard the O-ring seals.
11. Install plugs in, or tape over the opened heater core tubes and heater core ports.

12. Remove the seven screws (1) that secure the air distribution housing (2) to the HVAC housing (3).
13. Release the locking tabs located at the top of the distribution housing and tilt the distribution housing downward to disengage the tab-and-slot type retainers located at the bottom of the housing.
14. Remove the air distribution housing from the HVAC housing.
15. If required, disassemble the air distribution housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - AIR DISTRIBUTION HOUSING - DISASSEMBLY).

AIR INLET HOUSING

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.

1. Remove the HVAC housing assembly (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HVAC HOUSING ASSEMBLY - REMOVAL).
2. Disconnect the HVAC wire harness (1) from the recirculation door actuator (2).
3. Remove the three screws (3) that secure the air inlet housing (4) to HVAC housing (5).
4. Tilt the rear of the air inlet housing upward to disengage the two tab-and-slot type retainers located at the front of the inlet housing and remove the inlet housing from the HVAC housing.

NOTE: If the foam seal on the air inlet housing is deformed or damaged, it must be replaced.

5. If required, disassemble the air inlet housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRI-

BUTION/HOUSING-HVAC - AIR INLET HOUSING - DISASSEMBLY).

HVAC HOUSING ASSEMBLY

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: The HVAC housing assembly must be removed from the vehicle and disassembled for service of the air inlet housing, air distribution housing and the A/C evaporator.

NOTE: Take the proper precautions to protect the front face of the instrument panel from cosmetic damage while performing this procedure.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Drain the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAIN).
3. Disconnect and isolate the negative battery cable.
4. Remove the front floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).
5. Remove the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
6. Disengage the push-pin retainer (1) that secures the front console duct (2) to the gear selector (3).
7. Disconnect the front console duct from the air distribution housing (4) and remove the console duct.
8. Remove the screws (5) that secure the gear selector to the floor panel (6) and position the gear selector out of the way.

9. Disconnect the left rear floor duct (1) and the right rear floor duct (2) from the rear floor distribution duct (3).
10. Disconnect the rear floor distribution duct from the air distribution housing (4) and remove the distribution duct.
11. Disconnect the right front floor duct (5) and the left front floor duct (6) from the air distribution housing and remove the floor ducts.

12. Remove the nut (1) that secures the HVAC housing assembly (2) to the passenger side of the dash panel (3).

13. Disconnect the A/C liquid line and the A/C suction line from the A/C evaporator (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LINE-A/C LIQUID - REMOVAL).
14. Disconnect the heater hoses from the heater core tubes.
15. Remove the two bolts (1) that secure the HVAC housing assembly (2) to the engine compartment side of the dash panel (3).
16. Lift the HVAC housing assembly upwards so that the condensate drain tube clears the floor panel and remove the HVAC housing assembly from the passenger compartment.
17. If required, disassemble the HVAC housing assembly (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC ASSEMBLY - DISASSEMBLY).

DISASSEMBLY

AIR DISTRIBUTION HOUSING

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the mode-air and blend-air doors.

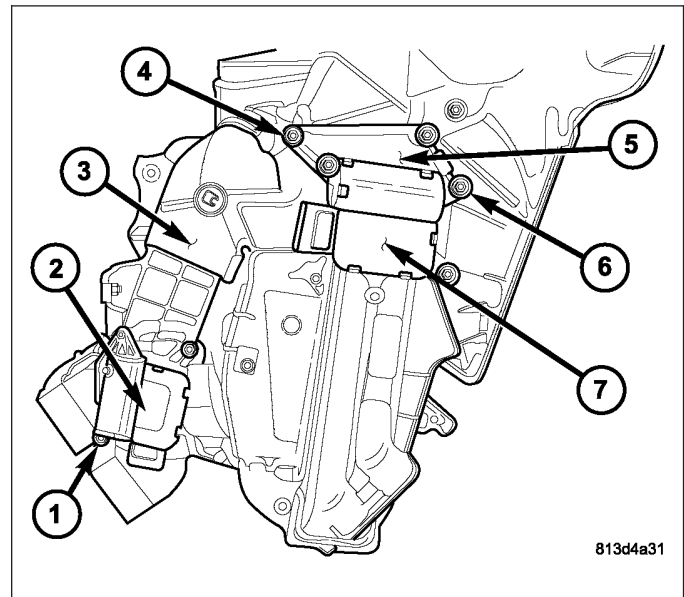

1. Remove the air distribution housing (1) from the HVAC housing and place it on a workbench (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - AIR DISTRIBUTION HOUSING - REMOVAL).
2. Remove the screws (2) that secure the blend door actuator (4) and the mode door actuator (7) to the driver side of the air distribution housing and remove the actuators.
3. Remove the screws (3 and 6) that secure the blend door actuator mounting bracket (5) and the mode door actuator mounting bracket (8) to the driver side of the air distribution housing and remove the mounting brackets.

4. Using a flat bladed tool, remove the upper defrost/panel door pivot gear (1), front floor door pivot gear (4) and the blend door stop (5) from the driver side of the air distribution housing (3).
5. Remove the upper defrost/panel door linkage rod (8) and the mode door cam (7) from the air distribution housing.
6. Remove the lower defrost/panel door pivot gear (2) and the front floor door linkage rod (6) from the air distribution housing.

7. Remove the screws (1) that secure the rear floor/console door actuator (2) to the passenger side of the air distribution housing (3) and remove the actuator.
8. If equipped with dual zone heating-A/C, remove the screws (6) that secure the blend door actuator (7) to the passenger side of the air distribution housing and remove the actuator.
9. If equipped with dual zone heating-A/C, remove the screws (4) that secure the blend door actuator mounting bracket (5) to the passenger side of the air distribution housing and remove the mounting bracket.

10. If equipped with dual zone heating-A/C, remove the blend door stop (1) from the passenger side of the air distribution housing (2).
11. Carefully pull the heater core (3) out of the passenger side of the air distribution housing.

12. Carefully cut the foam seal (1) along the parting line (2) of the two halves of the air distribution housing (3). If the seal is deformed or damaged, it must be replaced.
13. Remove the 4 metal clips (4) that secure the two halves of the air distribution housing together.
14. Remove the eight screws (5) that secure the two halves of the air distribution housing together.

15. Carefully separate the left half of the air distribution housing (1) from the right half of the air distribution housing (2).
16. Remove the center partition (3) from the distribution housing.

NOTE: If the seal on any air door is deformed or damaged, the air door must be replaced.

17. If required, remove the front floor air doors (1 and 3) from the center partition (2) by disengaging the retaining tabs (4) and pulling the air doors apart from each other.

NOTE: If the seal on any air door is deformed or damaged, the air door must be replaced.

18. Remove the upper defrost/panel-air door (1), lower defrost/panel-air door (2), directional vane (3), rear outlet-air door (4) and the blend-air door (5) from the passenger side air distribution housing (6) as required.

NOTE: If the seal on any air door is deformed or damaged, the air door must be replaced.

19. Remove the upper defrost/panel-air door (1), lower defrost/panel-air door (2), directional vane (3) and the blend-air door (4) from the driver side air distribution housing (5) as required.

AIR INLET HOUSING

NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.

1. Remove the air inlet housing (1) from the HVAC housing and place it on a workbench (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - AIR INLET HOUSING - REMOVAL)
2. Remove the two screws (2) that secure the recirculation door actuator (3) to the left side of the air inlet housing and remove the actuator.

NOTE: If the foam seal on the recirculation-air door or the air inlet housing is deformed or damaged, it must be replaced.

3. Carefully remove the recirculation-air door (4) from the air inlet housing.

HVAC HOUSING

NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

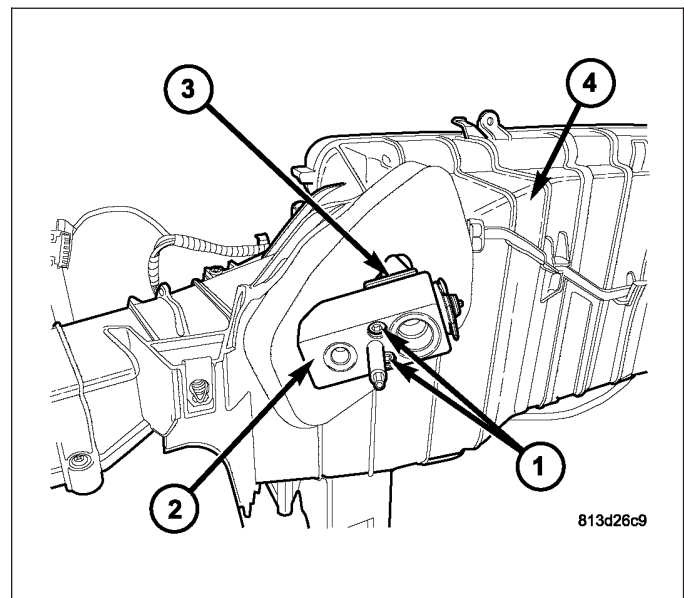

1. Remove the HVAC housing assembly and place it on a workbench (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION /HOUSING-HVAC - HVAC HOUSING ASSEMBLY - REMOVAL).
2. Remove the air distribution housing (3) from the HVAC housing (1) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - AIR DISTRIBUTION HOUSING - REMOVAL).
3. Remove the air inlet housing (2) from the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - AIR INLET HOUSING - REMOVAL).

4. Disconnect the HVAC wire harness (1) from the evaporator temperature sensor (2) and the blower motor resistor or power module (4) (depending on application).
5. Disconnect the wire harness for the blower motor (3) from the blower motor resistor or power module (depending on application).
6. Disengage the two HVAC wire harness retainers from the HVAC housing (5) and remove the wire harness.
7. Remove the blower motor (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/MOTOR-BLOWER - REMOVAL).
8. Remove the blower motor resistor or power module, depending on application (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/RESISTOR-BLOWER MOTOR - REMOVAL) or (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/MODULE-POWER-BLOWER MOTOR - REMOVAL).
9. Remove the evaporator temperature sensor (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/SENSOR-EVAPORATOR TEMPERATURE - REMOVAL).

10. Remove the two bolts (1) that secure the A/C expansion valve (2) to the evaporator tube tapping block (3) located at the front of the HVAC housing (4).
11. Remove the A/C expansion valve from the evaporator tube tapping block and remove and discard the O-ring seals.
12. Install plugs in, or tape over the opened evaporator tube fittings and all expansion valve ports.

13. Carefully cut the foam seal (1) along the parting line (2) of the upper half of the HVAC housing (3) and the lower half of the HVAC housing (4). If the seal is deformed or damaged, it must be replaced.
14. Remove the three metal retaining clips (5) that secure the two halves of the HVAC housing together.
15. Remove the ten screws (6) that secure the two halves of the HVAC housing together.
16. Disengage the two plastic retaining clips (7) and separate the two halves of the HVAC housing.

17. Open the rubber seal (1) and carefully lift the A/C evaporator (2) and insulator (3) out of the lower half of the HVAC housing (4).
18. If required, remove the rubber seal from the lower half of the HVAC housing. If the seal is deformed or damaged, it must be replaced.
19. If required, remove the insulator from the A/C evaporator. If the insulator is deformed or damaged, it must be replaced.

ASSEMBLY

AIR DISTRIBUTION HOUSING

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the mode-air and blend-air doors.

1. Install the upper defrost/panel-air door (1), lower defrost/panel-air door (2), directional vane (3) and the blend-air door (4) into the driver side air distribution housing (5) as required. Align the air doors with the pivot shaft holes in the housing.

2. Install the upper defrost/panel-air door (1), lower defrost/panel-air door (2), directional vane (3), rear outlet-air door (4) and the blend-air door (5) into the passenger side air distribution housing (6) as required. Align the air doors with the pivot shaft holes in the housing.

3. If removed, align the front floor-air doors (1 and 3) with each other and install them into the center partition (2). Make sure that the air door retaining tabs (4) are fully engaged.

4. Install the center partition (3) into the right half of the air distribution housing (2).
5. Install the left half of the air distribution housing (1) onto the right half of the air distribution housing. Align the air door pivot shafts with each other and with the pivot shaft holes in the housing.

6. Install the eight screws (5) that secure the two halves of the air distribution housing (3) together. Tighten the screws to 2.2 N·m (20 in. lbs.).
7. Install the four metal clips (4) that secure the two halves of the air distribution housing together.
8. Inspect the foam seal (1), especially at the parting line (2). If the seal is deformed or damaged, it must be replaced.

9. Carefully install the heater core (3) into the passenger side of the air distribution housing (2).
10. If equipped with dual zone heating-A/C, install the blend door stop (1) onto the passenger side of the air distribution housing.

11. Position the rear floor/console door actuator (2) onto the passenger side of the air distribution housing (3). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the floor/console door pivot shaft. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ACTUATOR-MODE DOOR - INSTALLATION).
12. Install the screws (1) that secure the rear floor/console door actuator onto the passenger side of the air distribution housing. Tighten the screws to 2 N·m (17 in. lbs.).
13. If equipped with dual zone heating-A/C, position the blend door actuator mounting bracket (5) onto the passenger side of the air distribution housing and install the retaining screws (4). Tighten the screws to 2 N·m (17 in. lbs.).
14. If equipped with dual zone heating-A/C, position the blend door actuator (7) onto the blend door actuator mounting bracket and install the retaining screws (6). Tighten the screws to 2 N·m (17 in. lbs.). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the blend door stop. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ACTUATOR-BLEND DOOR - INSTALLATION).

15. Install the front floor door linkage rod (6) and the lower defrost/panel door pivot gear (2) onto the driver side of the air distribution housing (3).

NOTE: Align the arrow on the lower defrost/panel door pivot gear with the locator in the window of the mode door cam during installation of the mode door cam.

16. Align and install the mode door cam (7) onto the driver side of the air distribution housing.

NOTE: Align the guide pin on the upper defrost/panel door linkage rod with the guides in the mode door cam during installation of the upper defrost/panel door linkage rod.

17. Align and install the upper defrost/panel door linkage rod (8) onto the driver side of the air distribution housing.

NOTE: Align the detent in the upper defrost/panel door pivot gear with the locator in the upper defrost/panel door linkage rod during installation of the upper defrost/panel door pivot gear.

18. Align and install the blend door stop (5), front floor door pivot gear (4) and the upper defrost/panel door pivot gear (1) onto the driver side of the air distribution housing.

19. Position the blend door actuator mounting bracket (5) and the mode door actuator mounting bracket (8) onto the driver side of the air distribution housing (1) and install the retaining screws (3 and 6). Tighten the screws to 2 N·m (17 in. lbs.).
20. Position the blend door actuator (4) and the mode door actuator (7) onto the mounting brackets and install the retaining screws (2). Tighten the screws to 2 N·m (17 in. lbs.). If necessary, rotate the actuators slightly to align the splines on the actuator output shaft with those on the mode door cam and the blend door stop (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ACTUATOR-BLEND DOOR - INSTALLATION) and (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ACTUATOR-MODE DOOR - INSTALLATION).
21. Install the air distribution housing onto the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - AIR DISTRIBUTION HOUSING - INSTALLATION).

AIR INLET HOUSING

NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.

1. Position the recirculation-air door (4) into the air inlet housing (1).

CAUTION: Make sure that the recirculation-air door pivot shaft is properly seated in the pivot seats located on the air inlet housing.

2. Install the recirculation door actuator (3) onto the air inlet housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the recirculation door pivot shaft (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ACTUATOR-RECIRCULATION DOOR - INSTALLATION).
3. Install the two screws (2) that secure the recirculation door actuator to the air inlet housing. Tighten the screws to 2 N·m (17 in. lbs.).
4. Install the air inlet housing onto the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - AIR INLET HOUSING - INSTALLATION).

HVAC HOUSING

1. If removed, install the insulator (3) over the A/C evaporator (2). If the seal is deformed or damaged, it must be replaced.
2. If removed, install the rubber seal (1) into the lower half of the HVAC housing (4). If the seal is deformed or damaged, it must be replaced.
3. Install the A/C evaporator into the lower half of the HVAC housing. Make sure that the evaporator drain within the HVAC housing is clean and unrestricted and that the insulator and rubber seal are properly installed.

4. Install the upper half of the HVAC housing (3) onto the lower half of the HVAC housing (4) and fully engage the two plastic retaining clips (7).
5. Install the ten screws (2) that secure the two halves of the HVAC housing together. Tighten the screws to 2.2 N·m (20 in lbs.).
6. Install the three metal retaining clips (5) that secure the two halves of the HVAC housing together.

7. Remove the tape or plugs from the evaporator tube fittings and all of the expansion valve ports.
8. Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the evaporator tube fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
9. Install the A/C expansion valve (2) onto the evaporator tube tapping block (3) located at the front of the HVAC housing (4).
10. Install the two bolts (1) that secure the A/C expansion valve to the evaporator tube tapping block. Tighten the bolts to 11 N-m (97 in. lbs.).

11. Install the evaporator temperature sensor (2) (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/EVAPORATOR TEMPERATURE SENSOR - INSTALLATION).
12. Install the blower motor resistor or power module (4), depending on application (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/RESISTOR-BLOWER MOTOR - INSTALLATION) or (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/MODULE-POWER-BLOWER MOTOR - INSTALLATION).
13. Install the blower motor (3) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/MOTOR-BLOWER - INSTALLATION).
14. Install the HVAC wiring harness (1) onto the HVAC housing (5) and engage the two wire harness retainers to the housing.

15. Connect the HVAC wire harness to the evaporator temperature sensor and blower motor resistor or power module (depending on application).
16. Connect the blower motor wire harness to blower motor resistor or power module (depending on application).

17. Install the air inlet housing (2) onto the HVAC housing (1) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - AIR INLET HOUSING - INSTALLATION).
18. Install the air distribution housing (3) onto the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - AIR DISTRIBUTION HOUSING - INSTALLATION).
19. Install the HVAC housing assembly (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HVAC HOUSING ASSEMBLY - INSTALLATION).

INSTALLATION

AIR DISTRIBUTION HOUSING

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the mode-air and blend-air doors.

1. Position the air distribution housing (2) onto the rear of the HVAC housing (3) by inserting the tabs on the bottom of the distribution housing into the slots located on the bottom of the HVAC housing.
2. Tip the air distribution housing upward until it is properly aligned with the HVAC housing and the locking tabs at the top of the distribution housing are fully engaged.
3. Install the seven screws (1) that secure the air distribution housing to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).

4. Remove the tape or plugs from the heater core tubes (2) and the heater core (5).
5. Lubricate new rubber O-ring seals with clean engine coolant and install them onto the heater core tube fittings. Use only the specified O-rings as they are made of a special material for the engine cooling system.
6. Install the heater core tubes onto the heater core and loosely install the bolt (4) that secures the tubes to the heater core.
7. Install the screw (1) that secures the heater core tubes to the HVAC housing. Tighten the screw to 2.2 N·m (20 in. lbs.).
8. Tighten the bolt that secures the heater core tubes to the heater core to 3 N·m (27 in. lbs.).

9. Install the heater core and tube cover (2) onto the HVAC housing (3).
10. Install the five screws (1) that secure the heater core and tube cover to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).

11. Connect the HVAC wire harness (1) to the mode door actuator (2) located near the bottom of the air distribution housing (3).
12. If equipped with dual zone heating-A/C, connect the HVAC wire harness to the blend door actuator (4) located on the passenger side of the air distribution housing.

13. Connect the HVAC wire harness (3) to the blend door actuator (4) and the mode door actuator (5) located on the driver side of the air distribution housing (2).
14. Engage the HVAC wire harness retainer (1) to the rear of the air distribution housing.
15. Install the HVAC housing assembly (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HVAC HOUSING ASSEMBLY - INSTALLATION).

AIR INLET HOUSING

NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.

1. Position the air distribution housing (4) onto the top of the HVAC housing (5) by inserting the two tabs located at the front of the air inlet housing into the slots located on the top of the HVAC housing.
2. Tip the air distribution housing downward until it is properly seated on the HVAC housing.
3. Install the three screws (3) that secure the air distribution housing to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).
4. Connect the HVAC wire harness (1) to the recirculation door actuator (2).
5. Install the HVAC housing assembly (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HVAC HOUSING ASSEMBLY - INSTALLATION).

HVAC HOUSING ASSEMBLY

NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the air inlet housing, air distribution housing and the A/C evaporator.

1. Position the HVAC housing assembly (2) into the passenger compartment side of the dash panel (3). Make sure that the condensate drain tube protrudes through the opening in the floor panel.
2. Loosely install the nut (1) that secures the HVAC housing to the passenger compartment side of the dash panel.

3. Install the two bolts (1) that secure the HVAC housing assembly (2) to the engine compartment side of the dash panel (3). Tighten the bolts to 7 N·m (62 in. lbs.).
4. Connect the heater hoses to the heater core tubes.
5. Connect the A/C suction line and A/C liquid line to the A/C evaporator (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING /LINE-A/C LIQUID - INSTALLATION).

6. Tighten the nut (1) that secures the HVAC housing assembly (2) to the passenger compartment side of the dash panel (3) to 7 N·m (62 in. lbs.).

7. Connect the right front floor duct (5) and left front floor duct (6) to the air distribution housing (4).
8. Connect the rear floor distribution duct (3) to the air distribution housing.
9. Connect the left rear floor duct (1) and the right rear floor duct (2) to the rear floor distribution duct.

10. Position the gear selector (3) to its installed location on the floor panel (6) and securely install the retaining screws (5).
11. Connect the front console duct (2) to the air distribution housing (4) and engage the push-pin retainer (1) to the gear selector.
12. Install the instrument panel (Refer to 23 - BODY/ INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).
13. Install the floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).
14. Reconnect the negative battery cable.
15. If the heater core is being replaced, flush the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM CLEANING/REVERSE FLUSHING).
16. Refill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).

17. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
18. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

PLUMBING

DESCRIPTION

The A/C refrigerant lines and hoses are used to carry the refrigerant between the various A/C system components. The refrigerant lines and hoses for the R-134a system on this vehicle consist of a barrier-hose design with a nylon tube sandwiched between rubber layers. The nylon tube helps to contain the R-134a refrigerant, which has a smaller molecular structure than R-12 refrigerant. The ends of the refrigerant lines are made from lightweight aluminum or steel, and commonly use braze-less fittings.

Any kinks or sharp bends in the refrigerant lines and hoses will reduce the capacity of the entire A/C system and can reduce the flow of refrigerant in the system. The radius of all bends in the flexible hose refrigerant lines should be at least ten times the diameter of the hose and the refrigerant lines should be routed so they are at least 80 millimeters (3 inches) away from the exhaust manifold(s) and exhaust pipe(s).

OPERATION

High pressures are produced in the refrigerant system when the A/C compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

The refrigerant lines and hoses are coupled to other A/C system components with block-type fittings. A flat steel gasket with an integral O-ring (dual plane seal) is used to mate the refrigerant line fittings with A/C system components to ensure the integrity of the refrigerant system.

The refrigerant lines and hoses cannot be repaired and, if faulty or damaged, they must be replaced.

WARNING

WARNINGS

WARNING: The A/C system contains refrigerant under high pressure. Repairs should only be performed by qualified service personnel. Severe personal injury or death may result from improper service procedures.

WARNING: Avoid breathing the refrigerant and refrigerant oil vapor or mist. Exposure may irritate the eyes, nose, and/or throat. Wear eye protection when servicing the A/C refrigerant system. Serious eye injury can result from direct contact with the refrigerant. If eye contact occurs, seek medical attention immediately.

WARNING: Do not expose the refrigerant to open flame. Poisonous gas is created when refrigerant is burned. An electronic leak detector is recommended. Severe personal injury or death may result from improper service procedures.

WARNING: If accidental system discharge occurs, ventilate the work area before resuming service. Large amounts of refrigerant released in a closed work area will displace the oxygen and cause suffocation and death.

WARNING: The evaporation rate of R-134a refrigerant at average temperature and altitude is extremely high. As a result, anything that comes in contact with the refrigerant will freeze. Always protect the skin or delicate objects from direct contact with the refrigerant.

WARNING: The R-134a service equipment or the vehicle refrigerant system should not be pressure tested or leak tested with compressed air. Some mixtures of air and R-134a have been shown to be combustible at elevated pressures. These mixtures are potentially dangerous, and may result in fire or explosion causing property damage, personal injury or death.

WARNING: The engine cooling system is designed to develop internal pressures of 97 to 123 kilopascals (14 to 18 pounds per square inch). Do not remove or loosen the coolant pressure cap, cylinder block drain plugs, radiator drain, radiator hoses, heater hoses, or hose clamps while the engine cooling system is hot and under pressure. Allow the vehicle to cool for a minimum of 15 minutes before opening the cooling system for service. Failure to observe this warning can result in serious burns from the heated engine coolant.

CAUTION

CAUTIONS

CAUTION: Never add R-12 to a refrigerant system designed to use R-134a. Do not use R-12 equipment or parts on a R-134a A/C system. These refrigerants are not compatible and damage to the A/C system will result.

CAUTION: Never use R-12 refrigerant oil in a A/C system designed to use R-134a refrigerant oil. These refrigerant oils are not compatible and damage to the A/C system will result.

CAUTION: The use of A/C system sealers may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or A/C system. Many federal, state/provincial and local regulations prohibit the recharge of A/C systems with known leaks. DaimlerChrysler recommends the detection of A/C system leaks through the use of approved leak detectors and fluorescent leak detection dyes. Vehicles found with A/C system sealers should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners voids the warranty for the A/C system.

CAUTION: Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: If equipped, do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: The internal parts of the A/C system will remain stable as long as moisture-free refrigerant and refrigerant oil is used. Abnormal amounts of dirt, moisture or air can upset the chemical stability. This may cause operational troubles or even serious damage if present in more than very small quantities. Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system. Keep service tools and the work area clean. Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug. This will prevent contamination from entering the A/C system.

CAUTION: Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

CAUTION: Do not overcharge the refrigerant system. Overcharging will cause excessive compressor head pressure and can cause compressor noise and A/C system failure.

DIAGNOSIS AND TESTING

REFRIGERANT SYSTEM LEAKS

WARNING: R-134a service equipment or vehicle A/C system should not be pressure tested or leak tested with compressed air. Mixture of air and R-134a can be combustible at elevated pressures. These mixtures are potentially dangerous and may result in fire or explosion causing property damage, personal injury or death.

Avoid breathing A/C refrigerant and lubricant vapor or mist. Exposure may irritate eyes, nose and throat. Use only approved service equipment meeting SAE requirements to discharge R-134a system. If accidental system discharge occurs, ventilate work area before resuming service.

If the A/C system is not cooling properly, determine if the refrigerant system is fully charged with R-134a. This is accomplished by performing a system Charge Level-Check or Fill. If while performing this test A/C liquid line pressure is less than 345 kPa (50 psi) proceed to System Empty procedure. If liquid line pressure is greater than 345 kPa (50 psi) proceed to System Low procedure. If the refrigerant system is empty or low in refrigerant charge, a leak at any line fitting or component seal is likely. A review of the fittings, lines and components for oily residue is an indication of the leak location. To detect a leak in the refrigerant system, perform one of the following procedures as indicated by the symptoms.

SYSTEM EMPTY

1. Evacuate the refrigerant system to the lowest degree of vacuum possible (approximately 28 in Hg.). Determine if the system holds a vacuum for 15 minutes. If vacuum is held, a leak is probably not present. If system will not maintain vacuum level, proceed to Step 2.
2. Prepare a 0.284 Kg. (10 oz.) refrigerant charge to be injected into the refrigerant system.
3. Connect and dispense 0.284 Kg. (10 oz.) of refrigerant into the evacuated refrigerant system.
4. Proceed to Step 2 of System Low procedure.

SYSTEM LOW

1. Determine if there is any R-134a refrigerant in the system.
2. Position the vehicle in a wind free work area. This will aid in detecting small leaks.
3. Bring the refrigerant system up to operating temperature and pressure. This is done by allowing the engine to run for five minutes with the A/C system set to the following:
 - Transmission in Park or Neutral with parking brake set
 - Engine idling
 - Mode control set to the outside air position
 - Blower control set to the high speed position
 - A/C set to the ON position
 - All windows open

CAUTION: A leak detector only designed for R-12 refrigerant will not detect leaks in a R-134a refrigerant system.

4. Shut the vehicle Off and wait 2-7 minutes. Then use an electronic leak detector that is designed to detect R-134a refrigerant and search for leaks. Fittings, lines or components that appear to be oily usually indicate a refrigerant leak. To inspect the A/C evaporator for leaks, insert the leak detector probe into the drain tube opening or an air outlet. A dye for R-134a is available to aid in leak detection. Use only DaimlerChrysler approved refrigerant dye.

STANDARD PROCEDURE

REFRIGERANT SYSTEM SERVICE EQUIPMENT

WARNING: Eye protection must be worn when servicing an A/C refrigerant system. Turn all valves off (rotate clockwise) on the equipment being used before connecting or disconnecting service equipment from the refrigerant system. Failure to observe these warnings may result in personal injury or death.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

When servicing the A/C system, a R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2210 must be used (1). Contact an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

A manifold gauge set (1) may be needed with some recovery/recycling/charging equipment. The manifold gauge set should have manual shut-off valves (2 and 6), or automatic back-flow valves located at the service port connector end of the manifold gauge set hoses (4 and 5). This will prevent refrigerant from being released into the atmosphere.

MANIFOLD GAUGE SET CONNECTIONS

CAUTION: Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and system damage will result.

RECOVERY/RECYCLING/EVACUATION/CHARGING HOSE – The center manifold hose (Yellow, or White, with Black stripe) (3) is used to recover, evacuate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set are opened, the refrigerant in the system will escape through this hose.

HIGH PRESSURE GAUGE HOSE – The high pressure hose (Red with Black stripe) (4) attaches to the high side service port. This service port is located on the top of the receiver/drier. This model is equipped with an A/C pressure transducer. A/C high-side pressures can be read using a scan tool. Refer to 9 - Engine Electrical Diagnostics for more information.

LOW PRESSURE GAUGE HOSE – The low pressure hose (Blue with Black stripe) (5) attaches to the low side service port. This service port is located on the A/C suction line near the A/C expansion valve.

REFRIGERANT SYSTEM RECOVERY

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

An R-134a refrigerant recovery/recycling/charging station (1) that meets SAE standard J2210 must be used to recover the refrigerant from the R-134a refrigerant system. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

REFRIGERANT SYSTEM EVACUATE

NOTE: Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the compressor.

If an A/C compressor designed to use R-134a refrigerant is left open to the atmosphere for an extended period of time. It is recommended that the refrigerant oil be drained and replaced with new oil or a new A/C compressor be used. This will eliminate the possibility of contaminating the refrigerant system.

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be filled. Moisture and air mixed with the refrigerant will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the A/C system and damage the A/C compressor. Moisture will boil at near room temperature when exposed to vacuum. To evacuate the refrigerant system:

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

1. Recover the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Connect a suitable charging station, refrigerant recovery machine or a manifold gauge set with vacuum pump and refrigerant recovery equipment (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM SERVICE EQUIPMENT).
3. Open the suction and discharge valves and start the vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to charge to eliminate all moisture in system. When the suction gauge reads -88 kPa (- 26 in. Hg) vacuum or greater for 30 minutes, close all valves and turn off vacuum pump. If the system fails to reach specified vacuum, the refrigerant system likely has a leak that must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the suction and discharge valves. Then allow the system to evacuate an additional 10 minutes.
4. Close all valves. Turn off and disconnect the vacuum pump.
5. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

REFRIGERANT SYSTEM CHARGE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: Always refer to the underhood HVAC Specification Label for the refrigerant fill specification of the vehicle being serviced.

After all refrigerant system leaks have been repaired and the refrigerant system has been evacuated, a refrigerant charge can be injected into the system. For the proper amount of the refrigerant charge, refer to the underhood HVAC Specification Label.

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to charge the refrigerant system with R-134a refrigerant. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

CHARGING PROCEDURE

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you **MUST** replenish any oil lost during the recovery process. Refer the equipment manufacturer instructions for more information.

1. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
2. A manifold gauge set and an R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2210 should be connected to the refrigerant system.
3. Measure the proper amount of refrigerant and heat it to 52° C (125° F) with the charging station. See the operating instructions supplied by the equipment manufacturer for proper use of this equipment.
4. Open both the suction and discharge valves, then open the charge valve to allow the heated refrigerant to flow into the system.
5. When the transfer of refrigerant has stopped, close both the suction and discharge valves.
6. If all of the refrigerant charge did not transfer from the dispensing device, open all of the windows in the vehicle and set the heating-A/C system controls so that the A/C compressor is engaged and the blower motor is operating at its lowest speed setting. Run the engine at a steady high idle (about 1400 rpm). If the A/C compressor does not engage, test the compressor clutch control circuit and repair as required.
7. Open the low-side valve to allow the remaining refrigerant to transfer to the refrigerant system.

WARNING: Take care not to open the discharge (high pressure) valve at this time. Failure to follow this warning could result in possible personal injury or death.

8. Disconnect the charging station and manifold gauge set from the refrigerant system service ports.
9. Reinstall the caps onto the refrigerant system service ports.

COMPRESSOR-A/C

DESCRIPTION

A/C COMPRESSOR

The A/C system uses a Denso 10S17C ten cylinder, double-acting swash plate-type A/C compressor (1). This A/C compressor has a fixed displacement of 170 cubic centimeters (10.374 cubic inches), and has both the suction and discharge ports (2) located on the cylinder head (3) at the rear of the compressor.

A label identifying the use of R-134a refrigerant is located on the A/C compressor.

HIGH PRESSURE RELIEF VALVE

A high pressure relief valve is located on the compressor cylinder head, which is at the rear of the A/C compressor. This mechanical valve is designed to vent refrigerant from the A/C system to protect against damage to the A/C compressor and other A/C system components, caused by condenser air flow restriction or an overcharge of refrigerant.

OPERATION

A/C COMPRESSOR

The A/C compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement. The A/C compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant.

The A/C compressor draws in low-pressure refrigerant vapor from the A/C evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the A/C condenser through the compressor discharge port.

The A/C compressor cannot be repaired and, if faulty or damaged, it must be replaced. The compressor clutch, pulley and bearing assembly, and clutch field coil are available for service.

HIGH PRESSURE RELIEF VALVE

The high pressure relief valve vents refrigerant from the A/C system when a discharge pressure of 3445 to 4135 kPa (500 to 600 psi) or above is reached. The high pressure relief valve closes with a minimum discharge pressure of 2756 kPa (400 psi) is reached.

The high pressure relief valve vents only enough refrigerant to reduce the A/C system pressure, and then re-seats itself. The majority of the refrigerant is conserved in the A/C system. If the high pressure relief valve vents refrigerant, it does not mean the valve is faulty.

The high pressure relief valve is factory-calibrated and cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The valve is only serviced as a part of the A/C compressor.

DIAGNOSIS AND TESTING

A/C COMPRESSOR

When investigating an A/C system related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during A/C operation can often be misleading. For example: What sounds like a failed front engine bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets or a loose compressor clutch assembly.

Drive belts are speed sensitive. At different engine speeds and depending upon drive belt tension, drive belts can develop noises that are mistaken for an A/C compressor noise. Improper drive belt tension can cause a misleading noise when the compressor clutch is engaged, which may not occur when the compressor clutch is disengaged. Check the accessory drive belt condition and tension as described in Cooling before beginning this procedure.

1. Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Turn the A/C compressor On and Off several times to clearly identify the compressor noise. Listen to the A/C compressor while the clutch is engaged and disengaged. Probe the A/C compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise.
2. Loosen all of the compressor mounting hardware and retighten. Check the compressor clutch retainer. Be certain that the clutch field coil is mounted securely to the A/C compressor, and that the clutch plate and pulley are properly aligned and have the correct air gap (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CLUTCH-A/C COMPRESSOR - INSTALLATION).
3. To duplicate high-ambient temperature conditions (high head pressure), restrict the air flow through the A/C condenser. Install a manifold gauge set or a scan tool to be certain that the discharge pressure does not exceed 2760 kPa (400 psi).
4. Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines and hoses for kinks or sharp bends that will restrict refrigerant flow, which can cause noises (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DESCRIPTION - REFRIGERANT LINES)
5. If the noise is from opening and closing of the high pressure relief valve, recover, evacuate and recharge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY), (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).
6. If the high pressure relief valve still does not seat properly, replace the A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR-A/C - REMOVAL).

REMOVAL

3.7L/4.7L ENGINES

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the compressor clutch, clutch coil, engine, engine cylinder head or the generator.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the resonator from the air cleaner housing and the engine (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - REMOVAL).
4. Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - REMOVAL).
5. Remove the nuts (1) that secure the A/C discharge line (4) and the A/C suction line (6) to the A/C compressor (2).
6. Disconnect the refrigerant lines from the A/C compressor and remove and discard the seals.
7. Install plugs in, or tape over all of the opened refrigerant line fittings and the compressor ports.

8. Disconnect the wire harness connector from the A/C compressor.
9. Loosen the bolt (5) that secures the bracket (7) to the accessory mounting bracket (4).
10. Remove the bolts (1, 6 and 3) that secure the A/C compressor (2) to the accessory mounting bracket.
11. Remove the A/C compressor from the engine compartment.

5.7L ENGINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the compressor clutch, clutch coil, engine, engine cylinder head or the generator.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the resonator from the air cleaner housing and engine (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - REMOVAL).
4. Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - REMOVAL).
5. Remove the nuts (2) that secure the A/C discharge line (1) and A/C suction line (3) to the A/C compressor (4).
6. Disconnect the refrigerant lines from the A/C compressor and remove and discard the seals.
7. Install plugs in, or tape over all of the opened refrigerant line fittings and the compressor ports.

8. Remove the three bolts (1) that secure the power steering pump (2) to the engine and position the pump out of the way (Refer to 19 - STEERING/ PUMP - REMOVAL).
9. Disconnect the wire harness connector (3) from the A/C compressor (5).
10. Support the A/C compressor and remove the bolts (4) that secure the compressor to the engine.
11. Remove the A/C compressor from the engine compartment.

INSTALLATION

3.7L/4.7L ENGINES

NOTE: If a replacement A/C compressor is being installed, be certain to check the refrigerant oil level. See Refrigerant Oil Level in this group for the procedures. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

1. Position the A/C compressor (2) onto the accessory mounting bracket (4).
2. Install and tighten the bolts in the following sequence:
 - Install bolt (3) and hand tighten.
 - Install bolt (6) and hand tighten.
 - Install bolt (1) and hand tighten.
 - Tighten bolt (3) to 40 N·m (30 ft. lbs.).
 - Tighten bolt (6) to 55 N·m (41 ft. lbs.).
 - Tighten bolt (1) to 55 N·m (41 ft. lbs.).
 - Tighten bolt (5) to 55 N·m (41 ft. lbs.).
3. Connect the wire harness connector to the A/C compressor clutch coil connector.

4. Remove the tape or plugs from the opened refrigerant line fittings and the compressor ports.
5. Lubricate new seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
6. Install the A/C suction line (6) and the A/C discharge line (4) onto the A/C compressor (2).
7. Install the nuts (1) that secure the refrigerant lines to the A/C compressor. Tighten the nuts to 20 N·m (15 ft. lbs.).
8. Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - INSTALLATION).
9. Install the resonator onto the engine and air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - INSTALLATION).

10. Reconnect the negative battery cable.
11. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
12. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

5.7L ENGINE

NOTE: Be certain to check the refrigerant oil level if the A/C compressor is being replaced. See Refrigerant Oil Level in this group for the procedures. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

1. Position the A/C compressor (5) into the engine compartment.
2. Install the bolts (4) that secure the A/C compressor to the engine. Tighten the bolts to 55 N·m (41 ft. lbs.).
3. Connect the wire harness connector (3) to the A/C compressor.
4. Position the power steering pump (2) onto the engine.
5. Install the three bolts (1) that secure the power steering pump to the engine. Tighten the bolts securely.

6. Remove the tape or plugs from the opened refrigerant line fittings and the compressor ports.
7. Lubricate new seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
8. Install the A/C suction line (3) and the A/C discharge line (1) onto the A/C compressor (4).
9. Install the nuts (2) that secure the refrigerant lines to the A/C compressor. Tighten the nuts to 20 N·m (15 ft. lbs.).
10. Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - INSTALLATION).
11. Install the resonator onto the engine and the air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - INSTALLATION).

12. Reconnect the negative battery cable.
13. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
14. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

CONDENSER-A/C

DESCRIPTION

The A/C condenser (1) is located in the front of the engine compartment behind the grille. The A/C condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the A/C compressor to give up its heat to the air passing over the condenser fins, which causes the refrigerant to cool and change to a liquid state.

The A/C condenser is equipped with an integral automatic transmission cooler and tapping block (2), mounting provisions for the power steering cooler (3) and a tapping block for the A/C discharge line and the receiver/drier (4).

OPERATION

When air passes through the fins of the A/C condenser, the high-pressure refrigerant gas within the A/C condenser gives up its heat. The refrigerant then condenses as it leaves the A/C condenser and becomes a high-pressure liquid. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the A/C system. Therefore, it is important that there are no objects placed in front of the radiator grille openings at the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or A/C condenser service.

The A/C condenser cannot be repaired and, if faulty or damaged, it must be replaced.

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the grille (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
4. Remove the air filter housing and air inlet tube (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - REMOVAL).

NOTE: It is not necessary to remove the hood latch from the radiator crossmember when servicing the A/C condenser.

5. Remove the upper radiator crossmember and support bracket and position them out of the way (Refer to 23 - BODY/EXTERIOR/CROSSMEMBER-RADIATOR - REMOVAL).
6. Remove the power steering fluid cooler or position it out of the way (depending on application) (Refer to 19 - STEERING/PUMP/COOLER-FLUID - REMOVAL).
7. Disconnect the automatic transmission cooler lines (1) from the transmission fluid cooler (2) (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE - TRANSMISSION COOLER LINE QUICK CONNECT FITTING).
8. Install plugs in, or tape over the automatic transmission cooler line fittings and the fluid cooler ports.

9. Disconnect the A/C discharge line (1) from the A/C condenser (2) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LINE-A/C DISCHARGE - REMOVAL).
10. Loosen the screw (3) that secures the receiver/drier (4) to the radiator and fan shroud (5).
11. Disconnect the receiver drier inlet tube (6) from the A/C condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/RECEIVER/DRIER - REMOVAL).

12. Remove the four bolts (1) that secure A/C condenser (2) to the radiator (3).
13. Carefully lift the A/C condenser straight up and out of the engine compartment.

INSTALLATION

NOTE: If the A/C condenser is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

1. Carefully position the A/C condenser (2) onto the radiator (3).
2. Install the four bolts (1) that secure the A/C condenser to the radiator. Tighten the bolts to 5 N·m (45 in. lbs.).

3. Connect the receiver/drier inlet tube (6) to the A/C condenser (2) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/RECEIVER / DRIER - INSTALLATION).
4. Tighten the screw (3) that secures the receiver/drier (4) to the radiator and fan shroud (5). Tighten the screw to to 5 N·m (44 in. lbs.).
5. Connect the A/C discharge line (1) to the A/C condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LINE-A/C DISCHARGE - INSTALLATION) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LINE-A/C LIQUID - INSTALLATION).

6. Remove the tape or plugs from the automatic transmission cooler line fittings and the fluid cooler ports.
7. Connect the automatic transmission cooler lines (1) to the transmission fluid cooler (2) (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE - TRANSMISSION COOLER LINE QUICK CONNECT FITTING).
8. Install the power steering fluid cooler (Refer to 19 - STEERING/PUMP/COOLER-FLUID - INSTALLATION).
9. Install the upper radiator crossmember and support bracket (Refer to 23 - BODY/EXTERIOR/CROSS-MEMBER-RADIATOR - INSTALLATION).
10. Install the air filter housing and air inlet tube (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - INSTALLATION).
11. Install the grille (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).

12. Reconnect the negative battery cable.
13. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
14. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).
15. Check the automatic transmission fluid level (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC/FLUID AND FILTER - STANDARD PROCEDURE - CHECK OIL LEVEL). Fill as required (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC /FLUID AND FILTER - STANDARD PROCEDURE - TRANSMISSION FILL).

CORE-HEATER

DESCRIPTION

The heater core (1) is mounted into the HVAC air distribution housing, located behind the instrument panel. The heater core is a heat exchanger made of rows of tubes and fins. The heater core tubes (2) are attached to the HVAC housing by a bracket and screw (3) and to the heater core by a flange and bolt (4).

The heater core can be serviced without removing the air distribution housing from the vehicle.

OPERATION

Engine coolant is circulated through the heater hoses to the heater core at all times. As the coolant flows through the heater core, heat is removed from the engine and is transferred to the heater core tubes and fins. Air directed through the heater core picks up the heat from the heater core fins. The blend-air door(s) allows control of the heater output air temperature by regulating the amount of air flowing through the heater core. The blower motor speed controls the volume of air flowing through the HVAC housing.

The heater core cannot be repaired and, if faulty or damaged, it must be replaced.

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: Take the proper precautions to protect the front face of the instrument panel from cosmetic damage while performing this procedure.

1. Drain the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAIN).
2. Disconnect and isolate the negative battery cable.
3. If required, disconnect the heater hoses from the heater core tubes in the engine compartment.
4. Remove the instrument panel (Refer to 23 - BODY/ INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
5. Remove the five screws (1) that secure the heater core and tube cover (2) to the HVAC housing (3).
6. Remove the heater core and tube cover from the HVAC housing.

7. If equipped with dual zone heating-A/C, remove the blend door actuator (1) from the passenger side of the HVAC air distribution housing (2) (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ACTUATOR-BLEND DOOR - REMOVAL).
8. Remove the screw (3) that secures the heater core tubes (4) and retaining bracket (5) to the HVAC housing (6).

NOTE: Take proper precautions to protect the carpeting from engine coolant. Have absorbent toweling readily available to clean up any spills.

9. Remove the bolt (7) that secures the heater tubes to the heater core (8).
10. Disconnect the heater core tubes from the heater core and remove and discard the O-ring seals.
11. Install plugs in, or tape over the opened heater core ports.
12. Carefully pull the heater core out of the HVAC air distribution housing.
13. If required, remove the heater core tubes from the vehicle.

INSTALLATION

1. Carefully install the heater core (8) into the passenger side of the HVAC air distribution housing (2).
2. Remove the tape or plugs from the heater core ports.
3. If removed, position the heater core tubes (4) into the vehicle.
4. Lubricate new rubber O-ring seals with clean engine coolant and install them onto the heater core tubes. Use only the specified O-ring as they are made of a special material for the engine cooling system.
5. Connect the heater core tubes to the heater core.
6. Install the bolt (7) that secures the heater core tubes to the heater core. Tighten the bolt securely.
7. Install the screw (3) that secures the heater core tube retaining bracket (5) to the HVAC housing (6). Tighten the screw to 2.2 N·m (20 in. lbs.).
8. If equipped with dual zone heating-A/C, install the blend door actuator (1) onto the passenger side of the HVAC air distribution housing (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ACTUATOR-BLEND DOOR - INSTALLATION).

9. Install the heater core and tube cover (2) onto the HVAC housing (3).
10. Install the five screws (1) that secure the heater core and tube cover to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).
11. Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).
12. If disconnected, connect the heater hoses to the heater core tubes in the engine compartment.
13. Connect the negative battery cable.
14. If the heater core is being replaced, flush the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM CLEANING/REVERSE FLUSHING).
15. Refill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).

CORE-VALVE-SERVICE PORT

DESCRIPTION

Refrigerant system service ports are used to recover, recycle, evacuate, charge and test the A/C refrigerant system. Unique sizes are used on the two service ports for the R-134a refrigerant system to ensure the system is not accidentally contaminated with R-12 refrigerant or by service equipment used for R-12 refrigerant.

NOTE: 4.7L engine shown in illustration. Service ports for other engines are located in similar locations.

The high side service port (1) is located on the receiver/drier (2) near the right side of the radiator (3) and its protective cap is attached to the service port with a tether strap. The low side service port (4) is located on the A/C suction line (5) near the dash panel (6). Both the high side and low side A/C service port valve cores are serviceable.

813f3431

NOTE: The protective cap aids in service port sealing and helps protect the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.

Each of the service ports has a threaded plastic protective cap installed over it from the factory. The service port caps are serviceable items.

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: Typical A/C service port shown.

1. Remove the protective cap (1) from the service port (2).
2. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Using a Schrader-type valve core tool, remove the valve core (3) from the service port.
4. Install a plug in or tape over the opened service port(s).

8126e644

INSTALLATION

NOTE: Typical A/C service port shown.

1. Lubricate the valve core (3) with clean refrigerant oil prior to installation. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Remove the tape or plug from the service port (2).

CAUTION: A valve core that is not fully seated in the A/C service port can result in damage to the valve during refrigerant system evacuation and charge. Such damage may result in a loss of system refrigerant while uncoupling the charge adapters.

3. Using a Schrader-type valve core tool, install and tighten the valve core into the service port(s).
4. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
5. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

NOTE: The protective cap helps aid in service port sealing and helps protects the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.

6. Install the protective cap (1) onto the service port.

EVAPORATOR-A/C

DESCRIPTION

The A/C evaporator (1) for the heating-A/C system is located within the HVAC housing, behind the instrument panel. The A/C evaporator and its insulator (2) are positioned in the HVAC housing so that all air entering the housing must pass over the evaporator fins before it is distributed through the heating-A/C system ducts and outlets. However, air passing over the evaporator fins will only be conditioned when the A/C compressor is engaged and circulating refrigerant through the A/C evaporator.

The A/C evaporator tubes (3) are connected and sealed to the A/C expansion valve by use of rubber O-rings (4) and a tapping block (5).

The A/C evaporator can only be serviced by removing and disassembling the HVAC housing assembly.

OPERATION

Refrigerant enters the A/C evaporator from the A/C expansion valve as a low-temperature, low-pressure mixture of liquid and gas. As air flows over the fins of the A/C evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the A/C evaporator.

The A/C evaporator cannot be repaired and, if faulty or damaged, it must be replaced.

REMOVAL

1. Remove the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - REMOVAL).
2. Disassemble the HVAC housing as necessary to access the A/C evaporator (1) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - DISASSEMBLY).
3. Open the rubber seal (1) and carefully lift the A/C evaporator (2) and insulator (3) out of the lower half of the HVAC housing (4).
4. If required, remove the rubber seal from the lower half of the HVAC housing. If the seal is deformed or damaged, it must be replaced.
5. If required, remove the insulator from the A/C evaporator. If the insulator is deformed or damaged, it must be replaced.

INSTALLATION

NOTE: If the front A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

1. If removed, install the insulator (3) over the A/C evaporator (2). If the seal is deformed or damaged, it must be replaced.
2. If removed, install the rubber seal (1) into the lower half of the HVAC housing (4). If the seal is deformed or damaged, it must be replaced.
3. Install the A/C evaporator into the lower half of the HVAC housing. Make sure that the evaporator drain within the HVAC housing is clean and unrestricted and that the insulator and rubber seal are properly installed.
4. Assemble the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - ASSEMBLY).
5. Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - INSTALLATION).

LINE-A/C DISCHARGE

DESCRIPTION

NOTE: 4.7L engine shown in illustration. A/C discharge line for other engines are similar.

The A/C discharge line (1) is the refrigerant line that carries refrigerant from the A/C compressor (2) to the A/C condenser (3). The A/C discharge line on models equipped with the 5.7L engine include a fitting for the A/C pressure transducer. For more information refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ TRANSDUCER-A/C PRESSURE - DESCRIPTION.

CAUTION: Use only seals specified for the vehicle. Failure to use the correct seals will cause the refrigerant system connections to leak.

The A/C discharge line has no serviceable parts except for the dual plane seals. The seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The seals must be replaced whenever the A/C discharge line is removed and installed.

If the A/C discharge line is found to be leaking or is damaged, it must be replaced.

REMOVAL

3.7L/4.7L ENGINES

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the grille (Refer to 23 - BODY/EXTERIOR/ GRILLE - REMOVAL).
4. Remove the air cleaner housing, air intake tube and the resonator (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - REMOVAL).
5. Remove the nut (1) that secures the A/C discharge line (4) to the A/C compressor (2).
6. Disconnect the A/C discharge line from the A/C compressor and remove and discard the dual plane seal.
7. Remove the nut (5) that secures the A/C discharge line to the A/C condenser (3).

8. Disconnect the A/C discharge line from the A/C condenser and remove and discard the dual plane seal.
9. Install plugs in, or tape over the opened discharge line fittings and the compressor and condenser ports.
10. Remove the A/C discharge line from the engine compartment.

5.7L ENGINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the grille (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
4. Remove the air cleaner housing, air intake tube and the resonator (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - REMOVAL).
5. Disconnect the wire harness connector (8) from the A/C pressure transducer (7) and remove the transducer from the A/C discharge line (5), if required.
6. Remove the nut (6) that secures the A/C discharge line to the A/C condenser (4).
7. Disconnect the A/C discharge line from the A/C condenser and the retaining bracket (9) and remove and discard the dual plane seal.

8. Remove the nut (2) that secures the A/C discharge line (1) to the A/C compressor (4).
9. Disconnect the A/C discharge line from the A/C compressor and remove and discard the dual plane seal.
10. Install plugs in, or tape over the opened refrigerant line fittings and the compressor and condenser ports.
11. Remove the A/C discharge line from the engine compartment.

INSTALLATION

3.7L/4.7L ENGINES

1. Position the A/C discharge line (4) into the engine compartment.
2. Remove the tape or plugs from the discharge line fittings and the A/C compressor (2) and A/C condenser (3).
3. Lubricate new dual plane seals with clean refrigerant oil and install them onto the A/C discharge line. Use only the specified seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Install the A/C discharge line onto the A/C compressor.
5. Install the nut (1) that secures the A/C discharge line to the A/C compressor. Tighten the nut to 20 N·m (15 ft. lbs.).
6. Install the A/C discharge line onto the A/C condenser.
7. Install the nut (5) that secures the A/C discharge line to the A/C condenser. Tighten the nut to 20 N·m (15 ft. lbs.).
8. Install the air cleaner housing, air intake tube and the resonator (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
9. Install the grille (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).
10. Reconnect the negative battery cable.
11. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
12. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

5.7L ENGINE

1. Position the A/C discharge line (1) into the engine compartment.
2. Remove the tape or plugs from the opened discharge line fittings and the compressor and condenser ports.
3. Lubricate new dual plane seals with clean refrigerant oil and install them onto the discharge line fittings. Use only the specified seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Install the A/C discharge line onto the A/C compressor (4).
5. Install the nut (2) that secures the A/C discharge line to the A/C compressor. Tighten the nut to 20

N·m (15 ft. lbs.).

6. Install the A/C discharge line (5) into the retaining bracket (9) and to the A/C condenser (4).
7. Install the nut (6) that secures the A/C discharge line to the A/C condenser. Tighten the nut to 20 N·m (15 ft. lbs.).
8. If removed, install the A/C pressure transducer (7) onto the A/C discharge line. Tighten the A/C pressure transducer securely.
9. Connect the wire harness connector (8) to the A/C pressure transducer.
10. Install the air cleaner housing, air intake tube and the resonator (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - INSTALLATION).
11. Install the grille (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).
12. Reconnect the negative battery cable.
13. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
14. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

LINE-A/C LIQUID

DESCRIPTION

The A/C liquid line (1) is the refrigerant line that carries refrigerant from the receiver/drier to the A/C expansion valve (2). The A/C liquid is serviced in one section and is secured to the right side frame (3) rail by two plastic retainer clips (4).

CAUTION: Use only seals specified for the vehicle. Failure to use the correct seals will cause the refrigerant system connections to leak.

The A/C liquid line has no serviceable parts except for the O-ring and dual plane seal. The seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The seals must be replaced whenever the A/C liquid line is removed and installed.

If the A/C liquid line is found to be leaking or damaged, it must be replaced.

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the air cleaner housing, air intake tube and the resonator (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - REMOVAL).

NOTE: 4.7L engine shown in illustration. Vehicles equipped with other engines are similar.

4. Remove the nut (3) that secures the A/C suction line (2) and the A/C liquid line (10) to the A/C expansion valve (1).
5. Disconnect the A/C suction line from the A/C expansion valve and remove and discard the O-ring seal.
6. Remove the nut (1) that secures the A/C liquid line (2) to the receiver/drier (3).
7. Disconnect the A/C liquid line from the receiver/drier and remove and discard the dual plane seal.

8. Disengage the two liquid line retainer clips (4) from the right frame rail (3). If required remove the clips from the liquid line
9. Disconnect the A/C liquid line (1) from the A/C expansion valve (2) and remove and discard the O-ring seal.
10. Install plugs in, or tape over the opened liquid and suction line fittings and the receiver/drier and expansion valve ports.
11. Remove the A/C liquid line from the engine compartment.

INSTALLATION

1. Position the A/C liquid line (1) into the engine compartment.
2. Remove the tape or plugs from the opened liquid and suction line fittings and the receiver/drier and expansion valve ports.
3. Lubricate a new O-ring seal with clean refrigerant oil and install it onto the rear liquid line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the A/C liquid line to the A/C expansion valve (2) and engage the two liquid line retainer clips (4) to the frame rail (3).

5. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the front liquid line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
6. Connect the A/C liquid line (2) to the receiver/drier (3).
7. Install the nut (1) that secures the A/C liquid line to the receiver/drier. Tighten the nut to 20 N·m (15 ft. lbs.).

8. Lubricate a new O-ring seal with clean refrigerant oil and install it onto the rear suction line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: 4.7L engine shown in illustration. Vehicles equipped with other engines are similar.

9. Connect the A/C suction line (2) to the A/C expansion valve (1).
10. Install the nut (3) that secures the A/C suction line and the A/C liquid line (10) to the A/C expansion valve. Tighten the nut to 23 N·m (17 ft. lbs.).
11. Install the air cleaner housing, air intake tube and the resonator (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - INSTALLATION).

12. Reconnect the negative battery cable.
13. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
14. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

LINE-A/C SUCTION

DESCRIPTION

NOTE: 4.7L engine shown in illustration. A/C discharge line for other engines are similar.

The A/C suction line (1) is the refrigerant line that carries refrigerant from the evaporator and A/C expansion valve (2) to the A/C compressor (3). The A/C suction line includes the low side service port (4).

CAUTION: Use only seals specified for the vehicle. Failure to use the correct seals will cause the refrigerant system connections to leak.

The A/C suction line has no serviceable parts except for the O-ring and dual plane seal, low-side service port valve and protective cap. The seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The seals must be replaced whenever the A/C suction line is removed and installed.

If the A/C suction line is found to be leaking or damaged, it must be replaced.

REMOVAL

3.7L/4.7L ENGINES

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the air intake tube and the resonator (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - REMOVAL).
4. Remove the nut (1) that secures the A/C suction line (6) to the A/C compressor (2).
5. Disconnect the A/C suction line from the A/C compressor and remove and discard the dual plane seal.
6. Remove the nut (7) that secures the A/C suction line to the A/C expansion valve (8).
7. Disconnect the A/C suction line from the A/C expansion valve and remove and discard the O-ring seal.
8. Install plugs in, or tape over the opened suction line fittings and the compressor and expansion valve ports.
9. Remove the A/C suction line from the engine compartment.

5.7L ENGINE

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the air intake tube and the resonator (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/ HOUSING-AIR CLEANER - REMOVAL).
4. Remove the nut (3) that secures the A/C suction line (2) to the A/C expansion valve (1).
5. Disconnect the A/C suction line from the A/C expansion valve and the retaining bracket (9) and remove and discard the O-ring seal.

6. Remove the nut (2) that secures the A/C suction line (3) to the A/C compressor (4).
7. Disconnect the A/C suction line from the A/C compressor and remove and discard the dual plane seal.
8. Install plugs in, or tape over the opened suction line fittings and the compressor and expansion valve ports.
9. Remove the A/C suction line from the engine compartment.

INSTALLATION

3.7L/4.7L ENGINES

1. Position the A/C suction line (6) into the engine compartment.
2. Remove the tape or plugs from the suction line fittings and the A/C compressor (2) and A/C expansion valve (8).
3. Lubricate a new O-ring and a dual plane seal with clean refrigerant oil and install them onto the A/C suction line. Use only the specified seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Install the A/C suction line onto the A/C compressor.
5. Install the nut (1) that secures the A/C suction line to the A/C compressor. Tighten the nut to 20 N-m (15 ft. lbs.).
6. Install the A/C suction line onto the A/C expansion valve.
7. Install the nut (7) that secures the A/C suction line to the A/C expansion valve. Tighten the nut to 23 N-m (17 ft. lbs.).
8. Install the air intake tube and the resonator (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
9. Reconnect the negative battery cable.
10. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
11. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

5.7L ENGINE

1. Position the A/C suction line (3) into the engine compartment.
2. Remove the tape or plugs from the opened suction line fittings and the compressor and expansion valve ports.
3. Lubricate a new O-ring and a new dual plane seal with clean refrigerant oil and install them onto the A/C suction line. Use only the specified seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Install the A/C suction line onto the A/C compressor (4).
5. Install the nut (2) that secures the A/C suction line to the A/C compressor. Tighten the nut to 20 N-m (15 ft. lbs.).

6. Install the A/C suction line (2) into the retaining bracket (9) and to the A/C expansion valve (1).
7. Install the nut (3) that secures the A/C suction line to the A/C expansion valve. Tighten the nut to 23 N·m (17 ft. lbs.).
8. Install the air intake tube and the resonator (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - INSTALLATION).
9. Reconnect the negative battery cable.
10. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
11. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

OIL-A/C REFRIGERANT

DESCRIPTION

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, polyalkylene glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils, and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available, and each contains a different additive package. The Denso 10S17 A/C compressor used in this vehicle is designed to use ND-8 PAG refrigerant oil. Use only this type of refrigerant oil the refrigerant system.

OPERATION

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause A/C compressor damage, and too much can reduce A/C system performance.

PAG refrigerant oil is more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil container immediately to prevent moisture contamination.

STANDARD PROCEDURE

REFRIGERANT OIL LEVEL

When an A/C system is assembled at the factory, all components except the A/C compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the A/C compressor is dispersed throughout the refrigerant system. The receiver/drier, A/C evaporator, A/C condenser and the A/C compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of refrigerant oil in the A/C system. This ensures proper lubrication of the A/C compressor. Too little oil will result in damage to the A/C compressor, while too much oil will reduce the cooling capacity of the A/C system and consequently result in higher discharge air temperatures.

CAUTION: The oil used in the Denso 10S17 A/C compressor is ND-8 PAG R-134a refrigerant oil. Only refrigerant oil of the same type should be used to service the A/C system. Do not use any other refrigerant oil. The oil container should be kept tightly capped until it is ready for use and then tightly capped after use to prevent contamination from dirt and moisture. Refrigerant oil will quickly absorb any moisture it comes in contact with, therefore, special effort must be used to keep all R-134a system components moisture-free. Moisture in the refrigerant oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

NOTE: Most reclaim/recycling equipment will measure the lubricant being removed during recovery. This amount of lubricant should be added back into the system. Refer to the reclaim/recycling equipment manufacturers instructions.

It will not be necessary to check the oil level in the A/C compressor or to add oil, unless there has been an oil loss. An oil loss may occur due to a rupture or leak from a refrigerant line, a connector fitting, a component, or a component seal. If a leak occurs, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when a receiver/drier, A/C evaporator or A/C condenser is replaced. See the Refrigerant Oil Capacities chart. When an A/C compressor is replaced, the refrigerant oil must be drained from the old compressor and measured. Drain all of the refrigerant oil from the new A/C compressor, then fill the new compressor with the same amount of refrigerant oil that was drained out of the old compressor.

REFRIGERANT OIL CAPACITIES

COMPONENT NAME	ml.	oz.
Total System Fill	130 ml.	4.4 oz.
A/C Condenser	30 ml.	1.0 oz.
A/C Evaporator	40 ml.	1.4 oz.
Receiver/drier	30 ml.	1.0 oz.
A/C Compressor	Drain and measure the oil from the old compressor. See text.	

RECEIVER/DRIER-A/C

DESCRIPTION

The receiver/drier (1) stores unnecessary refrigerant, filters the refrigerant, helps remove moisture from the refrigerant and retains any refrigerant vapor that may leave the A/C condenser (2) until it becomes a liquid. The receiver/drier is installed on the high-side of the A/C system and is connected directly to the right end of the A/C condenser. The receiver/drier can be easily serviced by removing the grille and air cleaner housing.

OPERATION

The receiver/drier performs a filtering action to prevent foreign material in the refrigerant from contaminating the A/C expansion valve. Refrigerant enters the receiver/drier as a high-pressure, low temperature liquid. Desiccant inside the receiver/drier absorbs any moisture which may have entered and become trapped within the refrigerant system. In addition, during periods of high demand operation of the A/C system, the receiver/drier acts as a reservoir to store surplus refrigerant.

The receiver/drier cannot be repaired. If the receiver/drier is faulty or damaged, or if the refrigerant system has been contaminated or left open to the atmosphere for an indeterminable period or if the A/C compressor has failed, it must be replaced.

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the grille (Refer to 23 - BODY/EXTERIOR/GRILLE - REMOVAL).
4. Remove the air cleaner housing and air inlet tube (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - REMOVAL).
5. Remove the nut (1) that secures the A/C liquid line (2) to the receiver/drier (3).
6. Remove the A/C liquid line from the receiver/drier and remove and discard the dual-plane seal.
7. Remove the screw (4) that secures the receiver/drier to the radiator and fan shroud (5).
8. Remove the nut (6) that secures the receiver/drier to the A/C condenser (7).
9. Disconnect the receiver/drier from the A/C condenser and remove and discard the dual-plane seal.
10. Install plugs in, or tape over the opened receiver/drier fitting and port and the condenser port.

INSTALLATION

NOTE: If the receiver/drier is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only the refrigerant oil of the type recommended for the A/C compressor in the vehicle.

1. Position the receiver/drier (3) into the engine compartment.
2. Remove the tape or plugs from the receiver/drier fitting and port and the port of the A/C condenser (7).
3. Lubricate a new dual-plane seal with clean refrigerant oil and install it onto the receiver/drier fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the receiver/drier to the right end of the A/C condenser.
5. Install the nut (6) that secures the receiver/drier to the A/C condenser. Tighten the nut to 20 N-m (15 ft. lbs.).
6. Install the screw (4) that secures the receiver/drier to the radiator and fan shroud (5). Tighten the screw to to 5 N-m (44 in. lbs.).

7. Lubricate a new dual-plane seal with clean refrigerant oil and install it onto the A/C liquid line (2) Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
8. Install the nut (1) that secures the A/C liquid line to the receiver/drier. Tighten the nut to 20 N-m (15 ft. lbs.).
9. Install the air cleaner housing and air intake tube (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - INSTALLATION).
10. Install the grille (Refer to 23 - BODY/EXTERIOR/GRILLE - INSTALLATION).
11. Reconnect the negative battery cable.
12. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
13. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

REFRIGERANT-A/C

DESCRIPTION

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas.

Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming.

OPERATION

R-134a refrigerant is not compatible with R-12 refrigerant in an A/C system. Even a small amount of R-12 refrigerant added to an R-134a refrigerant system will cause A/C compressor failure, refrigerant oil sludge or poor A/C system performance. In addition, the polyalkylene glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.

R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a refrigerant system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the A/C compressor to identify that the A/C system is equipped with R-134a refrigerant.

VALVE-A/C EXPANSION

DESCRIPTION

The A/C expansion valve controls the amount of refrigerant entering the A/C evaporator and is of a thermostatic expansion valve (TXV) design. The A/C expansion valve consists of an aluminum H-valve type body (1) with an integral thermal sensor (2) and is located at the dash panel between the A/C refrigerant lines and the A/C evaporator.

OPERATION

The A/C expansion valve controls the high-pressure, low temperature liquid refrigerant from the liquid line and converts it into a low-pressure, low-temperature mixture of liquid and gas before it enters the A/C evaporator. A mechanical sensor in the A/C expansion valve monitors the temperature and pressure of the refrigerant leaving the A/C evaporator through the suction line, and adjusts the orifice size at the liquid line port to let the proper amount of refrigerant into the A/C evaporator to meet the vehicle A/C cooling requirements. Controlling the refrigerant flow through the A/C evaporator ensures that none of the refrigerant leaving the A/C evaporator is still in a liquid state, which could damage the A/C compressor.

The A/C expansion valve is factory calibrated and cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING

A/C EXPANSION VALVE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The A/C expansion valve should only be tested following testing of the A/C compressor.

NOTE: Liquid CO² is required to test the A/C expansion valve. This material is available from most welding supply facilities. Liquid CO² is also available from companies which service and sell fire extinguishers.

When testing the A/C expansion valve, the work area and the vehicle temperature must be 21° to 27° C (70° to 85° F). To test the expansion valve:

1. Connect a charging station or manifold gauge set to the refrigerant system service ports. Verify the refrigerant charge level.
2. Close all doors, windows and vents to the passenger compartment.
3. Set the A/C-heater controls so that the A/C compressor is operating, the temperature control is in the highest temperature position, the mode-air doors is directing air output to the floor and the blower motor operating is operating at the highest speed.

4. Start the engine and allow it to idle. After the engine has reached normal operating temperature, allow the passenger compartment to heat up. This will create the need for maximum refrigerant flow into the A/C evaporator.
5. If the refrigerant charge is sufficient, the discharge (high pressure) gauge should read 827 kPa to 1655 kPa (120 psi to 240 psi). The suction (low pressure) gauge should read 207 kPa to 345 kPa (30 psi to 50 psi). If OK, go to Step 6. If not OK, replace the faulty A/C expansion valve.

WARNING:

Protect the skin and eyes from exposure to liquid CO² or personal injury can result.

6. If the suction (low pressure) gauge reads within the specified range, freeze the A/C expansion valve for 30 seconds using liquid CO² or another suitable super-cold material. **Do not spray R-134a or R-12 refrigerant on the A/C expansion valve for this test.** The suction (low pressure) gauge reading should drop by 69 kPa (10 psi). If OK, go to Step 7. If not OK, replace the faulty A/C expansion valve.
7. Allow the expansion valve control head to thaw. The suction (low pressure) gauge reading should stabilize at 207 kPa to 345 kPa (30 psi to 50 psi). If not OK, replace the faulty A/C expansion valve.
8. When expansion valve testing is complete, test the overall A/C system performance (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE TEST).

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNINGS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTIONS). Failure to follow the warnings and cautions could result in possible personal injury or death.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the air intake tube and the resonator (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - REMOVAL).
4. Remove the nut (1) that secures the A/C suction line (2) and the A/C liquid line (3) to the A/C expansion valve (4).
5. Disconnect the A/C suction and liquid lines from the A/C expansion valve and remove and discard the O-ring seals.
6. Install plugs in, or tape over the opened refrigerant line fittings and position the lines out of the way.

7. Remove the two bolts (1) that secure the A/C expansion valve (2) to the evaporator tube tapping block (3).
8. Remove the A/C expansion valve from the evaporator tube tapping block and remove and discard the O-ring seals.
9. Install plugs in, or tape over the opened evaporator tube fittings and all expansion valve ports.

INSTALLATION

1. Remove the tape or plugs from the evaporator tube fittings and all of the expansion valve ports.
2. Lubricate new O-ring seals with clean refrigerant oil and install them onto the evaporator tube fittings. Use only the specified seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Install the A/C expansion valve (2) onto the evaporator tube tapping block (3).
4. Install the two bolts (1) that secure the A/C expansion valve to the evaporator tube tapping block. Tighten the bolts to 11 N·m (97 in. lbs.).

5. Remove the tape or plugs from the A/C suction line (2) and the A/C liquid line (3).
6. Lubricate new O-ring seals with clean refrigerant oil and install them onto the A/C suction and liquid lines. Use only the specified seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
7. Connect the A/C suction and liquid lines to the A/C expansion valve (4).
8. Install the nut (1) that secures the A/C suction and liquid lines to the A/C expansion valve. Tighten the nut to 23 N·m (17 ft. lbs.).
9. Install the air intake tube and the resonator (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/HOUSING-AIR CLEANER - INSTALLATION).
10. Reconnect the negative battery cable.
11. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
12. Recharge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

EMISSIONS 3.7L/4.7L/5.7L

DESCRIPTION

STATE DISPLAY TEST MODE

The switch inputs to the Powertrain Control Module (PCM) have two recognized states; HIGH and LOW. For this reason, the PCM cannot recognize the difference between a selected switch position versus an open circuit, a short circuit, or a defective switch. If the State Display screen shows the change from HIGH to LOW or LOW to HIGH, assume the entire switch circuit to the PCM functions properly. Connect the DRB scan tool to the data link connector and access the state display screen. Then access either State Display Inputs and Outputs or State Display Sensors.

CIRCUIT ACTUATION TEST MODE

The Circuit Actuation Test Mode checks for proper operation of output circuits or devices the Powertrain Control Module (PCM) may not internally recognize. The PCM attempts to activate these outputs and allow an observer to verify proper operation. Most of the tests provide an audible or visual indication of device operation (click of relay contacts, fuel spray, etc.). Except for intermittent conditions, if a device functions properly during testing, assume the device, its associated wiring, and driver circuit work correctly. Connect a scan tool to the data link connector and access the Actuators screen.

DESCRIPTION - DIAGNOSTIC TROUBLE CODES

A Diagnostic Trouble Code (DTC) indicates the PCM has recognized an abnormal condition in the system.

Remember that DTC's are the results of a system or circuit failure, but do not directly identify the failed component or components.

BULB CHECK

Each time the ignition key is turned to the ON position, the malfunction indicator (check engine) lamp on the instrument panel should illuminate for approximately 2 seconds then go out. This is done for a bulb check.

OBTAINING DTC'S USING DRB SCAN TOOL

1. Obtain the applicable Powertrain Diagnostic Manual.
2. Obtain the DRB Scan Tool.
3. Connect the DRB Scan Tool to the data link (diagnostic) connector. This connector is located in the passenger compartment; at the lower edge of instrument panel; near the steering column.
4. Turn the ignition switch on and access the "Read Fault" screen.
5. Record all the DTC's and "freeze frame" information shown on the DRB scan tool.

6. To erase DTC's, use the "Erase Trouble Code" data screen on the DRB scan tool. **Do not erase any DTC's until problems have been investigated and repairs have been performed.**

TASK MANAGER

The PCM is responsible for efficiently coordinating the operation of all the emissions-related components. The PCM is also responsible for determining if the diagnostic systems are operating properly. The software designed to carry out these responsibilities is called the 'Task Manager'.

TRIP DEFINITION

The term "Trip" has different meanings depending on what the circumstances are. If the MIL (Malfunction Indicator Lamp) is OFF, a Trip is defined as when the Oxygen Sensor Monitor and the Catalyst Monitor have been completed in the same drive cycle.

When any Emission DTC is set, the MIL on the dash is turned ON. When the MIL is ON, it takes 3 good trips to turn the MIL OFF. In this case, it depends on what type of DTC is set to know what a "Trip" is.

For the Fuel Monitor or Mis-Fire Monitor (continuous monitor), the vehicle must be operated in the "Similar Condition Window" for a specified amount of time to be considered a Good Trip.

If a Non-Continuous OBDII Monitor fails twice in a row and turns ON the MIL, re-running that monitor which previously failed, on the next start-up and passing the monitor, is considered to be a Good Trip. These will include the following:

- Oxygen Sensor
- Catalyst Monitor
- Purge Flow Monitor
- Leak Detection Pump Monitor (if equipped)
- EGR Monitor (if equipped)
- Oxygen Sensor Heater Monitor

If any other Emission DTC is set (not an OBDII Monitor), a Good Trip is considered to be when the Oxygen Sensor Monitor and Catalyst Monitor have been completed; or 2 Minutes of engine run time if the Oxygen Sensor Monitor or Catalyst Monitor have been stopped from running.

It can take up to 2 Failures in a row to turn on the MIL. After the MIL is ON, it takes 3 Good Trips to turn the MIL OFF. After the MIL is OFF, the PCM will self-erase the DTC after 40 Warm-up cycles. A Warm-up cycle is counted when the ECT (Engine Coolant Temperature Sensor) has crossed 160°F and has risen by at least 40°F since the engine has been started.

COMPONENT MONITORS

There are several components that will affect vehicle emissions if they malfunction. If one of these components malfunctions the Malfunction Indicator Lamp (MIL) will illuminate.

Some of the component monitors are checking for proper operation of the part. Electrically operated components now have input (rationality) and output (functionality) checks. Previously, a component like the Throttle Position sensor (TPS) was checked by the PCM for an open or shorted circuit. If one of these conditions occurred, a DTC was set. Now there is a check to ensure that the component is working. This is done by watching for a TPS indication of a greater or lesser throttle opening than MAP and engine rpm indicate. In the case of the TPS, if engine vacuum is high and engine rpm is 1600 or greater, and the TPS indicates a large throttle opening, a DTC will be set. The same applies to low vacuum if the TPS indicates a small throttle opening.

All open/short circuit checks, or any component that has an associated limp-in, will set a fault after 1 trip with the malfunction present. Components without an associated limp-in will take two trips to illuminate the MIL.

OPERATION

TASK MANAGER

The Task Manager determines which tests happen when and which functions occur when. Many of the diagnostic steps required by OBD II must be performed under specific operating conditions. The Task Manager software organizes and prioritizes the diagnostic procedures. The job of the Task Manager is to determine if conditions are appro-

appropriate for tests to be run, monitor the parameters for a trip for each test, and record the results of the test. Following are the responsibilities of the Task Manager software:

- Test Sequence
- MIL Illumination
- Diagnostic Trouble Codes (DTCs)
- Trip Indicator
- Freeze Frame Data Storage
- Similar Conditions Window

Test Sequence

In many instances, emissions systems must fail diagnostic tests more than once before the PCM illuminates the MIL. These tests are known as 'two trip monitors.' Other tests that turn the MIL lamp on after a single failure are known as 'one trip monitors.' A trip is defined as 'start the vehicle and operate it to meet the criteria necessary to run the given monitor.'

Many of the diagnostic tests must be performed under certain operating conditions. However, there are times when tests cannot be run because another test is in progress (conflict), another test has failed (pending) or the Task Manager has set a fault that may cause a failure of the test (suspend).

- Pending

Under some situations the Task Manager will not run a monitor if the MIL is illuminated and a fault is stored from another monitor. In these situations, the Task Manager postpones monitors **pending** resolution of the original fault. The Task Manager does not run the test until the problem is remedied.

For example, when the MIL is illuminated for an Oxygen Sensor fault, the Task Manager does not run the Catalyst Monitor until the Oxygen Sensor fault is remedied. Since the Catalyst Monitor is based on signals from the Oxygen Sensor, running the test would produce inaccurate results.
- Conflict

There are situations when the Task Manager does not run a test if another monitor is in progress. In these situations, the effects of another monitor running could result in an erroneous failure. If this **conflict** is present, the monitor is not run until the conflicting condition passes. Most likely the monitor will run later after the conflicting monitor has passed.

For example, if the Fuel System Monitor is in progress, the Task Manager does not run the EGR Monitor. Since both tests monitor changes in air/fuel ratio and adaptive fuel compensation, the monitors will conflict with each other.
- Suspend

Occasionally the Task Manager may not allow a two trip fault to mature. The Task Manager will **suspend** the maturing of a fault if a condition exists that may induce an erroneous failure. This prevents illuminating the MIL for the wrong fault and allows more precise diagnosis.

For example, if the PCM is storing a one trip fault for the Oxygen Sensor and the EGR monitor, the Task Manager may still run the EGR Monitor but will suspend the results until the Oxygen Sensor Monitor either passes or fails. At that point the Task Manager can determine if the EGR system is actually failing or if an Oxygen Sensor is failing.

MIL Illumination

The PCM Task Manager carries out the illumination of the MIL. The Task Manager triggers MIL illumination upon test failure, depending on monitor failure criteria.

The Task Manager Screen shows both a Requested MIL state and an Actual MIL state. When the MIL is illuminated upon completion of a test for a third trip, the Requested MIL state changes to OFF. However, the MIL remains illuminated until the next key cycle. (On some vehicles, the MIL will actually turn OFF during the third key cycle) During the key cycle for the third good trip, the Requested MIL state is OFF, while the Actual MIL state is ON. After the next key cycle, the MIL is not illuminated and both MIL states read OFF.

Diagnostic Trouble Codes (DTCs)

With OBD II, different DTC faults have different priorities according to regulations. As a result, the priorities determine MIL illumination and DTC erasure. DTCs are entered according to individual priority. DTCs with a higher priority overwrite lower priority DTCs.

Priorities

- Priority 0 — Non-emissions related trouble codes
- Priority 1 — One trip failure of a two trip fault for non-fuel system and non-misfire.
- Priority 2 — One trip failure of a two trip fault for fuel system (rich/lean) or misfire.
- Priority 3 — Two trip failure for a non-fuel system and non-misfire or matured one trip comprehensive component fault.
- Priority 4 — Two trip failure or matured fault for fuel system (rich/lean) and misfire or one trip catalyst damaging misfire.

Non-emissions related failures have no priority. One trip failures of two trip faults have low priority. Two trip failures or matured faults have higher priority. One and two trip failures of fuel system and misfire monitor take precedence over non-fuel system and non-misfire failures.

DTC Self Erasure

With one trip components or systems, the MIL is illuminated upon test failure and DTCs are stored.

Two trip monitors are components requiring failure in two consecutive trips for MIL illumination. Upon failure of the first test, the Task Manager enters a maturing code. If the component fails the test for a second time the code matures and a DTC is set.

After three good trips the MIL is extinguished and the Task Manager automatically switches the trip counter to a warm-up cycle counter. DTCs are automatically erased following 40 warm-up cycles if the component does not fail again.

For misfire and fuel system monitors, the component must pass the test under a Similar Conditions Window in order to record a good trip. A Similar Conditions Window is when engine RPM is within ± 375 RPM and load is within $\pm 10\%$ of when the fault occurred.

NOTE: It is important to understand that a component does not have to fail under a similar window of operation to mature. It must pass the test under a Similar Conditions Window when it failed to record a Good Trip for DTC erasure for misfire and fuel system monitors.

DTCs can be erased anytime with a diagnostic scan tool. Erasing the DTC with the scan tool erases all OBD II information. The scan tool automatically displays a warning that erasing the DTC will also erase all OBD II monitor data. This includes all counter information for warm-up cycles, trips and Freeze Frame.

Trip Indicator

The **Trip** is essential for running monitors and extinguishing the MIL. In OBD II terms, a trip is a set of vehicle operating conditions that must be met for a specific monitor to run. All trips begin with a key cycle.

Good Trip

The Good Trip counters are as follows:

- Specific Good Trip
- Fuel System Good Trip
- Misfire Good Trip
- Alternate Good Trip (appears as a Global Good Trip on a scan tool)
 - Comprehensive Components
 - Major Monitor
- Warm-Up Cycles

Specific Good Trip

The term Good Trip has different meanings depending on the circumstances:

- If the MIL is OFF, a trip is defined as when the Oxygen Sensor Monitor and the Catalyst Monitor have been completed in the same drive cycle.
- If the MIL is ON and a DTC was set by the Fuel Monitor or Misfire Monitor (both continuous monitors), the vehicle must be operated in the Similar Condition Window for a specified amount of time.
- If the MIL is ON and a DTC was set by a Task Manager commanded once-per-trip monitor (such as the Oxygen Sensor Monitor, Catalyst Monitor, Purge Flow Monitor, Leak Detection Pump Monitor, EGR Monitor or Oxygen Sensor Heater Monitor), a good trip is when the monitor is passed on the next start-up.

- If the MIL is ON and any other emissions DTC was set (not an OBD II monitor), a good trip occurs when the Oxygen Sensor Monitor and Catalyst Monitor have been completed, or two minutes of engine run time if the Oxygen Sensor Monitor and Catalyst Monitor have been stopped from running.

Fuel System Good Trip

To count a good trip (three required) and turn off the MIL, the following conditions must occur:

- Engine in closed loop
- Operating in Similar Conditions Window
- Short Term multiplied by Long Term less than threshold
- Less than threshold for a predetermined time

If all of the previous criteria are met, the PCM will count a good trip (three required) and turn off the MIL.

Misfire Good Trip

If the following conditions are met the PCM will count one good trip (three required) in order to turn off the MIL:

- Operating in Similar Condition Window
- 1000 engine revolutions with no misfire

Warm-Up Cycles

Once the MIL has been extinguished by the Good Trip Counter, the PCM automatically switches to a Warm-Up Cycle Counter that can be viewed on the DRB III. Warm-Up Cycles are used to erase DTCs and Freeze Frames. Forty Warm-Up cycles must occur in order for the PCM to self-erase a DTC and Freeze Frame. A Warm-Up Cycle is defined as follows:

- Engine coolant temperature must start below and rise above 160° F
- Engine coolant temperature must rise by 40° F
- No further faults occur

Freeze Frame Data Storage

Once a failure occurs, the Task Manager records several engine operating conditions and stores it in a Freeze Frame. The Freeze Frame is considered one frame of information taken by an on-board data recorder. When a fault occurs, the PCM stores the input data from various sensors so that technicians can determine under what vehicle operating conditions the failure occurred.

The data stored in Freeze Frame is usually recorded when a system fails the first time for two trip faults. Freeze Frame data will only be overwritten by a different fault with a higher priority.

CAUTION: Erasing DTCs, either with a scan tool or by disconnecting the battery, also clears all Freeze Frame data.

Similar Conditions Window

The Similar Conditions Window displays information about engine operation during a monitor. Absolute MAP (engine load) and Engine RPM are stored in this window when a failure occurs. There are two different Similar conditions Windows: Fuel System and Misfire.

FUEL SYSTEM

- **Fuel System Similar Conditions Window** — An indicator that 'Absolute MAP When Fuel Sys Fail' and 'RPM When Fuel Sys Failed' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.
- **Absolute MAP When Fuel Sys Fail** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.
- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Fuel Sys Fail** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.
- **Upstream O2S Volts** — A live reading of the Oxygen Sensor to indicate its performance. For example, stuck lean, stuck rich, etc.

- **SCW Time in Window (Similar Conditions Window Time in Window)** — A timer used by the PCM that indicates that, after all Similar Conditions have been met, if there has been enough good engine running time in the SCW without failure detected. This timer is used to increment a Good Trip.
- **Fuel System Good Trip Counter** — A Trip Counter used to turn OFF the MIL for Fuel System DTCs. To increment a Fuel System Good Trip, the engine must be in the Similar Conditions Window, Adaptive Memory Factor must be less than calibrated threshold and the Adaptive Memory Factor must stay below that threshold for a calibrated amount of time.
- **Test Done This Trip** — Indicates that the monitor has already been run and completed during the current trip.

MISFIRE

- **Same Misfire Warm-Up State** — Indicates if the misfire occurred when the engine was warmed up (above 160° F).
- **In Similar Misfire Window** — An indicator that 'Absolute MAP When Misfire Occurred' and 'RPM When Misfire Occurred' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.
- **Absolute MAP When Misfire Occurred** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.
- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Misfire Occurred** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.
- **200 Rev Counter** — Counts 0–100 720 degree cycles.
- **SCW Cat 200 Rev Counter** — Counts when in similar conditions.
- **SCW FTP 1000 Rev Counter** — Counts 0–4 when in similar conditions.
- **Misfire Good Trip Counter** — Counts up to three to turn OFF the MIL.
- **Misfire Data**— Data collected during test.
- **Test Done This Trip**— Indicates YES when the test is done.

NON-MONITORED CIRCUITS

The PCM does not monitor the following circuits, systems and conditions that could have malfunctions causing driveability problems. The PCM might not store diagnostic trouble codes for these conditions. However, problems with these systems may cause the PCM to store diagnostic trouble codes for other systems or components. **EXAMPLE:** a fuel pressure problem will not register a fault directly, but could cause a rich/lean condition or misfire. This could cause the PCM to store an oxygen sensor or misfire diagnostic trouble code

FUEL PRESSURE

The fuel pressure regulator controls fuel system pressure. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line fuel filter, or a pinched fuel supply or return line. However, these could result in a rich or lean condition causing the PCM to store an oxygen sensor or fuel system diagnostic trouble code.

SECONDARY IGNITION CIRCUIT

The PCM cannot detect an inoperative ignition coil, fouled or worn spark plugs, ignition cross firing, or open spark plug cables.

CYLINDER COMPRESSION

The PCM cannot detect uneven, low, or high engine cylinder compression.

EXHAUST SYSTEM

The PCM cannot detect a plugged, restricted or leaking exhaust system, although it may set a fuel system fault.

FUEL INJECTOR MECHANICAL MALFUNCTIONS

The PCM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a rich or lean condition causing the PCM to store a diagnostic trouble code for either misfire, an oxygen sensor, or the fuel system.

EXCESSIVE OIL CONSUMPTION

Although the PCM monitors engine exhaust oxygen content when the system is in closed loop, it cannot determine excessive oil consumption.

THROTTLE BODY AIR FLOW

The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.

VACUUM ASSIST

The PCM cannot detect leaks or restrictions in the vacuum circuits of vacuum assisted engine control system devices. However, these could cause the PCM to store a MAP sensor diagnostic trouble code and cause a high idle condition.

PCM SYSTEM GROUND

The PCM cannot determine a poor system ground. However, one or more diagnostic trouble codes may be generated as a result of this condition. The module should be mounted to the body at all times, also during diagnostic.

PCM CONNECTOR ENGAGEMENT

The PCM may not be able to determine spread or damaged connector pins. However, it might store diagnostic trouble codes as a result of spread connector pins.

EVAPORATIVE EMISSIONS

DESCRIPTION

HIGH AND LOW LIMITS

The PCM compares input signal voltages from each input device with established high and low limits for the device. If the input voltage is not within limits and other criteria are met, the PCM stores a diagnostic trouble code in memory. Other diagnostic trouble code criteria might include engine RPM limits or input voltages from other sensors or switches that must be present before verifying a diagnostic trouble code condition.

DIAGNOSIS AND TESTING

OBD II Monitor Information

Comprehensive Components Monitor (Includes All Engine Hardware Sensor, Switches, Solenoids, etc.)	Major Monitors Non Fuel Control & Non Misfire (Monitors Entire Emission System)	Major Monitors Fuel Control & misfire (Monitors Entire System)
Most are one trip Faults	Most are Two Trips Faults	Two Trip Faults
Usually Turns on The Mil and Sets DTC After One Failure	Turns On The Mil and Sets DTC after Two Consecutive Failure	The Mil and Sets DTC After Two Consecutive Failure
Priority 3	Priority 1 or 3	Priority 2 or 4
All Checked For Continuity	Done Stop Test = Yes	Fuel Control Monitor
Open	Oxygen Sensor Heater	Monitors Fuel Control System For: Fuel System Lean
Short To Ground	Oxygen Sensor Response	
Short To Voltage	Catalytic Converter	Fuel System Rich
Inputs Checked For Rationality	Efficiency Except EWMA	Requires 3 Consecutive Fuel System Good Trips to Extinguish the MIL
Outputs Checked For Functionality	up to 6 test per trip and a one trip fault (SBEC) and two trip fault on (JTEC)	
	EGR System	Misfire Monitor
	Evaporative Emission System (purge and leak) Non-LDP LDP	Monitors for Engine Misfire At: 4 X 1000 RPM Counter (4000 Revs) (Type B) **200 X 3 (600) RPM counter (Type A)
Requires 3 Consecutive Global Good Trips to Extinguish the MIL*	Requires 3 Consecutive Global Good Trips to Extinguish the MIL*	Requires 3 Consecutive Global Good Trips to Extinguish the MIL
*40 Warm Up Cycles are required to erase DTCs after the MIL has been extinguished		** Type A misfire is a one trip failure on pre-1999, 2 trip failure on 1999 and later. The MIL will illuminate at the first or second failure, based on MY.

OBD II MONITOR RUN PROCESS

The following procedure has been established to assist Chrysler Dealer Technicians in the field with enabling and running OBD II Monitors. The order listed in the following procedure is intended to allow the technician to effectively complete each monitor and to set the CARB Readiness Status in the least time possible.

NOTE: A. Once the monitor run process has begun, do not turn off the ignition. By turning the ignition key off, monitor enabling conditions will be lost. NVLD Monitor runs after key off. B. By performing a Battery Disconnect, or Selecting Erase DTCs, the CARB Readiness and all additional OBD II information will be cleared.

Monitor Preliminary Checks:

1. Plug a SCAN TOOL into the vehicle's Data Link Connector (DLC).

2. Turn the ignition, KEY ON - ENGINE OFF. Watch for MIL lamp illumination during the bulb check. MIL lamp must have illuminated, if not, repair MIL lamp.
3. On the SCAN TOOL Select #1 Stand-alone.
4. Select #1 1998-2004 Diagnostics.
5. Select #1 Engine.
6. Select #2 DTCs and Related Functions.
7. Select #1 Read DTCs.
 - Verify that No Emissions Related DTCs are Present.
 - * If an Emissions DTC is Present, the OBD II Monitors may not run and the CARB Readiness will not update.
 - The Emissions related DTC, will need to be repaired, then cleared. By clearing DTCs, the OBD Monitors will need to be run and completed to set the CARB Readiness Status.
8. Return to Engine Select Function Menu and Select #9, OBD II Monitors.
9. Select #3 CARB Readiness Status.

Do all the CARB Readiness Status Locations read YES?

- *YES, then all monitors have been completed and this vehicle is ready to be I/M or Emission Tested.
- *NO, then the following procedure needs to be followed to run/complete all available monitors.

NOTE: A. Only the monitors, which are not YES in the CARB Readiness Status, need to be completed. B. Specific criteria need to be met for each monitor. Each monitor has a Pre-Test screen to assist in running the monitor. For additional information, refer to the DaimlerChrysler Corporation Technical Training Workbook titled On Board Diagnostics: OBD II/EOBD, part number 81-699-01050. C. The most efficient order to run the monitors has been outlined below, including suggestions to aid the process.

Natural Vacuum Leak Detection with Purge Monitor

This monitor requires a cool down cycle, usually an overnight soak for at least 8 hours without the engine running. The ambient temperature must decrease overnight - parking the vehicle outside is advised. To run this test the fuel level must be between 15-85% full. For the monitor run conditions select the EVAP MON PRE-TEST in the SCAN TOOL, OBD II Monitors Menu. The Purge monitor will run if the small leak test reports a pass. Criteria for NVLD monitor:

- Engine off time greater than @ one hour.
- Fuel Level between 15% and 85 %.
- Start Up ECT and IAT within 10 C (18 F).
- Vehicle started and run until Purge Monitor reports a result.

NOTE: If the vehicle does not report a result and the conditions where correct. It may take up to two weeks to fail the small leak monitor. DO NOT use this test to attempt to determine a fault. Use the appropriate service information procedure for finding a small leak. If there are no faults and the conditions are correct this test will run and report a pass. Note the Small leak test can find leaks less than 10 thousands of an inch. If a small leak is present it takes approximately one week of normal driving to report a failure.

Catalyst / O2 Monitor

With NGC, Catalyst and O2 Monitor information are acquired and processed at the same time. Most vehicles will need to be driven at highway speed (< 50 mph) for a few minutes. Some trucks run the monitor at idle in drive. If the vehicle is equipped with a manual transmission, using 4th gear may assist in meeting the monitor running criteria. For the monitor run conditions, select the BANK 1 CAT MON PRE-TEST in the SCAN TOOL, OBD II Monitors Menu.

EGR Monitor

The EGR monitor now runs in a closed throttle decel or at idle on a warm vehicle. However, it is necessary to maintain the TPS, Map and RPM ranges to allow the monitor to complete itself. For the monitor run conditions, select the EGR PRE-TEST in the SCAN TOOL, OBD II Monitors Menu.

O2 Sensor Heater Monitor

This monitor is now continuously running once the heaters are energized. Pass information will be processed at power down. For the monitor run conditions, select the O2S HEATER MON PRE-TEST in the SCAN TOOL, OBD II Monitors Menu.

SPECIFICATIONS

SOLENOID-EVAP/PURGE

DESCRIPTION

The duty cycle EVAP canister purge solenoid (2) is located in the engine compartment attached to a bracket.

OPERATION

The Powertrain Control Module (PCM) operates the solenoid.

During the cold start warm-up period and the hot start time delay, the PCM does not energize the solenoid. When de-energized, no vapors are purged. The PCM de-energizes the solenoid during open loop operation.

The engine enters closed loop operation after it reaches a specified temperature and the time delay ends. During closed loop operation, the PCM energizes and de-energizes the solenoid 5 or 10 times per second, depending upon operating conditions. The PCM varies the vapor flow rate by changing solenoid pulse width. Pulse width is the amount of time the solenoid energizes. The PCM adjusts solenoid pulse width based on engine operating condition.

REMOVAL

The duty cycle EVAP canister purge solenoid (1) is located in the engine compartment attached to a bracket.

1. Disconnect electrical wiring connector (2) at solenoid.
2. Disconnect vacuum lines at solenoid.
3. Remove solenoid from mounting bracket by lifting straight up.

INSTALLATION

1. Install solenoid assembly (1) to mounting bracket.
2. Connect vacuum harness.
3. Connect electrical connector (2).

CAP-FUEL FILLER

DESCRIPTION

The plastic fuel tank filler tube cap is threaded onto the end of the fuel fill tube. Certain models are equipped with a 1/4 turn cap.

OPERATION

The loss of any fuel or vapor out of fuel filler tube is prevented by the use of a pressure-vacuum fuel fill cap. Relief valves inside the cap will release fuel tank pressure at predetermined pressures. Fuel tank vacuum will also be released at predetermined values. This cap must be replaced by a similar unit if replacement is necessary. This is in order for the system to remain effective.

CAUTION: Remove fill cap before servicing any fuel system component to relieve tank pressure. If equipped with a Leak Detection Pump (LDP), or NVLD system, the cap must be tightened securely. If cap is left loose, a Diagnostic Trouble Code (DTC) may be set.

REMOVAL

REMOVAL/INSTALLATION

If replacement of the 1/4 turn fuel tank filler tube cap is necessary, it must be replaced with an identical cap to be sure of correct system operation.

CAUTION: Remove the fuel tank filler tube cap to relieve fuel tank pressure. The cap must be removed prior to disconnecting any fuel system component or before draining the fuel tank.

ORVR

DESCRIPTION

The ORVR (On-Board Refueling Vapor Recovery) system consists of a unique fuel tank, flow management valve, fluid control valve, one-way check valve and vapor canister.

OPERATION

The ORVR (On-Board Refueling Vapor Recovery) system is used to remove excess fuel tank vapors. This is done while the vehicle is being refueled.

Fuel flowing into the fuel filler tube (approx. 1" I.D.) creates an aspiration effect drawing air into the fuel fill tube. During refueling, the fuel tank is vented to the EVAP canister to capture escaping vapors. With air flowing into the filler tube, there are no fuel vapors escaping to the atmosphere. Once the refueling vapors are captured by the EVAP canister, the vehicle's computer controlled purge system draws vapor out of the canister for the engine to burn. The vapor flow is metered by the purge solenoid so that there is no, or minimal impact on driveability or tailpipe emissions.

As fuel starts to flow through the fuel fill tube, it opens the normally closed check valve and enters the fuel tank. Vapor or air is expelled from the tank through the control valve and on to the vapor canister. Vapor is absorbed in the EVAP canister until vapor flow in the lines stops. This stoppage occurs following fuel shut-off, or by having the fuel level in the tank rise high enough to close the control valve. This control valve contains a float that rises to seal the large diameter vent path to the EVAP canister. At this point in the refueling process, fuel tank pressure increases, the check valve closes (preventing liquid fuel from spiting back at the operator), and fuel then rises up the fuel filler tube to shut off the dispensing nozzle.

PUMP-NATURAL VAC LEAK DETECTION

DESCRIPTION

The NVLD pump (2) is attached to the EVAP canister (3). This assembly is located in the left-rear quarter-panel behind the left-rear tire. Refer to NVLD Removal / Installation for additional information.

OPERATION

The Natural Vacuum Leak Detection (NVLD) system is the next generation evaporative leak detection system that will first be used on vehicles equipped with the Next Generation Controller (NGC). This new system replaces the leak detection pump as the method of evaporative system leak detection. This is to detect a leak equivalent to a 0.020" (0.5 mm) hole. This system has the capability to detect holes of this size very dependably.

The basic leak detection theory employed with NVLD is the "Gas Law". This is to say that the pressure in a sealed vessel will change if the temperature of the gas in the vessel changes. The vessel will only see this effect if it is indeed sealed. Even small leaks will allow the pressure in the vessel to come to equilibrium with the ambient pressure. In addition to the detection of very small leaks, this system has the capability of detecting medium as well as large evaporative system leaks.

A vent valve seals the canister vent during engine off conditions. If the vapor system has a leak of less than the failure threshold, the evaporative system will be pulled into a vacuum, either due to the cool down from operating temperature or diurnal ambient temperature cycling. The diurnal effect is considered one of the primary contributors to the leak determination by this diagnostic. When the vacuum in the system exceeds about 1" H₂O (0.25 KPA), a vacuum switch closes. The switch closure sends a signal to the NGC. The NGC, via appropriate logic strategies, utilizes the switch signal, or lack thereof, to make a determination of whether a leak is present.

The NVLD device is designed with a normally open vacuum switch, a normally closed solenoid, and a seal, which is actuated by both the solenoid and a diaphragm. The NVLD is located on the atmospheric vent side of the canister. The NVLD assembly may be mounted on top of the canister outlet, or in-line between the canister and atmospheric vent filter. The normally open vacuum switch will close with about 1" H₂O (0.25 KPA) vacuum in the evaporative system. The diaphragm actuates the switch. This is above the opening point of the fuel inlet check valve in the fill tube so cap off leaks can be detected. Submerged fill systems must have recirculation lines that do not have the in-line normally closed check valve that protects the system from failed nozzle liquid ingestion, in order to detect cap off conditions.

The normally closed valve in the NVLD is intended to maintain the seal on the evaporative system during the engine off condition. If vacuum in the evaporative system exceeds 3" to 6" H₂O (0.75 to 1.5 KPA), the valve will be pulled off the seat, opening the seal. This will protect the system from excessive vacuum as well as allowing sufficient purge flow in the event that the solenoid was to become inoperative.

The solenoid actuates the valve to unseal the canister vent while the engine is running. It also will be used to close the vent during the medium and large leak tests and during the purge flow check. This solenoid requires an initial

1.5 amps of current to pull the valve open, but after 100 milli-seconds, will be duty cycled down to an average of about 150 mA for the remainder of the drive cycle.

Another feature in the device is a diaphragm that will open the seal in the NVLD with pressure in the evaporative system. The device will "blow off" at about 0.5" H₂O (0.12 KPA) pressure to permit the venting of vapors during refueling. An added benefit to this is that it will also allow the tank to "breathe" during increasing temperatures, thus limiting the pressure in the tank to this low level. This is beneficial because the induced vacuum during a subsequent declining temperature will achieve the switch closed (pass threshold) sooner than if the tank had to decay from a built up pressure.

The device itself has 3 wires: Switch sense, solenoid driver and ground. It also includes a resistor to protect the switch from a short to battery or a short to ground. The NGC utilizes a high-side driver to energize and duty-cycle the solenoid.

REMOVAL

The NVLD pump (2) is attached to the EVAP canister (3). This assembly is located in the left-rear quarter-panel behind the left-rear tire.

1. Raise and support vehicle.
2. Remove left-rear tire.
3. To access EVAP canister or NVLD pump, remove plastic splash shield at rear of left-rear tire.
4. Disconnect electrical connector (4) at pump.
5. Carefully remove vapor/vacuum hoses at pump.

6. Pry outward on tab (3) and rotate pump **clockwise** about 70 degrees for removal.

7. Remove NVLD pump o-ring (2) from EVAP canister (1).

INSTALLATION

1. Install new NVLD pump o-ring (2) to EVAP canister (1).

2. Position NVLD pump (4) into EVAP canister (1).
3. Rotate pump (4) until tab (3) aligns with notch in EVAP canister (1).

4. Carefully install vapor/vacuum lines (1) and (6) to NVLD pump and EVAP canister. **The vapor/vacuum lines and hoses must be firmly connected. Check the vapor/vacuum lines at the NVLD pump, filter and EVAP canister purge solenoid for damage or leaks. If a leak is present, a Diagnostic Trouble Code (DTC) may be set.**
5. Connect electrical connector (4) to pump.
6. Install plastic splash shield at rear of left-rear tire.
7. Install left-rear tire.

VALVE-PCV

DESCRIPTION

3.7L V-6 / 4.7L V-8

The 3.7L V-6 and 4.7L V-8 engines are equipped with a closed crankcase ventilation system. The Positive Crankcase Ventilation (PCV) valve (6) is mounted to the oil filler housing (4).

The PCV valve is sealed to the oil filler housing with an o-ring (1).

Two interconnected breathers (1) threaded into the rear of each cylinder head are used with the system.

The system also includes the air cleaner housing and various tubes and hoses to connect the system components.

5.7L V-8

The 5.7L V-8 engine is equipped with a closed crankcase ventilation system and a Positive Crankcase Ventilation (PCV) valve.

A PCV valve (4) mounted into the top of the intake manifold (1), located to the right / rear of the throttle body (2) is used.

The PCV valve (1) is sealed to the intake manifold with two o-rings (2).

The system also consists of passages in the intake manifold, and various tubes and hoses to connect the system components.

80f3018d

OPERATION

A typical enclosed crankcase ventilation system is shown in the graphic.

The PCV system operates by engine intake manifold vacuum. Filtered air is routed into the crankcase through the air cleaner hose. The metered air, along with crankcase vapors, are drawn through the PCV valve (4) and into a passage in the intake manifold.

The PCV system manages crankcase pressure and meters blow by gases to the intake system, reducing engine sludge formation.

The PCV valve contains a spring loaded plunger. This plunger meters the amount of crankcase vapors routed into the combustion chamber based on intake manifold vacuum.

80d12d17

When the engine is not operating or during an engine pop-back, the spring forces the plunger back against the seat. This will prevent vapors from flowing through the valve.

During periods of high manifold vacuum, such as idle or cruising speeds, vacuum is sufficient to completely compress spring. It will then pull the plunger to the top of the valve. In this position there is minimal vapor flow through the valve.

During periods of moderate manifold vacuum, the plunger is only pulled part way back from inlet. This results in maximum vapor flow through the valve.

DIAGNOSIS AND TESTING

PCV VALVE - 3.7L V-6/ 4.7L V-8

1. Disconnect PCV line/hose (5) by disconnecting rubber connecting hose at PCV valve fitting.
2. Remove PCV valve at oil filler tube by rotating PCV valve downward until locating tabs (2) have been freed at cam lock (3). After tabs have cleared, pull valve straight out from filler tube. **To prevent damage to PCV valve locating tabs, valve must be pointed downward for removal. Do not force valve from oil filler tube.**
3. After valve is removed, check condition of valve o-ring (1). Also, PCV valve should rattle when shaken.
4. Reconnect PCV valve to its connecting line/hose.
5. Start engine and bring to idle speed.
6. If valve is not plugged, a hissing noise will be heard as air passes through valve. Also, a strong vacuum should be felt with a finger placed at valve inlet.
7. If vacuum is not felt at valve inlet, check line/hose for kinks or for obstruction. If necessary, clean out intake manifold fitting at rear of manifold. Do this by turning a 1/4 inch drill (by hand) through the fitting to dislodge any solid particles. Blow out the fitting with shop air. If necessary, use a smaller drill to avoid removing any metal from the fitting.
8. **Do not attempt to clean the old PCV valve.**
9. Return PCV valve back to oil filler tube by placing valve locating tabs (2) into cam lock (3). Press PCV valve in and rotate valve upward. A slight click will be felt when tabs have engaged cam lock. Valve should be pointed towards rear of vehicle.
10. Connect PCV line/hose (5) and connecting rubber hose to PCV valve.
11. Disconnect rubber hose from fresh air fitting at air cleaner resonator box. Start engine and bring to idle speed. Hold a piece of stiff paper (such as a parts tag) loosely over the opening of the disconnected rubber hose.
12. The paper should be drawn against the hose opening with noticeable force. This will be after allowing approximately one minute for crankcase pressure to reduce.

13. If vacuum is not present, disconnect each PCV system hose at top of each crankcase breather (1). Check for obstructions or restrictions.
14. If vacuum is still not present, remove each PCV system crankcase breather (1) from each cylinder head. Check for obstructions or restrictions. If plugged, replace breather. Tighten breather to 12 N·m (106 in. lbs.) torque. Do not attempt to clean breather.

15. If vacuum is still not present, disconnect each PCV system hose (1) at each fitting, and at each check valve (2). Check for obstructions or restrictions.

REMOVAL

3.7L V-6 / 4.7L V-8

The PCV valve (6) is located on the oil filler tube (4). Two locating tabs are located on the side of the valve (2). These 2 tabs fit into a cam lock (3) in the oil filler tube. An o-ring (1) seals the valve to the filler tube.

1. Disconnect PCV line/hose (5) by disconnecting rubber hose at PCV valve fitting.
2. Remove PCV valve at oil filler tube by rotating PCV valve downward (counter-clockwise) until locating tabs (2) have been freed at cam lock (3). After tabs have cleared, pull valve straight out from filler tube.
To prevent damage to PCV valve locating tabs, valve must be pointed downward for removal. Do not force valve from oil filler tube.
3. After valve is removed, check condition of valve o-ring (1).

5.7L V-8

The PCV valve (4) is mounted into the top of the intake manifold (1). This is located to the right / rear of the throttle body (2).

1. The PCV valve is sealed to the intake manifold with 2 O-rings (2).
2. Remove PCV valve by rotating counter-clockwise 90 degrees until locating tabs (3) have been freed. After tabs have cleared, pull valve straight up from intake manifold.
3. After valve is removed, check condition of 2 valve O-rings (2).

INSTALLATION

3.7L V6 / 4.7L V-8

The PCV valve is located on the oil filler tube. Two locating tabs are located on the side of the valve. These 2 tabs fit into a cam lock in the oil filler tube. An o-ring seals the valve to the filler tube.

1. Return PCV valve back to oil filler tube by placing valve locating tabs into cam lock. Press PCV valve in and rotate valve upward. A slight click will be felt when tabs have engaged cam lock. Valve should be pointed towards rear of vehicle.
2. Connect PCV line/hose and rubber hose to PCV valve.

5.7L V-8

1. Clean out intake manifold opening.
2. Check condition of 2 o-rings on PCV valve.
3. Apply engine oil to 2 o-rings.
4. Place PCV valve into intake manifold and rotate 90 degrees clockwise for installation.

LINES-VACUUM

DESCRIPTION

A vacuum schematic for emission related items can be found on the vehicles VECI label. Refer to Vehicle Emission Control Information (VECI) Label for label location.

CANISTER-VAPOR

DESCRIPTION

The EVAP canister (3) is located in the left-rear quarter-panel behind the left-rear tire.

OPERATION

The EVAP canister is filled with granules of an activated carbon mixture. Fuel vapors entering the EVAP canister is absorbed by the charcoal granules.

Fuel tank pressure vents into the EVAP canister. Fuel vapors are temporarily held in the canister until they can be drawn into the intake manifold. The duty cycle EVAP canister purge solenoid allows the EVAP canister to be purged at predetermined times and at certain engine operating conditions.

REMOVAL

The NVLD pump (2) is attached to the EVAP canister (3). This assembly is located in the left-rear quarter-panel behind the left-rear tire.

1. Raise and support vehicle.
2. Remove left-rear tire.
3. To access EVAP canister or NVLD pump, remove plastic splash shield at rear of left-rear tire.
4. Disconnect electrical connector (4) at pump.
5. Carefully remove vapor/vacuum hoses (1) and (6) at pump.

6. Remove three canister bracket-to-body nuts (1) and (2).
7. Separate canister from mounting bracket by removing two canister-to-bracket nuts at front of canister (4). The opposite end of canister is equipped with two alignment pins. Remove canister from support bracket by pulling these two pins from the two rubber grommets (6).

To Separate NVLD Pump from EVAP canister:

8. Pry outward on tab (3) and rotate pump **clockwise** about 70 degrees for removal.

9. Remove NVLD pump o-ring (2) from EVAP canister (1).

INSTALLATION

To Install NVLD Pump to EVAP canister:

1. Install new NVLD pump o-ring (2) to EVAP canister (1).

2. Position NVLD pump (4) into EVAP canister (1).
3. Rotate pump (4) until tab (3) aligns with notch in EVAP canister (1).

To Install EVAP canister:

4. Position canister (5) into mounting bracket (4). Install and tighten two canister-to-mounting bracket nuts.
5. Position canister/pump assembly to body. Install and tighten three mounting bracket-to-body nuts.

6. Carefully install vapor/vacuum lines (1) and (6) to NVLD pump and EVAP canister. **The vapor/vacuum lines and hoses must be firmly connected. Check the vapor/vacuum lines at the NVLD pump, filter and EVAP canister purge solenoid for damage or leaks. If a leak is present, a Diagnostic Trouble Code (DTC) may be set.**
7. Connect electrical connector (4) to pump.
8. Install plastic splash shield at rear of left-rear tire.
9. Install left-rear tire.

OPERATION	31		

VALVE-EGR

DESCRIPTION

4.7L Engine

The electronic EGR valve and solenoid assembly (3) is attached to the rear of the left cylinder head. An exhaust gas routing tube (1) connects the EGR valve to the intake manifold.

5.7L Engine

The electronic EGR valve and solenoid assembly (2) is attached to the front of the right cylinder head. An exhaust gas routing tube (4) connects the EGR valve to the intake manifold.

OPERATION

Exhaust gas recirculation flow is determined by the Powertrain Control Module (PCM) and is controlled by an electronic EGR valve assembly. For a given set of conditions, the PCM knows the ideal exhaust gas recirculation flow to optimize NOx and fuel economy as a function of the pintle position. Pintle position is obtained from the position sensor. The PCM adjusts the duty cycle of 128 Hz power supplied to the solenoid coil to obtain the correct position.

The electronic EGR valve assembly consists of a pintle, valve seat, and housing which contains and regulates exhaust gas flow. An armature, return spring, and solenoid coil provide the operating force to regulate exhaust gas flow by changing the pintle position. The solenoid coil assembly is wired in parallel with a diode that connects two internal connectors.

REMOVAL

4.7L Engine

The electronic EGR valve and solenoid assembly (4) is attached to the rear of the left cylinder head. An exhaust gas routing tube (3) connects the EGR valve to the intake manifold.

1. Remove electrical connector (5) at top of EGR valve solenoid.
2. Remove tube mounting bolt (1) at intake manifold.

3. Remove two bolts (4) connecting EGR tube (1) to valve assembly.
4. Remove gasket located between EGR tube flange and EGR valve assembly.
5. Remove two EGR valve mounting bolts (5).
6. Separate valve assembly (3) from engine.
7. Remove and discard metal gasket located between cylinder head and valve assembly.

5.7L Engine

The electronic EGR valve and solenoid assembly (3) is attached to the front of the right cylinder head (1). An exhaust gas routing tube connects the EGR valve to the intake manifold.

1. Disconnect electrical connector (1) from EGR solenoid (2).
2. Remove two bolts (3) connecting EGR tube (4) to valve assembly.
3. Remove gasket located between EGR tube flange and EGR valve assembly.

4. Remove two mounting bolts (2).
5. Separate valve assembly (3) from cylinder head (1).
6. Remove and discard metal gasket located between cylinder head and valve assembly.

INSTALLATION

4.7L Engine

1. Clean area at rear of left cylinder head where it joins base of EGR valve.
2. Clean EGR tube where it joins EGR valve.
3. Position new gasket between EGR valve and cylinder head.
4. Position EGR valve to cylinder head. Install and tighten two bolts (5). Refer to Torque Specifications.
5. Position new gasket between EGR tube flange and EGR valve assembly.
6. Position EGR tube (1) to side of EGR valve and into intake manifold. Install two bolts (4) finger tight (temporarily).

7. Install EGR tube flange bolt (1) at intake manifold. Tighten bolt. Refer to Torque Specifications.
8. Connect electrical connector (5) to top of EGR valve solenoid (2).

9. Do a final tightening of two EGR tube bolts (4). Refer to Torque Specifications.

5.7L Engine

1. Position a new metal gasket between cylinder head (1) and valve assembly (3).
2. Install two mounting bolts (2) and tighten. Refer to Torque Specifications.

3. Clean EGR tube where it joins EGR valve.
4. Position new gasket between EGR tube flange and EGR valve assembly.
5. Install two bolts (3) connecting EGR tube (4) to valve assembly (2). Tighten bolts. Refer to Torque Specifications.
6. Connect electrical connector (1) to EGR solenoid (2).
